Coptic Women, Muslim Women and the Makings of a Social Movement in Egypt

Is it possible for Coptic and Muslim women in Egypt to organize a social movement together to improve conditions for women in Egypt? This question is significant because the literature is limited on the discussion of the role and importance of Coptic women in the feminist movement. Coptic and Muslim women have more in common than they do differences thus making it possible to mobilize a social movement.

I look at literature on the feminist movement from 1939-1952. The movement evolved from the gentlewomen of the revolution through presidents Nasser, Sadat and Mubarak. Coptic and Muslim women expressed their goals alongside one another through the use of various methods from protests to publications. There were obstacles meet along the way that were exclusive to Muslim women that also had a secondary effect on Coptic women (e.g. the veil). Religious fundamentalism has been a major obstacle for the women’s efforts and affects the state’s support for the movement. I turn to Sharia Law and its interpretation and application in society. Most importantly, Sharia Law has a great deal of influence on Constitutional Law, which applies to all citizens regardless of their religious identity. Other barriers include the state supervision of organized groups, the assimilation of religious and Constitutional Law and its application in society, as well as the state’s refusal to approve or abide by international agreements regarding women’s issues. I also review human rights violations against both groups of women and focus specifically on its effect on Coptic women (e.g. female genital mutilation). In order to assess the possibility of a social movement under current President Mubarak and future governments, I look at decisive variables in other countries where Muslim and other minority women have achieved a successful social movement that do not exist in Egypt. The countries I analyze are the Women in Black in Israel and Palestine and the Muslim and Orthodox women in Serbia and Kosovo.

The concern over the rights of women in the Middle East is crucial at this point in the world’s political history. Alongside these women are other minority women, which have a strong presence. From religion to law to gender, women face challenges that are better overcome with unity. Understanding the dynamics of these groups and their challenges allows for a broader understanding of the future of the Middle East and its assimilation or isolation from the West and the rest of the world. The question is important for this conference because it falls into politics, history, society and religion in the Middle East and can reference movements in other parts of the region.
Coptic Women, Muslim Women and the Makings of a Social Movement in Egypt

The position of women in the Arab world is often criticized in terms of stereotypes. The women are viewed as being at the mercy of their husbands, bias religion, and a government that neglects them. Although Arab countries differ in their practice of Islam, both Sharia Law and the Quran make the rights and obligations of women clear. Egypt is an Arab country which practices Islam differently as it chooses to accentuate the elements of the religion most congenial to their way of life (Badran 1995, 23). In the midst of the focus on Arab women, there is another minority of women that are totally overlooked in Egypt and those are the Coptic Christian women. Coptic women are directly affected by the laws of a government that borderlines theocracy. One would almost be inclined to believe that these women could have ever had the opportunity to voice their oppositions or needs. In fact Egypt has seen a feminist movement that has fluctuated in strength, number and form over several decades. The movement has involved both the Coptic as well as Muslim women. Even though Coptic women are not subjected to the same rules at the level of their home or church, they share a common goal as women in a repressive society. Although Coptic women were involved in the movement, their participation varied and many times posed a challenge to the movement. This paper will look at whether or not it is possible for Coptic and Muslim women in Egypt to organize a social movement now to improve conditions for women in Egypt. I posit that these women have more in common than they do differences therefore making it possible to mobilize a social movement.

The women’s movement, as is the case in many other countries, was subsumed under the Egyptian nationalist movement. “According to Mervat Hatem, the result of the debate in Egypt was a patriarchal alliance between middle and upper class men and
women, beginning at the turn of the century and continuing until the present day, whereby change for women has been incumbent upon changes introduced from the top by men.” (Russell 1992, 127) The nexus between the women’s movement and the nationalist movement was based on the social construct that the family unit forms the basis of society. The woman’s role was idealized as being the center of that unit thus glorifying her role as one of necessity for the progression and success of the future of the nation. Advocates of women’s emancipation such as Qasim Amin, (1865-1908) stressed the need to educate and liberate women in order for them to raise children who are also educated and could participate and promote a free and progressive society. Although Qasim Amin did argue for the equality of women on the basis that they are human beings as men are, he did not argue that women’s education should lead her into a life outside the traditional realm and into a public profession. Women who could not marry could take up professions, otherwise, women were to remain in the home. (Philipp 1978, 286) The views of these protagonists boosted the position of middle and upper class women but could not affect the lower class as they had no choice, economically, but to work.

1919 REVOLUTION

In order to begin a discussion of the feminist movement, we must go back to the revolution in 1919 when women first stepped onto the political scene. Prior to 1919, the women’s movement lacked political involvement or patriotism. Publications, whether literary or historical, focused on issues such as the home and marriage. “The Egyptian revolution of 1919 is pointed out as the occasion at which the feminist movement showed its first tangible results. For the first time in Egyptian history, women participated actively in political demonstrations.” (Philipp 1978, 278) Women from all classes
protested the British occupation in the streets. They waved national banners and shouted cries for independence. Stories of these demonstrations went as far as England. Muslim and Coptic women met in a Coptic church to draw-up protests against actions by the British government. Badran writes, “veiled women in procession carried flags with crescents and crosses, brandishing the national unity of Muslims and Copts in the face of colonial “divide and rule” (1995, 75).

The wives of the political elite of the Wafd Party, an Egyptian nationalist group formed in 1918, organized strikes, demonstrations, boycott of British goods and wrote petitions to foreign embassies protesting British actions in Egypt. Their demands, though, were not for the rights of women but their goal was the same as that of the men, national independence. On the other hand this can be seen as one of the first times that both Muslim and Coptic women came together for the sake of a cause. They were able to communicate and organize themselves if only for the improvement of their nation which in turn would affect them, their husbands and their homes. The “gentlewomen” as they were referred to because they belonged to the upper class, were not only involved in grassroots politics but began their own social movement. They unveiled, rejected traditional norms such as the harem and organized social services for women and the poor.

Unfortunately, after the revolution and in the wake of forming a constitution, the issue of women’s rights and equality was mostly ignored but there were those that held differing opinions on the issue. Muslim reformists argued the position of women had suffered as a result of the misinterpretation and distortion of the Quran. Issues such as education and marriage were among the many that were addressed in the discussion of
the emancipation of women. “The limits to any improvements were set by the concept that conceived of woman as only a functional part of the whole society and not as a human individual with the same innate rights and capacities as the man.” (Philipp 1978, 287)

After the revolution, the women continued to play a public role, specifically with regards to establishing charitable organizations. Several organizations were formed in the late to early twentieth centuries. Most of these women were from the upper class and could afford to do unpaid public work. They incorporated religious traditions such as almsgiving. “Most were local or regional endeavors formed along religious lines.” (Baron 1994, 171) Each religious community established an organization to advance their own goals. Many women were social activists and their work did not face opposition from the government. Such women as Hidiya Barakat, organized hospitals, ministered to the sick, established orphanages, childcare centers, and trade schools for young girls. (Marsot 1978, 215) Many women attended openings and fundraisers and gave grants to universities. Wealthy women gave their land property in trust to organizations. Some charities mobilized in an effort to help in international and national crises by sending clothes and starting schools in their homes to teach nursing. (Baron 1994, 174)

Butrus Ghali helped Coptic women to establish organizations such as the Coptic Charitable Organization. Coptic organizations were strongly connected with or established through the church diocese. Once again Muslim and Coptic women joined efforts and became public servants. “Social assistance came to be understood as not solely a religious obligation but also a civic and national responsibility for Muslims and Christians to shoulder together as Egyptians. Thus Egyptian women created a space for
themselves in the public arena in which to perform collective roles as citizens rather than as members of separate religious communities.” (Badran 1995, 51)

THE FEMINIST MOVEMENT

By the early 1920s, Muslim and non-Muslim women started unveiling in public. Egypt began to go through economic and cultural change. Religious and ethnic affiliations started to take precedence over class. For non-Muslim women veiling was considered Islamic and therefore they were not bound to uphold these practices. This was important for Coptic women because Copts were involved in the business of trade and commerce with Europeans and wanted to take on a more modern stance. At the time Coptic and Syrian Christian women had benefited more from school education than Muslim women and thus had more “incentive to innovate” (Badran 1995, 47).

On the other hand, in the early twentieth century, it was Muslim women that had the advantage of leading the feminist movement. “Minority women (Christians and Syrians, as well as non-Arab minorities-Greeks, Jews, and Armenians), although freer to innovate, and thus set precedents, could not confer legitimacy; Muslim women were more constrained, but only they could lend cultural legitimacy to new behaviors. Although middle-class Syrian Christians led in discarding the accoutrements and practice of domestic incarceration, paradoxically they also led in creating a new cult of domesticity. Middle and upper-class Muslim women who were slow to remove their veils and break with conventions of gender segregation were at the forefront in articulating a feminist ideology” (Badran 1995, 48).

The feminist movement was generally nationalist and secular, made up of middle and upper class women. These women made it part of their agenda to help the poor and
lower class women. It was made up of Christians and Muslims that respected one another’s religions and would not allow their movement to be torn by these differences. “Egyptian secular feminism situated itself within the parameters of religion, appropriating the discourse of Islamic modernism in a general way to legitimize its overall agenda and most specifically its campaign to reform the religiously based Muslim personal status code. Christian feminists, however, abstained from involvement in the drive to reform the Muslim code and never endeavored to change their own personal status codes” (Badran 1995, 95). Badran argues that this was keeping in line with their approach of “innovation without proclamation” (1995, 69). Muslim women first made feminist demands in 1911 at the Egyptian National Congress. They demanded reform in marriage and divorce provisions. Copts on the other hand, waited until 1936 at the Coptic National Congress, to present feminist demands.

In the early 1920s, Huda Sha’rawi, the recognized leader of the feminist movement, organized the Egyptian Feminist Union which became the leading and most recognized women’s organization. Her founding members were both Christian and Muslim. The EFU did not associate themselves with any political party, did not wear veils, referred to themselves as feminists and associated themselves with the international women’s movement, attending conferences in other countries. They appealed to Egypt’s early history when women enjoyed equal rights with men but, they argued, foreign intrusion as well as misinterpreted Islam had stripped women of these rights. Their agenda was feminist and the goal was to advance women in Egyptian society. Their demands were economic and social in nature, from employment to education to social services.
It was not until 1935 that the Egyptian feminist movement demanded for the political rights of women. (Philipp 1978, 291) In 1944 the EFU made a formal demand at the Arab Feminist Congress in Cairo for political rights such as voting and participation in elections. Women received the right to vote and to be elected in 1956. The EFU struggled for Muslim Personal Status Code reform, against poverty, prostitution, advocated the education of girls and fought along side men in nationalist efforts against outside intrusion. They were philanthropists, politicians and suffrage activists recognized abroad. By the 1940s, three feminist organizations actively promoting women’s political rights had grown out of the EFU. The Arab Feminist Union was formed in 1945. “However, while women could form a broad coalition in nationalist struggles against colonialism and against internal suppression of democracy, they were unable to achieve the same unity in a struggle for their own political rights. Women were unable to transcend differences of class and associational allegiances. Their leaders found it difficult to unite” (Badran, 217).

Post-World War II in Egypt saw a growth of Islamic fundamentalism, communism, a broad-based feminism, and nationalist resurgence. More radical, Leftist women’s groups emerged in the 1940s such as the League of Women Students and Graduates from the University and Egyptian Institutes. “In Egypt, progressive women did not work through existing women’s organizations largely because of ideological differences which were too serious to bridge: while radical women advocated social transformation of Egyptian society, mainstream feminists supported more limited emancipation” (Botman 1999, 21).
In the 1940s and early 1950s, many women, mostly young and upper class, were involved in the underground Communist movement, although it was predominantly male. The movement was small and lead by the Jewish Egyptian minority. “In the Marxist-feminist paradigm social reproduction, the family, and gender are analyzed in connection with the capitalist state which is viewed as acting in the interests of the dominant class. The family is seen as institutionally reproducing labor power and maintaining existing social relations” (Botman 1999, 69). The women were involved in demonstrations and served on committees. The Communist movement came to an end with the rule of Nasser.

By 1951 a wave of conservatism remerged in the country. Islamic leaders made statements that granting women political rights was contrary to Islam and the constitution. “In the 1920s, 1930s, and 1940s, the everyday lives of middle and upper class women in Cairo and Alexandria generally stood apart as freer than the lives of their counterparts in Beirut, Damascus, Jerusalem and Baghdad” (Badran 1995, 236). Unfortunately, with the new revolutionary regime, the efforts of feminists came to an end.

**NASSER: 1954-1970**

Gamal Abdel-Nasser took power after the revolution in 1952 and consolidated state power. In his efforts at national development, Nasser gave Coptic Christians as well as Muslims, economic predominance. Opportunities were extended to religious minorities equally with those of Muslims. The popular nationalist slogan reemerged under Nasser, “the nation for everyone and religion for God.” Some women consider that great advancements were made for women under Nasser. Botman cites Mervat Hatem
“that while the state used feminist ideology to catalyze national and international support it was still patriarchal at its core” (1999, 63).

Under Nasser, women gained the right to vote and compete in elections. In the 1960s Egypt elected the first woman government minister to the position of Minister of Social Affairs. A position still held today by a woman, as well as the position of Minister of Environment (Ammar1999, 153). Women also participated in government organizations and were employed into government positions. “Feminists were neither brought into decision-making positions nor consulted about the needs of female constituents. Since women did not serve in the military, they were not part of the revolutionaries’ inner circle. Men continued to reserve for themselves the exclusive right to construct the categories of social and political behavior” (Botman 1999, 52). The constitution was amended to declare all Egyptians equal before the law, endorse the fair treatment of all those in the work force and promised to support women in reconciling their public and private responsibilities.

Women’s enrollment in schools and higher education dramatically increased along with literacy rates. Nasser guaranteed male and female university graduates jobs in the state bureaucracy. Lower and middle class families began to depend on the income of women just as much as men. Women’s health services improved with the new free public health care system. Clinics were established in rural and urban areas. Family Planning was established along with better access to birth control. Ultimately, the regime did not advance women in their own right. “Herein lay the fundamental contradiction in society: state-sponsored “feminism” created a new system of public gender relations while the old forms of private patriarchy in the family were maintained” (Botman 1999, 74).
In 1956 the state forced the EFU along with all other independent organizations, to dissolve. The regime felt these organizations threatened their attempts at consolidation. The EFU became the Huda Sha’rawi Association dedicated strictly to social service under government control. (Badran 1995, 219) The consolidation of state systems required women’s groups to be heavily monitored by the state. They were required to register with the state Ministry of Social Affairs which gave them a stipend and monitored them; Arab Feminist Union members had to obtain entry and exit visas in order to attend meetings abroad; women had to receive formal permission from husbands, fathers or nearest male guardians to travel; and, the state decided which groups would represent women and which would become part of the state’s political organizations. “What had been born out of independent feminist activism in the mid-1940s had come by the 1950s and 1960s to be harnessed by states to serve their purposes” (Badran 1995, 250).

**BRAIN DRAIN**

Unfortunately, Egypt experienced a severe brain drain after 1965. This was largely due in part to the government’s solution for a saturated labor market by sending its students to study abroad. Statistics from the INS shows that approximately forty-three percent of the immigrants to the United States were women between the ages of 20-29 and 30-39. The motivations for remaining in the US varied from students studying in America finding jobs to marital ties. On the other hand, the motivations for leaving Egypt had to do with the government as much as they did with individual reasons. The government, prior to the sixties, had made it difficult for individuals to obtain exit visas and passports. Students that studied in the US with government scholarships were
required to return to work in Egypt upon completion of their studies. In the mid-sixties the United States abolished national-origin quotas thus making it easier for Egyptians to immigrate to the country.

On an individual level, the reasons varied from personal to professional to socio-economic. (Russell 1992, 131) “Flocks of Christian Egyptians started moving to the United States beginning in the 60’s. Most did not come to the United States for better opportunity or a better life, but simply to stay alive” due to the severe persecution they endured under Islam. (Soliman 2002, 2) In the eighties, half a million Copts left Egypt for America and Canada. Included in this immigration were a large number of University professors, professionals and wealthy businessmen. (Soliman 2002, 3) Many of the educated that returned to Egypt found the country’s condition to have deteriorated in terms of low salaries and poor educational facilities. Many universities did not have the resources to serve the number of students enrolling in higher education. The teacher-student ratios increased and as a result the quality of the students lowered.

The affect on the government of the immigration of so many Egyptian females to the United States is multiple. “The most serious of the female brain drain is in the social sphere of development. The nineteenth century intellectuals who argued that the education of the woman spreads education to the nation were absolutely correct in their assessment. The educated woman, in her reproductive capacities, both her own knowledge and her high estimation of education to her children; and Egypt’s future course of development depends on the development of these human resources.” (Russell 1992, 137)

The situation for Copts took a different turn under the Anwar Sadat regime than it had under the Nasser regime. During Sadat’s rule, Islamic fundamentalists had a major impact on the debates over women’s rights and minorities. Although Sadat made efforts to distance himself from Nasser by enforcing a “corrective revolution”, he built on Nasser’s legacy of promoting women’s rights. Anwar and Jihan Sadat were major proponents of women’s rights. At the same time this was countered by an increase in tension between Muslims and Copts, which created an obstacle for Coptic women. Sadat exiled the Coptic pope, put priests and bishops under house arrest, and censored the Coptic press. He also jailed Milad Hanna, a nationalist and spokesperson for the Coptic community because he believed that Hanna stimulated sectarian strife (Al-Ali 2000, 43).

Sadat made attempts at building a relationship with Islamics in order to avoid conflict. A major setback for women under his regime was the revised constitution in 1971 that made Sharia Law the primary source of law for the country. The gender equality law established under Nasser became limited by Sharia Law. Literal readings and conservative interpretations of Islamic texts had negative effects on the rights Nasser had established for women in the work place and politics. He established mandatory quotas for women in the electoral system and created a pension program for widows. “His government acknowledged women’s independent right to work without the consent of husbands, sanctioned equal pay for equal work, and in a controlled way ensured a minimum level of middle-class female representation in parliament” (Botman 1999, 87). He managed to amend the personal status laws for women but unfortunately, after his death, these were overturned by the Courts that were under fundamentalist influence.
In 1976 the constitution was amended again to make Islam the principle source of law-making. In an effort to appear progressive to his new allies in the West, the United States and Israel, Sadat permitted women to establish their own organizations including the Arab Women’s Solidarity Association in 1984, which was dissolved by the state in the late 1990s. Jihan Sadat aggressively promoted women’s rights. This eventually had a negative effect on feminism. To its detriment, the feminist movement became associated with the regime. She was involved in charitable activities and found financing for social services from outside countries. She promoted higher education for women by getting a master’s degree from the American University in Cairo. She was condemned by religious conservatives as “Western-oriented and un-Islamic” (Botman 1999, 82). He managed to amend the personal status laws for women but unfortunately, after his death, these were overturned by the Courts that were under fundamentalist influence.

Under Sadat, Muslim women thought they had made progress in their empowerment but the Court stepped in once again. Sadat revoked the House of Obedience Law in 1976 that required women be returned home to their husbands by the police if they attempted to flee. A woman could appeal to the courts if her husband forced her to return. In 1979 he enacted the Personal Status Law which requires a man to provide his wife with notice of divorce and a notarized certificate of divorce. It permitted women to divorce on specific grounds and also extended the age at which the mother must return a child to their father. The custody of children belongs to the man under Egyptian law. Unfortunately, the Supreme Court struck down the law as unconstitutional.

MUBARAK: 1981-PRESENT
Husni Mubarak is now in his fourth term as president. He has been in power since 1981 when Sadat was assassinated by fundamentalists. It is Mubarak who rescinded the Coptic pope’s exile. Mubarak faces many challenges including major economic crisis, poverty and unemployment. Religious fundamentalists disregard his regime and cause him hardship. Mubarak is caught between the push and pull of Islamic fundamentalists and the pro-democracy movement (Russell 1992, 32).

Fundamentalists have a powerful influence on the government. They have used this influence to force women out of the labor force and back into the home. They ignore the fact that due to the economic state of the country, many households rely on the income of both the husband and wife. Botman reported that “although it is against the law, newspapers have recently begun publishing job advertisements discouraging female applications” (1999, 90). The women are burdened with both the responsibilities of the home and the work-place and find no support from the government as Nasser had promised in the revision of the Constitution. The division of labor by gender reinforces the subordination of women. Egypt has fewer females in the labor force than other developing societies in the economic south (Botman 1999, 99).

The two major advances made by Sadat for the progression of women were reversed under Mubarak due to Islamic influence. The system of free education and public health that were established under Nasser were dismantled under Mubarak. The legislative quotas set in 1979 were reversed by Mubarak in 1986. The changes in personal status codes were overturned by the Courts on procedural grounds that Sadat over extended his authority. Mubarak has made efforts to make peace with Islamics and at the same time distance himself from the Sadat regime and its pro-feminist efforts.
Mubarak endorses more traditional public activity for women such as the work of social service organizations. He forced the Arab Women’s Solidarity Association to dissolve. Islamic fundamentalists found the group’s publications to be anti-Islamic and opposed to the laws of Sharia. “But Mubarak’s government prevents women (and men) from, organizing independently. As a result, women have been relegated to the sidelines of important decisions and deliberately shut out of the political mainstream” (Botman 1999, 92). In the wave of the Islamic revival, women from all walks of society have reverted to wearing the veil, with the exception of Coptic women. Religious women accept and espouse the traditional views of Islam for women with regards to motherhood and the family.

Tension with Islamics also raises the debate as to whether or not Copts constitute a minority in Egypt. “Despite widespread Coptic involvement in nationalist politics and anti-imperialist struggles, and despite the common rhetoric on harmony and national unity, Copts have been continuously identified with foreign and alien powers and threats” (Al-Ali 2000, 95). While some theorize that religious tension flares only in times of social, political or economic crisis, others believe that “in recent years, in light of growing Islamist activism, widespread economic discontent, the perception of western cultural and political infiltration, increased Muslim-Coptic sectarian strife and regional politics (especially the Gulf war, Palestinian-Israeli politics and the debate on a Middle East market), the issue of Egypt’s cultural and political identity has been revived” (Al-Ali 2000, 43).

Among activist women, there are some that will recognize the additional forms of discrimination that Coptic women suffer due to their minority status while others deny
that any differences exist. Coptic women activists have a particular stake in the debates about secularism. One Coptic activist has said, “Public figures in the Coptic community argue from a political religious context. It is not that I want to assert myself as a Copt, but if the whole society only sees you in this frame, you have two options: either you denounce it, or you say ‘yes, so what’. But I never say ‘I am Copt first’, I say ‘I am Egyptian.’ When suddenly in the seventies a religious identity replaced a national identity, I still made the choice that I am Egyptian first and then a Copt. This is against the general trend though. I still feel that the only salvation of this country is to go back to the 1919 revolution slogan: ‘Religion is for God, and the nation for its citizens.’ I believe in a secular state where being Egyptian means to be a citizen. In an Islamic state citizenship is based upon a particular religious denomination. That automatically discriminates against non-Muslims” (Al-Ali 2000, 145).

**PUBLISHING**

The printing press has always functioned as an outlet for women to express their issues, concerns and demands. There were many articles and books published about women’s issues. Such publications were not always considered a threat by the government. Early on women invoked nationalism as a tool and justification for their writing. It reflected their cooperation and desire to help in the struggle for independence. Women also claimed that writing facilitated communication with other women and combated isolation and loneliness at home. (Baron 1994, 41) Before World War I, there were approximately fifteen magazines in Arabic, founded and edited by women, on the subject of women’s issues. (Philipp 1978, 280) Only one of the magazines was founded
and edited by a Coptic woman, two others by Jewish women, half belonged to Syrian Christian women and the rest belonged to Muslim women.

Writers targeted urban middle and upper class women. (Baron 1994, 116) The women had a unified voice in terms of speaking on behalf of women of all economic, religious and cultural backgrounds. Unfortunately, “women writers did not speak in a unified voice in part because they did not agree on the proper solution-or even the exact nature-of the problem.” (Baron, 120) The women did agree that expressing their views and writing were crucial especially in opposition to ideals. In turn their plight was not to struggle against men but to better their position. The women did not ask for economic freedom or ask for the same jobs as men. They were clear on and agreed that their role was different than that of the men but that it needed to improve – separate but equal.

There were common positions that were taken up by the intellectuals but the one most appealing to religious minorities such as the Copts and Syrians was that of restricting religion to private life while emphasizing education and domesticity. (Baron 1994, 121) Coptic and Syrian women, even though they may have been from liberal families or had husbands that were in the industry of publishing, emphasized domestic roles. These minority Christian women did so because they were also under constraint and did not want their ideas to appear threatening thus risking rejection of their innovations by the public majority on such sensitive issues as unveiling in the early twentieth century. (Badran 1995, 62)

Coptic women were practicing veiling and segregation up until the beginning of the twentieth century. On the other side, Coptic women still tended to be more socially conservative than their Syrian sisters. There were a few Coptic writers that accused the
Arabs for the introducing such practices that undermined the woman’s position in society. (Baron 1994, 109) There were efforts to overcome the religious differences between the Arabs and the Copts. On the other hand, there was a publication by a Christian woman, Malaka Sa’d, who was one of the Syrian Christian editors before World War I that sparked suspicion. She indirectly attacked Islam as the cause of the deterioration of the woman’s position in society. She outlined the esteemed status of women from Pharaonic times through the Roman and Byzantine periods but the position of women had become low. “Implicitly, Islam was made responsible for the downfall of women in society. This line of thought was bound to alienate most Egyptian nationalist, who at the time had only rarely cut all strings of loyalty to the Islamic past and heritage of Egypt.” (Philipp 1978, 282)

At the end of the nineteenth century, women writers started to address more contemporary issues but the most common was education. The discussion of education was to be the remedy for the question of women’s issues. The women campaigned for education on the grounds that it was necessary for women in order to help strengthen the homes and thereby their country. “The women’s education issue was part of the larger women’s question which in turn was part of the Islamic reform movement. (Russell 1992, 126) Muslims and Christians had to maintain separate schools. Coptic mothers protested instruction of the Quran and not the Bible. Some women feared young girls being instructed by Christian foreigners would raise Christian children thereby creating a Christian nation. Najiya Rashid is quoted as having said that ignorance is preferable to such an education. (Baron 1994, 140)
“In calling for girls’ education, advocates never suggested that girls enter male institutions, in spite of the fact that some girls had previously studied with boys in kuttabs. When considering girls’ education on a much larger scale, a parallel system—not integration—was their goal. This was an important point, for Muslims had to be convinced that girl’s education was not a Christian idea.” (Baron 1994, 125) Copts opened their own private schools in the 1890’s, the result of these schools and other non-Muslim schools was “the percentage of literate female Copts far surpassed the percentage of literate female Muslims in the early 1900s.” (Baron 1994, 134)

Writers hoped to raise the status of women by professionalizing the role in the home and raising awareness of the importance of maternal responsibilities. They maintained that marriage should be monogamous and spoke of the atrocities, such as suicide, that resulted from forced marriages and easy divorces.

In the late 1930s through 1940, the EFU published two internationally distributed journals L’Egyptienne and Al-Misriyah. Both journals had contributions from Christian and Muslim women alike. The second editor of Al-Misriyah was a Coptic woman, Eva Habib al-Masri, who was also the first Egyptian woman to graduate from the American University in Cairo. There were times when the publication attempted to make feminism compatible with Islam which marginalized the Coptic women but they continued to participate in the EFU. The journal addressed issues regarding the economy, the poor and women’s family roles. The EFU stopped publishing these journals at the wake of World War II.
SHARIA LAW & THE CONSTITUTION

The major issue with Islam is that it does not make a distinction between community practices and Sharia Law, nor between state and religion, therefore creating an environment where religion serves as a disguise for political and fundamentalist agendas. Religious laws and beliefs are mixed with political agendas making it difficult for the people to understand even their religion in its purest form. “While conservative groups may be manipulating the doctrine of Islam to create an illusion of religious resistance to female empowerment, Egypt's discriminatory laws, cultural norms, and sexual standards represent genuine and formidable obstacles to the achievement of equality.” (Jewett 1996, 9) One of the many obstacles that Egyptian women face is that of Sharia Law. In order for there to be advancement in the rights of women, there have to be several changes. The first is new interpretations of Sharia Law which is possible under the rules of Islam. “Islamic scholars disagree as to the appropriate way to analyze the Quran, sunna and ijma in order to discover the rules of sharia.” (Lombardi 1998, 4) There is also a gap between the laws set out by a country according to Sharia and the actual practices of the community with regards to these laws. This loophole gives further room for interpretation of Islamic Law. Indeed, in some regions, such as Egypt, politics have become Islamic even when the state structures have not”. (Nielsen 2002, 4)

The education of women in their religion is a key factor in the effort to create change. It is often the case that women are ignorant of what the Quran actually means when it comes to the guidelines it sets out for women. They need to be educated in their religion and its interpretation. Unfortunately, many of the Islamically literate elite were lost to professions and specialties associated modernization introduced by the rise of
European economic and political power in the nineteenth century. The result was superficial comprehension of the rules of Sharia, ignorance of its subtleties and its scope for flexibility in interpretation. (Nielsen 2002, 2) Finally the Egyptian Constitution needs to be amended to protect women and their rights. As it stands, Coptic women are subject to the same inheritance and property laws as Muslim women. Inheritance rights under Islamic law applies to both Muslim and Coptic women.

Sharia is traditional Islamic law. “Muslims consider obedience to the sharia to be a crucial religious duty” (Lombardi 1998, 5). Islam draws no distinction between religious and secular life. Hence Sharia covers not only religious rituals, but many aspects of day-to-day life and has roots in social customs (al-urf). The main sources of Islamic law are the Quran and the Hadith. Qiyas, reasoning by analogy, was used by the law scholars (Mujtahidun) to deal with situations where the sources provided no concrete rules. Islamic jurisprudence (fiqh) is divided into two parts: the study of the sources and methodology (usul al-fiqh - roots of the law) and the practical rules (furu’ al-fiqh - branches of the law). (Online Encyclopedia)

Egypt is a leader in Islamic jurisprudence and is home to one of the oldest and most renowned Islamic schools in the Arab world, Al-Azhar. Many aspects of Muslim life including their views of women and family are based on medieval Islamic jurisprudence which was based on religious and cultural components. The cultural components gave rise to political and social assumptions, which became so imbedded in Islamic jurisprudence that many Muslims are not aware of their non-religious origins. (al-Hibri 1997, 3)
Egypt does not claim to have an Islamic constitution, as do Iran, Saudi Arabia and a few other Arab countries. The current constitution of Egypt was adopted in 1971. At the time, Egypt was dominated by a secularist party that did not feel the need to reflect traditional Islamic values in the law and the Article could not be interpreted in such a way by the courts. Egyptian laws were not required to conform to Sharia Law. In 1980 Article 2 of the Egyptian Constitution was amended to read, “Islamic sharia will be the principle source of Egyptian legislation.”

The Constitution is also the supreme source of law in the country. The Supreme Constitutional Court of Egypt has the authority to interpret the Constitution as is permitted by Islamic Law. Islamic Law permits scholars to interpret the law when the Quran and hadith are unclear on an issue. Any laws that contradict sharia would have to be struck down by the courts. Legislation cannot even contradict the spirit of sharia. (Lombardi 1998, 12) The Court has defined sharia to consist of all laws which conform to the broad legal principles that were laid down in the Quran and which have been accepted by all Muslim jurists over the years (Lombardi 1998, 4).

The Constitution contains articles that promote the equality of women but within the boundaries of their traditional roles. Article 8 guarantees equality of opportunity to citizens. On the other hand, Article 11 states, “the State shall guarantee the proper coordination between the duties of woman towards the family and her work in the society, considering her equal with man in the fields of political, social, cultural and economic life without violation of the rules of Islamic jurisprudence.” Women may only progress to the extent that they do not violate Islamic rules. The Court distinguishes between the principles and the rules of Islamic law. Reasoning based on first principles or
“ijtihad” is forbidden as to the principles of Islamic Law. This poses an obstacle for Egyptian women because interpretations in their favor maybe considered unconstitutional if the Court finds that the interpretation violates a principle of Islamic Law.

One of the major problems in Islam is the use of religion by traditionalists and extremists to justify civil and human rights abuses especially with regards to women. For example in 1996 the Minister of Education handed down an administrative banning veiling using a niqab from schools. The case came before the Supreme Constitutional Court which found the ban unconstitutional. After an appeals process the holding was overturned because the Court could not find a clear order in the Quran or sunna with regards to veiling. In another case they found that the Quran does not permit schoolgirls to wear skirts above the ankle. The Court did not give any explanation for their finding. “Although none of the parties to the suit were Copts, it is clear that while the courts refused to impose an excessive dress code on all Egyptian school girls, Copts are subjected to the dress code issued by the Minister of Education as he implements the sharia. (Brown 2000, 16).

The fact that it is not only difficult to define sharia, but to interpret it, creates the concern that it could be hit or miss for women with the Court. According to the Court, “Article 2 commands the Egyptian government to obey principles that advance certain noble social goals. Any number of laws could then be said to conform to sharia”. (Lombardi 1998, 15) The Court has the power to define sharia in such a way as to progress the position of women if such progression could be considered a “noble social goal” by Islamists.
Discrimination against women can also be found in the civil and criminal laws. “Unfortunately, Egypt has adopted numerous discriminatory laws which, along with the gender roles perpetuated by Egypt’s male-dominated society, create a substantial barrier to the empowerment of women” (Jewett 1996, 7). The Egyptian courts have drafted civil and criminal laws that subordinate women to men; these include “crimes against honor”. Under the penal code, women face harsher sentences than men for the same crimes as adultery and murder. “It is important to note that, according to one scholar, these laws do not derive from Islamic Law but rather from nineteenth century French Penal Code. Therefore these laws are a misinterpretation of the sharia and an example of cultural norms overriding religious norms.” (Jewett 1996, 8)

Sherman Jackson, a professor of Arabic and Islamic Studies at the University of Michigan, suggests that “not every opinion recorded in the authoritative manuals of classical Islamic law is necessarily binding in a modern context. On the contrary, there is always a need to separate what is factual from what is legal, and to restrict the authority of the law books and the jurists to strictly legal domain. This opens the possibility, indeed the necessity, for significant change, even in areas where the legal deductions of the classical jurists are deemed to be correct” (2003, 6). On the other hand, some interpretations of Sharia Law could be problematic for Coptic women while liberating for Muslim women. He offers the hypothetical change to divorce laws. Divorce is permissible according to Islamic law but prohibited in Coptic Christianity. Hypothetically, if an Islamic state were to recognize divorce and a Coptic woman petitioned for divorce, the State would grant her request based on the principle of equality. The State would then put itself at odds with the authority of the Coptic Church.
The Coptic Church would have a rightful claim that the State was favoring Muslims. If the State denied the Coptic woman’s petition, she could then argue that the State had violated the principle of equality because she was denied a right extended to Muslims. He suggests that to avoid this problem, the government takes on a stance of “equality of respect.” It could authorize Muslim and Christian communities to define certain rights and obligations exclusive to their communities. (Jackson 2003, 7)

Muslim women, as opposed to Christian women, also have to deal with polygamy. The Coptic Church does not permit men or women to have more than one spouse and prohibits divorce. Sharia permits men to marry up to four women and divorce a woman without justification. Some scholars claim that polygamy is a misinterpretation of the Quran and that the saying (ayah) actually means that since it is difficult for a man to take care of more than one wife equally, it is better for him to keep only one.

“According to the conventional interpretation of Islam, and of Christianity, wives were under the authority of their husbands” (Badran 1995, 124). For some Coptic women, Sharia penetrates into their home life. Coptic men use Sharia Law to get their way at home. For example, a Coptic woman wanted a divorce. Under the Coptic Church she must convert to Greek Orthodoxy in order to request the divorce, as Sharia will permit the divorce if the spouses are from different religions. Her husband tried to stop the divorce by seeking bayt al’ta’a to keep her from leaving the country and would not give her permission to travel (Al-Ali 2000, 103).

RECOMMENDATIONS

Lombardi notes that “for the past twenty years, Egypt has been in a state of near-civil war with secularists, who include most members of the government party, and
Islamists, who enjoy considerable support among the Egyptian people. The government of Egypt agreed to the amendment of Article 2 in 1980 as a concession to Islamists” (1998, 13). The compromise was guaranteeing an Islamic nature to the law and flexibility of the law for secularists. The government and Court are in a difficult position trying to keep the Islamists satisfied and at the same time trying to progress the country. Nielsen argues that ultimately, the political environment and laws depend on the local political situation, the degree to which the regime is under pressure from Islamist groups, as well as the balance of power between different Islamist trends. (2002, 7)

Jewett suggestion for reform is “advocates of women’s rights must encourage Islamic leaders to acknowledge that the ideas of gender equality, respect, and individual freedom are not alien western conceptions but are compatible with Islamic law and the visions of the Prophet Mohammed” (1996, 10). Activists and reformists must also be careful in demanding sweeping reforms as that will cause fundamentalists and traditionalists to react defensively. Islamic leaders must be convinced that reform is consistent with Islamic law. Activists must enlist the help of religious leaders, women’s groups and women in their efforts for reform.

Middle and lower class women must be educated as to their religion and the scope of it in terms of their rights and freedoms. Women have to be convinced that the new interpretations of Islamic Law promote their fundamental interests. Traditional norms still govern the rights of rural women who are the majority. Article 16 of the Constitution guarantees the services to citizens in villages in order to raise their standards of living. Al-Hibri points out “the majority of Muslim women who are attached to their religion will not be liberated through the use of a secular approach imposed from the outside by
international bodies or from above by undemocratic governments. The only way to resolve the conflicts of these women and remove their fear of pursuing rich and fruitful lives is to build a solid Muslim feminist jurisprudential basis which clearly shows that Islam not only does not deprive them of their rights, but in fact demands these rights for them.” (1997, 2) Early Muslim women were involved and contributed to Islamic jurisprudence as well as the everyday life of their society. In Islam men and women have similar religious duties, religious education of men and women was the same in early Islam, there are discussions between the Prophet and women in the Quran and women also participated in the selection of the Prophet to lead the Muslims (al-Hibri 1997, 18). Women must also be cautious of factions within them such as female leaders of branches of the Muslim Brotherhood who promote the segregation of women and an alternative Islamic feminism.

**FUNDAMENTALISM & HUMAN RIGHTS**

**COPTS**

The relationship between Muslims and non-Muslims has traditionally been one of toleration. Copts make up ten percent of the Egyptian population yet they do not hold political power or share in social influence in Egypt. As a matter of fact, Egypt is home to some of the most active fundamentalist groups in the Arab region such as the Muslim Brotherhood. Some fundamentalists call for Muslims to shun Christians. The Copts strive to maintain their “pre-Muslim, non-Arab, ancient Egyptian lineage.” (Arzt 2002, 9)

The Copts have suffered many human rights violations under Islam: They are harassed and beaten in the streets and in schools; tortured especially for attempting to convert Muslims to Christianity; militants have burned churches and villages; raided
meetings and services causing mass murder; priests and women are harassed in the streets; and, monasteries attacked. In 2000, the Christian villagers of al-Kosheh were slaughtered in a mass murder. Muslim converts to Christianity are forced to either flee the country or live a life in fear of being killed by their former religious brothers. In 2003, St. Anthony Monastery on the Red Sea was surrounded by militants for three days trying to tear down the building. Under the International Religious Freedom Act, the United States may impose economic sanctions on countries for not protecting their religious groups from attacks by nonstate actors. Egyptian Copts did not react well to this legislation as they feared the sanctions would generate more violence as “violent acts within Egypt have been shown to correlate with Egypt’s economy” (Brown 2000, 11).

Christians feel that the primary cause of division in society is religion. This fear is a result of “the hard-line Islamic movements that seek to impose their fossilized concept of Sharia” (Nielsen 2002, 5). The Egyptian Constitution makes a distinction between non-Muslims and Muslims and treats them accordingly. Non-Muslims cannot be president nor can more than one hold a minister position in government at the same time. No Copts hold military or governerships. Copts are Constitutionally prohibited from forming political parties. Even if they could, they would have to be non-religious and gain eight percent of the vote before getting a seat in Parliament. (Brown 2000, 16) “In the last two decades, Christian Egyptians have been systematically eliminated from positions as Cabinet ministers, army officers, police officers, governors, bankers, parliamentary representatives and university professors” (Soliman 2002, 3). All Egyptians carry national ID cards identifying their religion. They must also identify their religion on their birth certificates, driver’s licenses, travel papers, and employment
documents. (Brown 2000, 17) This practice has brought about injustices for Christians. Copts have lost job opportunities, although perfectly competent for the positions, delays in social security, they must stand at the end of the line for food stamps, and are placed at the end of waiting lists for simple needs such as a telephone line for their home (Soliman 2002, 1). Copts are subject to restrictions on the building of churches, discrimination in housing, and land distribution (Arzt 2002, 8). “President Mubarak has traditionally appointed two Copts as ministers to his cabinet and is authorized to appoint up to ten members of Parliament, typically consisting of Copts and women” (Brown 2000, 6).

The amendment to Article 2 of the Constitution brought on a great deal of problems for Copts and Muslims. Although the amendment was to appease Islamists, they took it as an opportunity to subject Muslims and Christians alike, to extremist acts. During this decade, Islamists gained influence over Muslims in universities, especially at Al-Azhar University. In general, they were becoming stronger all over the Middle East and pressuring governments to adopt sharia as the primary source of law. Governments gave in to the demands out of fear of being condemned as anti-Islamic. (Brown 2000, 5)

In 1980, the Constitution was again amended to specify Islam as the official state religion. This caused riots and violence to break out between Copts and Muslims.

“A total and complete implementation of sharia into Egypt’s legal system would clearly violate the Copts’ religious human rights. For example, the sharia does not treat non-Muslim living in an Islamic state as a full citizen of that state” (Brown 2000, 12). Also, under the International Covenant on Civil and Political Rights, even if a country recognizes one religion as its official state religion, international law does not allow states to invoke religious law as an excuse for breaching their treaty obligations. (Brown 2000,
12) Egypt also violates the CCPR with regards to public education as Coptic children are required to memorize parts of the Quran while not teaching Christianity in schools. (Brown 2000, 16) Copts are often denied admission to medical school because extremists find the treatment of Muslim women by Coptic doctors offensive. (Brown 2000, 16)

In 1991, Ahmad Kamal Abu al-Magd, published a discussion of the political ordering of the Islamic state in response to the growing tension between the government and Islamic political extremists. He expressed that it is possible to write a modern constitution which gives full religious freedom and civil rights to all and still be in consonance with Sharia Law. (Nielsen 2002, 5) Granted the Quran 2:256 decrees “there is no compulsion in religion: truth stands out clearly from error.” On the other hand, a 1976 meeting between Muslims and Christian theologians resulted in an agreement that there is legitimacy to the “right to convince and to be convinced.” (Nielsen 2002, 6)

The discussion of the status of non-Muslims in Muslim countries (dhimmis) has brought about the emergence of such publications and groups as the Arab Muslim-Christian covenant, published in 2001, and The Arab Working Group on Dialogue whose goal is strengthen national unity, as the opposite climate opens the doors to international interference and obstructs democratic development. (Abu-Lughod 1998, 7)

WOMEN

“The contemporary threat to women and their rights in the Muslim world springs mainly from a resurgence of radical fundamentalist thought and politics in the last quarter of the twentieth century (Afkhami 2001, 235). “Efforts to empower women encourage rebellion by fundamentalist Islamic groups that wish to reassert the sharia as the exclusive source of both public and private law” (Jewett 1996, 11). Over half of Egyptian
women still wear the veil. “There are many reasons why women continue to wear the veil instead of wearing western dress. One of the most obvious reasons is the pressure from Islamic fundamentalists who emphasize traditional family values and regard the home as the proper place for women” (Jewett 1996, 4). Unfortunately, they use Sharia Law to justify their positions as it governs daily life of Muslims such as women’s attire. “Some of the scholars theorize that gender-discriminating members of Egyptian society manipulate Islam in order to suppress their female counterparts” (Jewett 1996, 6). In as recent as 1998 to the present time, Coptic girls are being kidnapped, raped and forced to convert in such cities as Port Said.

Women’s bodies and sexuality are under a great deal of control. Egypt is one of the top five countries to maintain the practice of female genital mutilation. Although it is a Muslim practice, both Coptic and Muslim women are subjected to circumcision. It is mostly performed on lower class girls living in rural areas. It is practiced in unsanitary conditions and performed by just about anyone from butchers to village women using instruments from broken glass to butcher knives. Reasons given for the practice are it keeps a woman pure as it reduces chances of promiscuity and increase the chances for marriage. The belief is a girl is more likely to remain a virgin if she has been circumcised. Islam highly regards the sexual purity of females. University research in Egypt has found that “ninety-eight percent of all girls in Egyptian countryside and poor girls in Cairo had been circumcised (both Muslims and Coptic Christians), while upper-class girls in Cairo were subjected to the procedure thirty percent of the time” (Botman 1999, 106).
In 1981, Hedy Banoub founded the Care for Girls Committee in the Coptic city of Beni Sueif in order to raise awareness of FGM in the Coptic community. The committee is extremely active in the community as it makes home visits, trips to local villages to make presentations on the harms of FGM using various educational tools for children and addresses other issues such as marriage defloration, arranged marriages and inheritance customs. (Dillon 2000, 9)

The global media attention to this issue caused Egypt to draft a law banning female circumcision. The law was later abandoned and circumcision was relegated to government hospitals. “Female activists assert that Egypt did not pass legislation criminalizing female circumcision because it did not wish to upset Muslim religious leaders” (Jewett 1996, 6). In 1994 the Health Minister lifted the ban on FGM. This became the impetus for the formation of the Egyptian National FGM Task Force. Its goal was not promote legislation but raise awareness. (Dillon 2000, 9) In 1995, for fear of U.S. aid sanctions and pressure from human rights groups, the government ceased performing FGM but later reverted to the practice. The brief ban was due to a lawsuit brought against the leader of Al-Azhar University. In 1996 a new Health Minister banned FGM but in 1997 a lower administrative tribunal ruled in favor of fundamentalists and revoked the ministerial ban on FGM (Dillon, 12). The Supreme Court overturned the ruling later the same year stating that FGM is not sanctioned by Sharia Law. (Dillon 2000, 13)

Egypt has the highest population among Arab countries. Family planning is yet another way that the government controls the bodies and sexuality of women. Egypt has the Cairo Family Planning Association, established in 1979, that has been successful in conducting seminars on the harms of FGM. Unfortunately, it has had little impact on the
health of women or population growth. In 1994 the U.N. sponsored the International Conference on Population and Development in Cairo. The goal of the conference was to present a program of action that would reduce world population growth over twenty years. “The ICPD Program of Action emphasizes that for the program to succeed, nations worldwide must strive to empower their female citizens and to provide them with adequate family planning services and information.” Islamic groups attacked the ICPD on the grounds that it promoted extramarital sex and prostitution and threatened family unity. (Jewett 1996, 1) Women are not provided with the proper care for their reproductive health and are limited in their participation in slowing down population growth. The ICPD could not be followed unless it was consistent with Islamic Law. Egypt endorsed the compromise provision of the ICPD which ensures that the program will respect each nation’s religious, cultural and ethical beliefs. Although Islam does not prohibit family planning, Islamic extremists feel that education of girls regarding their reproductive health would taint their purity and promote promiscuity.

INTERNATIONAL AGREEMENTS & NGOs

Egypt has generally had a good relationship with the United Nations. In 1992, a Copt was appointed Secretary-General of the UN, Boutros Boutros-Ghali. Not surprisingly, before his appointment to the UN, he was only appointed as the deputy to Mubarak’s Minister of Foreign Affairs, despite his expertise in foreign affairs (Brown 2000, 16). Egypt has made a public commitment to combat religious human rights violations but unfortunately, in practice, Egypt has a pattern of not committing to International Agreements that would promote the progression of women. From CEDAW, to the Hague Convention, Egypt has found that these agreements are not in accordance
with Sharia Law and therefore can only be partially implemented in Egypt. Two factors have hindered the country’s ability to adhere to standards of women’s rights. The first is the requirement of women to balance work and home. The second factor is that women may only progress as long as it does not violate the rules of Islam. (Jewett 1996, 8)

With regards to the UN Declaration of Human Rights, Egypt had difficulties with Articles 16 and 18. Article 16 allows for equal rights within marriage while Article 18 includes the right to change one’s religion. Islamic organizations have attempted to draft their own human rights documents. One such document is the Universal Islamic Declaration of Human Rights which is subject to Sharia Law.

In 1981 Egypt signed the International Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW). As it is Egypt’s pattern, it had reservations about Articles 2, 9 and 16 and would only implement them to the extent that they were consistent with Islamic Law. Article 2 required nations to take legislative action against discrimination; Article 9 would grant women equal rights with men regarding the nationality of their children and Article 16 called for nations to abolish discrimination against women with regards to marriage and family relations.

Egypt allows for NGO’s unlike Saudi Arabia and Iran. These countries deny the constitutional legitimacy of secular and universal human rights laws. (Jewett 1996, 10) All nongovernmental organizations in Egypt are under state supervision. There are over fourteen thousand of these organizations in and over one hundred serve women. During the rule of Nasser, NGOs were subsumed by national politics and remerged in the 1980s. (Ammar 1999, 153) The Alliance for Arab Women is one of the most active. There are several NGO’s working to educate women on the harms of FGM. There is a Task Force
of approximately sixty NGOs conducting grassroots education and awareness programs (Dillon 2000, 9).

The Coptic Association is also one of these NGOs serving the Coptic community. Another NGO that specifically serves the Coptic community is the Association for the Development and Enhancement of Women. This group works with the zabaleen or community of trash collectors. They have established a credit loan program modeled after the Grameen bank in Bangladesh (Al-Ali 2000, 161). The program has been running successfully for ten years. The NGO has also developed a legal assistance program for women which provides women with legal advice and helps them to obtain ID cards so that they may have access to government benefits.

WOMEN IN OTHER COUNTRIES

The attempts to bridge the gap across religious lines for a larger cause has been successful in other countries. A primary example is that of the Women in Black in Israel. They organized to demonstrate for peace. It was important to the organization that the people were aware that not all Israelis agreed with the violence against Palestinians and that not all Palestinians thought all Israelis were anti-Palestinian. The impact of these women was even recognized by President Mubarak “in the context of taking heart from the peace camp in Israel” (Svirsky 2000, 241). The women conducted their vigils on street corners all over Israel but in the early stages just in Jerusalem every Friday for one hour. Originally the groups were made up primarily of Jewish women and some Palestinian citizens of Israel but grew to include sizable representations from both religious groups. They banned together in their cause for peace while struggling to develop a dialogue and common language with each other (Svirsky 2000, 244).
Fortunately for these women, Israel is far more advanced democratically than Egypt. There are people in the government to whom the women can turn for sympathy to their plight. There are factors that existed in Israel that aided these women in their success that do not exist in Egypt. According to Svirsky, the Palestinian-Arab and Israeli-Jewish women were successful in looking past their religious divisions because they used an international feminist approach. “This was not a woman’s natural predilection for peacemaking, but the ideological commitment of women to a vision of international peace. It did not come from instinct, but from socializing and educating each other over the years. Being outside establishment politics was an asset in taking a more critical perspective of them” (Svirsky 2000, 240).

Israeli and Palestinian women had been involved in international conferences for peace before starting the Women in Black. These women were already active in politics and had been organizing before forming the group. Women in Israel and Palestine suffer from religious fundamentalism, as well. It breeds fear and there are many involved who have stakes in promoting acts of terrorism. Israel has been attacked by such groups as Hamas and Hezbollah. Like the Egyptian women, there were divisions in thought among Israeli women. An extremist group of women formed the Women in Green and promoted religious fundamentalism while holding hostile demonstrations.

The women of the former Republic of Yugoslavia are yet another example of women that were able to ignore religious cleavages in order to further their cause. The Serbians are Orthodox Christians, like the Copts of Egypt, and the Croatians are predominantly Muslim. During the war in Kosovo, they created a feminist movement in resistance to the war. Feminist groups have established a Women’s Parliament and
centers to serve women in all walks of life, from the disabled to the poor to the abused. As is the case in Egypt, the Serbian Constitution and laws control women’s reproductive health. It is a Serbian government nationalist goal to have women produce more children so they may be sent to war to defend the country. Abortion was no longer legal under the constitution and there was education on planned parenthood. Women found themselves cornered without any choice but to succumb to the burden. Nationalist hatred fueled violence against women. Men began to beat their wives, and soldiers harassed women in the street.

Feminism is a concept that was introduced to Yugoslavia from outside the country. In 1986, the first feminist organization was formed. One of the challenges to feminism in Yugoslavia was Communism but feminist groups continued to flourish into the early nineties. Prior to the war, women banded together to protest against war. Belgrade had an active Women in Black. These activists “defined themselves as an antinationalist, antimilitarist, feminist, pacifist group who rejected the reduction of women to the role of mothers” (Mladjenovic 2000, 261). The group protested, published, and became radical. They especially demanded that the perpetrators of rape against women during the war be condemned. They participated in grassroots democracy in Serbia and worked along side human rights groups and other organized groups working to improve the country. The women faced opposition from Milosevic’s regime but continued to organize. They crossed into other states regardless of its religious group, served people in mosques as well as churches, and came together with Albanian, Croatian, and Roma women.
CONCLUSION

The women of Egypt organized a feminist movement in the past with Muslims working alongside Copts. The literature on the feminist movement in Egypt makes mention of the Copts where significant but I have not come across literature that makes a direct comparison between Copts and Muslims. This comparison is significant because changes in the law and society will affect all women in Egypt whether they belong to the majority or minority. The feminist movement has taken these women through various trials from the revolution in 1919 to present day struggles under Mubarak. All along they were able to find that they had enough in common to work alongside one another for a common goal. The differences that exist between these women are imposed by society and religion and at the same time serve as an impetus to unite once again across religious lines although this will prove to be a long and daunting task.

From Nasser to Mubarak, women made gains as well as suffered setbacks. Nasser was pro-women but ultimately all political strides kept women within the private patriarchal structure. Sadat made advances for women, often as a means of promoting his political agenda with the West. Unfortunately, fundamentalism stripped women of these advances. Under Mubarak, women have to deal with the resurgence of conservative Islam, rising fundamentalism, poverty, and international political tension. Coptic women and the Coptic community as a whole must endure religious oppression and persecution by fundamentalists. In addition to fundamentalism which affects Copts on another level than Muslims, Copts must find an identity as a minority in Egypt.

Muslim and Coptic women must struggle together against discriminating laws and amendments. They face retaliation and changes in the law that may be more liberating for
one group and at the same time violating for another. They are struggling against a
government that restricts help through International Agreements and monitors their
organization. The women have struggles in the home that is structured with the man as
the head. Al-Misriyah published an article, “If You Want a Good Wife, Find a Good
Husband,” pointed out that a husband’s actions had a direct bearing on his wife’s
behavior (Badran 1995, 138). Women must deal with issues from public dress to sexual
repression.

As adequately put by Adel Hussain, “true believers in Islam, Christianity and
Judaism may discover that they have important shared points against the present
dominant materialism and secularism, which threaten all religious values, and threatens
the very existence of nations, starting from the very basic social infrastructure, i.e.
families” (Al-Ali 2000, 136). Although Coptic women have additional barriers than
Muslim women, the two groups have enough in common as minorities to search for
answers together.

Life Skill as Household’s Human Capital for Women Living in Rural Areas

This study extends the traditional human capital theory for household’s skill. Using NC223 data, it looks at the correlations of life skills with other skills that are related to non-market skills, and estimates a life skill model based on the traditional human capital theory. Results showed that life skill score is highly correlated with total scores of knowledge in community skills and total scores of parental confidence. Results also revealed that age, educational attainment, and social skills are significantly related to life skill score, indicating similarities in types of traditional human capital investments to that of household’s. The results are of interest to policymakers in promoting programs to increase household human capital among women in rural areas and educators in introducing the concept of household human capital.

*Keywords: women, rural, human capital*
Life Skill as Household’s Human Capital for Women Living in Rural Areas

Human capital is commonly related to the skills developed to increase people’s demand in a market workplace. Human capital catalyzes the enhancement of market productivity in helping people to get better paying jobs. However, it can be argued that in the growing complexity of the world today, household production needs an adequate amount of household human capital for higher household productivity. Household human capital is essential in raising dynamic families. Household human capital may minimize the costs of raising a family or maximize the net returns from household and market productions from the members of household. For instance, non-working mothers with high life skills may be able to manage time efficiently, manage good budgets, grab good deals from shopping (from sale or coupons), apply for governmental assistance (such as food stamps or Temporary Assistance for needy Family, TANF), attain the most useful credit cards for consumption smoothing, assist children with homework, and help working spouses unwind (by providing good food and being a good friend).

Adapting the traditional Human Capital model (Becker, 1964), this study looks at the relationship between life skill score to other self-assessed skills and estimates the life skill assessment score for women. The traditional Human Capital model posits that the increase of one’s human capital in market skills will increase one’s market productivity. Pertaining to household human capital, an increase in the household human capital increases one’s household productivity. Human capital is affected mainly by having and raising children, formal education, experience, health, migration, and marriage. For life skill assessment estimation, the human capital factors tested are having and raising children, education, experience, and marriage.
The purpose of this study is to explore life skills of women living in poverty in rural areas as human capital for household production. This segment of the population is of interest to us because they tend to have less income and less opportunity to work due to familial responsibilities and lack of employment opportunities in the rural areas. Poverty in the rural areas in the U.S. is a pressing issue. Poverty increased significantly from 1979 to 1989 with the rate in non-metro areas being higher than in metro areas (Lichter et al., 1994). The poverty rate has been high (U.S. Census, 2001). Due to lack of and decreasing employment opportunities, poverty in rural areas tends to be persistent and long-term relative to those in non-rural areas (Deavers & Hoppe, 1992).

Despite these constraints, women in rural areas still have opportunities to increase their earnings and improve on their well-being status. We argue that women can do these by making full use of the opportunities of local, state, and federal programs from parenting training program to food stamps application. These programs enhance women’s capabilities for improving their welfare and increasing their household efficiency as parents, wives, members of the community, and so forth. While the government is fighting poverty throughout the U.S., it is imperative that people in the rural area utilize all available resources to alleviate themselves from extreme hardship. Based on human capital theory and other studies, we look at how household human capital relates to age, educational attainment, social capital, employment status, and ethnicity. We observe two main findings. First, life skills are related to many other skills. Second, age, educational attainment, social capital, and ethnicity, but not employment status, are related to household human capital. Policy implications of the results are shared in the discussion section.

RELATED LITERATURE

Household Human Capital
We have not found any studies relating household human capital to women in rural areas. This may be so because women in the rural areas do not have many opportunities to gain human capital, let alone utilize human capital in the rural markets. Most educated rural women have to migrate from their rural hometown to areas where their experiences and skills obtained will be highly valued. Due to the nature of the data, we specify our analysis to rural women with children twelve years old and younger.

The proposed household human capital is different from the traditional human capital, as formally introduced by Becker (1964), in a way that the former is directed towards household production while the latter is more towards market production. Human capital theory revolves around the idea that people attempt to gain skills and knowledge by going to school in order to be more effective – thus, highly demanded – in the job market. We are arguing that in the increasing complex social and economic environment, household chores require essential skills for home production, in terms of goods and services.

The concept of household human capital can be adapted to Becker’s other theory; the household time allocation theory (Becker, 1965). This model is concerned towards how households divide their limited time (e.g. 24 hours per day and 168 hours per week) between market production (working in the job market), household production (goods and services produced at home mainly for personal consumption), and leisure in their attempt to maximize utility obtained directly from leisure and household production, and indirectly from goods and services purchased in the market using income via paid job. Becker argued that the production possibility frontier shapes individual’s capabilities and efficiency in household production and that this frontier determines whether an individual is better off producing goods and services at home or buying them in the market using income from paid jobs. For instance, a person who can
get paid $50 for a two-hour job is better off purchasing a meal that would only cost $10 in the market than spending 2 hours making the same quality and quantity meal. Extending the example to a more efficient household (i.e., the one with “higher” production possibility frontier), a household with high household human capital may need two hours to produce the same meal for a family of five for lunch and dinner (prepared together – microwave for dinner), which would cost the household $100 if purchased in the market.

We believe life skills closely represent our conception of household human capital because it relates closely to the ability to function efficiently in the household setting in meeting the needs of household members. Life skill is not only limited to preparing meals for your family, but also to other non-work related skills such as applying for car insurance, managing bills, applying for a credit card, launching consumer complaint, and filling out income tax forms.

**Hypotheses**

As we have stated before, we did not find any studies that directly relate to this topic. This is not surprising considering this is an attempt to study human capital from a new perspective. There are six types of human capital investment: The main ones are education, experience, and health, while the others are migration, raising children and marriage (Bryant, 1990). Due to data limitation, we are not able to test all of these variables. According to human capital theory, people tend to accumulate human capital as they age although the human capital absorbed increases at a decreasing rate. Age is also a good proxy of one’s experience. This can also be applied to the household human capital model. Thus,

H$_1$: Household human capital increases with age.
Some of the materials learned in a formal setting may be directly applied in non-working setting. For instance, people may learn the skills to manage money and children development in classes, which would be helpful in a real-life environment. Thus,

H₂: Household human capital increases with educational attainment.

People may also gain skills and information by working in the market. Some skills that apply at work are useful in household-related matters. For instance, management skills, communication skills, and manual comprehension skills can be directly applied in a household setting. We differentiate employment by areas of employment to test for the significance of employment status in a meaningful manner, i.e. white-collar area vs. blue-collar area. Thus,

H₃: Household human capital is higher among employed people compared to unemployed people.

We test for a positive relation between household human capital and various social skills. Social skills relates to social capital that measure the quality and range (quantity) of social relationship within and between individuals, families, neighbors, communities, etc (Putnam, 1993). We predict that people with better social skills are able to get valuable information and knowledge on various aspects of life. Thus,

H₄: Household human capital is higher in people with higher social skills.

Marriage can affect people’s household in opposing manners. On one hand, one can argue that marriage creates specialization between husband and wife where each spouse focuses on the fields in which they have comparative advantage over the other spouse. As a result, each person may unlearn the skills they did not focus on. On the other hand, people may learn new things by getting married by having the one spouse share the information or skills that the other does not possess. We have decided not to hypothesize the relation between marital status and
household human capital. However, we will include the variable in the model to control for any systematic differences by age. Besides marital status, we also include ethnicity as a confounder because one can argue that immigrants might be in a slight disadvantage mainly due to language barriers (Hargraves, 2002). All in all, we are interested in testing the relations of age, educational attainment, social skills, and employment on household social capital in the manner discussed above while controlling marital status, ethnicity, and income.

METHODS

Data

This paper utilizes the multi-stage NC223 Rural Family Well-Being survey 2001, which is a longitudinal project that tracks and assesses annually at three points in time the functioning and well-being of women in 14 states that includes New York, Ohio, Minnesota, Louisiana, Nebraska, Oregon, and California. This survey was supported in part by grants from U.S. Department of Agriculture/ The Cooperative State Research, Education, and Extension Service/ National Research Initiative Competitive Grants Program (USDA/CSRESS/NRICGP) and Cornell University with funding from many universities (Olson et al., 2004). As the name suggests, the survey focuses on data-collection of well-being of women in the rural areas. The sample of this study only includes women with at least one child 12 years old or younger who are at or below 200 percent of the poverty line. The survey collected data from 448 women, with minimum of 15 families from each county. Data from all respondents are used for the analysis.

With the help of educators and Cooperative Extension Service, researchers in the 14 states recruited families in the rural areas to take part in the survey. Rural is defined as counties with Rural-urban Continuum Codes of 6, 7, or 8 (Butler & Beale, 1994), which is based on metropolitan status and population. In some cases, non-metropolitan requirement suffices the
“rural” definition but based on this code, the maximum county population is 19,999. In some larger counties and states with no such codes, a more relaxed requirement is adapted.

Trained interviewers gathered data from mothers in each household in English or Spanish. Information collected in this survey includes household size and composition, demographic characteristics, parents’ educational background, employment, income, general physical and mental health conditions, and life skills.

**Measurements**

The main variable of interest here is the total scores of life skill assessment, or simply, life skill. Life skill is composed of 25 questions that include questions on having driver’s license, car insurance, car registration, health insurance, checking account, local library card; developing a good credit history, ability to write personal checks, manage bills, make family budgets, stretch groceries at the end of the month, registering to vote, applying for credit cards, preparing meals, getting telephone service, working with landlord, filing a consumer complaint, talking to children’s teachers, applying for a job, creating a resume, joining local clubs, and creating a personal support system. In the survey, respondents were asked on whether they are highly skilled in the questioned tasks. Then, a score of 1 is given for any “Yes” response and 0 for any “No” response. So, life skill scores range from 0 to 25.

Other scores in the survey are knowledge of community service score, depression scale score, food security score, parental confidence score, and parental support score. For all these scores except for food security score, an increase in the score indicates an increase in the particular measure. For instance, higher parental confidence score means that a woman has higher parental confidence. For food security, however, higher score indicates lower food security level (i.e. higher food insecurity). These scores will be used for the correlation analysis,
along with other variables in the regression analysis. The latter variables are included to avoid any multicolinearity problems in the regression. These variables are discussed in Table 1.

Based on human capital theory and other related studies, the independent variables for the regression analysis are marital status, ethnicity, age, highest educational attainment, (natural log of) household money income, knowledge of community services, parental confidence score, and employment type. The variables used in the correlation and regression analyses are discussed in Table 1.

[Table 1 about here]

Method

SAS software is used for the correlation and regression analyses. Pearson’s correlation is used for correlation analysis. The Ordinary Least Square (OLS) Regression of life skill, as a proxy to household human capital, is utilized for the regression analysis. We would like to include all skills or scores related to non-working matters in the model, but this is not possible when there is multicolinearity – high correlation among independent variables. Variables selected in the OLS are based on previous research findings, control variables, and hypotheses.

RESULTS

Descriptive Statistics

The descriptive statistics are presented in Table 2. Overall, the variables do not show any concerns for correlation and regression analyses. Variables are not terribly skewed except for household income. Therefore, natural log of income (plus 1) will be used in the regression analysis. Groupings of categorical variables do not seem to produce any single group, being very small in proportion.
Descriptive statistics indicate that women in rural area of this sample have mean age of 30.1 and standard deviation of 9.12. Almost half of them are married despite the prerequisite of being considered in the survey is having a child 12 years old or younger. The average and standard deviation of income is $1,338.48 and $885.93, respectively, which includes those who are not working full-time. Among the sampled people, 45.5 percent consider themselves to be unemployed. Majority of the sampled group of people have high school diploma at 26.9 percent while 23 percent of women have some experience at the college level. In our sample, the percentage of non-Hispanic Whites, Blacks, and Hispanics are 64.4, 9.0, and 21.6 percents, respectively. Close to 40 percent of these women here work in a blue-sector area while 15.3 percent worked in a white-collar area.

The mean and standard deviation of six scores related to knowledge and skills are also presented in Table 1. Overall, people have high life skill assessment, knowledge of community, parental confidence, and parental support scores while low on food security and depression scales. The larger the possible ranges of total scores, the higher the observed standard deviation.

Life skill assessment correlation

Table 3 presents the correlation results of the scores and other continuous variables in the regression analysis. Significance level is set at 0.001 level. Life skill is found to be highly correlated with all two scores: knowledge of community services and parental support. Only one correlation is found to be higher than 0.5 and one other between 0.4 and 0.5. The correlation between life skill and knowledge of community services is the highest, at 0.519. The second highest correlation is between scores of parental confidence and parental support. Seven other correlation relationships are found to be significant at 0.1 significance level. Based on the
correlation analysis, we decide to include total scores of knowledge in community services and total score of parental support in the regression analysis.

[Table 3 about here]

**Multivariate Analysis**

Table 4 presents the OLS regression analysis. The model estimated is significant (F(14, 258) = 18.92, p < .001). The R² is 0.5066, indicating that 50.66 percent of the variability in the total scores of life skill assessment is explained by the independent variables in the OLS model. Out of a total of 448 women in the data, only 273 (60.9 percent) observations are used in the OLS regression analysis.

Variables that are highly significant, at 1 percent significance level, are educational attainment, log of household income, total scores of knowledge in community skills, and total scores of parental confidence. Variables that are significant at 5 percent significance level (but not at 1 percent) are Hispanics and age. Based on partial F-tests (not included), marital status and type of employment are not found to be significant at 5 percent significance level.

The interpretation of the unstandardized coefficients when controlling for all other variables, are as follows. Only significant variables will be discussed here. Hispanics are expected to have 1.4 lower life skill scores compared to non-Hispanic Whites. For every year increase in age, life score is expected to increase 0.05 point. A more meaningful interpretation is that life score is expected to increase 0.5 point for every 10-year increase in age. Educational attainment is positively associated with life skill scores. Compared to high school graduates, women with less than eighth grade education level and some high school are expected to have 3.5 and 2.5 life skill score less while those with at least some college experience is expected to have 1.3 more. For every one percent increase in household income, life skill score is expected
to increase by almost 1 point. For every point increase in the total score of knowledge in community skills and total scores of parental confidence, life skill score is expected to increase by 0.2 and 0.2, respectively. A more meaningful interpretation would be that for every 5-point increase in the total score of knowledge in community skills and total scores of parental confidence, life skill score is expected to increase by 1.2 and 1.0, respectively.

[Table 4 about here]

**DISCUSSION, CONCLUSION AND IMPLICATIONS**

The main goal of this study is to explore life skills as household human capital. We looked into the correlation between different types of skills and scores not directly related to working in the market. We also investigated factors associated to household human capital, adapted from the traditional human capital theory. We proposed four hypotheses with regards to relations between household human capital (operationalized using life skill score) and four variables, three of which were types of human capital investment. Three of the four proposed hypotheses were supported by the data and model. We also found that life skill scores are highly correlated with total scores of community skills and scores of parental confidence.

The three supported hypotheses are the positive relation between household human capital to age, educational attainment, and social skills. The one not supported is the relation between household human capital and employment. For every 10-year increase in age, life skill score is expected to increase by 0.5. Compared to women with high school education attainment, women with less than 8th grade education level, some high school experience, and at least some college experience are expected to have 3.5 less, 2.5 less, and 1.3 more life skill score, respectively. The two social scores included in the regression analyses are scores of knowledge in community skills and scores of parental confidence. For every point increase in these scores,
life skill score is expected to increase by 0.23 and 0.20 points, respectively. Experience, as operationalized by age, is always useful in increasing people’s efficiency, regardless of the situation, and as the saying goes; wisdom comes with age.

Educational attainment provides a general type of training that is useful in the market and household settings. As household matters become increasingly complex with dynamic technology, households require adequate educational background to be familiarized with these advances. Social skills open up paths for information flow for people to gain or exchange information pertaining to household matters, which corresponds to a result found in Teachman et al. (1997). The insignificant relation between employment status and household human capital is also found by Lichter et al. (1994). People tend to get married with others of the same background. Considering job opportunities, wage differentials, and familial responsibilities, women in rural area might be better off staying at home nurturing their children and handling household matters while their spouses (if they have one) work in gaining comparative advantage (Becker, 1985). An additional explanation is that women who stay at home may redirect their career interest towards advancing their husbands’ careers, as observed by Airsman and Sharda (1993). Another interesting finding of this study is that marital status variable is not significant. As mentioned in an earlier section, although marital status has been mentioned as a type of human capital investment, we argued that marital status may be related to household human capital in both positive and negative directions.

Although the model proposed is very useful, the model has some rooms for improvements. One cannot say for sure of the direction of causality between scores, except for the depression scale. The direction of causality cannot be directly assessed from this study. Besides, the fact that these scores are self assessed might be underestimated or overestimated to
represent respondents in a positive sense. People may want to present themselves in the best possible manner that they are likely to report that they have the capabilities of doing various tasks when they actually do not have the capabilities. The dependent variable and some independent may have been jointly determined. Thus, this model can be improved using a simultaneous-equation model. An improved sample selection method and interview techniques may significantly improve data quality and result in an unbiased sample. In our regression analysis, about 40 percent of the sample cannot be used due to incomplete data. This, together with sample selection method, may affect the generalizability of results.

This study expands the horizon of human capital to household in a similar manner Grossman (1972) expanded the traditional human capital theory to health. The Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA) may have instituted programs to have “work first” mindset, rather than applying to poverty-related assistance. However, women with children in rural areas may be better off staying at home taking care of household-related matters, nurturing children, and helping their spouses. This is considering that women tend to get lower wages than men and that job opportunities in the rural areas may be scarce. Poverty for some women in rural areas may easily be alleviated if the government provides programs to increase their household human capital.

Tradition and Change in Life and Literature in India

Smita Agarwal

Prof. in English
University of Allahabad.

Those of us concerned with the observation, study and analysis of culture and literature are well aware that it is difficult to pinpoint where tradition ends and the change of modernity commences. As we cannot isolate this point of departure, we are relieved to imagine of tradition and change as a continuously flowing river of ideas, each new and radical thought being born out of a previous one – a linked chain.

Having said that, it would do us good if we scanned life as represented in the *Mahabharat* and the *Ramayan*. Both these stories, in all their versions, whether oral or written, revolve around relationships – humans amongst themselves, humans with animals, humans with gods and goddesses, humans with devils, so on and so forth, and, it is interesting when we narrow down the scope by focussing on the man woman relationship – issues like gender politics and sexual harrassment - Kunti, having to decide between the legitimate and the illegitimate; Sita becoming the paradigm for that “interplay of truth and sex” on her return from Lanka; Draupadi humiliated by Duryodhana and the unwarranted and unwanted sexual advances of Kichaka in Viraat’s kingdom. Have these lifestories of women altered in the India of today? …

Former Miss India and popular MTV VJ, Nafisa Joseph, who committed suicide, is an example of how painful it is proving for women to adapt to a changing society. Joseph was a postmodern, Gen Y girl, living the no-holds-barred high life, but hankering for conventional security and accountability when it came to

---

Trying to reconcile new-age values with the age-old, unable to bear the pain, confusion and loss of control her lifestyle pitched her into, she took this sad way out. One wonders why she remained so insecure, when, at a young age, she had already achieved most of the essentials like economic independence, fame and unbounded confidence that Feminism roots for. Human emotions and the fragility of the immature human heart are points that are not as much stressed upon and examined as they should be.

Contemporary tv serials in Hindi are topping popularity ratings by fielding women characters in their storylines. Hindi cinema is also caught up in mirroring the changing face of the New Indian Woman. It is, as if, script writers have discovered the promising financial possibilities of women-centric screenplays. Dimple Kapadia in Dil Chahta Hai essays a middleclass university teacher who is unafraid to love and sleep with a younger man. Preity Zinta in Kya Kehna is a strong girl who decides to brave the travails of becoming an unwed mother, and, in Chori Chori Chupke Chupke the same actress is a surrogate mother. This film is an example of tradition and change. Whereas, right upto the ‘80’s, a middleclass housewife unable to have a baby, would have elicited audience sympathy by appearing sacrificial and martyred on screen, in Chori Chori Chupke Chupke, it is Rani Mukherjee, the wife, who advises her husband to beget a child off another woman, so that the family line could continue and the extended family never find out that the ideal bahu suffers from the grievous fault of infertility. The current film Dobara presents a menage a trois of Jackie Shroff, wife Mahima Chowdhry, and Shroff’s ex-wife, Raveena Tandon, where the wife is shown, quite unabashedly, sponsoring the murder of her errant husband.

Current heroines aren’t queasy about strong dialogue. In Vishaal Bharadwaj’s Maqbool Masumi calls Tabu a slut. Today, heroines are doing what Nadira, labeled a
vamp or a bad girl, did 40 yrs. ago in Kamal Amrohi’s *Dil Apna aur Preet Parayee* – Preity Zinta in Honey Irani’s *Arman* plays Randhir Kapoor’s spoilt rich daughter who makes life miserable for her husband. Films are relishing the idea of presenting the woman in the Malevolent Mode, in a bid to register the 21st century Indian Woman changing from Sati Savitri to a Savvy Slut, very much in control of her life, and also, exercising a decisive power over the lives of her men and society. In the past, Mala Sinha in BR Chopra’s *Dhool Ka Phool*, Rekha in Dulal Guha’s *Do Ajnabee*, Reena Roy in J.Om Prakash’s *Apnapan*, dared to step out of marriage. But, they lived to regret these roles which they felt had tarnished their image with the public. Contemporary heroines have no such qualms. They are unafraid of negative roles and, in fact, welcome them as a challenge. This willingness shows their confidence as actors. Also, as the practical Aishwarya Rai has noted, cinema has to create new expectations for the audience. So, in Ken Ghosh’s *Fida*, Kareena, unafraid of the role of a wanton, capricious woman, in connivance with her lover, brings about the ruin of a boy besotted by her. Aishwarya Rai in *Khakhee* is the hard-nosed *femme fatale* female cop who shoots down the man who loved her. This willingness to play negative roles and experiment shows their confidence as actors. Male actors have had the freedom to experiment with evil without fear of public retribution, whereas, for females in out and out negative roles, the film flopped eg. *Fida* and *Khakhee*. So, despite the changes since Meena Kumari and Mala Sinha’s times, the tradition of the Indian public being very uncomfortable with bad girls, continues. However, Bollywood’s urge for experimentation remains insatiable. In *Jism* Bipasha Basu is the unapologetic adulteress who cheats on her husband and professes no interest in her lover other than self interest. In Sanjay Gupta’s *Musafir*, Sameera Reddy plays a bored small town housewife who sleeps with a number of
men who pass through. The idea behind this seems to be that if Shah Rukh can play negative roles and still be popular, so can the girls. Is this an indication of change in male-dominated Bollywood culture with more power to women? Is it indicative of a change in the mindset of the viewer having become more literate, more liberal, and more Westernised due to the reach of the visual media? For the student and scholar of culture, is this indicative of the leveling homogenity of globalisation wherein, what was, till now, black and white, is allowed shades of grey if not full-blown colour, as ideas to which the sixties Indian assigned negative values, are now acquiring different valuations?

What we are calling the new Bollywood Mantra, women in their negative avataars, is nothing new if not traditional for us Indians; a reworking and reinvention of tales of the goddess Kali dancing over the supine Shiva, and Durga, Mahishasurmardini, symbolising the reversal of the patriarchal order. All this seems to have impacted on teleserials too. Balaji telefilms abound in women who are mean, full of evil intent and intrigue. Payal in Kyunki Saas Bhi Kabhie Bahu Thi wants to destroy the family empire, while, in real life and real time, the seemingly wilful and capricious Badi Ma, Priyamvada Birla, wife of M.P. Birla of the Birla Empire, wills her assets to an outsider – her accountant, Lodha. The moot point is, are these changes real in an Indian context? Has real life in India really become as gynocentric as is imagined in popular culture? Has the contemporary Indian Woman managed to make a dent in a largely patriarchal society? or, is there a false image, an artificially generated image of the Indian woman current in popular culture in connivance with the media?
On the one hand, it seems, as if India has metamorphosed into a truly postmodern terrain where the Grand Narrative\(^2\) of Shiva is over and the little narratives of Parvati have begun. On the other, we must consider, what Jean Baudrillard calls the ‘hyperreal’,\(^3\) where reality is simulated by technology in such a manner that simulation takes the form, not of unreality, but of manufactured objects and experiences which attempt to be more real than reality itself. Hyperreality brings with it a collapse or implosion of all dichotomies of value where antagonisms are annulled by the dependence of one upon the other.

By and large, the change in India is painfully slow: the rural woman and the urban workforce woman is a far cry from the liberated Shefali Zariwala of the “Kaanta Lagaa” music video. The sex ratio has declined in India and may drop further by the next census. At present, in India, there are 927 girls to a 1000 boys.\(^4\) Television Reality Shows may monitor changes in the desires of the burgeoning Indian middle class with disposable incomes, but, when they attempt to pry into the minds of the rural masses, we discover that the masses remain orthodox and traditional.

Recently, a pregnant woman Gudiya, was forced to choose between two husbands in a show aired by Zee TV. Gudiya’s first husband, Mohammed Arif, was taken prisoner of war in Pakistan, in the 1999 Kargil War. Presuming her husband to be dead, her family married her off again after a wait of a few years. In 2004, after five years, Mohammed Arif returned and wanted her back. Meanwhile, Gudiya was eight months pregnant by her second husband, Taufiq. Together with the feuding husbands and Gudiya, the members of all three families, the village Panchayat, Mulas and Kazis came on TV in a bid to reach a settlement that Gudiya return to the military

---

man, Mohammed Arif. The incident took place in a predominantly Muslim area of Mundali village near Meerut, U.P. The programme reinforced the idea of the backward Indian village and its equally backward institutions of justice like the Panchayat. The media, invasive of the individual’s privacy, corroborated Marshal McLuhan’s quote, that, in this age of communication, the world is a global village. Hence, the media is a global panchayat. Media can’t resolve social conflict but, it can bring them out in the open, and focus attention on them. And, of course, the media can make a lot of money by upping TRP ratings by airing such programmes.

Anees Jung’s first book, Unveiling India, describing conditions in which Indian women live and the attitudes they face, was a bestseller. 19 years later, her second book,\(^5\) shows us a younger India, the daughters of those whom she met on her first journey. The courtyard is the binding image holding the stories together. She admits that “The spaces beyond the cramped courtyard of the young hold undeciphered visions …” “I remember my mother’s sense of security and serenity. Have I lost something in gaining my freedom? Yes. My centre. I don’t have my own inner courtyard. I lost it in my effort to reach a space beyond”, she says, as she discovers paradoxes like young educated women not knowing how to forge ahead. Caught between traditional ways and the nascent modernism of a globalised society, young women often seem trapped, the benefits of education and progress being frittered away or grounded in convention and patriarchy. Where is Ameena, the child bride rescued by an Indian Airlines Air Hostess from her elderly Arab groom? Married to a widower with 3 children. Why has she squandered the enormous goodwill she encountered? Why did she not change her life? Mary, a victim of domestic violence in Kerela, still feels marriage is the best option for her 2 daughters. Silence, either self

imposed or by the family and environment, seems to predominate, while silence between the mother and the daughter is the price of change as they feel they inhabit different time zones. Often, illiterate mothers faced with a more hostile environment are cheerful and show a strength of character sadly missing in the daughters. In a village in Rajasthan, unwanted girls bear names like Dukhi (sad) and Naaraaz (angry). Jung’s sense of disappointment is evident in the book as she surveys the scene. Even if one woman in exploited circumstances dreams, it is worth celebrating. The book is a barometer of change and development and is valuable for those engaged in Gender Studies.

Having taken a look at contemporary life in India let us now cast a glance on the flow and flux of tradition and change in the literature of India. For this purpose, since the area is very wide and quite beyond the scope of this paper, I shall focus my attention on two pieces of writing, first, an episode from the Mahabharat where Arjun as Brhannala is the trope for an exposition on both manly and unmanly qualities, and then, on Mahesh Dattani’s play in English. Dance Like a Man which is an expose on middleclass ideas of masculinity.

In the thirteenth year of their exile, the Pandavas seek refuge in the court of Virata, the King of the Matsyas. They introduce themselves to the King under false names and properly disguised. They hide their weapons on a tree near the cremation grounds on the outskirts of the town. In Virata’s court, Yudhishtara pretends to be an excellent gambler and gets himself appointed the King’s comrade and confidence man. Bhima is the King’s cook, Nakula is employed as a horse-breaker, Sahadeva as a cattle-inspector and Draupadi, the queen’s chamber-maid. The foremost warrior of the

---

Mahabharat, Arjuna, the epitome of all masculine qualities, pretends to be a eunuch, Brhannala, and is appointed as dance-master to princess Uttara. At this point, it is interesting to pay attention to the description accorded to Arjuna. He is described as a goodlooking man, who is wearing ornaments that women wear; kundala in his ears, shell and gold bangles on his wrists. He has long hair, long arms and the gait of an elephant, as if, with each step, he makes the earth tremble. Arjun’s cross-dressing implies that he chooses to divest himself of all power and privilege in order to protect his identity as the ablest warrior on earth. The King is reluctant and uncomfortable to elicit work from Brhannala, a eunuch – apparently devoid of manly qualities - and condescends to offer him the supposedly effeminate and not-so-demanding job of a dance-master engaged in teaching women. Later on, in the Viraat Parva, Draupadi is the victim of Kichaka’s unwanted attentions and uncontrollable lust. Incensed at being insulted by Kichaka in front of a full court, she seeks the help of her husbands and eventually succeeds in having Bhima slay Kichaka and his brothers. On her return to the town from the cremation grounds, she meets Arjun in the natyashala, and, a concerned Arjun asks her to narrate how she managed to free herself of Kichaka and his clan. At which, Draupadi derides him for having crossed over and become a eunuch, thereby implying that he has lost all manly qualities of chivalry and valour and hence should not pretend concern for the trials and tribulations in a woman’s life.

Later on, in the Viraat Parva, it is the eunuch Brhannala who mentors the scared young prince Uttar in the arts of war and is instrumental in bringing about a major victory for King Viraat. The King exults at the bravery exhibited by his son, the young Prince Uttar, at which the disguised Yudhishtara (Kanka) points out that whosoever has Brhannala as a charioteer is ensured of victory in the battlefield. Viraat
is incensed and lists it a crime that Yudhishtara should praise the valiant Prince in the same breath as a hijra. Yudhishtara is punished for his insolence with the King hitting him on the face with the dice. Through the cross dressing of Arjun in the Mahabharat, the binary opposition of brave warrior and emasculated eunuch, yoddha and hijra, is imaged, as also, ideas regarding manly and unmanly behaviour, and, as to what constitutes masculinity. This is the mindset of a patriarchal society reflected in the literature produced in a heroic age. Here, gender roles are clearly defined and Draupadi is fully justified in deriding Brhannala at his inability to protect her. But, what of now? How does contemporary Indian literature in English mirror a postmodern society's perspective on gender and masculinity. Dance Like A Man makes it evident that there is hardly any change in society’s mindset, and, contemporary writing’s representation of masculinity, continues to hark back to images dating back to the Mahabharat.

Dattani’s play revolves around Jairaj whose passion is dance. Jairaj’s father, Amritlal Parekh, is ‘one of the richest men in town’, ‘the sethji of the city’. Amritlal Parekh disapproves of his son’s decision to become a dancer. He considers the activity unmanly, effeminate and most definitely worthless because, ‘It doesn’t give you any income.’ or social prestige. In a dramatically riveting face-off, two generations of Indian men, father and son, reveal their attitudes towards work, value, society, prejudices. The scene reaches a linguistic high when Dattani is able to play upon the word ‘independence’ to show the generational chasm. For Amritlal Parekh, independence is about the Mahatma, the freedom struggle and the reconstruction of India, while, for his son Jairaj, the word has achieved connotations of ‘to do what I want.’

DLAM p. 415.
However, despite his firmness, in the play, Jairaj is a failed dancer – the victim of middleclass Hindu society’s bias against a man dancing. Can a man ever hope to dance and that too like a proud member of his sex or is he doomed to remain entrapped in gender as it is socially and culturally constructed for him. In interrogating masculinity, Dattani weaves in the power play within the same sex and the sexes. Amritlal Parekh uses the force of authoritarianism and practical cunning to shoot down his son’s bird of ambition. And Ratna, Jairaj’s wife who shares his passion for dance, is fired by an ambition greater than her husband’s, and hence, has to ruthlessly outmanouvre him in her bid for success.

Is Jairaj a loser because he decides to crossover to an unmanly profession? Does he relinquish all power and prestige associated with the male gender when he decides to do this? Does he face failure at a personal and social level because he has diluted/polluted his gender?

Just as Draupadi speaks pejoratively of Arjun’s eunuch state inability to protect her honour, Dance Like A Man has ample dialogue where Ratna berates Jairaj for failing her. Just as Draupadi is both cunning and manipulative with her husbands when it comes to her self interest, Ratna too uses Jairaj in a subtle or gross manner. Amritlal Parekh cannot stomach the fact that his son will grow his hair long because it helps his abhinaya. Jairaj’s long-haired dance master is a description that seems to have come to us unchanged from texts like the Mahabharat.

Like the Brhannah episode in the Mahabharat, Dance Like A Man raises questions of gender – how it outlines existence and how it makes us its prisoner, but whereas, in the earlier text, Arjun’s secret life eventually wins him the trust and admiration of society and projects him as the ideal, (as a eunuch – austere ascetic; as a
man – a warrior), sadly, in our postmodern times, Dance Like A Man exposes our hypocritical attitudes towards gender and masculinity.

Title: Social Work in times of natural disaster: social work services to drought affected families in NSW

This paper details the results of research conducted with drought affected farm families in NSW. The study reveals the significant health and welfare stresses experienced by families and the lack of access to services and support. The research was conducted in three sites in rural and remote areas of NSW in 2003. Farm family members, service providers and other community key informants were interviewed. The paper outlines ways that the social work profession can respond to significant natural disasters.
ROAD SAFETY: DEVELOPMENTAL TRENDS IN MALAYSIAN CHILDREN’S CHOICE OF SAFE ROUTES TO CROSS ROADS

Dr. Kwame Ampofo-Boateng
FACULTY OF SPORTS SCIENCE AND RECREATION, UNIVERSITY TECHNOLOGY MARA, 40450 SHAH ALAM, SELANGOR. MALAYSIA.

ABSTRACT

Background. Children’s accidents as pedestrians are high in both developed and developing countries. Measures to reduce or prevent them have also failed, because they are not preceded by research. The present research studies an aspect of children’s pedestrian behavior as a way of offering suggestions for training them to be adept pedestrians.

Aims. The present research was designed to test the range of applicability of the results of (Ampofo-Boateng, Thomson, Grieve, Pitcaim, Lee & Demetre, 1993) that found age-related trends in children’s choice of safe routes at sites where vision was either masked or where traffic could approach from different directions.

Sample. Eighty Malaysian children aged 5, 7, 9 and 11 years, were tested near roads to examine their choice of safe routes to cross roads.

Method. Each child selected safe routes at four specific road sites. Two of the sites had visibility occluded, and the remaining two had traffic emerging from different directions. Children’s accidents as pedestrians tend to congregate at these sites (Ampofo-Boateng, et al., 1993).

Results. Their results were confirmed. Five- and 7-year-olds exhibited only a rudimentary understanding, while 9year-olds, showed some understanding of the full repertoire of referents that are essential for selecting safe routes to cross roads. By age 11, children made adult-like selections of safe routes to cross roads that avoided dangerous road structures, such as, areas with masked vision due to occluding objects and junctions. These routes would have enabled them to cross safely, if they had been employed in actual road crossing situations.

Conclusion. The implications of the findings in developing countermefasures for child pedestrians are discussed and suggestions made for future research.
INTRODUCTION
For the majority of adults, and for most of the time, the act of road crossing is simple and taken for granted. As adult pedestrians, we do not perceive road crossing as a daunting task. In fact, as adult pedestrians, we have acquired the full repertoire of referents needed to rely on to cross roads safely. These include an understanding of how accidents are caused and the development of skills, knowledge and abilities that we can deploy to cross roads safely, even in the most complex of traffic situations. As adult pedestrians, we are able to routinely undertake complex judgements in deciding when, where and how to cross safely, with little or no problem. How much adults have mastered and are adept at crossing roads as pedestrians is borne out when pedestrian accident statistics of adult and child pedestrians are compared. Such statistics always show unambiguously that child pedestrians are over-represented in the pedestrian casualty figures than adult pedestrians (Ampofo-Boateng & Thomson (1990, 1991).

In all countries where accident statistics are available, road accidents constitute a major source of injury and death to children Ampofo-Boateng and Thomson (1990, 1991). The focus on child pedestrian accidents as a serious health problem was happened a long time ago, when road accidents were perceived as “the most major problem of child health today” (Jackson, 1978: 807). The situation, at the present time, is still the same (Zeedyk, Wallace, Carcary, Jones & Larter 2001). And, as Thomson and his colleagues noted in their 1996 review of child pedestrian road safety issues, that child pedestrian accidents are the most serious of all health risks facing children in developed countries” (Thomson, Tolmie, Foot & McLaren, 1996), and even in developing countries, such as, Malaysia (Ampofo-Boateng et al.,). This makes accidents a major health problem for children on which research effort should be concentrated (Ampofo-Boateng & Thomson, 1991).
In an effort to reduce such accidents, attention should be focussed on the most vulnerable group of road users (Ampofo-Boateng, et al., 1993). With regard to pedestrian accidents, and as already identified above, attention should be concentrated on child pedestrians and especially those below 9 years, who have been identified as the most vulnerable in developed countries (Ampofo-Boateng et al., 1993; Thomson, Ampofo-Boateng, Grieve, Pitcairn, Lee & Demetre, 1992).

Where statistics are available, developing countries also experience high levels of traffic accidents. For example, Malaysia as a country continues to record high levels of injuries and deaths due to road accidents (Salleh, 1996). Also, within Malaysia, when it comes to pedestrian accidents, young children are the most vulnerable group. In the case of Malaysia, young children age 10 years and below, are the most at risk pedestrian group (Statistical Report Road Accidents Malaysia, 1996). This trend in Malaysia, confirms what has been observed internationally (Ampofo-Boateng et al., 1993; Ampofo-Boateng & Thomson, 1990; 1991).

Overall, attempts to reduce accidents in Malaysia have been met with limited success, as they continue to show an annual increase. Internationally, also, road safety methods have failed to reduce road accidents (Got, 1994; Thomson, 1991). At best, results from road safety campaigns have been inconclusive, and at worse totally ineffective (see Ampofo-Boateng, et al., 1990, for a review).

A solution has been mooted to address the problem. It takes the form of problem solving as a means of increasing the effectiveness of road safety programmes, at least for young children (Ampofo-Boateng et al., 1993; Ampofo-Boateng & Thomson, 1990;
This strategy is simple and easy to adopt. First, the accident statistics of the target country is judiciously examined, in order to uncover the circumstances leading to young children’s accidents as pedestrians (Ampofo-Boateng, 1987). In particular, road structures, road geometry and road layouts where such accidents tend to converge are identified (Ampofo-Boateng & Thomson, 1990; 1991; Thomson, Ampofo-Boateng, Lee, Grieve, Pitcairn & Demetre, 1998). Next, research is conducted to examine how children appreciate the dangers inherent in the delineated areas (Ampofo-Boateng et al., 1993; Ampofo-Boateng & Thomson, 1991). Finally, a training programme is mounted to rectify any deficiencies in the way they deal with safety and danger issues while crossing roads (Thomson et al., 1998).

Using the problem solving approach advocated above, Ampofo-Boateng and Thomson (1991), perused critically the child-pedestrian accident statistics in the Strathclyde Region of Scotland, United Kingdom, and discovered that children’s accidents as pedestrians, often occurred in areas where visibility was occluded by road side obstacles (for example, parked cars), or where the complexity of the road layout (for example, junctions), meant that traffic could approach from a number of different directions. These tasked the cognitive and perceptual skills of young pedestrians making them vulnerable to experience accidents in these locations. Based on the above findings, Ampofo-Boateng, et al. (1993) and Thomson, et al. (1998), studied developmental trends in the way children selected safe routes to cross the road at these locations. The research revealed developmental patterns in the type of problem that children encountered in choosing safe routes to cross the road at these sites. Five- and 7-year-olds were particularly poor at the task. Their choice of safe routes to cross the road, were unsafe as they mostly ignored the dangers posed by the road sites. For example, they elected to cross at sites where vision was either obscured by roadside obstacles or in areas
where traffic could emerge from a number of different directions. Their choice of routes was also the most direct route to their intended destinations.

By age 9, and especially at 11 years, children made adult-like selections of safe routes to cross. They achieved this by taking into account all important road referents that are important to guarantee safety. This included avoiding crossing at sites where their vision would have been occluded by obstacles. Additionally, they also avoided crossing at sites where they would have had to contend with dealing with traffic emerging from different directions. On several occasions, they had to take a detour by walking on the pavement and only opting to cross when a safe route was identified.

The aim of the present research was to examine the range of applicability of the results obtained by Ampofo-Boateng et al. (1993), by conducting a comparable research with a sample made up of Malaysian children. Specifically, the research explored age- and gender-related trends in Malaysian children's choice of safe routes to cross roads. Will the choice of safe routes of a sample of Malaysian children show identical developmental trends to those found with a sample of Scottish children? The research additionally, addressed this question.

**METHOD**

*Participants*

Four age groups of 5, 7, 9 and 11 year-olds, with each age group consisting of 20 participants each, were used for the research. Each age group comprised of equal number of boys and girls. The mean ages of each age group were: 5 years 8 months; 7
years 6 months; 9 years 7 months; and 11 years 9 months. The participants were randomly chosen from a sample of nursery and primary school children in the Selangor State of Malaysia, whose parents had given their permission for them to participate in the research.

*Procedure*

The children were taken individually from their classrooms at the time when their teachers deemed it appropriate for them to be taken out. The sites were all on quiet two-lane roads (with speed limits of approximately 48 kilometres per hour) in the vicinity of their nurseries (5 year-olds) or schools (7, 9 and 11 year-olds). The testing sites were all on roads nearby to either the children’s nurseries or schools. This ensured that the time taken to walk to the test sites was not too long, to disrupt their classes.

The test-sites were four, with two in areas where vision was occluded or restricted and two at junctions where traffic could emerge from several directions. These sites were chosen because of their identification as areas where children accidents as pedestrians tended to congregate and also children’s inherent lack of appreciation of the danger posed at these sites (Ampofo-Boateng & Thomson, 1991). At each of the 4 locations, children were asked by the experimenter to imagine they were on their own and wanted to cross the road to get to destinations at the other side. Their task was to select what they considered to be the safest route to get there. Each destination was identified with a red cone measuring 64 centimetres high and was of the type normally used by the police in traffic control.
At each road site, there were two starting points and two destinations. The child’s task was to choose 4 safest routes to cross at each of the four sites, adding up to a combined choice of 16 routes per a test session. Each child completed the testing on two separate occasions yielding a total of 32 constructed safest routes per child.

The children identified their selection of safest routes to cross by pointing and explaining it to the experimenter. At no point were children made to cross the actual road to indicate their selected safest route. Each identified safest route by children were recorded on schematic diagrams of the test locations.

**Scoring**

The routes chosen by children as safest were studied and coded into 4 safety categories, based on the extent to which they evaded dangerous road features in the chosen route. These safety categories were not randomly chosen, but instead they were obtained empirically from the patterns of safest routes that were identified in the children’s choice of safest routes and were similar to those employed by Ampofo-Boateng et al. (1993). The 4 categories, ranging from minimum to maximum safest route awareness were described as follows:

1. **Very unsafe**: a route leading directly to the destination (often involving a long, diagonal crossing of the road), that also ignored the dangerous road feature at which the starting point was located (for example, a parked car);
2. **Unsafe**: a straight route across the road not aimed directly at the destination, but which ignored dangerous road features. This was deemed to be an improvement
on (1) because it at least reduced the time spent on the road during crossing and its attendant reductions in exposure to danger;

3. **More safe**: a route that avoided some but not all dangerous road features. This usually occurred when the child made a detour away from a dangerous road position (for example, walking down the road away from a parked car), but ended up at a new location which might also be dangerous (for example, at a sharp bend); and

4. **Safe**: a route that avoided all the dangerous road configurations. This typically involved the child walking along on the pavement away from the dangerous features at the crossing location, and crossing only when a safe site was found.

Reliability of the scoring scheme was evaluated in a previous research through the randomly choosing a 25 percent sample of the protocols and having them independently coded by a second evaluator (Ampofo-Boateng, et al., 1993), with inter-rater reliability found to be 0.89.

**RESULTS**

For each child, a calculation was made of the mean proportion of routes falling into each of the 4 safety categories. Subsequently, a calculation was made for the mean proportion of routes falling into each safety category for each age group. Table 1 is a presentation of the result of this calculation. The same procedure was followed in analysing the effect of gender, but was excluded from the table because no significant effect was recorded for gender.
From Table 1, it can be observed that the choice of safe routes to cross the road of 5 year-olds was very rudimentary. It was characterised by either unsafe or very unsafe. By age 7, the choice of safe routes to cross the road was only marginally better than that of 5 year-olds. The choice of safe routes of 7 year-olds was mostly limited to unsafe routes. Their selected safe routes mostly fell into the unsafe category. Children started to display a better understanding of the selection of safe routes to cross roads, by the age of 9, where routes chosen were mostly more safe and safe. Eleven-year-olds, on the other hand, had a large proportion of their choice of safest routes to cross the road falling within the safe category.

Two types of statistical analysis were computed on the children’s choice of safest routes to cross the road shown in Table 1. The first statistical calculations was based on the proportion of routes that fell into the “safe” route category, which was adjudged to be the standard of being sufficiently safe had the children being allowed to actually cross the actual road (see Ampofo-Boateng et al., 1993).

A two-way analysis of variance (ANOVA) yielded a main effect of age on the safe route ($F(3,76) = 36.94, p<0.01$) but not of gender ($F(1,78) = 0.43, \text{n.s.}$). No interaction was also observed. Pos hoc comparisons using Scheffe test indicated significant differences between each age group. In each comparison, the younger age groups selected fewer proportion of safe routes than their older counterparts, and was recorded as ($p<0.01$), for all comparisons.

The second statistical analysis centred on the proportion of routes that were classified under the “very unsafe” category for each age group. This route was also chosen for analysis because it represented the extreme end of the safety continuum. Whilst the “safe” route guaranteed safety if it was employed in actual road crossing, the “very unsafe” would have represented a very high risk had it been used in an actual road crossing. A two way ANOVA was computed on the “very unsafe” category. The results yielded a main effect of age ($F(3,76) = 97.71, p<0.01$), but not of gender ($F(1,78) = 0.27$). Pos hoc comparisons using Scheffe test indicated significant differences between each age group. In each comparison, the younger age groups selected higher proportion of the “unsafe” routes than their older counterparts. This was found to be ($p<0.01$), for all comparisons.
DISCUSSION

The present research sought to replicate Ampofo-Boateng et al. (1993) findings of an association between age and children’s ability to select safe routes to cross roads. The results showed that children’s ability in this task was significantly related to their age. Five- and 7-year-olds choice of safe routes were basic and limited to the two routes that were classified as very risky, which were, “very unsafe” and unsafe”. Thus, they opted to cross either diagonally, which increased the length of road they had to traverse and the concomitant increased exposure to danger (very unsafe) or straight from where they were standing without taking into consideration the danger inherent in the crossing location (unsafe).

In choosing these two rudimentary routes of very unsafe and unsafe, they also exhibited a total lack of understanding of the dangers embedded at crossing at sites. For example, they opted to cross at locations where their vision of the road was occluded by objects, such as, parked car, which would have made it difficult for them to see the road and also for other road users to see them. Additionally, they selected to cross at junctions that presented them with the danger of dealing with traffic coming from several directions. The danger at junctions became more pronounced with the “very unsafe” strategy adopted by 5-year-olds, which would have taken them right across the middle of the junction, and aside of increasing the length of time required to cross, would have also exposed them to traffic coming from several directions.

The 9- and in particular the 11-year-olds displayed a mature understanding of the full repertoire of referents that are required to be taken into consideration in choosing safe
routes to cross roads. Their selection strategies were classified mostly as either “more safe” or “safe”. The distinguishing feature of their strategy from that of the 5-and 7-year-olds was that while theirs took evasive measures against all the dangerous road features inherent in the crossing sites those of the 5-and 7-year-olds did not take measures to avoid them. Thus, while the older age groups (9- and 11-year-olds) selected routes that reduced their risk of crossing, those of the younger age groups (5- and 7-year-olds) increased their risk of crossing. Among the safety measure adopted by the 9- and 11-year-olds was moving away from the danger ingrained in the crossing locations and opting to cross when a safe site where a clear view of the road was guaranteed was identified. By contrast the 9- and 11-year-olds showed far more awareness of what constitute a safe or dangerous route and were much more likely to take appropriate action to reduce risk, for example by moving down the road to a safe spot.

The above results supported the findings of Ampofo-Boateng et al. (1993), which the present research set out to replicate. As revealed by Ampofo-Boateng et al. (1993), two additional important considerations also emerged from the current research, that were worth noting at this point. Firstly, they concerned the changes that took place with age, which seemed almost to constitute a change of strategy in choosing safe routes to cross roads. Five-year-olds’ strategy was basically to select a route that made directly for the destination, and in doing so moved diagonally across the road or junction if necessary. In general, they were happy to walk straight out from next to a parked car or other obstruction, quite failing to see the danger of this. By seven, the children seemed much more likely to walk straight across the road, apparently realizing the danger of the longer diagonal traverse of the road preferred by 5-year-olds. However, they were still unlikely to recognize the danger posed by obstructions to their vision. Moreover, in a proportion of the cases where they did, the action they took to deal with the problem led them to a
new location that was also dangerous. Only by 9 and especially 11 years do children seem to have developed some skill in recognizing the danger of inadequate vision of the road and adopt a successful strategy to overcome it.

An important aspect of the present result was the lack of any gender differences in the proportion of safe routes identified. This was contrary to the significant sex differences in child pedestrian accident frequencies, with boys more involved in such accidents than girls. What the results indicated was that the over-representation of boys in pedestrian casualty figures than girls could not be attributable to their inferior choice of safe routes to cross roads. The real reason behind the disparity in the pedestrian casualty figures of boys and girls is an issue that should be addressed in a future research.

Overall, the results of the present research were quite similar to those previously reported by Ampofo-Boateng and Thomson (1991). In the earlier research, it was found that 5- and 7-year-olds judgement of danger were very heavily contingent on whether or not they could see a car in the vicinity of the road. If they could see a vehicle in their current position, they almost always proceeded to perceive the site as dangerous. The perception of danger was irrespective of the real or relative danger posed by the sighted traffic. For example, the perception of danger was sometimes made in relation to vehicles, which were so far away from the location of the child, as to be scarcely visible at all or even, in some cases, vehicles that were actually moving in the opposite direction (and as a result posed no danger to the child).

Conversely, if no vehicles were present in their field of view they would judge the site to be a safe one, irrespective of the road conditions and structures present in the site that might be rendering it dangerous. Thus, bros of hills, sharp bends, complex intersections
or positions obscured by vehicles were all regarded as safe crossing points by most 5- and 7-year-olds (Ampofo-Boateng & Thomson, 1991). The children failed to understand that these locations were unsafe precisely because they could not see any vehicles in the immediate vicinity of the road due to the road conditions and structures inherent in the sites that rendered it impossible to have a clear site of the road. From the results, it appeared unambiguously that those younger children within the 5-7 years age bracket’s road behaviour appeared to be governed by rather rigid rules of thumb, such as, “do not cross the road if you see a car coming” and “cross the road if you cannot see any car coming”.

CONCLUSION

The results of the present study, like that of Ampofo-Boateng et al. (1993) unambiguously identified an important aspect of young children’s traffic behaviour that needed improvement, and related to knowledge and skills required to choose safe routes to cross roads. The question to be posed here is: Can the rudimentary way in which 5- and 7-year-olds selected safe routes to cross roads, be altered through training? This has already been done rather successfully in research in the United Kingdom (Thomson et al., 1992; 1998; Ampofo-Boateng et al., 1993). This leads to the question of whether this type of training could be successfully undertaken in Malaysia. It is an issue that can be investigated in a future research. It is recommended that a future study could address this issue in Malaysia.

THE MOTIVES MALAYSIANS ASSIGN FOR PARTICIPATING IN SPORTS

Dr. Kwame Ampofo-Boateng
Faculty of Sport Science and Recreation, University Technology MARA, 40450 Shah Alam. SELANGOR. MALAYSIA. E-mail kwameampb@yahoo.com

ABSTRACT

Background. One of the most important issues confronting sports psychologists is the motive people assign for participating in sports (Duda, 1989). The present research continued this trend by investigating the motives Malaysians’ give for taking part in sports.

Aim. The aims of the current research were two-fold: (a) to examine the motives Malaysians give for taking part in sports; and (b) to investigate the influence of demographic variables on the motives Malaysians’ provide for participating in sports.

Method. A modified version of Duda’s (1989) Purpose of Sport Questionnaire was used as the research instrument. It was administered to 602 randomly selected Malaysians (resident in the Selangor State of Malaysia).

Results. The data collected was collated and statistically analyzed using SPSS. Principal component analysis of the data revealed 6 motives for taking part in sports. They were: (a) competitiveness and social status; (b) physically active lifestyle; (c) self-esteem; (d) good citizens; (e) high status careers; and (f) teaching tools. Overall, the results also showed the influence of demographic variables of occupation, income and race on motives for taking part in sports.

Conclusion. The implications of these results as they relate to the devising of strategies to encourage Malaysians to participate in sports are discussed, and suggestions offered for future research.
INTRODUCTION

The health benefits of participation in sports (also referred to synonymously throughout this paper as participation) are recognized worldwide, in both developed (Gill, 2000) and developing countries, such as, Malaysia (Siti Sa’aidah, 1997). It is also generally accepted that participation has numerous health benefits that include the strengthening of the cardiovascular system, and the prevention of cardiac disease, which has been identified as one of the greatest killer diseases of current times (Leeder, 2004; Siti Sa’aidah, 1997). Participation can also prevent cancer and stroke, and improve, overall health (Gill, 2000). However, many people still do not participate in physical activity (Gill, 2000). This makes research into the motives people assign for participation very important. Gill (2000: 87) defined the concept of participation motivation as “the basic motivational issue of why people participate in sports and exercise.”

Most developing countries, including Malaysia, are embracing sport participation as a means of improving the health of their citizens and helping reduce healthcare costs, but the number of Malaysians actively engaged in port is limited (Siti Sa’aidah, 1997). In her study of exercise among adults aged 18 years and above in Malaysia, Siti Sa’aidah (1997) found that only about 38% of the respondents participated in exercise. Participation was defined as engaging in participation at least on three occasions a week in the last two weeks, each with a duration of at least 15 minutes, in any one of 10 types of exercise, including jogging, brisk walking, cycling, rope skipping, rowing, swimming, aerobics, team sports, racquet sports and callisthenics.
In view of the importance of participation for improving health, the present research examined the factors that were perceived by Malaysians as motivating them to participate in sport. Most of the available research on motives for participation in Malaysia also used only students or students-athletes as participants. For example, Salman (1997) found that the major motives given by student-athletes for participation in sports, were health, interest, sense of achievement, to partake in school or university activities, to socialize, reduce weight, competition and improvement of shape of the body. In a separate research with University Putra Malaysia students, Sim Poh Chuen (1994) found 6 major motives of achievement, body shape, physical fitness, teamwork, learning new skills and challenges, while Rahim Harun (1985) found 6 motives of availability of adequate facilities, socialization, personal interest, the structure of the sports program, health and academic reasons for participation in sports. Overall, research into motives for participation in Malaysia, have either used students or student-athletes. The present research extended the motives for participation research, previously limited to only students or student-athletes to all Malaysians. Understanding the motives Malaysians give for participation can help in the devise of fun and fitness activities for Malaysian sports participants to encourage participation (Vincent, 2002).

OBJECTIVES

The present research addressed the following objectives.

1. What are the main motives given by Malaysians' for taking part in sports?
2. What is the influence of specific demographic variables of age, gender, marital status, educational background, occupation, income and ethnicity on Malaysians’ motives for participation in sports?
RESEARCH METHODOLOGY

SAMPLE

The sample consisted of 602 participants, randomly selected from among the residents of the Selangor State of Malaysia, living in 2 urban areas of Shah Alam and Petaling Jaya, which are among the most populous areas in the state. At both locations, 10 streets were randomly chosen (Alexandris and Carroll, 1997a, b), and every fifth house or flat in the streets, was visited by one of a team of 5 researchers (Veal, 1992). All occupants in the houses or flats visited, aged 18 years and above, were invited to participate in the survey and none refused participation. The demographic details of the sample are shown in Table 1.

### QUESTIONNAIRE AND DATA COLLECTION

A questionnaire, a modified version of the Purpose of Sport Questionnaire developed by Duda (1989) for investigating motives for taking part in sports was used for the research. Respondents were instructed to rate each of 46 items representing motives for participation on a 5-point Likert-type scale that ranged from; 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree and 5 = Strongly Agree.

### RESULTS
DATA ANALYSIS

The data collected was subsequently collated and analysed using SPSS.

PRINCIPAL COMPONENT ANALYSIS

A principal component analysis, a statistical technique applied to a single set of variables, to discover whether specific variables within a set of factors form coherent subsets of factors that are relatively independent of one another was performed on the data (Tabachnick and Fidell, 1989). To achieve this, only those components with an eigenvalue greater than 1.0 were retained and rotated (Thomas & Nelson, 2001) with orthogonal (varimax) and oblique rotations. The alpha for the whole scale was 50.60, which is considered to be good (Devellis, 1991).

Six factors emerged and were:

Factor 1 – Competitiveness/Social Status;
Factor 2 – Physically Active Lifestyle;
Factor 3 – Enhanced Self-Esteem;
Factor 4 – Good Citizen;
Factor 5 – High Status Career; and
Factor 6 – Teaching Tools (see Table 2) all had acceptable internal consistency reliabilities (see Table 2). The 6 factors are described as below.

Competitiveness/Social Status (12 items) (Factor 1) reflected those items indicating that participation should make a person competitive, enhance his or her popularity and
help him or her to move up the social ladder (see Table 2 for the items that defined this factor). **Physically Active Lifestyle** (7 items) (Factor 2) comprised of items indicating that participation should help people to be active and fit for life. The 7 items identified under this factor are shown in Table 2.

**Enhanced Self-Esteem** (6 items) (Factor 3) was made up of items that showed that participation enhances one’s self-esteem (see Table 2). **Good Citizen** (6 items) (Factor
4) captured those attributes that were intended to help people become good citizens through participation (see Table 2). **High Status Career** (3 items) (Factor 5) comprised of items suggesting that participation will help an individual to obtain a high status career (see Table 2). **Teaching Tools** (4 items) (Factor 6) consisted of items suggesting that participation also worked as a teaching tool for participants (see Table 2).

The internal consistency of each of the 6 factors was determined. The Cronbach alpha coefficients were found to be high ranging from 0.70 to 0.89, except for Factor 5 (High Status Career, 0.48) and Factor 6 (Teaching Tools, 0.29) (see Table 2), with alpha coefficients for the other factors being, Competitiveness/Social Status (0.89), Physically Active Lifestyle (0.73), Enhanced Self-Esteem (0.77) and Good Citizen (0.70).

The correlations among the 6 factors are reported in Table 3, with moderately high positive correlations of approximately \( r > 0.50 \) observed between the Competitiveness/Social Status, Enhanced Self-Esteem and Good Citizen dimensions. The correlations were: Competitiveness/Social Status and Enhanced Self-esteem \( (r>0.55) \); and Competitiveness/Social Status and Good Citizen \( (r>0.52) \) as seen in Table 3.

In addition, the belief that sport enhances Physically Active Lifestyle was related to the notion that participating functions as a Teaching Tool ($r > 0.50$). Also, enhanced Self-Esteem was positively related to the view that participation teaches us to be Good Citizens ($r > 0.52$), (see Table 3).

THE INFLUENCE OF DEMOGRAPHIC VARIABLES ON MOTIVES FOR PARTICIPATION IN RECREATIONAL SPORTS

A series of one-way multivariate analysis of variance (MANOVA) were calculated on the influence of demographic variables of age, gender, marital status, educational
background, occupation, income and ethnicity on Malaysians’ motives for participation in sports.

**OCCUPATION AND MOTIVES FOR PARTICIPATION IN RECREATIONAL SPORTS**

The results for the one-way MANOVA on *occupation* and motives for participation are shown in Table 4. Self-employed respondents perceived Competitiveness/Social Status ($F(4,556) = 4.36, p<0.01$), Physically Active Lifestyle ($F(4,565) = 3.29, p<0.025$), Enhanced Self-Esteem ($F(4,563) = 2.67, p<0.05$) and High Status Career ($F(4,564) = 3.33, p<0.01$) to be important motives for their participation, than the other occupational groups, with *Scheffe* follow-up test of $p<0.05$ for all comparisons, except for the comparison between the self-employed and students on the Competitiveness/Social Status motive and between the self-employed and government employees on the Physically Active Lifestyle motive for participation which were not significant.

| Table 4. Observed means and standard deviations (in parentheses) by occupation for the motives for participating in sports |
### INCOME AND MOTIVES FOR PARTICIPATION IN RECREATIONAL SPORTS

The results for the one-way MANOVA on income and motives for participation are presented in Table 5. Respondents' in the lowest income bracket (RM1000 and below, a month) perceived Competitiveness/Social Status ($F(3,489) = 2.62, p<0.05$), Enhanced Self-Esteem ($F(3,494) = 4.58, p<0.01$), Good Citizen ($F(3,493) = 2.97, p<0.025$), and Teaching Tools ($F(3,485) = 3.78, p<0.01$) to be their motives for participation, than the...
other income groups, and was confirmed by *Scheffe* test \((p < 0.05\) for all comparisons). Those who earned between RM1001 to RM2000 perceived High Status Career \((F(3,495) = 3.26, p<0.025)\) to be the most important motive for their participation, and it was confirmed by *Scheffe* test \((p<0.05,\) for all comparisons between them and the other income groups on the high status factor.

RACE AND MOTIVES FOR PARTICIPATION IN RECREATIONAL SPORTS

The results of the one-way MANOVA on race and motives for participation are shown in Table 6. Malay respondents' perceived the motives of Physically Active Lifestyle ($F(3,569) = 7.38, p<0.001$), Enhanced Self-Esteem ($F(3,567) = 4.07, p<0.01$), Good Citizen ($F(3,567) = 8.50, p<0.001$), and Teaching Tools ($F(3,556) = 3.79, p<0.01$) to be their main purpose for participation than the other races, and was confirmed by follow-up Scheffe test of $p<0.05$, for all comparisons, except for the comparison with Indians on the good citizen factor. Indians perceived Competitiveness/Social Status ($F(3,561) = 10.63, p<0.001$) and high status career ($F(3,568) = 4.22, p<0.01$) to be their motives for participation and was confirmed by Scheffe follow-up test with ($p<0.05$ for all the comparisons) except the comparison with Malays.

Malays and Indians also chose Teaching Tools as their motive for participation, than the Chinese (F(3,556) = 3.79, p<0.01), with post hoc *Scheffe* analyses confirming this with (p<0.05) for the comparison between Malays/Indians and Chinese. The comparison between Indians and Malays on the Teaching Tools was not significant. The demographic variables of gender, age, marital status and educational level failed did not influence participation motives, and consequently the results relating to them were not reported.

**DISCUSSION AND RECOMMENDATIONS**
PRINCIPAL COMPONENT ANALYSIS RESULTS OF THE MAIN MOTIVES FOR PARTICIPATION

The results of the principal component analysis indicated 6 main motives that influenced participation, and were Competitiveness/Social Status, Physically Active Lifestyle; Enhanced Self-Esteem; Good Citizen; High Status Career; and Teaching Tools. It is recommended that any future strategy to increase the rate of participation among Malaysians should take these core motives for participation into account.

THE INFLUENCE OF THE DEMOGRAPHIC VARIABLES ON MOTIVES FOR PARTICIPATION

Despite the observed differences in frequency of participation as influenced by gender, age, marital status and level of education, these demographic variables were not significant in influencing motives Malaysian’s assigned for participation under the present research. The demographic variables of, occupation, income and race, which are identified as affecting onset and frequency of participation (Alexandris, 1999), also had significant influence on Malaysian’s motives for participation. **Occupation:** Regarding occupation, the self-employed motives for taking part in recreational sport included: Competitiveness/Social Status; Physically Active Lifestyle; Enhanced Self-Esteem and High-Status Career; students’ scored significantly higher on the Competitiveness/Social Status motive for participation; and government employees selected the Physically Active Lifestyle as their motive for participation. Any future programmes aimed at encouraging the self-employed, students and government employees to take part in recreational sport, should prominently feature their motives for participation.
**Income:** The lowest income group of RM1000 and below, major motives for participating in recreational sport included: competitiveness/social status; enhanced self-esteem; good citizen; and teaching tools, and should be emphasised in campaigns for participation aimed at them. While, data was not collected on age and characteristics of respondents in the RM1000 and below income bracket, it is speculated that it must have included a large number of young people who had entered the job-market early instead of furthering their education, and perceived participation as a means of helping them to negotiate through life. Those within the RM2001-RM3000, income group selected high status career, as their major motive for participation, than the remainder of the income brackets studied. In the absence of specific information on the participants within this income group, it is once again being conjectured that this income group included a sizeable number of fresh university and college graduates, at early stages of their career and perceived participation as helping them to attain a high status career in their chosen professions.

**Race:** Malays principal motives for taking part in recreational sport, included: physically active lifestyle; enhanced self-esteem; teaching tools; and good citizen. Apart from the good citizen motive, which registered no significant difference between Malays and Indians, Malays chose the motives above, more than the two other races (Indians and Chinese) assessed under the present research. The reason behind Malays choice of these motives for participation might be imbued in their rich religious and cultural traditions (Mohd. Sofian, 2001). A future research, could delve into the specific nature and intricacies between culture and the motives the different races in Malaysian give for participation. Indians, main motives for participation were competitiveness/social status and high status career. Once again, the extent to which cultural mores influenced
Indians choice of these motives for participation is difficult to determine under the present research. All we can suggest is that a future research should examine the relationship, if any, between culture and motives for participation as different races or cultures might have different perceptions and understanding of sport participation (Coakley’s, 2001).

Abstract: To better address the social justice needs of the international community, social work educators need a framework for understanding and addressing those needs. This paper proposes a framework that combines the concepts of indigenous practice, the developmental model, and empowerment into a structure for addressing international social problems. Further, examples and suggestions are also made as to how social work educators might use this framework in addressing current international problems comprehensively.

Abstract: The association between alcohol and aggression has been extensively researched, however, fewer studies account for the cognitive and dispositional factors that may influence alcohol consumption and the resulting aggressive behavior. This study measured the association between dispositional aggression, explicit and implicit expectancies, alcohol consumption and the reported aggressive behavioral outcomes. Residents of a large, urban and ethnically diverse metropolitan city participated in the study (N = 246). Participants completed a timed computerized task, the Implicit Association Test (IAT) in addition to paper and pen questionnaires assessing alcohol expectancies and dispositional aggression. Of these, the Buss and Perry Aggression Questionnaire, and the Alcohol Expectancies Regarding Sex, Aggression and Sexual Vulnerability (AESASVQ) yielded the most significant correlations (p<.05). It was hypothesized that the greater the individual’s disposition for aggression, the greater the expectancy for drinking alcohol, and the more likely the participant would behave aggressively when intoxicated. The data for dispositional aggression and alcohol expectancies were significant, yielding correlations of (r = .41) for physical aggression, (r = .19) for verbal aggression, (r = .36) for anger, and (r = .34) for hostility. In addition, individuals who reported drinking a greater number of alcoholic beverages on a single occasion were found to have higher alcohol expectancies (r = .30) and to act more aggressively (r = .47) than those individuals who reported drinking a fewer number of drinks per occasion, but a greater number of times per month (r = .11). The existence of a binge-drinking component can potentially re-direct future research and preventative programs by encouraging them to focus their efforts on the quantity rather than frequency of alcohol consumption.
Output growth and volatility
A study of New Zealand’s long-run GDP

Terry S. Auld
Department of Applied and International Economics

E-mail: T.S.Auld@massey.ac.nz

Abstract
Real GDP can be decomposed into a trend component and fluctuations about that trend. The trend component (or potential GDP) is the consequence of real forces such as technological development and growth in the capital stock and labour force. The fluctuations about the trend arise principally from short-run shocks. In this study, the Hodrick-Prescott filter is used to estimate the output gap. Spectral analysis is applied to real GDP and real GDP growth to determine whether demand-side or supply-side influences are the principal source of long-run growth. GARCH-M models are used to investigate the relationship between output growth and volatility in real GDP. A comparison is made between the results of this study for this relationship and an earlier one using a different, if related, data set. The main conclusions are that supply-side influences are the probable source of New Zealand’s output growth, that after the Second World War volatility in output growth declined, and that there has been a probable change in the relationship between volatility and growth rates in the post-war years.

Key Words: Output gap, Hodrick-Prescott filter, growth rates, growth volatility, spectral analysis, GARCH-M, Black’s hypothesis, the Keynesian hypothesis
Introduction

Since colonisation, New Zealand’s long-run economic growth has been the consequence of several factors. Amongst these factors are a relatively low growth in average labour productivity, demand and supply shocks from global and regional recessions and expansions, the oil shocks of the 1970s, and supply shocks from natural disasters that affect agricultural output. The two world wars and the Korean War also have had some impact.

The observed time series for real GDP is the outcome of these factors. The time path of observed real GDP is a combination of an unobservable underlying long-run trend and a fluctuation about that trend. The fluctuations result from short-term shocks.

The long-run trend arises from real forces such as technological development, growth in the capital stock, and growth in the labour force. The transient component of output is the output gap, the deviation of actual GDP from trend GDP. Both the trend rate of output growth and output volatility are of interest.

Numerous studies have provided evidence that in many developed countries, output growth has become recently much less volatile than in the past. Blanchard and Simon (2001a) argue that volatility of US output has declined steadily since the 1970s, if with interruptions in the 1970s and early 1980s. Blanchard and Simon (2001b) and Simon (2001) provide evidence that output volatility also declined sharply in the mid-1980s in Canada, the United Kingdom and Australia. The Reserve Bank of New Zealand (RBNZ) has noted that New Zealand’s output volatility has declined since the 1970s. (Reserve Bank of New Zealand, 2000)

Recognition of greater stability in US output is not new. In his 1959 Presidential address to the American Economics Association, Burns (1960) noticed the decline US output volatility after World War II, attributing it to shifts to the service economy away from agriculture and manufacturing, improvements in capital markets and a greater ability to maintain income and consumption during downturns. The reasons advanced in various recent studies to account for the greater stability in output include lower inflation volatility, reduction in business cycle volatility arising from more effective monetary and fiscal policies, more efficient markets, openness to trade, increases in financial wealth, better control of inventories, and plain good luck (i.e., fewer shocks). (Blanchard & Simon, 2001; Simon, 2001; Stock & Watson, 2002, 2003; Romer, 1999; Barrell & Gottschalk, 2004; McConnell & Perez-Quiros, 2000; Ahmed, Levin, & Wilson, 2002)

1 Some economists refer to the time series generated by short-term shocks as the “growth cycle”.

---

1 Some economists refer to the time series generated by short-term shocks as the “growth cycle”.
Data

This study uses annual data to analyse New Zealand’s output growth and volatility over the last 140 years. It also considers how output volatility has affected output growth rates. The appendix compares the results for the relationship between output growth and volatility with a similar study that covered the years 1874-1994 using Maddison’s data. (Maddison, 1995)

Compared with other OECD countries, New Zealand’s national income data prior to 1950 is quite poor. Annual official and semi-official estimates of New Zealand’s national income have been available only since 1932. The data used in this study was compiled principally by Briggs (2003) and posted on the New Zealand Institute of Economic Research’s website (www.nzier.org.nz). Briggs’s data set covers the period 1860 - 2002. It has been updated using the latest available data from Statistics NZ.

Methodology

Detrending time series has been the subject of intense research by mathematicians and economists for many years. This study uses the Hodrick-Prescott (HP-) filter to estimate trends and cycles for real GDP and real GDP per capita. There has been considerable debate about the use of the HP-filter to detrend time series, none of which is considered here.

Mills (2003) shows that the HP-filter solves the constrained minimisation problem:

\[ \min_{\hat{y}_i} \sum_{t=1}^{N} \left( (y_t - \hat{y}_t)^2 + \lambda (\hat{y}_{t+1} - \hat{y}_t - (\hat{y}_t - \hat{y}_{t-1}))^2 \right). \]

The cycle is given by the deviation from the trend \((y_t - \hat{y}_t)\). Essentially, this is a least squares minimisation problem subject to a constraint from the acceleration of the trend. The usual interpretation of the Lagrange multiplier \(\lambda\) is that it penalises the acceleration of the trend relative to the cycle component. Whereas \(\lambda = 1600\) is used typically for quarterly data, there has been considerable experimentation with the value for annual data.

This paper follows Ravn and Uhlig’s suggestion that \(\lambda = 6.25\) be used to extract the trend and cycle series for annual data. (Ravn and Uhlig, 2002, pp. 374-5)

Spectral analysis is used to investigate the source of New Zealand’s long-run output growth.

GARCH-M models are used to study the relationship between output growth and volatility.
output volatility.

Results

A. Actual and trend growth rates

Most of the analysis in this study starts in 1865 because the years 1861-1863 seem to have abnormally high growth rates. Figure 1 shows the growth rates in actual and trend GDP and GDP per capita. After 1950, real GDP growth was less volatile than before. Between 1865 and 1939, GDP grew at an average annual rate of 3.7%, but for 1945-2004, it grew at an average rate of 2.8% per year. Between 1865 and 1939, actual real GDP per capita grew at average annual rates of about 1.0%, whereas for 1945-2004, the average annual growth rate was about 1.3%.

It is interesting to note that while real GDP growth slowed in the post-World War II period, real GDP per capita grew faster than previously, principally due to a significant fall in the population growth rate. The earliest estimates of New Zealand’s total population start in the 1870s. The annual population growth rate was about 2.1% between 1875 and 1939, falling to 1.5% per year between 1945 and 2004. Provided the employment-to-population ratio is not subject to swift and large changes over time, growth in real GDP per capita is a reasonable approximation to growth in average labour productivity.

---

Figure 1

Most of the analysis in this study starts in 1865 because the years 1861-1863 seem to have abnormally high growth rates. Figure 1 shows the growth rates in actual and trend GDP and GDP per capita. After 1950, real GDP growth was less volatile than before. Between 1865 and 1939, GDP grew at an average annual rate of 3.7%, but for 1945-2004, it grew at an average rate of 2.8% per year. Between 1865 and 1939, actual real GDP per capita grew at average annual rates of about 1.0%, whereas for 1945-2004, the average annual growth rate was about 1.3%.

It is interesting to note that while real GDP growth slowed in the post-World War II period, real GDP per capita grew faster than previously, principally due to a significant fall in the population growth rate. The earliest estimates of New Zealand’s total population start in the 1870s. The annual population growth rate was about 2.1% between 1875 and 1939, falling to 1.5% per year between 1945 and 2004. Provided the employment-to-population ratio is not subject to swift and large changes over time, growth in real GDP per capita is a reasonable approximation to growth in average labour productivity.

---

3 EViews 5.1 has been used to carry out most of the data analysis. SPSS V12.0.1 was used to estimate the spectral densities.
B. The output gap

The output gap is the difference between actual GDP and trend GDP. Casual observation of Figure 2 creates immediately the impression that both real GDP and real GDP per capita have exhibited lower growth volatility over the past five decades. Altman’s (1995) volatility measure, which uses the standard deviation of the percentage output gap, confirms this impression. For the years 1865-1939, the standard deviation for the output gap real GDP was 3.4%, whereas for 1945-2004, it fell to 1.9%. When the effects of World War II and the Korean war are removed, if rather crudely, by considering the years 1952-2004, the standard deviation falls to 1.4%. For real GDP per capita, the output gap had standard deviations of 3.1% for 1865-1939, 1.9% for 1945–2004 and 1.3% for 1952–2004.

C. Spectral analysis of output and growth

Spectral analysis of economic time series has become more common since the initial publication of Granger’s *Spectral analysis of economic time series* (Granger, 1964). The spectrum can be interpreted as a device for decomposing the variance of a time series. If the spectrum is flat, the time series is close to white noise. If the spectrum exhibits peaks, it has cyclical components at the frequencies involved. If the time series has a trend component, it has a strong peak at very low frequencies.

Granger claimed that the latter spectrum was typical of economic time series. In fact, he argued that the existence of this typical spectral shape suggested a law: “The long-term fluctuations in economic variables, if decomposed into frequency components, are such that

---

4 Altman calculated the standard deviation of log(GDP) – log (trend GDP).
5 A simple introduction to spectral analysis can be found in Wonnacott and Wonnacott (1977, pp. 619-625). A more detailed treatment is in Kendall and Ord (1990, Chapters 10-11).
the amplitudes of the components decrease smoothly with decreasing period. Granger warns that economic cycles are not strictly periodic fluctuations but important frequency bands.

It is common, but by no means universal, practice to divide the frequency range into three components: long-run frequencies \((0 \leq \omega \leq 0.785)\), business cycle frequencies \((0.785 \leq \omega \leq 2.09)\), and short-run frequencies \((2.09 \leq \omega \leq \pi)\), where \(\omega\) is the angular frequency.\(^7\) For annual data, these frequencies correspond respectively to cycles that are longer than eight years (the growth band), three to eight years (the business cycle band), and shorter than three years (the irregular band).

The estimated spectral densities for real GDP and annual growth in real GDP are presented in Figure 3.

![Figure 3](image)

Over the years 1865–2004, the spectral density of New Zealand’s real GDP exhibits Granger’s typical shape. The power in the spectrum declines smoothly, with most of it concentrated in the low frequency band. Given that the power spectrum indicates the variance of a time series, this implies that since 1865 most of the variability in New Zealand’s GDP has been due to long-run or growth components. A further implication is that the variability of GDP arises from shocks with strong persistence and that business cycle and short-term components contribute little to output fluctuations over time. Yet another implication is that the long-run growth in New Zealand’s real GDP has arisen from supply rather than aggregate demand shocks.

---

\(^6\) Granger (1966, p. 155)

\(^7\) The period in cycles \(T = 2\pi/\omega\), where \(\omega\) is the frequency. For this study, when \(\omega = 0.785\), \(T \approx 6.283/0.785 = 8\) years. When \(\omega = 2.09\), \(T \approx 6.283/2.09 = 3\) years, etc., i.e., long periods imply low frequencies; short periods, high frequencies.
Evidence provided by the spectral density of annual growth rates for New Zealand real GDP strengthens these conclusions. Figure 3 shows that most of the power (i.e., variance) is located in the low frequency band, although there are peaks in the business cycle and irregular frequency bands. The spectral density in periods 0–25 years (see Figure 4) reveals more clearly the relative power in different frequencies. Some power is located in the business cycle band from 3–8 years, but most is concentrated in the low frequency (or growth components) corresponding to periods of more than 10 years.

Figure 4

D. **Output growth and volatility**

Casual observation of Figures 1 and 2 points to the possible positive correlation between average output growth rates and output volatility, a relationship known as Black’s hypothesis (Black, 1987).

Black’s argument is that when entrepreneurs choose technologies, they face a positive trade-off between risk (measured by volatility of output) and return (measured by output growth rates). Given risk averse entrepreneurs, higher risk implies higher average returns to investment. The potentially higher returns encourage greater investment and thus higher growth rates.

---

8 Unit root testing showed that the output growth rate series was stationary.
On the other hand, many economists have argued the reverse case. Their view is that greater uncertainty of future demand (i.e., increased risk) makes risk averse entrepreneurs more wary of making investment expenditures and encourages higher saving. Since investments in capital goods cannot be reversed when unexpected adverse business conditions emerge, their hypothesis is that higher volatility leads to lower investment and thus to lower growth rates. This hypothesis can be traced to Keynes and is explicit or implicit in post-Keynesian theorising.

These two opposed hypotheses are subject to empirical testing.

Tests of Black’s hypothesis have been undertaken by a number of researchers using GARCH-in-mean (GARCH-M) models. Caporale and McKiernan (1996) discuss Black’s hypothesis and report on the application of a GARCH-M model to industrial production in post-war Great Britain. They found a positive relationship between output volatility and growth rates. Caporale and McKiernan (1998) applied an ARCH-M model to annual US GNP for the years 1871 to 1993 and found that output variability increased significantly output growth rates. Speight (1999) disputes their results. When he applied ARMA-GARCH-M models to UK monthly industrial production data for 1948 to 1994, he found a positive but insignificant effect of output volatility on output growth rates. Macri and Sinha (2000) employed an ARCH-M model to analyse quarterly indices of Australian industrial production (57:Q3-99:Q4) and GDP (59:Q3-99:Q4). Their analysis rejects Black’s hypothesis in favour of the Keynesian position.

Some of the tests of Black’s hypothesis use variants of the following model:

\[ g_y = \alpha_0 + \sum_{i=1}^{n} \alpha_i g_{y,t-i} + \sum_{j=1}^{n} \beta_j \varepsilon_{t-j} + \lambda \sigma_p^p + \varepsilon_i \]

\[ \sigma_t^2 = \sigma^2 + \sum_{k=1}^{q} \gamma_k \varepsilon_{t-k}^2 + \sum_{l=1}^{p} \delta_l \sigma_{t-l}^2 \]

where \( g_y \) is output growth, \( \varepsilon \) the error term, \( \sigma \) the conditional standard deviation and power \( p \) is either 1 or 2. The first equation is the conditional mean equation, the second the conditional variance equation. Volatility of output growth is measured by the conditional standard deviation. If volatility raises output growth, \( \lambda \) is positive, but if volatility reduces output growth rates, \( \lambda \) is negative. If volatility has no effect on average growth rates, \( \lambda \) will be zero.

The autocorrelation and partial autocorrelation coefficients suggested that the growth rate should be lagged one period in the conditional mean equation. The Akaike and Schwarz information criteria and residual tests (Q-stats, Q²-stats, Jarque-Bera normality and ARCH-LM) were used to find the best model to test Black’s hypothesis for the years 1865-2004.
These tests indicated that it was:

\[ g_y = \alpha_0 + \alpha_1 g_{y,t-1} + \beta \varepsilon_{t-1} + \lambda \sigma_{t-1}^2 + \varepsilon_t \]
\[ \sigma_t^2 = \omega + \gamma \varepsilon_{t-1} + \delta \sigma_{t-1}^2 \]

Tables 1 and 2 present the estimation results and test statistics. Initially, dummy variables for World War I, World War II and the Korean War were included in the estimation, but were found to be insignificant and were dropped.

For the years 1865-2004, \( \lambda \) was positive and significant at the 5% level, providing some support for Black’s hypothesis.

E. **A change in investment behaviour?**

When the data set is split into two subsets, pre-World War II and post-World War II, interesting differences in model specification and \( \lambda \)'s sign emerge. The results reported below must be considered with some caution because each subset has a relatively small number of observations. ARCH and GARCH effects are more likely to have greater significance in high frequency data.

For the pre-World War II period (1865-1939), according to the information criteria and residual tests, the conditional mean equation that performs best is:

\[ g_y = \alpha_0 + \alpha_1 g_{y,t-1} + \beta \varepsilon_{t-1} + \lambda \sigma_{t-1}^2 + \varepsilon_t \]

i.e., the growth rate is lagged twice and the conditional standard deviation measures the volatility. A dummy variable for the effect of World War I was found to be significant for the years 1865-1939. Although this dummy is omitted from Table 1, the coefficients and p-values reported for 1865-1939 are those estimated with it included.¹⁰

For the post-World War II period, according to the statistical tests, the conditional mean equation that performed best is:

\[ g_y = \alpha_0 + \alpha_1 g_{y,t-1} + \alpha_2 g_{y,t-2} + \beta \varepsilon_{t-1} + \lambda \sigma_t^2 + \varepsilon_t \]

i.e., the growth rate has two lags and, as with the full sample, the conditional variance captures the volatility.

When the pre- and post-World War II periods are compared, \( \lambda \) changes sign but is still significant at the 5% level. **Negative** \( \lambda \) implies that the Keynesian view of the growth-volatility relationship holds for the post-World War period.

¹⁰ Actually, inclusion of the dummy has no real impact on the conclusions relevant for this study.

All models were estimated in EViews 5.1 using the Marquardt optimisation and Bollerslev-Wooldridge heteroskedasticity consistent covariance options. All values are rounded to 2 or 3 dp.

Figure 5 gives the conditional variance for the years 1865–2004. Output growth volatility is quite persistent, especially in the years prior to 1960. Given that $(\gamma + \delta)$ has a value of 0.98 (see Table 1), this is hardly surprising. The sharp peak in the early 1950s has its source in the rise in growth rates associated with the Korean War wool boom. Its impact on output growth shows some persistence. In later years, volatility in growth rates is associated strongly with external events like the first oil shock in the mid-1970s.

The conditional variance and the GDP growth rate were subjected to Granger causality tests, the results of which are in Table 3. If anything, as more lags are added, the tests tend to support the hypothesis that output growth Granger-causes output variability rather than output variability Granger-causes output growth.

Conclusions

Spectral analysis showed that the main variations in New Zealand’s real GDP and GDP growth rates occur at low frequencies, pointing to supply-side effects rather than demand-side effects as the dominant long-run sources of output growth.

Output gap analysis confirmed the casual observation that output volatility declined after the Second World War and especially after the effects of the Korean War wool boom had subsided. Over the whole period 1865-2004, there was a positive relationship between growth rates and output volatility.

When the data was divided into two sub-sets, it appeared that the relationship altered. Before World War II, there was a positive relationship between growth rates and volatility (supporting Black’s hypothesis), whereas after it, a negative relationship emerged (supporting the Keynesian hypothesis).

Support for the belief that this is more than statistical illusion comes from work done by the New Zealand Treasury. Starting from the observation that in the past two decades, sustained output growth has been associated with lower levels of volatility, Treasury analysts have undertaken considerable work to find out why.

Buckle, Haugh, and Thomson (2001) used quarterly data to study volatility in different sectors of the economy. Their disaggregated analysis demonstrated that declining volatility in New Zealand’s real GDP from the mid-1980s was due to a reduction in volatility in growth in the service and manufacturing sectors.

Although service sector stability was the dominant factor in reducing output volatility, Buckle et al.’s analysis does not support the hypothesis that the decline arose principally from the shift in output composition towards services.

Their belief was that Think Big projects, various regulatory interventions and the introduction of GST (in 1986) provide the key to explaining the higher volatility in the early-1980s. In their view, the ending of these interventions, introduction of deregulation in markets and possible improvements in inventory management were the important reasons for the fall in GDP volatility.

Since the early 1990s, the volatility in output growth has been associated primarily with events over which New Zealand has no influence, the most important examples of which occurred in the late 1990s. The impact of the 1997 Asian Crisis on New Zealand coincided with a serious drought that reduced agricultural output. These simultaneous supply-side and demand-side shocks caused a significant widening of the output gap.

A key element in the reforms alluded to by Buckle et al. were path-breaking changes
made to macroeconomic management in New Zealand. Since the early 1990s, macroeconomic policy in New Zealand has been designed to eliminate surprises arising from Government actions.

Fiscal Policy is now set within a framework provided by the Fiscal Responsibility Act 1994, which has the objective of removing the temptation to use fiscal policy for short-term political gain.

Monetary policy is now set within a framework created by the Reserve Bank Act 1989. This Act was implemented in the early 90s. It gave the RBNZ independence in the implementation of monetary policy within broad guidelines set in agreement with the Minister of Finance.

Independence in implementation of monetary policy was granted to the RBNZ in order to remove the ability of the Government to use monetary policy for short-term electoral gain. A key feature of the regime is the requirement to keep inflation within a defined band. There can be little doubt that this policy regime has been a major influence in reaching and maintaining low inflation rates.\(^\text{12}\)

An hypothesis that arises quite naturally is that the coincidence of high growth and low volatility is the consequence of the more stable domestic macroeconomic climate created by the policy reforms. Buckle et al. reject this interpretation.

They argue that the timing and industry specific nature of the decline in the variance of output in various sectors of the economy suggest that neither fiscal nor monetary policy are likely to provide the predominant explanation for the decline in New Zealand’s GDP volatility. Amongst other reasons, the move to inflation targeting was implemented after the decline in output volatility had begun. Their viewpoint is supported by the time path of the conditional variance presented in Figure 5.

Whatever the cause, it is indisputable that New Zealand output has been less volatile in the last few decades.

Appendix: A comparison of three data sets

Rafferty (2002) estimated the model below for a number of countries, including New Zealand, for the years 1874-1994.

\[
g_y = \alpha_0 + \alpha_1 g_{y,t-1} + \alpha_2 g_{y,t-2} + \alpha_3 g_{y,t-3} + \beta \varepsilon_{t-1} + \lambda \sigma_t + \varepsilon_t
\]
\[
\sigma_t^2 = \omega + \gamma \varepsilon_{t-1} + \delta \sigma_{t-1}^2
\]

Rafferty used Maddison’s 1995 data, the latest version of which is in Maddison (2003). Maddison created his New Zealand data set from essentially the same sources as have been used in this study. The results from re-estimating Rafferty’s model with the data set used in this study and with Maddison’s latest data set are in Table 4, along with his results.

Comparison of the different estimations reveals points of considerable similarity and one noteworthy point of difference.

The coefficients for the lagged growth and error terms have the same sign, somewhat similar magnitudes and are quite significant in the main.
However, for the constant New Zealand dollar data, $\lambda = 0.098$ (p-value = 0.64), much smaller with even less significance than Rafferty’s $\lambda$ of 0.71 (p = 0.18). (Rafferty, 2002, p. 314). Maddison’s latest data set for New Zealand results in $\lambda = 0.60$ (p-value = 0.065).\footnote{Maddison’s data was obtained from the OECD website: www1.oecd.org/publications/e-book/4103063.xls via a link in the e-book for Maddison (2003).}

When GDP data is measured in constant New Zealand dollars, there is a strong rejection of any relationship between growth and volatility. The re-estimation of Rafferty’s model with Maddison’s latest data set gives greater plausibility to Black’s hypothesis than does Rafferty’s original study.

Presumably the differences between the results reflect, in part, Maddison’s conversions from national currencies to international Geary-Khamis dollars. These differences point to the need for caution when cross-country comparisons are made using data sets valued in a common currency.

Abstract
The relationship between output and price has long been of interest to macroeconomics. Studies using detrended data have indicated that, after the Second World War, a change in the relationship occurred for some countries. Whereas prior to the Second World War, the price level was procyclical, output and the price level were negatively correlated after it. Using data from 1860 to 2004 for New Zealand’s real GDP and implicit GDP deflator, this paper investigates whether New Zealand exhibits the same break in correlation between price and output. Correlation and spectral analysis were applied to filtered data. There seems little doubt that prices were procyclical for the period 1865-1939. The relationship between price and output from 1945 onwards is not clear-cut, but it is more likely that at business cycle frequencies and low frequencies, price and output are positively correlated. Inflation and growth are negatively correlated at very low frequencies.

Key words Output, price, growth, inflation, Hodrick-Prescott filter, band pass filters, correlation analysis, spectral analysis
Introduction

Numerous studies have been done into the cyclical behaviour of output and prices. Their purpose has been to gain knowledge about the stylised facts of the business cycle and about the source of shocks that generate business cycles. Cross correlations have been used often to establish the relationship between output and prices.

Traditional macroeconomic teaching models use aggregate demand-aggregate supply to explain the relative movements between output and the price level. In these models, demand shocks cause output and prices to rise and fall together, whereas supply shocks cause output and prices to move in the opposite direction from each other. In the usual interpretation, demand shocks are consistent with positive correlations and supply shocks are consistent with negative correlations.

Recent textbooks have models that link inflation to the output gap. In these models, demand shocks change the output gap, trigger off changes in the inflation rate and cause output adjustments that bring the economy back to potential output. Assuming no change in potential output, as the economy adjusts to a new long-run equilibrium, output and inflation can move in the same or in opposite directions. During the adjustment process, rises and falls in output are consistent with rising or falling inflation rates. There is no clear division between demand-side and supply side shocks that is revealed by the correlations between either output and price or inflation and output growth.

The general belief has been that the price level is procyclical. Studies for a number of countries using detrended data have found that the relationship between price and output changed following World War II. Instead of being procyclical, prices have been countercyclical. For example, the oft-cited study of 10 countries conducted by Backus & Keyhoe (1992) found that inflation rates were more persistent after World War II. They also found that price level fluctuations were typically procyclical before it and countercyclical after it.

This paper uses correlation analysis and spectral analysis to investigate the relationship between annual data for New Zealand price over a period of 140 years.

Data

Compared with other OECD countries, New Zealand’s national income data prior to 1950 is quite poor. Annual official and semi-official estimates of New Zealand’s national

---

1. Examples of textbooks used in New Zealand that use the more modern approach include Frank and Bernanke (2004) and Taylor & Dalziel (2002).
2. This study is similar to that of Pakko (2000) in its approach.
income have been available only since 1932. In this paper, output is measured by real GDP and price by the implicit GDP deflator. The annual data series were compiled principally by Briggs (2003) and posted on the New Zealand Institute of Economic Research’s website (www.nvier.org.nz). Briggs’s data have been updated using the latest available data from Statistics NZ. Although Briggs’s data set covers the period 1860–2002, the analysis in this paper covers the years 1865-2004. The beginning point was set at 1865 in order to eliminate some of the influence of what appears to be excessive growth rates for the years 1861-1863.

Similar studies for other countries have used quarterly data. Unfortunately, for many important economic time series, New Zealand quarterly data of significant length is largely unavailable. At the time this study was done, GDP data was available for the period 1977(Q2) to 2004(Q3). Where it might add some extra evidence, this data has been drawn upon.

Results
A Output and price

![Output and Price](image)

**Figure 1**

New Zealand’s output has the expected upward trend. The GDP deflator trends down from 1865 to the beginning of the 20th Century. It then begins a long trend upward, apart from a pause in the 1920s and a fall during the Great Depression.

Both series were detrended with the Hodrick-Prescott filter (HP-filter) and various

---

EViews 5.1 was used to carry out most of the data analysis. SPSS V12.0.1 was used for the spectral analysis.
band pass filters to produce stationarity. The detrended series were correlated against each other to get some initial information about their relationship. There were high correlation coefficients for real GDP between the HP-filtered series and the business cycle series generated by the Baxter-King (BK), the Christiano-Fitzgerald (full length symmetric - CFFLS) and the Christiano-Fitzgerald (full sample asymmetric - CFFSA) filters.

In the light of this, Table 1 reports only the correlations between the HP filtered series for GDP and the filtered price series. The calculations begin in 1870 and end in 2001 to take into account the missing values consequent upon use of the Baxter-King and Christiano-Fitzgerald full-length symmetric filters.

Table 1 illustrates a well-known problem in correlation analysis: the correlations are sensitive to the methods used to detrend a variable. When sub-samples are compared, cross correlations produced by the CFFSA filter behave oppositely from the other cross correlations: when the full sample asymmetric filter correlation coefficient rises or falls, the others fall or rise. This behaviour was insensitive to the stationarity assumption made.

\(^a\) Standard errors calculated according to the normally-distributed Fisher Z-statistic are in brackets.

\(^4\) All filtering with the HP-filter uses \(\lambda = 6.25\), as suggested by Ravn & Uhlig (2002) for annual data.

\(^5\) The business cycle spans periods from two to eight years. Mills (2003) Chapter 4, pp. 75-104, has considerable information on these filters. In addition, Baxter & King (1999) and Christiano & Fitzgerald (2003) deal with their filters.

\(^6\) Experiments not reported here were done to see whether the stationarity assumption chosen for cycle extraction by the Christiano-Fitzgerald filters was important. In no case did the signal extraction method have more than an insignificant effect on the numerical value of the correlation coefficient.
For the whole sample 1870-2001, the cross correlations provide no unequivocal evidence about the relationship between output and price. There seems little doubt that prices were procyclical in the period 1870-1939. When tested at the 5% level, the cross correlation coefficients were greater than 0, except for the CFFSA filter.

For the years 1945 onwards, the standard errors in Table I show unequivocally that for three of the four filters used, the cross correlation coefficients cannot be shown to be significantly different from zero. Once again, the results for the CFFSA filter contradict those of the other filters. Based on the standard errors, the population cross correlation coefficient could be anywhere in a negative to positive range.

Extra information about the output-price relationship for part of the post-World War II period was sought by using quarterly data for 1977(Q2) to 2004(Q3). The price level was measured by the CPI and output by seasonally-adjusted real GDP. HP-filtered data resulted in a cross correlation coefficient of -0.017 (standard error, 0.101). Clearly, the null hypothesis of no correlation cannot be rejected at the 5% level. It is clear that this test offers no acceptable evidence for judging whether output and price might be negatively correlated.

B Spectral analysis of output and price

The spectrum of a stationary time series decomposes its total variance to disclose the contribution that each frequency makes to that variance. The spectral density plot for a single variable is a graphical representation of the spectrum and, therefore, of the variance.

- When the spectrum is flat, the time series is close to white noise.
- When the spectrum exhibits peaks, the time series has cyclical components at the relevant frequencies.
- When the spectrum has a strong peak at very low frequencies, the time series has a trend component.

The cospectrum measures the contribution of comovements at various frequencies to the total covariance between two time series. The cospectral density plot separates the high frequency components from the low frequency components.

The cospectral density plots for HP-filtered price and output for the sample period...
1870-2001 reveal that the positive covariance captured, however uncertainly, in Table 1 is principally the consequence of comovement in the higher end of the business cycle range. These contributions are more visible when the cospectrum is plotted as a function of period (Figure 3) rather than frequency (Figure 2). Given the high correlation between the HP-filtered series and the business cycle series produced by the Baxter-King and Christiano-Fitzgerald filters, this result is unsurprising. Some negative contributions come from frequencies near the middle and just outside the business cycle range.

That little of the total covariance is contributed by the high frequency components is due to more than the filtering process. Most of the power in the spectrum for the unfiltered series is at lower frequencies (longer periods) rather than at higher frequencies (Figure 4). Both price and output exhibit Granger’s typical shape. Time series with trend components have strong peaks at very low frequencies. Granger claimed that the latter spectrum was typical of economic time series.\footnote{Granger (1966, p. 155)} He warns that economic cycles are not strictly periodic fluctuations but important frequency bands.
The correlation coefficients in Table 1 show a positive relationship between price and output for the sub-sample 1870-1939. Figure 5 presents the cospectrum, plotted against period for ease of interpretation, for this sub-sample.

**Figure 4: Output and price exhibit Granger’s typical shape**

The correlation coefficients in Table 1 show a positive relationship between price and output for the sub-sample 1870-1939. Figure 5 presents the cospectrum, plotted against period for ease of interpretation, for this sub-sample.

**Figure 5**

Most of the covariance between price and output is positive and concentrated in the business cycle frequencies. Some significant positive covariance is generated in periods just above the business cycle band. Negative contributions to the total covariance are generated about the 20-year period.

The double-peaked density either side of a period of about 6 years arises from a
peculiarity common to both price and output: for each variable, the spectral density has a minimum at the same period of about 6 years.

For the sub-sample 1945-2001, the null hypothesis of zero correlation cannot be rejected at the 5% level. When the 95% confidence interval is considered, the possibility of positive, zero or negative correlation between output and price cannot be ruled out.\textsuperscript{11} The sub-sample cospectrum gives some support to the possibility that price and output are procyclical (see Figure 6). Most of the covariance is in the business cycle band and positive. Some negative contributions arise at periods of five years and 14 years. Overall, the covariance appears to be positive.

*Standard errors calculated according to the normally-distributed Fisher Z-statistic are in brackets.

Table 2 presents the cross correlation coefficients and standard errors for annual growth and inflation for various periods. It can be concluded with some confidence that in the pre-World War II period, the correlation coefficients are positive. For the years 1945 onward, there is a hint of a possible change in the relationship between inflation and real growth rates. Using a 95% confidence interval, the correlation coefficient could be anywhere in the range [-0.43, 0.09]. The standard error makes any conclusion very tentative.
Quarterly data for 1977(Q2) to 2004(Q3) for CPI inflation and seasonally-adjusted GDP growth rates resulted in a coefficient of -0.274 (standard error = 0.101). This provides some evidence that in the post-World War II period, inflation and output growth might be negatively correlated. When plotted against period (Figure 8), the cospectral density between inflation and growth for 1945 onwards shows that most of the covariance is contributed by long period (very low frequency) elements and is negative. The negative correlation between output and price at very low frequencies (long periods) holds when the cross correlation coefficients are calculated for the whole sample and various sub-samples.

![Figure 8](Image)

![Figure 9](Image)

For the whole sample, the cospectrum between growth and inflation (Figure 9) shows that long frequencies (long periods) contribute most of the covariance that is negative. It can be speculated that the cross correlations should be positive at business cycle frequencies and low frequencies and negative at very low frequencies.

This conjecture can be tested by extracting series for inflation and growth rates at business cycle frequencies (periods, 2-8 years), low frequencies (periods, 8-20 years) and very low frequencies (periods, 20-40 years). The CFFSA filter band pass filter was used for the extraction and the resulting correlations are presented in Tables 3, 4 and 5.

*The null hypothesis of zero correlation was rejected at the 5% level for these coefficients.*

The only coefficients that are significantly different from zero at the 5% level are for growth and inflation in the same frequency band. Frequencies that correspond to periods of 2 to 20 years are positively correlated and significant at the 5% level, whereas for very low frequency (long period) data, inflation and growth are negatively correlated.

Sub-samples for the extracted series for the years 1865-1939 and 1945-2004 produce much the same results (see Tables 4 and 5).

</tbody>
</table>

*The null hypothesis of zero correlation was rejected at the 5% level only for the very low frequency band covering periods 20-40 years.*
For the sub-sample 1865-1939, inflation and growth rates are positively correlated for periods up to 20 years but negatively correlated at very low frequencies corresponding to periods of 20-40 years. For the sub-sample 1949-2004, the only cross correlation coefficient that is significant at the 5% level is that for long periods; it is also negative. The correlations in Table 5 are consistent with the cospectrum in Figure 9.

**Conclusion**

There seems little doubt that from 1865-1939, output and price and inflation and growth were positively correlated, a result consistent with models that attribute procyclical price behaviour to demand shocks. But for 1945 onwards, the situation is somewhat murky. There is no clear evidence for a change in the price level-output relationship, although both correlation and spectral analysis hint at the possibility of such a change. A small bit of evidence for this possibility was provided by quarterly data for 1977(Q2) to 2004(Q3). If reliable quarterly data were available for the whole of the post-World War II period, a stronger test could be provided.

Abstract

Interviews with 38 women from three different ethnic groups residing in battered women’s shelters on the issue of self-labeling revealed that regardless of the label they chose, three themes emerged: self-blame, abuser-blame, and the use of referents (substitution words) about the abuse they suffered. While feminists and policymakers place responsibility for violence on men and social structures, these women instead internalized responsibility for the abuse. Labeling theory and feminist analysis are used to explore the women’s stories about their abuse. Those who work in human services need to understand women’s perceptions of their victimization, and appropriate actions to take.
Language of the Self in Battered Women: Deviance and Stigmatization

Feminists and domestic violence workers have advocated for those who suffer violence from abusive partners for decades. Feminists, especially, have critiqued social structures and systems that have overtly and covertly demeaned women. Women traditionally are paid less than men are, although women may have comparable experience and education. Women are traditionally viewed as “passive” and “feminine,” attributions that are less powerful and hold less status than attributions held for men, who are usually pronounced as “masculine” and “strong” or “aggressive.” These traditionally masculine qualities are favored in most societies, while women’s traditional qualities are not.

Reflected in society’s favoritism of masculine qualities is the language used to describe people who are victims of violence. Men and boys who suffer violence are especially vilified, and are often taunted by other men who see them as less masculine, and therefore, less valued in society. Women subjected to domestic violence are judged even less valuable to society.

Research has been conducted with women who have been raped to begin to understand their use of words such as survivor and victim, and how those labels in turn affect women’s perceptions and feelings about themselves, as well as how they believe society perceives them (see, for example, Spry, 1995 and Wood & Rennie, 1994). Researchers have discovered that the labels women apply to their experiences reflect women’s self-esteem, and how they are dealing with the effects and the results of the violence against them. This article continues examining the labels women use for the violence they have experienced, and what those labels mean to the women, with the focus on battered women from three different ethnic groups.

This article uses the symbolic interactionist approach of labeling theory, with a feminist analysis, to examine the meanings women give to the abuse they suffered at the hands of their male partners from responses to a qualitative interview. With this theoretical base, advocates for women who have been subjected to domestic violence can better understand and develop more useful micro, meso, or macro approaches to assist them, and perhaps for the men who abuse as well. Azmi (1999) strongly argues for a qualitative approach to studying relationships among
Language of the self

ethnic groups and welfare usage because “current conceptual frameworks are insufficiently grounded in the perceptions of target populations. … It is essential to understand what human beings subjectively perceive” (p. 2). Her argument is significant for studying battered women’s perspectives, as well, whether or not they are using welfare to survive, using a qualitative method of research. Thus, this study explores the perspectives of 38 African American, Mexican American, and non-Hispanic White women who have been in violent relationships, and how they would label themselves in relation to the abuse they have suffered. The findings have clear implications for domestic violence shelters and programs, counselors, those who employ women who have suffered domestic violence, theoreticians, scholars/researchers, policymakers, activists, and professionals in every human service field (police, emergency services, child protective services, etc.).

Literature Review

The Victimization Process

Research on women who have been involved in abusive relationships reveals that they sometimes have strong preferences for specific terms or labels, and of these, victim and survivor have been studied the most. Some domestic violence advocates and feminists (Bograd, 1999; Hamby, 1998) prefer the term “battered” because it has the ability to invoke images of the real damage inflicted by abusive partners. Using labeling theory as a method of naming the unnamed in order to make the private public, feminists have challenged the construction of women’s identities when they have been assaulted or abused by men. While attempting to create an uproar, and thus action to remedy woman abuse, feminists and domestic violence activists have painted a picture of children and women as relatively powerless over men’s domination in a patriarchal society. Through emphasizing the large numbers of women and children who are brutalized by men (Kelly, et al, 1996, p. 82), this victimization role also ignores the strength and coping skills that women use. Criticism from certain feminists suggests that by labeling women as victims in order to obtain more assistance for the outrageous acts committed against them, we
have created “victim feminism,” whereby women are constructed as powerless and passive victims, as well as encouraging them to act like victims (Kelly et al., 1996, p. 83).

In their discussion of the difficulty of naming a sexual assault experience as rape, Wood and Rennie (1994) point out that rape victims are victimized by both the actual rape, and their induction into victim status in society. While the victim label may offer women some reprieve and sympathy for their suffering, the status of victim is also stigmatizing and can cause problems for women because society shows little tolerance for these stigmatized women. Victims of all types in society are considered passive and powerless.

Janoff-Bulman (1979) distinguishes between self-blame as a characterological or as a behavioral attribute. In her provocative analysis, women who were raped and blamed themselves for their behaviors (such as walking alone at night) could be seen as responding positively in that they seemed to believe they have more control, less depression, higher self-esteem, and believed they could avoid being raped in the future. Women who blamed themselves due to characterological attributes (such as feeling like an unworthy person) believed they deserved to be raped. It remains to be seen whether any type of self-blaming is truly positive for women, since women cannot really avoid being raped or abused by men who are intent on doing so. Wood and Rennie (1994) reinforce this view suggesting that, “Supporters of traditional and patriarchal views of rape argue that self-blaming maintains the myth of women’s masochism or indicates a woman’s seductive contribution to her assault” (p. 127).

Symbolic Interactionism and Labeling Theory

Symbolic interaction theory provides a useful model to guide researchers in analyzing communication symbols for meanings and perspectives. Communication is a primary tool that humans use to make sense or meaning of their world (Lauer & Handel, 1983). Humans manipulate symbols with the purpose of achieving a desired response from the receiver in order to control the meaning of the communication. However, even individuals from the same family interpret symbols differently and attribute different meanings to symbols. Thus, the study of
individual definitions of a situation is crucial because each person creates her or his own meaning and idiosyncratic responses to a particular situation.

Labeling theory, developed by Howard Becker (1963), emerged from symbolic interactionism to explore deviance. Lindsey and Beach (2004) say that, “The purpose of labeling is to apply a stigma, a powerfully negative public identity, to an individual who is believed to have violated important social norms” (p. 211). Stigmatizing labels influence how others treat the labeled person. Labels can be acquired in three ways: (1) people may choose to self-label; (2) family and friends may affix labels to people; and (3) formal systems, such as the criminal justice system, apply certain labels to people (Lindsey & Beach, 2004). The more social power a person or system has, the more they can label and stigmatize others. According to labeling theorists, White, wealthy, middle-aged, and heterosexual men are better able to resist stigmatizing labels than the more oppressed segments of society (Schur, 1984; Adams et al., 1998 as cited in Lindsey & Beach, 2004).

Deviance is typically defined by powerful segments of society as behavior that violates social norms (Lindsey & Beach, 2004). However, dominant groups also have the power to “define others as deviant in terms of their very being” (Neubeck & Glassberg, 2005, p. 263). Therefore, women, ethnic groups, gay men or a lesbians, people with a disability, or the poor are often “defined as deviant by dominant groups, even in the absence of any actual behavior that violates norms” (Neubeck & Glassberg, 2005, p. 263). As a pioneer in the sociological study of patriarchal society, Edwin Schur (1984) demonstrated how patriarchy effectively keeps women in oppressive gender roles by labeling (Lindsey & Beach, 2004). From the moment they are labeled as such, women who are victims of domestic violence are considered deviants. Because the dominant reference group is primarily White, heterosexual, wealthy men—who definitely do not consider themselves victims—women, by being labeled victims of violence, are considered deviant for that reason, as well as their gender.

*Women and self-blame*
According to symbolic interactionists, labels can change behavior and become part of our self-concept (Henslin, 2003). In light of this perspective, could it be that women who accept the labels “victim” or “battered woman” feel more helpless and hopeless than do women who resist or reject those terms, and use other labels instead? People may resist labels using various methods and techniques, but, due to their socialization and other influences, some people may have a difficult time resisting deviant labels. For example, battered “women often accept the blame that society places on them” (Barnett, Miller-Perrin & Perrin, 1997, p. 212), while batterers tend “to blame others for their assaults, most especially their female partners, and to downplay the significance and seriousness of their violence” (Barnett et al., 1997, p. 237). Additionally, a dominant discourse in society is to “blame the victim.” With respect to battered women, the victim is considered more deviant than the batterer because society encourages this type of behavior and thinking in boys, who grow up to be adults using the same skewed thinking.

Sykes and Matza (1988) explored male juvenile delinquents’ thinking patterns to discover how they neutralize their deviant behaviors and the labels that can accompany them in order to deflect society’s label of deviance. Sykes and Matza discovered that the delinquents created five techniques that neutralized their criminal behaviors: denial of responsibility, denial of injury, denial of a victim, condemning the condemners, and appealing to higher loyalties. According to Henslin (2003), these five neutralization techniques can be summarized as follows: “(1) “I couldn’t help myself”; (2) “Who really got hurt?”; (3) “Don’t you think she deserved that, after what she did?” (4) “Who are you to talk?” and (5) “I had to help my friends – wouldn’t you have done the same thing?” (p. 221). These five neutralization techniques coincide with a study conducted by Dutton (as cited in Barnet et al., 1997) who analyzed the stories of male batterers and found three patterns: (a) victim provocation (which is the same as “she deserved it”), (b) self-blame with denial and minimization of its effects (which ties in with “I had to do it,” “Who really got hurt?” and “I couldn’t help myself”), and (c) self-blame, but connecting behaviors to some problem like drinking too much (“I couldn’t help myself”).
Similarly, Barnet et al. (1997) suggest that “probably the most common explanation[s] given by batterers runs something like this: “I told her not to do it [e.g., staying late after work, mouthing off]. She knew what would happen. She did it anyway. She got what she asked for” (p. 237). These common explanations have been shared by thousands of women in domestic violence shelters across the nation. Women hear them repeatedly from their abusers and internalize the blame. This blame has become the dominant discourse in society as exemplified by the all-too-common question “Why doesn’t she just leave him?” Additionally, victim blaming not only comes from the abusers and society in general, but also from professionals who have an underlying belief that victims ask for the abuse. A study conducted by Wilson and Wilson (as cited in Barnett et al., 1997, p. 212) revealed that nearly 14% of mental health professionals, corrections staff, shelter staff, court staff, coroners, etc. agreed or strongly agreed “victims ask for it.”

A little explored issue in the domestic violence literature is the use of referents, which are indirect words or word substitutions, such as “it,” in language or stories. Referents are one way that women address labeling and self-blame. Wood and Rennie (1994) label this type of language “avoidance” and suggest that it is “one solution to the problem of naming one’s experience” (p. 133). Furthermore, they propose “the absence of an agent and particularly the implication of accident (‘happens’) suggest that, although unnamed, the experience could not have been rape, [and that] avoidance is often combined with minimization” (p. 133). Their analysis appears just as relevant in discussions about male partners assaulting their female partners physically and emotionally, and is explored in this article. Adams (1990) also suggests that the use of referents, such as “it,” are inanimate and have no power in language. There is a great deal of difference between saying, “he hit me” and saying, “it happened.”

To determine whether women in battered women’s shelters have moved away from self-blame that may have hindered them in the past, this study considers the labels and perceptions that battered women from three different ethnicities use to describe themselves. Additionally, the way patriarchal societal structures are maintained by usage of particular labels is examined.
Method

Purposive sampling was used to recruit women from two different domestic violence shelters in Texas, one in central and one in south Texas. Both shelters are located in major urban areas of the state. Since this study is concerned with the subjective interpretations and perspectives of each woman, rather than generalizability (Cummerton, 1986; Richie, 1996), a purposive rather than a probability sample was used. For purposes of the study, shelter staff asked women, who had been in the shelter for at least seven days, if they identified as one of the three groups that comprise the major ethnic groups in the area (Mexican American, African American, and Anglo) and if they would be willing to be interviewed. The researcher regularly called the shelter staff to see if there were any potential interviewees and, if there were, arranged to conduct the interview at a convenient time for the study participant.

Literature suggests that people of minority ethnic groups are less willing to disclose some events or thoughts with those of the dominant culture (Marin & Marin, 1991). Because of this, the researcher hired and trained women who were either Hispanic or Black and who had experience in social services to conduct interviews with participants from these two ethnic groups. The researcher herself, who is White, conducted the interviews with the White women. The study participants signed a written consent form indicating that they understood the purpose of the study, their role in the study, and agreed to be interviewed and taped. For additional protection, a federal certificate of confidentiality was obtained, and was useful in obtaining clearance from the University Institutional Review Board. This certificate prevented any documents, records, interviews, etc. from being used in legal proceedings.

A qualitative interview with each participant took place in a private room or office in the battered women’s emergency shelters. A semi-structured interview guide was used for the
interviews, which lasted from one to two hours each. Interviews were tape recorded with the interviewees’ permission and later transcribed. For confidentiality purposes, participants chose a pseudonym and that name was the only one used to record the interview responses and label the tapes.

Measures

After the taped interviews were transcribed, themes were explored in the data analysis of the individual interviews. Additionally, a focus group, consisting of six women – two from each ethnic group – was used to enhance validity of the findings.

Limitations

While the women were assured that their interviews would remain confidential, the possibility remained that some women felt uncomfortable sharing certain information for fear of future repercussions. Finally, some of the African American women’s responses regarding self-labeling could be due to interviewer bias. One of the Black interviewers merely asked those she interviewed if they would call themselves battered, rather than asking the question in the more open-ended fashion that the other interviewers used. The author reexamined the Black women’s entire interviews to see if more information could be gleaned about the labels they chose, and will be discussed later.

Participants

Though the emphasis is not on generalizability and the sample size of 38 is relatively small, study participants are very similar in demographics to the shelter population as indicated by shelter statistics and other local and national studies of sheltered battered women (Astin, Lawrence, & Foy, 1993; Bowker & Maurer, 1985; Champion, 1996; Cox & Stoltenberg, 1991; Gondolf, et al., 1988; Hilbert, Kolia, & VanLeeuwen, 1997; Johnson, 1992; Krishnan, et al., 1997; Shir, 1999; Sullivan & Davidson, 1991; Torres, 1991).
All 38 sample members were English speaking. Twelve were Mexican American, 12 were African American, and 14 were White (non-Hispanic) women; ethnicity was based on self-identification. The women had been living in the shelters from seven days to three months and ranged in age from 18 to 58 years, with an average age of 32 (refer to Table 1 for demographics). One woman had no children; the remainder had from one to five. The largest percentage of women, 34 percent (13) had less than a high school educational level. Only 29 percent (11) of the sample was employed with an average annual income of $5,566. Fifteen (39%) of the women were married to the abuser at the time of the interview. The majority 28 (74%) of the interviewees had received some type of public assistance during their lives, though only 14 (37%) were receiving public assistance at the time of interview. Of those 14, only 8 (21%) reported receiving Temporary Assistance to Needy Families (TANF) at the time of the interview.

[Table 1 about here]

Findings

Of the sample of 38 women, only 12 identified with the term “battered” when asked how they would label themselves in regards to the abuse they suffered that resulted in their residency at the battered women’s shelter, and of these 12, eight were African American. The remaining 26 women resisted or rejected the term battered, and instead chose other terms such as “abused,” “victim,” “survivor,” or chose no static label at all to describe themselves in relation to the treatment inflicted by their abusive partners.

The women’s interviews were analyzed to obtain a better understanding of their labeling or non-labeling choices. What emerged from their stories were themes relating to their identity or sense of self. Three common themes included 1) self-blame: learning a lesson, feeling unworthy, becoming a better person through experiencing the abuse, and trying not to think
about the abuse; 2) abuser-blame: the abuse was his fault and the cycle of abuse had been passed on; and 3) referents about the abuse: using terms like “it,” “that,” “that’s,” and “they” when discussing the abuse or the batterer’s behaviors. Each of these themes will be explored in more detail using labeling theory, with a feminist perspective.

**Self-blame**

Because of the continual victim-blaming by dominant and powerful groups in society, and with men continuing to divert their responsibility for their actions onto women and other less powerful people, it is not surprising that the stories of almost all the women in this study contained the predominant theme of self-blame. Women discussed their struggles to make sense of the violence done to them, but still assumed most of the responsibility for the men’s behaviors.

*I’m unhealthy. I was a battered woman, but I’m not a victim anymore. If we stopped labeling ourselves as victims, we would get our power back.*

Carol, Anglo, 37 years old

Carol’s first words to describe herself were “I’m unhealthy,” not, “he’s unhealthy.” She also equates being a victim with the label “battered,” and suggests that women will not be powerful until they stop using the term “victim,” which seems to be an attempt to resist society’s view of domestic violence victims. Carol actually prefers the label “survivor,” as it seemed to her a way to gain some power, or to neutralize the deviant oppressive role in which society has put her.

*I don’t regret any of it [the abuse] – I look at it as a lesson that’s not going to happen to me again. It’s made me a stronger person.*

Faroh, White, 26 years old

Faroh makes a statement that being treated horribly is actually a valuable lesson; this is how women get stronger – by being beaten. In fact, she does not regret that she was physically and psychologically abused. Several women in the study suggest that they learned an important
lesson from being abused, and several women, as Sally said things similar to Faroh’s reinforcing the idea that they are stronger women for having experienced domestic violence:

*I’m a better person for it [the abuse]. I think it’s made me a better person because I know I won’t put up with shit like that.*

Sally, Anglo, 23 years old

Sally’s words imply that women can learn valuable lessons from their abuse, and that it is actually a positive experience, because, as Sally reasons, being abused can teach women not to get involved with abusive men again. Another woman who labeled herself as “abused” reflected on how she thinks about the abuse she suffered:

*I feel like I was dumb and how could I have been so blind and stayed so long and put up with it. I feel like I should have known, even before I got married. I feel like a fool – a sucker.*

SLC, White, 25 years old

Not only did SLC feel stupid for staying so long with the abuser, she also thinks she should have been clairvoyant and known that he would be abusive.

When asked how she thinks about the abuse she experienced, Michelle W. said:

*Ridiculous. There’s no need for it [the abuse]. Why didn’t I leave sooner?*

Michelle W., African American, 19 years old

Michelle W.’s question about leaving her abuser sooner reflects society’s constant question asking why women do not just leave the abusers. Again, Michelle W.’s question reflects the idea that resolving domestic violence is completely up to the woman.

Finally, Pat, who labeled herself a “battered” woman, said that she is:

*mentally messed up and confused. I was stupid for taking it that long.*

Pat, African American, 32 years old

Pat, who had been abused by various people in her life since the age of 12, not only feels mentally deviant, but also feels stupid for not leaving the relationship sooner than she did, a feeling described by several other women in the study.
Abuser-blame

Very few of the women made statements that put the responsibility for the battering squarely on the men they left. This lack of blame for destructive and dangerous behaviors is indicative of the dominant theme in patriarchal society: men have the power to oppress women, children, minorities, and others subject to the whims of men’s behaviors, while the oppressed have little recourse to prevent unwanted psychological, emotional, or physical harm.

Bridgett, who had difficulty labeling herself, but chose “survivor,” said, when asked how she thinks about the violence in her relationship that

*He pulled me down.*

Bridgett, Anglo, 42 years old

When asked how she thinks about the abuse and the attacks, Bridgett said

*I try not to… [because] I get depressed and mad.*

Although Bridgett blames the batterer for the violence, she also tries to avoid addressing the violence she suffered because she gets depressed, which can be viewed as a form of self-blame. Though Bridgett is attempting to place the blame on the shoulders of the man responsible for his actions, her depression may indicate that she is still struggling to achieve an identity as a survivor, rather than a victim.

Polly, who identified herself as a “victim,” seemed to be in process of evaluating her identity as a “victim,” i.e., being blamed for her involvement with an abusive man, shared this with the interviewer:

*When I first got here [the shelter] I thought it was my fault…. I thought I was unworthy. I did something wrong or I didn’t do enough, but now I don’t look at it that way. I think he’s the one who screwed up and there’s something wrong with him.*

Polly, White, 46 years old

Polly shows that she has been thinking about who is really to blame for the abuse in her relationship, and has gone from a stage of self-blame to a stage of assigning blame to the man
who hurt her. Though Polly identifies as a “victim,” she does not respond with what is commonly regarded as victim language. Polly may be re-evaluating her relationship and perhaps society’s labels and roles, resisting the idea that being a victim is equated with the negatives of powerlessness and helplessness. Indeed, she goes on to say:

I see myself back then and I see myself now and I did a lot of stupid things I shouldn’t have done because of him. He made me try drugs; I was so inexperienced, and he took me to places when I was doing drugs that no one has ever seen.

In this passage, it sounds as though Polly blames her abusive partner for misusing his power and his experience. While she says she did stupid things, which sounds like she is still blaming herself sometimes, she is also reconstructing her image of a victim, and coming to the conclusion that people who do have power should not abuse it in the way her partner did.

Michelle J., who identified as a victim, talks about the abuse as a cycle:

The way I think about the abuse is it doesn’t just stop with the person who’s getting abused; I think it goes on and on. That’s the way I feel about it - like with kids, you know, or other people who are around. I think it’s just a cycle, that’s what I think about abuse. Somebody gets abused and they pass it on, you know, maybe not trying to, but it’s going to get passed on some way. Any kind of abuse.

Michelle J., Mexican American, 23 years old

Michelle J. is not blaming herself for the batterers’ behaviors; she is blaming the people who passed it on to her abusive partner, and perhaps indirectly blaming him for his behaviors.

SLC, who was mentioned earlier for her self-blaming content, also directly implicated responsibility for the abuse on her ex-partner:

He did more than hit me; he abused me emotionally and physically in every way he could. The emotional was every day, the physical wasn’t.

SLC is one of the very few of the 38 women who actually states that the batterer hit her. It is also interesting that she implies that the emotional abuse was more difficult to deal with than the physical abuse, because so few women in this study discussed this, although it is a common
theme among domestic violence survivors. Bones can heal, they say, but words will never go away. Thus, SLC may be moving from a stage of self-blame, telling herself and others that she was dumb and a fool, to shifting the responsibility for the abusive behaviors on the perpetrator.

Referents

Few study participants directly named the specific behaviors of their abusers; SLC was one of the very few to do so, as revealed in the passage above. Renee F., who identified herself as a “battered” woman, discusses her thoughts about the abuse:

It hurts, and you wonder why it happened, what did you do wrong. You try to do everything right and the more you try to do right, the worse things got.

Renee F., African American, 41 years old

Renee F. refers to the violence and battering as “it” twice in this passage. When asked how she thinks about the violence in her relationship, Diamond, who also identified as a “battered” woman, said:

It hurts. If I go there, I’d get angry. I’m at the point I usually cry about it, then I get angry about it. I don’t want to get angry about it – I did it so many times, I just want out.

Diamond, African American, 39 years old

Diamond uses the referent ‘it’ several times in this passage, and is referring to a variety of experiences with that pronoun, as well. She also uses the term ‘there’ as a referent to the abuse and her desire to not think about it because it is so painful.

Finally, Carol, who said she is a “survivor,” had this to say about how she makes sense of the abuse:

I think it’s unconscionable that someone would do [it]. First of all, I don’t think anyone has the right to put their hands on me, or to tear down their self-esteem to the point… my head knows why he did it…

Carol, White, 37 years old
Carol uses other referents in this passage such as ‘put their hands on me’ and ‘tear down their self-esteem.’ The first ‘their’ most likely refers to her ex-partner hitting her with his hands, while the second ‘their’ refers to Carol’s own self-esteem.

Discussion

What became clear in the women’s labeling stories is that almost all of them used terms to describe themselves that seemed to indicate that they were to blame for the abusive partner’s behaviors, no matter their ethnicity. Additionally, many of the women had a difficult time even identifying with a label, such as “victim,” “survivor,” “abused,” “battered;” indeed, eight of them could not identify with a label to apply to themselves. Overwhelmingly, this group of 38 diverse women told of their own personal flaws they must overcome instead of focusing on their strengths. Nor did they identify who or what is truly responsible for the violence they suffered: members of the patriarchal society, which continues to devalue women and girls, stigmatizing them as inferior and even deviant. While some of the women chose labels that indicated they were moving from a place of self-blame to a place of other blame (such as “survivor”), the essence of their talk still reflected their own flaws. These interviews occurred during 1999-2000. Although decades of education, legislation, and some advances in society have been made for women, it is sadly obvious that these women are still receiving and internalizing messages that devalue the female, and it is evident regardless of the ethnicity of the woman. Self-doubts only blur the line between compliance and coercion (Sheffield, 1987). Power and control in public and private spheres are still primarily held and issued by men. As Brittan and Maynard (1984) describe: “What in fact has happened is that marginal and peripheral concessions have been made in employment, and in other public spheres, but the reality of male power is still all around us” (p. 94). From these women’s stories, it still seems clear that “every socialization site is the scene for the confirmation of the subservient status of women” (Brittan & Maynard, 1984, p. 86).

Additionally, the Black women in this study were more likely to label themselves as “battered,” although this finding must be viewed with caution due to one of the interviewer’s
questioning style. However, that these eight African American women did not reject the label battered; i.e. they did not tell the interviewer that they would not accept the label battered as did several other study participants. Thus, these eight women did apparently connect with the label “battered.” That these eight women would accept the label battered is provocative. Despite African American or Black women’s roles as head of many families, they are valued even less in our society than White women are. To use the label “battered” would put these Black women in a double minority, or deviant, status and could result in even further victimization. The stigmatization of this group of eight women is likely even more severe than the remainder of the study participants and deserves studying in future research.

Stories like Faroh’s and Sally’s imply that the lessons they learned from the abuse they received are symbolic of the juvenile delinquents’ neutralization of deviance. As described earlier, the victim deserved her treatment, and when she learns to stop ‘misbehaving,’ perhaps the ‘lessons’ will stop, too. This way of thinking about abuse reflects society’s messages that people, and especially women and other minority group members, get what they deserve, and hopefully, they learn their lessons from their ‘trials.’ There is no indication that the abuser should not have behaved the way he did. Additionally, SLC’s comments that she should have known that her husband was abusive before she married him reflects the essence of victim blaming, and that women like SLC have internalized society’s reflections that women should somehow know how to spot abusers, and that it is the women’s responsibility to avoid these men. There is no culpability for the men’s behaviors; it is completely up to women to solve the problem of domestic violence, according to this type of reasoning. Furthermore, women who somehow miss the multiple signs they are supposed to be searching for in every man with whom they develop a relationship, are complete idiots, or fools, as in SLC’s case. Some women expressed feeling depressed because of their abuse. Counseling professionals often describe depression as anger and sadness turned inward. Instead of being able to effectively change a situation, and thus have some power and control, people may become despondent and turn their
frustration inward. We also heard from Bridgett that she feels angry about the abuse, which most
would say is a healthy reaction to being battered.

Finally, women’s language reconstructs society’s shorthand methods of minimizing
abusive behaviors, responsibility, and culpability. Use of the referents such as “it,” “there,”
“that,” and “the situation” are ways people use to deflect the horrendous acts of violence
perpetrated on powerless people in society. Referents are also less powerful than using the
actual words. Contrast the sentence “Beating me made me a better person” with “It makes me a
better person.” The first sentence is much more powerful than the second. Adams (1990) calls
the use of referents as “masked violence and muted voices” (p. 63). Are women such as Renee F.
avoiding labeling the abuse or omitting the label because violence is so horrible that it can be
painful to name and admit? Perhaps this is a method of minimizing the atrocities that have been
inflicted upon her, as well as her children, who have also been abused in some cases. Wood and
Rennie (1994) suggested that the use of the word ‘happened’ could mean that Renee F believes
her abuse could not have been as bad as all that; after all, she is still alive. Diamond and Carol
provided several examples of the use of these referents, which reflected the language of most of
the study participants. Diamond revealed that she did not want to get angry about the violence
anymore because then she would cry. Perhaps these women do not want to cry about their
experiences because that is considered a sign of weakness, “victim-ness,” and definitely not
associated with powerful others. Many women who have been in abusive or violent
relationships also relate that their abusers tell them things like ‘stop crying, or I’ll really give you
something to cry about;’ language associated with controlling and domineering fathers. The
referents used by study participants minimize the oppression by abusive men, which in turn is
reflected in society’s oppression of women in general.

Feminists differ on the most useful methods of addressing the continued devaluation of
women: should legal reforms continue, should education in the schools be enforced/enhanced,
should feminists collaborate more with non-feminists in the hopes of educating them, etc? What
is required for a society to truly change the dominant ideology that women-and especially
minority women-are inferior to men? Have we really made major leaps in this arena, or does it just appear that way because women have been granted pieces of legislation that addressed domestic violence and other gender oppressive acts, and women have been allowed into traditionally male arenas. Or is it true, as Audre Lorde (1984) pointed out, “we cannot dismantle the master’s house using his tools” (p. 110)? Nonetheless, continued inroads can be made in the political arena through well-designed feminist policies that address inequality of the genders on a national basis.

There is some evidence that the macro approach helps reinforce the micro approach, as promoted by symbolic interactionists. Symbolic interactionists suggest that the work that continually needs to be done occurs between individuals to effect societal changes. An often-proposed intervention, therefore, is individual or group counseling for both abusers and their female partners, with the hopes that both of them will make significant changes such that the abuse stops with them. Safety issues are a major concern, however, and may impede a woman’s progress in therapeutic treatment (Petretic-Jackson, et al., 2002) because their partners may become abusive after a therapeutic session. This is why most in the domestic violence field advocate separate programs for men and women. A meso intervention is continued education about personal responsibility, ethics, and morals in the school system, although this approach is certainly problematic: who decides what is ‘taught,’ how much and how often does this type of education need to be ‘taught’ to make effective and long-lasting changes in both boys and girls, men and women? Such educational programs are sometimes termed “social skills instruction,” but their efficacy thus far is questionable (Leffert & Siperstein, 2003). Another intervention could be positive and strong female and/or male role models for both girls and boys, as found in some mentor programs such as Big Brothers/Big Sisters (Bynum & Thompson, 2005). Additionally, organizations such as the Oakland Men’s Project are composed primarily of men to educate batterers, as well as teenagers in schools, and help them explore their own masculinities and societal pressures to conform to “macho-type” behaviors (Allen & Kivel, 2004). Another approach involves a concerted effort in both public and private spheres to disallow male
neutralization techniques: mothers and fathers, as well as societal institutions, must hold boys and men responsible for their actions. Adults need to point out, and critique, the male response to justifications of their delinquent and criminal acts.

Stigmatization and blaming are still prevalent in our society. Until patriarchal structures reverse the position that women are inferior, and that “victims” are even less valuable, women will be unable to break free of self-blame and devaluation. Domestic violence will not end until all groups and types of women are valued by the larger society.

ABSTRACT

Teaching and testing for critical thinking can be a challenge for new and experienced social work educators because critical thinking has no operational definition. Educational objectives commonly include the word “understanding,” but this word is vague and impractical for classroom use. Bloom's Taxonomy of Educational Objectives (Bloom, 1956) is a tool from the wider context of education that can help new and experienced social work educators to think more precisely about what it means to teach and test for critical thinking.

This workshop addresses using Bloom's Taxonomy of Educational Objectives to define and achieve critical thinking. The six taxonomy levels are presented along with sample test items. Since achieving critical thinking is neither easy nor automatic, the cautions social work educators should consider when teaching and testing for higher knowledge levels are addressed. For example, critical thinking does not automatically “happen” after simply learning factual information, instruction must intentionally support critical thinking.

Understanding the taxonomy does not automatically mean social work educators can write test items that measure different knowledge levels. Novice instructors will find it especially difficult to teach and test for critical thinking if they receive the common advice to “stay one chapter ahead of the students.” Guidelines for writing effective exam questions, a topology of student learning errors and ways to correct those learning errors also will be examined.
PROBLEM

The importance of accountability and measuring student outcomes is a current theme in social work education and higher education. Focusing on clear student outcomes should encourage social work educators to think more precisely about what we teach and test in the social work classroom. However, social work educators who wish to go beyond teaching and testing for memorization or “rote” learning will find that “critical thinking” has no clear operational definition and is too broad a term for practical use in the social work classroom (Bloom, 1956; Wiggins & McTighe, 1998). Critical thinking is a theoretical construct and social work educators must measure behaviors that point to it (Bloom, 1956). This may be why educators can experience difficulty writing exam questions that do more than test for simple memorization or comprehension. As social work educators, we do not lay claim to the term critical thinking. Rather, we belong to a larger community of professional educators who are also aware of the importance of going beyond having students memorize material, to having students “understand” material related to higher or deeper levels (Bloom, 1956; Wiggins & McTighe, 1998). However, what is “understanding” and how do we recognize it in the social work classroom?

There are many tools from the wider context of education that offer social work educators, especially new ones, a context from which to “think” about critical thinking. One such tool is the Taxonomy of Educational Objectives (Bloom, 1956). The taxonomy of educational objectives can help social work educators to more precisely define the outcomes expected from our
undergraduate students on exams and to create educational materials consistent with our learning expectations and conceptions of critical thinking. The six knowledge levels of the taxonomy of educational objectives are presented along with sample test items. Cautions that social work educators must consider when teaching and testing for critical thinking also are described.

**INTRODUCTION**

The Taxonomy of Educational Objectives (1956) is often simply called Bloom’s taxonomy. The taxonomy was intended to offer all educators a way to classify and talk about educational objectives (Bloom, 1956). The taxonomy was written to add clarity and precision to the potentially challenging task of writing educational objectives. Educational objectives referring to students “knowing about” or “understanding” a topic are common in education, but are too broad to guide teaching and testing. For example, how will social work educators know when students “understand” a topic and what kinds of test questions verify that students “understand” a topic?

Bloom’s taxonomy does not explicitly define critical thinking. Rather, it includes six knowledge levels that constitute the construct of critical thinking. The six knowledge levels can help social work educators to clarify what critical thinking and “understanding” mean. For example, we could define critical thinking as translating technical jargon into common English (comprehension), applying problem-solving skills to new situations (application), making inferences about the impact of social policy (analysis), producing intervention plans based on client problems (synthesis), or evaluating the appropriateness of intervention
methods (evaluation). This precision can make it simpler to align what we teach with what we test.

The taxonomy applies to all materials in the social work curriculum, including the knowledge courses (e.g., introductory courses), skill courses (e.g., practice methods) and field instruction. The taxonomy also can be utilized with either the supply or choice test item format. The supply format requires students to recall information from memory and supply correct answers because the answers are not present for students to view. The completion, short answer, and essay testing formats, and written projects are examples of the supply format. The choice format requires students to recognize correct answers from among incorrect choices, i.e., the multiple choice, true/false, and matching formats where students view correct answers among incorrect answers. The multiple-choice format is utilized here because it can test all but the synthesis level of the taxonomy while avoiding scoring and inter-rater reliability problems. Readers should bear in mind that the multiple choice format can easily be converted into the true/false, short answer, or essay format depending on social work instructor preferences.

**BLOOM’S TAXONOMY**

Figure one shows the six knowledge levels of the taxonomy arranged from the lowest knowledge level (knowledge) to the highest (evaluation), along with verbs associated with common student tasks at the knowledge levels (Bloom, 1971; Green, 1970, 1975). The knowledge levels are discrete and mastery of one level does not insure that students can automatically perform to higher levels. For
example, simply knowing the elements of an intervention plan (knowledge) does not guarantee that students can produce one (synthesis) or critique one (evaluation). Teaching and testing are therefore linked, and teaching must support whether testing, for example, requires recognition of the name "Mary Richmond" (knowledge) or requires a critique of her contribution to social work (evaluation).

Note: Adapted from: Bloom, 1971; Green, 1970, 1975.

**Knowledge**

Knowledge is the lowest or simplest taxonomy level. Knowledge can be considered the facts or information students must learn. Knowledge is probably the most common level tested in higher education because instructors can simply use a textbook to determine what “knowledge” students must learn and create exams targeted to a textbooks’ contents (Bloom, 1956). If a social work educator wants more detail at the knowledge level, the taxonomy further classifies knowledge into the following categories: (a) knowledge (of) (specifics, terminology, specific facts), (b) knowledge of ways and means of dealing with specifics (conventions, trends and sequences, classifications or categories,
criteria, methodology), and (c) knowledge of universals and abstractions of a field (principles and generalizations, theories and structures).

Figure one includes verbs associated with tasks students are often expected to perform at the different knowledge levels. The verbs can help social work educators to align their educational objectives with their classroom activities and ultimately their test items where students must demonstrate that they learned the material to the desired knowledge level.

Creating items that tap knowledge can be as simple as taking the key point or word out of a sentence and making it a choice among multiple choices or by simply having students decide if a sentence is true or false. A sentence also could easily be turned into a completion item by omitting a key word or phrase that students must supply.

**Figure 2. Knowledge Level Test Items**

1) What is the Social Work professional organization called?
   - NASW **
   - CSW
   - CSWE
   - DSW
   - AMA

2) How much is the current food budget from the poverty line?
   - $1.00
   - $3.00
   - $1.98
   - $1.19 **
   - $.89

3) Respectively, which choice shows the strongest positive, and strongest inverse correlations?
   - -1.0, -.20
   - +.96, -.89 **
   - -.99, +1.0
   - +.96, -.79
   - +.96, +.05

In item one of figure two, students must recognize the acronym for the social work professional organization from among other choices. Alternatively,
instructors could include a clearly incorrect choice (e.g., REM) or humorous choice (e.g., WWF) to lessen test anxiety. However, eliminating potential choices makes the item less difficult. Item two requires students to recognize a number integral to the measurement of poverty (Schiller, 1998), and item three does the same but with correlation coefficients (Williams, Unrau & Grinnell, 1998).

A criticism of testing and teaching only at the knowledge level is that students can simply put information into an easier to recall form and “memorize without understanding” (Gentile, 1990). For example, as children turn the letters EGBDF into a sentence to recall musical notes, my students use MRCOS and JAHH to recall aspects of social work history (MRCOS = Mary Richmond Charity Organization Society; JAHH = Jane Addams Hull House). Since the knowledge levels are discrete, memorizing MRCOS will not enable students to discuss Mary Richmond’s impact on social work.

Making knowledge questions challenging without making them “tricky,” as students say, can be difficult (How do we make a “fact” harder?). One strategy is to “hide” essential material within material not intended for testing. The learning task becomes increasingly difficult because students must learn a greater volume of material or correctly guess what material will be tested (e.g., Will our professor test us on the textbook, the lectures, or both?). Students who memorize a greater volume of material than other students may not necessarily have greater understanding. Another strategy to make knowledge items more challenging is to have students make finer discriminations between response choices. For example, the choices in the NASW item in figure one could read: NAWS, NSWA,
NASW, NWAS, NWSA. Students reading quickly could select an incorrect choice because they all contain the correct letters but in the wrong order. Similarly, answering the item correctly does not mean students understand the purpose of NASW.

**Comprehension**

Comprehension involves having students demonstrate they, for lack of a better word, understand material by doing more than simply memorizing and repeating it. Aspects of comprehension involve translation, interpretation, and extrapolation. Translation involves translation of learned material into a different, but correct, form. I often have students translate social work terminology into “plain English” clients would understand to demonstrate comprehension. I must make judgments about the correctness of the translations and supply alternate examples if the student examples are poor. Interpretation involves summarization of learned material or examining material from different views. In my research course students must interpret tables of results by first translating the results into “plain English” and by summarizing and explaining what the results mean. I also have students interpret the results from different views, i.e., the client and social work agency. Extrapolation involves identifying trends and consequences. I often have students describe intended and unintended consequences of social policies or legislation to verify that they can identify consequences.
Figure 3. Comprehension Level Test items

1) Which of these poverty theories is politically the most progressive?

Genetic Inferiority Theory  Functionalist Explanation  Orthodox Economic Theory
Subclass Theory **  Culture of Poverty

2) “Statistical significance” means what?

Decreased odds that results are due to “chance” **
The measures used have external validity
The study has internal validity
Increased odds that correct statistics were employed
The study was conducted in a reliable manner

3) What should the plan of action include to help clients see they are making progress?

Short and long term goals **  Partializing and prioritizing
Listening and empathy  Assessment and information gathering
Objectivity and feedback

In figure three, item one shows that students must recall conservative, liberal, progressive ideologies (Macht & Quam, 1986), recognize the listed poverty theories (Schiller, 1998; Waxman, 1983) and match the theories with their political orientation. In item two students must recognize an interpretation of “statistical significance” that utilizes non-technical language. Students cannot answer this item correctly by simply recalling the association between “statistical significance” and the symbol p<.05. Item three requires students to recognize which element of an intervention plan has the described purpose.

A comprehension question can accidentally be reduced to a knowledge question if the task expected on testing is completed in class. For example, students could simply recall how the poverty theories were sorted in class without comprehending why. To avoid this, a social work educator could sort some, but
not all, of the theories in class, or simply tell students they must sort the poverty theories by political ideology on the exam.

**Application**

Application involves carry-over or transfer of learning to new situations or situations new to the students. Application is an important knowledge level for social work since students must eventually apply what they learn to the problems clients will present. Similarly, I expect my research students to apply their learning to research studies they will encounter in the social work literature. Students practice application if we present them with new situations where they must apply their learning. For example, I often have students create new examples of essential concepts from their home lives and work lives, and eventually from social work contexts different from my examples. I must judge if their examples are valid and either correct them or supply other examples.

Creating different scenarios for teaching and testing involves advance preparation and can be time consuming. However, using the same example or scenario for teaching and testing means students may memorize the example without understanding it. For example, if I demonstrate “setting priorities” using an example of domestic violence and utilize the same example on testing, students may simply associate “setting priorities” with domestic violence to answer test items (e.g., When you see a question about domestic violence, choose the answer with setting priorities.).
Figure 4. Application Level Test Items

1) Donald Duck doesn't think Goofy will be a good Disneyland tour guide and chooses Mickey instead. What is this called?

In figure four, item one requires students to recall the definition of a causation (or feedback) loop and apply it to a scenario very different (e.g., cartoon characters) from the one utilized in class. Item two involves recalling specific communication errors and applying them to a novel set of communications (Eriksen, 1979). The question could easily be rewritten to have a definition in the question and novel examples as the response choices. Item three requires students to apply research concepts to a novel and humorous research study (Ellenbogen, 1993). Alternatively, the short answer or essay format could easily require students to write their answers (e.g., Describe how the Social Security Act would have been different if President Reagan wrote it.).
Analysis

Analysis requires examination of parts or elements of what was learned, analyzing the relationship between wholes and parts (e.g., conclusions and evidence) or organizing knowledge based on some principle. It also can involve making inferences based on data. I often draw conclusions from research studies and have students determine if the conclusions are supported by the results. I also have students make inferences on what the writers of social policy may have thought based on their proposals (e.g., What could President Hoover have been thinking when he wrote this legislation?). Students can also organize what they have learned based on some criteria or principle. I have students organize social programs by whether they are residual or institutional (Wilensky & Lebeaux, 1958) and have students locate and organize research studies based on purpose (exploratory or descriptive) or whether quantitative or qualitative data collection methods were employed (Williams, Unrau & Grinnell, 1998). Social work educators may use any desired organizing principle to analyze any course material. I often do this when students wish to discuss current or newsworthy events to add focus to the discussions (e.g., examining school shootings from different perspectives).
Figure 5. Analysis Level Test Items

1) Turn to the study on page 132 in your text. “All the perpetrators of sexual abuse in this study were first time offenders”. Does the data in table C support this claim?

   Yes, the data supports the claim  
   No, the data does not support the claim **
   The data partially supports the claim

2) Based on what President Roosevelt did in the New Deal, he probably thought:

   Social programs were giving too much money in aid to the poor  
   There was a general lack of work ethic being caused by social welfare programs  
   Helping the poor would make the economy worse than it already was at the time  
   Poverty was linked to the economy so government should help the poor **  
   Poverty was solved by a strong individual work ethic

3) Examined from an ideological perspective, which one does not belong with the others regarding the view of the poor?

   Elizabethan Poor Law – 1601  
   Grant in Aid Programs  
   War on Poverty  
   Puritan Work Ethic **  
   Speenhamland Act

In figure five, Item one requires students to determine if a valid conclusion has been drawn from a table of statistical results. Item two has students infer what an American president thought based on legislation he proposed. These items can be created utilizing the myriad of historical figures and events related to social work. In item three, students must utilize political ideologies to reorganize historical events related to poverty to determine which choice does not belong with the others. As with the other knowledge levels, the items are reduced to the knowledge level if this exact material is taught in class because students can simply memorize the answers.
Synthesis

Synthesis may be thought of as creativity because it involves the production of things that are new or unique. Synthesis is an ideal knowledge level for social work since much of our work involves the production of professional documents, intervention plans, communications, and the display of skills in unique combinations in response to client situations.

Writing objective format test questions for synthesis can be difficult. The creative demonstration of learning and skills lends itself more to the essay format. Another way to assess if students can perform a skill or complete a task is with performance assessment where students actually perform a skill or complete a task (e.g., conduct a research study or client interview). This method assumes that the best test of whether a student can perform a skill or task is to have students actually perform it (Wiggins & McTighe, 1998). Student portfolios are ideal for synthesis as students would collect or perform new work that demonstrates their social work skills.
1) Multi-part Essay Question

- Create a new way or improve how we currently deal with poverty in America. Your suggestions must include a RATIONALE.
- If your suggestions have been tried before in history (and they probably have in some form) how will you overcome the problems they encountered?
- What are the problems with your suggestions and what could you do to overcome these problems?
- Suggest an alternative policy that would be more progressive than what you just proposed and identify reasons why someone would support it.

2) Written Project

- Produce an audiotape and process recording of a client interview you conduct with a classmate who portrays a client from your field placement.
- Write a psychosocial assessment of the client you interviewed. Supplement material you did not have time for in the interview.
- Create an intervention plan based on the psychosocial assessment you did from your client interview.

Item one in figure six requires students to suggest a new or improved way to handle American poverty. Students also identify weaknesses in their suggestions and view their work from a specific ideological position. Item two requires students to perform a client interview, a process recording and a psychosocial assessment to demonstrate communication and writing skills. Any project or written assignment involves synthesis if it requires students to demonstrate social work skills. Similarly, instead of writing multiple choice items for the synthesis level, my research students actually write research proposals and projects. Said differently, if you want to determine if a student can perform a skill, test them by making them perform the skill.
Evaluation

Evaluation requires students to make judgments based on external criteria or internal evidence. Social work educators must give the students the external criteria and demonstrate how to utilize it to render judgments so students can practice this skill. Evaluative criteria exists for judging the soundness of research projects and hypothesis, judging the correctness of communication and responding skills, judging the correctness of ethical decisions, etc. I often have students evaluate ethical dilemmas with an ethical ladder of priorities (Loewenberg & Dolgoff, 1988). The ladder has seven rungs and I often have students utilize it to examine and create ethical dilemmas (e.g., Does right to privacy supercede protection of life? Is it wrong if a state trooper tells a family that a victim died instantly instead of sharing gory details?). The social work code of ethics also lends itself to the evaluation knowledge level.

Evaluation with internal evidence involves students using personal perspectives or value systems to evaluate situations. Students often demonstrate evaluation with written projects or class discussion since judgements from internal evidence are neither “right nor wrong.” Students can utilize both internal evidence and external criteria if we have them create ethical dilemmas involving their values and the social work code of ethics or the values of social work and a social agency, etc.

Figure 7. **Evaluation Level Test Items**

1) Which of the following is the best operational definition?

- Caring and loving behavior
- Homosexual behavior
- Violent behavior
- Hitting behavior
- Slapping behavior **

2) Turn to the study on page 184 in your textbook. The main **SAMPLING** problem in this study was that the sample:

- Self selected **
- Did not match the population
- Was too large
- Was too small and too homogeneous
- Was too diverse

3) What criteria did the agency most probably use to reject this research study?

“A social work agency rejects a proposed study because clients in crisis are assigned to a control group and will receive no service.

- Researchable
- Researcher interest area
- Relevant
- Ethical **
- Feasible

In figure seven, Item one requires students to judge which choice meets the criteria for the best (most behaviorally specific) operational definition. As with all the levels, students must recall all relevant definitions and evaluative criteria to answer the question. Item two has students critique and evaluate the weakness with the sampling method employed in a research study. In item three students must evaluate a research proposal with the criteria for conducting ethical studies (Williams, Unrau & Grinnell, 1998).

**CAUTIONS**

In the social work curriculum, Bloom’s taxonomy lends itself to knowledge level introductory courses, skill level practice methods courses, and obviously, to fieldwork where undergraduate students employ both social work knowledge and
skills. Social work educators can begin with a basic understanding of Bloom’s taxonomy and with experience utilize a broader array of classroom activities and test items. However, there are several issues to consider when teaching and testing to higher knowledge levels in the social work classroom.

**Teaching**

Curriculum alignment is a major consideration in the preparation of course materials because mastery of one knowledge level does not insure mastery of higher levels. For example, we cannot expect social work students to produce intervention plans (synthesis) after simply memorizing their elements (knowledge). Matching course content and testing to expected knowledge levels takes time and intention, but it has allowed me to increase my classroom “time efficiency” by more closely matching instructional time spent to what is expected on testing. In other words, I will spend less instructional time on “Mary Richmond” if students must only recognize her name and spend more time if students must critique her contribution to social work. Therefore, social work educators must decide in advance what material will be taught to higher and lower knowledge levels to plan teaching and testing accordingly.

Although the knowledge levels for teaching and testing should match, the examples used for teaching and testing should not match or students can simply memorize the examples. Therefore, we must develop a storehouse of examples intended for teaching or testing but not both. Having students produce unique examples of important concepts during brief classroom exercises is a creative way to accomplish this task. Valid examples students produce can be saved and
utilized for teaching or testing in future semesters. However, soliciting student examples opens us to receiving non-instructive examples. I brace myself when a student begins with “my ex-partner did this,” or “I saw this on a TV talk show.”

How do students react to learning to higher knowledge levels? Many students are unfamiliar with the terms “critical thinking” and “higher levels of knowledge.” In their defense, I also was before using the taxonomy. Instead of telling students to “study harder,” I now demonstrate my learning and performance expectations with short ungraded quizzes and classroom exercises similar to the knowledge levels expected on testing. Short ungraded quizzes reveal if students understand material to the expected knowledge levels. For example, often students believe they understand material better than they actually do and have few clarification questions before a quiz but have many questions after one. Short classroom exercises also reveal if students understand material to expected knowledge levels. As one example, I have students spend five minutes trying to operationalize “love” after learning about operationalizing variables. Students who cannot begin this task may be unable to do similar tasks in projects and exams.

Some students are skeptical when I demonstrate my learning expectations and seem content to simply memorize material (until the first quiz at least). Other students memorize concepts and the examples used to teach a concept, but also find they cannot apply their learning to new examples. Students must be told that studying by reading notes repeatedly will be insufficient for testing at the higher knowledge levels. In class I try to discourage these study methods by presenting,
for example, a range of different tables of results, requiring students to produce additional tables, and by clearly stating that testing will include new tables of similar difficulty.

**Testing**

A simple way to begin incorporating Bloom’s taxonomy into testing is to classify existing test items as either lower level knowledge (knowledge, comprehension) or upper level knowledge items (application, analysis, synthesis, evaluation). Classifying exam questions into two categories is initially easier than utilizing all six taxonomy levels and it will reveal what percent of an exam (or course) targets upper and lower knowledge levels. The sorting itself can be very instructive for new social work educators who utilize exams inherited from other faculty or exams taken from instructor manuals.

Gaining experience with the taxonomy can result in dissatisfaction with exams written by others that may not address the content we consider essential or address that content to the desired knowledge level (let alone both). I began writing my own exams and eventually writing instructor manuals for this reason (Aviles, 1999, 1998, 1997). I pilot test new (or revised) items by including them at the end of an exam. These items can be graded if they work correctly or ungraded and revised if they do not. Allowing students to ask questions about these items can reveal problems with an item, but it opens up the possibility of arguments about validity, reliability, or arguments for extra points. Establishing ground rules for this activity is essential or social work educators may quickly find themselves in what can feel like a “shootout.” Pilot testing new or revised items
on ungraded quizzes is often painless because students freely describe problems encountered with items, but won’t waste effort arguing for points on an ungraded quiz. Revised quiz items eventually appear on exams and additional quiz items are created.

As I gained skill with the taxonomy, I found myself wanting to test only upper knowledge levels and not ‘waste’ time testing simple memorization. However, this strategy made it difficult to determine why students answered items incorrectly. For example, if students forget the data needed to answer a knowledge question, that data will be unavailable to correctly answer items at higher knowledge levels. Therefore, incorrectly answered items at the evaluation knowledge level could mean a student needs additional practice with evaluation, or it could mean the student simply forgot the material required for an evaluation task. In the first case, the student may need more practice at the evaluation level. In the second case, the student may need to restudy the material, to get material from any missed classes, or (in rare instances) to purchase the textbook. I incorporate lower and upper knowledge level items in tandem on exams to determine if students incorrectly answered upper or lower knowledge level items (or both). Students answering lower knowledge level items incorrectly almost always cannot answer upper level items (e.g., If you don’t know what the ANOVA is, forget about interpreting this table of results.).

Testing problems may involve a student’s test-taking skills instead of problems with the taxonomy knowledge levels. For example, students may be accustomed to selecting the first choice recognized, often without fully reading
the question or all the choices. These students may need to slowly read the entire question and all the choices. Alternatively, students may need to spend less time reading items if they over-interpret test items or change their answers. On testing, social work educators may still find that students memorized or turned higher level material into easier to recall forms. One semester my research students seemed able to create examples of independent variables and correctly answered related quiz items. However, almost the entire class selected the same incorrect choice on a similar exam item! The students had reduced their knowledge of independent variables to an acronym (i.e., IVGF: Independent Variable Go First) and misidentified the first item in the title of a research study as the independent variable, although the title began with the sample! For correction I had students rearrange titles of research studies to demonstrate that while independent variables do occur prior to measurement of the dependent variable, they do not always “go first” in the title. Although such instances can make a social work educator long for retirement, correcting these problems can improve the quality of teaching and improve student performance on learning outcomes.

**CONCLUSIONS**

One conclusion social work educators, especially new ones, may reach from this article is that achieving critical thinking can be a challenging process involving intention and advance preparation. To be honest, it does. Achieving critical thinking in the social work classroom is not a matter of increasing the sheer volume of material taught and telling students to study harder. Nor does
this process lend itself to writing exams the night before needed while trying to recall what was taught. The process takes time and intention but the effort is well worth it. The taxonomy has helped me clarify my intentions in teaching and testing and in creating course materials that match my expectations of student learning outcomes. The taxonomy also has allowed me to make my tests more challenging by teaching and testing to higher knowledge levels instead of by burying essential information within other information not intended for testing, or by making finer discriminations between response choices. Students often say that the course material is “tough but fair” (high praise from students). I hope all social work educators will try utilizing Bloom’s taxonomy. The taxonomy can help social work educators gain greater clarity and precision about teaching, testing, and student outcomes as we all try to ascend into the rarified air of “critical thinking.”

ABSTRACT

Workshops on teaching methods often focus on "what I do in my classroom" instead of presenting "how can it be done in your classroom." This workshop presents how to implement the essential elements of mastery learning in simple, complex and creative ways in the social work classroom.

Mastery learning is an outcome based teaching method that has had positive results on student achievement in higher education and social work education (Aviles, 1996; Guskey & Pigott, 1988; Kulik, Kulik, & Bangert-Drowns, 1990). Social work educators may implement some or all of the following mastery learning instructional elements:

- Choosing instructional content & writing instructional objectives
- Vertical and horizontal curriculum alignment
- Communicating learning objectives to students
- Formative evaluations (ungraded quizzes), summative evaluations (graded exams)
- Feedback, correctives & retesting cycles

Participants will learn different ways to structure the mastery elements to give instructors maximum flexibility in adapting mastery learning to their classrooms. Take quizzes for one example. Quizzes can be objective format or essay, or instructors could simply ask what students learned in the last class. Quizzes may occur weekly or not at all, closely align with instructional outcomes or only test a sample of material taught, be graded, retaken if failed, and count toward final grades (or not). Quizzes can be taken in class, outside class and be administered by instructors, teaching assistants or by computer.

Since the classroom structure of all the instructional elements of mastery learning can be structured in ways ranging from simple to complex, instructor time required for different implementations also will be presented.
Creatively Adapting Mastery Learning and Outcome-Based Education to the Social Work Classroom

INTRODUCTION

Outcome-based education shares similarities with competency-based education, which was popular in social work education in the 1970s (Arkava & Brennen, 1976; Kasworm, 1980; Neill, 1978). The most distinguishing feature of both outcome-based and competency-based education is that instructional planning proceeds “backwards” from the terminal objectives students must attain (Arkava & Brennen 1976; Murphy, 1984; Spady, 1980). Utilizing outcome-based education requires social work educators to first clarify the terminal objectives students must attain before creating supporting instructional materials and testing. We can simply clarify what we expect our students to know, or utilize any materials that outline the competencies social work students should attain (Baer & Federico, 1978).

The backward direction of outcome-based education is in contrast to the common practice of teaching instructional content first and then creating testing. Utilizing outcome-based education means we cannot manage our courses by ‘staying one chapter ahead of the students.’ Although clearly outlining expected educational outcomes is a main feature of outcome-based education, it is not instruction. Thus, a major criticism of outcome-based and competency-based education was that it helped educators clarify the outcomes expected from students, but offered no guidance about teaching (Gross, 1981; Spady, 1980).

Mastery learning complements outcome-based education because mastery learning is a ‘backwards driven’ instructional method. Mastery learning has roots in
behaviorism, as is evident with its emphasis on clearly defined learning objectives, repeated practice and feedback, and repeated learning trials. Mastery learning is the group-based implementation of the Carroll (1963) model of school learning. The Carroll model suggests learning depends on the amount of time needed to learn, and time allowed to learn. Learning should increase as time allowed increases. In other words, achievement is held constant and time allowed is varied, instead of holding time constant (e.g., one semester) and allowing student achievement to vary (ex: the normal score distribution) (Bloom, 1968, 1984; Carroll, 1963). Mastery learning involves using time flexibly to increase student learning. Students are given extra time to take parallel exams or redo projects until attaining the expected outcome, or reaching an instructor chosen "mastery" standard. The additional time allows students to clarify poorly understood material before retesting.

Mastery learning has been implemented in all educational levels and studied enough to warrant two meta-analyses that included research studies in higher education (Guskey & Pigott, 1988; Kulik, Kulik & Bangert-Drowns, 1990). The higher education studies all reported positive results using achievement (generally exam or course grades) as an outcome measure. Mastery learning was also implemented in a BSW course with positive results (Author, 1996). Reviewing research studies revealed that the essential mastery learning elements were implemented in whole or in part, implemented differently, and at times not implemented at all (Guskey & Pigott, 1988; Kulik, Kulik & Bangert-Drowns, 1990).
Essential Elements of Mastery Learning

Mastery learning has several essential elements (figure one) that may or may not be incorporated into the social work classroom and structured differently (Anderson, 1981, 1993; Block, 1974; Bloom, 1968, 1984; Guskey, 1987; Kulik, Kulik, & Bangert-Drowns, 1990). Most of the mastery elements can be structured either very simply or in complex ways. The potential structure of the mastery elements is described below.

Figure 1. The Essential Elements of Mastery Learning

- Choosing instructional content
- Writing instructional objectives
- Performing vertical and horizontal curriculum alignment
- Communicating learning objectives to students
- Formative and summative evaluations
- Feedback and correctives
- Retesting cycles
- Criterion referenced instead of Norm referenced grading

Choosing Instructional Content

Choosing instructional content refers to determining what course content to teach and is not particular to mastery learning. Instructional content should be considered essential only if it supports terminal instructional objectives. Content not supporting the terminal objectives can be considered supplementary and may or may not be taught. Spending instructional time only on essential content may make social work educators more time efficient in the classroom since time is not spent on nonessential content. Focusing on essential content also may make it easier for instructors to decide if issues brought up in class sidetrack or support terminal instructional objectives. Social work educators have some freedom in determining essential course content and may use departmental
requirements and the Council of Social Work Education curriculum policy statement for guidance. Text book chapters can be used to help break the content into learning units or instructors can divide the content in any way that makes sense for the course (Block, Efthim & Burns, 1989; Daines, 1982; Guskey, 1985). Ideally, instruction cannot begin until the essential content is chosen.

Writing Instructional Objectives

Instructional objectives must be written explicitly enough so students and instructors both understand the learning expectations. For clarity, instructional objectives can be written with Bloom's (1956) Taxonomy of Educational Objectives (e.g., knowledge, comprehension, application, analysis, synthesis, and evaluation). A taxonomy of knowledge can help educators write specific and detailed instructional objectives. However, social work educators also can simply decide what students must know as clearly and explicitly as possible. Figure two includes Bloom’s Taxonomy of Educational Objectives and words corresponding to common student learning objectives.

Note: Adapted from: Bloom, Hastings & Madaus, 1971; Green, 1970.
Curriculum Alignment

Curriculum alignment refers to the similarity of content taught and tested (Guskey, 1985; Cohen & Hyman, 1991). The similarity includes instructional content (horizontal alignment) and knowledge level (vertical alignment). "Horizontal" refers to the linear progression of material from lesson planning through teaching and testing. Horizontally aligned material is both taught and tested. Thus, all essential course content is tested instead of only a sample. Arguably, all essential course content should be tested to verify students learned it. Instructors must decide if they will spend instructional time on content that will not be tested and reduce time left for essential content.

Vertical alignment refers to the hierarchical nature of Bloom's (1956) Taxonomy of Educational Objectives. Vertically aligned material is taught and tested to the same knowledge level. In a social work practice course for example, vertical alignment refers to the difference between a student knowing the elements of a process recording (knowledge), producing one (synthesis) and critiquing one (evaluation). Material is poorly aligned if an instructor simply teaches the elements of a process recording (knowledge) but expects students to produce one (synthesis). Writing explicit instructional objectives facilitates matching what is taught and tested (Guskey, 1985).

A table of specifications can help social work educators check for curriculum alignment. A table of specifications is a chart that can include information about what will be taught and tested (Bloom, Hastings & Madaus, 1971; Gentile, 1990; Gronlund, 1981; Guskey, 1985). At its simplest, instructors could note that "Mary Richmond" would be taught in unit one, or use the course topical outline to identify material to be taught. Alternatively, a table of specifications could include the terms and facts students must
know for each learning unit or concept. Even more examples could include a) how many exam questions test a concept, b) knowledge levels expected, and c) corresponding test items. The table of specifications allows educators to "see" if any exam questions did not connect with some content or if any essential content had no exam questions (Author, 1996; Guskey, 1985; Squires, 1984, 1986; Torshen, 1977). Alternatively, the connection between teaching and testing is revealed if social work educators simply 'mark' what content on the topical outline has corresponding exam questions.

A table of specifications also can help to match instructional time and testing. For example, less instructional time may be spent on "Mary Richmond" if students are only expected to recognize her name and more time spent if students must critique her contribution to social work. Additionally, if the table of specifications shows when material is taught it can help to plan where (and if) nonessential content occurs. For example, nonessential content could be placed at the end of a course and covered if time allows.

Running out of instructional time is a problem when the final material is integrative in nature, or if it connects to another course ("No professor, we did not get that far in Human Behavior 1"). Figure three includes five entries from a table of specifications for a learning unit about poverty. The specifications table includes how many exam questions test the material, and the terms and facts needed to answer the questions.
Communicating Objectives

Instructional objectives should be shared so students can study the essential content. Social work educators could simply tell students what to study or create detailed study guides. Study guides have no ideal form or frequency. Telling students what to study may be the easiest for instructors, but written study guides can act as a study reference that helps students focus on essential material. Study guides could simply list essential content (as a topical outline does), or contain questions students must answer. Written study guides may help students realize they cannot answer a study question. More complex study guides have enough space left beneath the questions for students to record their lecture notes. Study guide/lecture outlines go furthest in detail and in focusing students on essential content because students would "see" blank spaces under any unanswered questions. Answering study guide questions in order can help
instructors resume where they ended in previous classes by simply asking students what study question was answered last.

**Formative Evaluations**

Formative evaluations are often short, ungraded quizzes that are immediately scored to help students identify their learning errors. Their purpose is to check the progress, but not grade, student learning (Bloom, Hastings & Madaus, 1971). An instructor could simply ask questions about course material or have written quizzes. Asking questions may not allow instructors to reach students who do not speak up. Written objective format quizzes allow all students to be evaluated.

The ideal number of quizzes is unknown. Examining several mastery learning studies revealed that quizzes occurred anywhere from weekly to not at all (Guskey & Pigott, 1988; Kulik, Kulik & Bangert-Drowns, 1990). Frequent evaluation is implied with mastery learning to increase feedback on performance and increase chances that learning errors are corrected. For example, weekly quizzes allow instructors to determine before "mid term" if students understand the material. However, more test questions must be located or created for weekly quizzes. Instructors also must decide if quizzes will be as difficult or more difficult than the exams. Very difficult quizzes can demoralize students, while easier quizzes can make students think they know material better than they actually do. Quizzes should be scored in class so students and instructors see which questions were answered incorrectly.

**Summative Evaluations**

Summative evaluations are usually graded exams (objective or other format) intended to measure student performance and are not particular to mastery learning. Instructors
choose the exam frequency and format as they would with any teaching methods. Exam frequency can range from a single comprehensive final to the midterm-final exam format, or be more frequent. Frequent testing can shrink the size of the learning units being tested and allows for earlier and more frequent evaluation of student performance. Instructors may test with objective format exams, essays, papers or other projects.

Feedback & Correctives

Feedback refers to instructors providing information on student learning and may be as simple as posting exam grades or be as detailed as student evaluations. Correctives refer to correcting student learning errors by re-teaching material, providing remedial material or using other methods. Correctives can be structured differently and involve at least four major variations. First, correctives can occur inside or outside class. For in-class correctives, time limits must be set so students needing additional correction do not hold the class back. Outside class correctives allow additional time without holding back an entire class. Instructors could use both, perhaps having a 15-minute in-class review session after a quiz or exam, and spending additional time outside class. Second, correctives may be required or voluntary. Voluntary outside class correctives are not always well attended by students and can result in lower grades compared to mandatory correctives (Goldwater & Acker, 1975; Jones, 1975; Lewis, 1984). Mandatory correctives can help instructors reach students who incorrectly believe they need no additional help.

Third, correctives can occur with individual or many students. Correcting students individually should result in increases in grades because correction can target learning errors (Block, 1974; Bloom, 1976, 1984; Denton & Seymour, 1978; Yeany, 1979). However, individual correctives have been criticized as time intensive (Arlin, 1984;
Fitzpatrick, 1985; Lewis, 1984; Palardy, 1986; Slavin, 1987, 1990). Group correction may be more time efficient for instructors when many students make similar errors. Fourth, correctives can be led by instructors or students. With an instructor present material can be clarified or re-taught. With student led correctives, students who understand the material help those who did not. Using students, teaching assistants or computers to give correctives is a more efficient use of instructor time, but control over the effectiveness of correctives may be lost (Anderson, 1978; Bloom, Hastings & Madaus, 1971; Danielson & Haupt, 1977). The instructor led format takes more time than the student led format, but the time can be minimized by working with groups of students (Author, 1996). Choosing between instructor and student led correctives may depend on whether students or teaching assistants can identify and correct any learning errors (Anderson, 1978; Block, Efthim & Burns, 1989).

Re-testing Cycles

Re-testing refers to students taking parallel or alternative versions of quizzes or exams. Students who do not master the material could take parallel versions of an exam (or rewrite a project) until reaching what an instructor decides is a minimum performance level. Re-testing allows verification that learning errors were corrected. Re-testing cycles refer to the number of times students can redo work or retake exams. Unlimited re-testing cycles give students the greatest opportunity to improve, but instructors must create or collect enough test questions to make this feasible. The time spent re-administering, re-scoring, and re-correcting quizzes or exams could be prohibitive without teaching assistants or computer support (Dunkleberger & Knight 1979; Nepote-Adams, 1991;
Honeycutt, 1974). Re-testing cycles can be offered outside of class to minimize instructional time spent.

An alternative is to retest only material answered incorrectly on the first attempt. However, each computer-scored answer key must be unique to the students’ errors. Taking an entire makeup exam may be more feasible. Another retesting option is to have students write a short targeted essay explaining why their incorrect answers are incorrect and why the correct choice is correct. Students must explain instead of simply choose an answer, and instructors must read and grade the explanations. Instructors also must decide when to allow makeup exams or rewrites. An instructor could require everyone not earning an A grade (or reaching some criterion) to retake an exam or rewrite a project, or only require it for failing students. To make rewriting and re-grading projects more feasible, an instructor could mark passages that require improvement during grading. Students would then edit and rewrite only those parts. If rewritten parts are highlighted, an instructor would easily locate the ‘before & after’ versions of marked passages without re-reading the entire paper. Requiring students to submit papers on computer disk makes editing easier.

Grading

Mastery learning uses criterion-referenced instead of norm referenced measurement to grade student performance (Bloom, Hastings & Madaus, 1971). Criterion referenced measurement compares performance to a standard and not the performance of other students as with norm-referenced measurement (the normal curve). Criterion referenced measurement may produce score distributions deviating from normal because all students could meet the criterion (Gronlund, 1981; Martuza, 1977).
Criterion referenced measurement is consistent with a fundamental belief of mastery learning: all students are capable of achieving to higher levels if given enough time, feedback, correctives and clear learning goals. Exams or projects should be graded individually so low scores are not ‘averaged away’ by high scores in other units. For example, an "F" on a client assessment learning unit and an "A" on an intervention planning learning unit do not average out to a "C". In this case, strong intervention planning skills do not compensate for weak assessment skills. Retesting cycles allow students to improve any deficient skills.

Grading may employ traditional letter grades or mastery and non-mastery grades (e.g., M, NM). No external criterion exists for setting the mastery level for a given topic. Instructors choose which traditional letter grades show mastery or non-mastery and decide if re-testing cycles occur when mastery is not reached. A creative option is to grade exams and projects in tandem. For example, objective format exams could be graded as mastery or non-mastery and mastery converted to a score of 70%. In other words, exam scores from 70% to 100% all convert to a C. A grade of B would require a paper that meets an instructor standard (B or better for example). A grade of A could require a second more difficult or extensive paper.

**Classroom Structure**

Outcome-based education has no specific classroom structure. The essential elements of mastery learning can be structured differently based on instructor resources. This makes it difficult to picture what mastery learning can look like in the social work classroom. I have taught with mastery learning for 14 years and have implemented it in the following way. My courses have three, instead of the traditional two, learning units.
(e.g. mid term and final exam). Each learning unit includes one, 20 question written study guide that students receive. The study guides include words corresponding to the knowledge levels of Bloom’s (1956) Taxonomy that students must demonstrate on the exams. I answer and review complex study guide questions in class and students answer the simpler ones on their own. For testing, each learning unit includes two, 15 question ungraded quizzes’, one graded 50 question, objective format exam, and one graded makeup exam. The makeup exams are parallel versions of the exam with the same objective format and number of questions. I have written my own test questions because it allows me to target my essential course content and prevents my having to defend the validity of test questions written by others.

I also utilize in-class and outside class, instructor-led group feedback and correctives. After students check the answer key for the quizzes and exams, I spend about 20 minutes in class and about one hour outside class answering student questions about exams and quizzes. It is enlightening to see which test questions the students found easy and difficult. When most students answer a test question incorrectly it may mean material was taught poorly (faulty teaching), taught correctly but understood poorly by the students (faulty learning or studying) or simply not taught.

All students who intend to take a makeup exam must attend a mandatory one-hour, outside class review session prior to the makeup exam. Students with an exam score below 70% are required to take a makeup exam. Students scoring above 70% on the exam can elect to take the makeup exam to improve their score. The outside class format provides additional time to clarify and re-teach material without spending class time. Most students who take makeup exams have scored 70% or higher on their exams (sometimes
but take makeup exams to raise their exam scores. In other words, the chance to improve grades motivated students to take makeup exams when they were not required to. Students take makeup exams as a group outside class time.

Taken together, students receive a study guide and use the lectures and text to answer the study guide questions. They take an ungraded quiz on the first half of the study guide, check their answers with the answer key and ask questions in class about incorrectly answered items for about 15 minutes. This ‘teach & test’ cadence is repeated for the second half of the study guide. The students then take a graded exam and again ask questions in class about incorrectly answered items. Students who are required or wish to take a makeup exam must attend a mandatory review session to help insure they do not repeat their mistakes on the makeup exams. The ‘quiz, quiz, exam, makeup exam’ cadence is repeated in each learning unit, or three times during the semester. My mastery standard is a grade of "C" (e.g., 70% of 100%).

CAUTIONS

Perhaps because the mastery elements are linked, research has not clarified their ideal classroom structure. For example, the 'ideal' number of retesting cycles (if it exists) may be related to the degree learning errors are corrected. In other words, retesting cycles could be unnecessary with enough quizzes and correctives. Even if an ideal classroom structure for mastery learning existed, we still would have to implement mastery learning in the most feasible rather than ideal way. An important feasibility issue is instructor time spent because mastery learning has been criticized as time intensive (Abrams, 1979; Barber, 1979; Brown, 1977; Burns, 1987; Decker, 1989; Dunkleberger & Knight, 1979; Guskey, 1985; Honeycutt, 1974; Klein, 1979; Nepote-Adams, 1991). Conversely, one
A meta-analysis found mastery learning required only about 4% more instructional time than control groups (Kulik, Kulik & Bangert-Drowns, 1990). Is mastery learning time intensive or not? Instructor time spent appears linked to several mastery elements. For example, switching from group to individual correctives would have increased my time spent during the semester from 21 to approximately 79 hours. Adding a second exam retesting cycle and a quiz retesting cycle, in addition to individual correctives, would have increased instructor time required to 127 hours. Unlimited retesting cycles would further increase instructor time spent. Utilizing teaching assistants to proctor makeup exams and lead correctives, computer administration of quizzes, and existing test item banks would decrease instructor time spent. The time required to use mastery learning could be similar to other instructional methods depending on how the mastery elements are structured.

In summary, mastery learning is a flexible, outcome-based teaching method. Since measuring student outcomes is a current concern in social work education, instructors could begin by simply clarifying what they teach and matching the testing and instructional time spent to what is expected of students. Social work educators also could implement a few mastery elements while using their normal teaching methods. Social work educators could go further and implement the mastery elements in ways that make sense for their courses given available resources and time. I believe social work educators who try mastery learning will find that they enjoy increased awareness and control over the essential content taught in their classrooms.

The Application of Mediation(\textit{Sulh}) and It’s Implication to the Management of Family Dispute Cases at Malaysian Syaria Courts

Raihanah Azahari

Department Of \textit{Fiqh} and \textit{Usul}
Academy of Islamic Studies
University of Malaya

Introduction

Though \textit{sulh}/mediation\(^1\) has long been practised by the Malaysian Syariah Court, yet it was exercised in the absence of specific provisions on the reference and formation of a special body on mediation attached with the court.\(^2\)

Among other states in Malaysia, the Selangor Syariah Courts has taken the lead to encourage \textit{sulh}/mediation in dispute settlement. The trigger factor here is a heavy caseload of the courts. The Court has gazetted the rules relating to mediation and has appointed a mediator to observe the mediation process. These rules cited as the Syariah Court Civil Procedure (\textit{Sulh}) Selangor Rules 2001 and have come into operation on August 2001.\(^3\)

The aim of this paper is therefore to analyze that the process of mediation in the Selangor Syaria Court has led to resolving and reconciliating in several cases of family dispute.

In order to conduct this study, the data concerning \textit{sulh}/mediation cases were gathered in the Selangor Sharia court’s files. All particulars of \textit{sulh} cases were collected and analysed. These particulars include the period to settle the case, the type of the case and the statistic of the cases. This informations will help us to understand the background of the \textit{sulh}/mediation process in Malaysia.

Mediation(\textit{Sulh}): The Syaria and The State Law

\textit{Sulh} literally means termination of case. According to Muslim Jurists, it means a covenant between two disputing parties to end their dispute. It is clear from the definition that \textit{sulh} is a process whereby parties to any dispute make an agreement to resolve their disputes amicably.\(^4\)

\(^1\) In this paper, the words mediation and \textit{sulh} are treated as synonymous and interchangeable. Although there are differences in perception regarding their respective functions, in practice there is a very fine line of distinction between the two.

\(^2\) Hj Mohd Na'im Hj Mokhtar, Administration of Family Law in the Syariah Court [2001] 3 \textit{MLJ}, p. lxxx

\(^3\) Dato Sheikh Ghazali Abd Rahman, (Chief Director, Department of Syaria Judiciary of Malaysia) \textit{Sulh/Mediation in Islamic Law}, paper presented at the Seminar of ADR in Islamic Perspective, 56 November 2001, IKIM, Kuala Lumpur

\(^4\) \textit{Majallah al-Ahkam al-'Adliyyah}, Article 1531
There is a direct evidence in the Quran on the subject of *sulh* regarding family disputes. This can be seen from Chapter 4 verse 128 which reads as follows:

> And if woman fears cruelty or desertion on her husband’s part, there is no sin for them both if they make terms of peace between themselves; and making peace is better. And human inner-selves are swayed by greed. But if you do good and keep away from evil, verily, Allah is ever well-acquainted with what you do.

It is clear from the above injunction of the Holy Quran that *sulh*/mediation is highly recommended.

In a hadith narrated by ‘Amr bin ‘Awf, it is reported that the Prophet Muhammad (PBUH) said:

> Conciliation is permissible among Muslims except the one which makes permissible what has been forbidden or forbids what has been permitted.  

Based on the above hadith, it is understood that the basis of settlement in any dispute in Islam is that it must be conformed to Islamic. There can be no valid settlement if the parties agreed to terms contrary to Hukum Syara’.

Beside, s. 99 of the Syariah Court Civil Procedure (State of Selangor) 2003 provides: “The parties to any proceedings may, at any stage of the proceedings, hold *sulh* to settle their dispute in accordance with such rules as may be prescribed or, in the absence of such rules, in accordance with Hukum Syara’.”

As to how the *sulh* should be conducted, Selangor has gazetted the rule relating to *sulh* which cited as the Syariah Court Civil Procedure *(Sulh)* Selangor Rules 2001. This rules provides:

(S.3) “Where after receiving a summons or an application for any cause of action, the Registrar is of the opinion that there is reasonable possibility of settlement between the parties to the action, the Registrar shall-
(a) not fix the date for the trial of the action within the period of three months;
(b) fix a date, as soon as practicable, for the parties to hold *sulh*; and
(c) serve the notice of the date fixed for *sulh* on the parties

**The Application of Mediation at Selangor Syaria Court**

The State of Selangor has eleven Syariah Lower Courts, and one Syariah High Court located in her capital Shah Alam. The State had been proactive in gazetting the Civil Procedure Rule *(Sulh)* of Selangor 2001 in December 2001 as stated in the Government gazette of the State of Selangor Sel. P.U. 44 as provided for by section 254 Syariah Civil Procedure Code Enactment of Selangor, No. 7, 1991. It means that dispute resolution by mediation started its operation on the first of

---

6 Formerly known as s.87 of the Selangor Syariah Civil Procedure Enactment 1991
May 2002. Ten mediators were appointed to serve in nine of the Lower Courts and the High Court. Thus, a mediator or *sulh* officer is assigned to each of the designated courts. In implementing the Civil Procedure Rule (*Sulh*) Selangor 2001, a Mediation Work Manual was organized for use by the mediators. Amongst its objectives, this manual seeks to explain and standardize the procedures to be followed by the mediators in conducting the mediation.

For the first year of its practice (1/5/2002 till 31/5/2003) there were 1529 cases registered with 1416 cases (92%) successfully concluded, out of which 1029 cases (67.3%) achieved settlement by means of mediation. The other 387 cases (25.3%) chose to go to trial by court and 113 cases (7.4%) were postponed. Similarly, data from May 2002 extended to December 2003 showed a registration of 2555, where 1748 cases or 68% were successfully settled by means of mediation, 666 cases or 26% preferred trial by court and 141 or 6% were postponed Thus mediation seemed to have produced the result expected of it.

**Mediation: The Process**

```
Case Registration

Assessment by Registrar

Settlement through court

Settlement by mediation

Notification

Attendances of parties in mediation sessions

Fail to agree

Successful agreement

Court proceedings

Submitted to court for the judge to issue orders

Decision/orders by court

Court orders issued
```
Table 1 above shows the flow chart on the process of mediation in the Syaria Court of Selangor. Guided by the above flow chart, a case usually takes two weeks to reach settlement which is, a short duration compared to if it were to go through the court.

A mediation process can lead to settlement with just one meeting, depending on the abilities of the mediator and/or the nature of the dispute. Some mediators hold a minimum of two meetings, the first being the discussion and negotiation of the dispute, and the second being the signing of the agreement reached. This allows space for the disputants to deliberate or give further thought on the agreement reached, before signing it. If a case is complicated, then more separate and/or joint sessions may take place.

These cases that reach settlement within a short duration are those submitted under sections 23, 45 or 47 of the Act, where disputing parties are present in court to file their claims. If they then agree to go through mediation, the process may start the same day. If there is agreement reached, the chairperson will submit it to the judge for issuing of orders.

A study was conducted where 500 cases were randomly picked from the cases registered between May 2002 and December 2003 that had been settled by means of mediation. The duration of the process is the time taken between registration, and submission of the agreement reached, to the judge for decision based on mutual agreement.

Table 2 (below) shows the cases in the study registered according to year. The two cases registered in 2001 were settled in 2002.

<table>
<thead>
<tr>
<th>Year</th>
<th>Number</th>
<th>Percentage</th>

<td>100</td>
</tr>
</tbody>
</table>

Table 3 shows the 500 cases divided into categories where 423 i.e., 84.6% were divorce cases. The remaining 77 were cases related to polygamy, maintenance of children, claim of *mut’ah* (consolatory gift), maintenance of *’iddah*, arrears of maintenance, maintenance of wife, custody, jointly acquired property and others. It can be seen from the table that the times taken to resolve each of the varying kinds of cases did not vary significantly, where 438 of the 500 cases i.e., 87.6% were resolved within three months of registration

Source: Case information sheets
The settlements included specific claims on maintenance during ‘iddah, mut’ah and jointly acquired property, which otherwise would be managed separately if the disputes were to go through court proceedings, with the obvious longer duration of time required.

There was a case in the Lower Court of Syariah, Klang, submitted under section 47 of the Islamic Family Law (State of Selangor) Enactment 4/84 involving claims for maintenance of children, custody and access rights arising the submission for divorce. This case was registered on 14th August 2002 managed by means of mediation on the same day, and had the court order issued on the same day.

There was another case submitted for mediation under section 56 of the Islamic Family Law (State of Selangor) Enactment 4/84 involving claims of maintenance of child, custody, access rights and mut’ah. It was registered on 27th July 2002, followed by mediation on 31st July, with the court orders issued at the end of the same day. The agreement reached stated that the defendant agreed to pay mut’ah of RM 4000 within two payments, pay maintenance of children of RM 250 per month with custody of child given to the mother where the father was given access rights during appropriate times provided prior notice is given to the mother. The agreement also stated that the plaintiff (mother) will not make further claims and will not prevent the defendant (father) from visiting the child.

In 2004, it was formally decided that the date for mediation be decided at the time of registration of the case. This replaces the notification system, which usually takes two weeks from the date of registration. All these lead to a system where cases are managed within a shorter duration, and with more efficiency.

As stated above, after agreement is reached between the parties; the agreement is brought to the judge for the issuance of court orders. However, there were cases where delays in the issuance of court orders happened. These were due to certain factors such as the unavailability of the judge, the absence of one of the parties to the dispute, or the request of one of the parties to the dispute that it be delayed, so that he/she/they would have adequate time to reflect and be truly ready to accept the agreement.

**Kinds of Cases to be resolved by Mediation**

In principle no categorization of cases are made for the purpose of resolution by mediation. However section 245(2) of the Act provides if there is lacunae, or if there is anything that is not clearly provided for by this enactment the court shall apply Hukum Syarak.

The pamphlet for mediation produced by the Syariah Court of the state of Selangor lists the kinds of cases that may be resolved by means of mediation.

1. Claims on breach of promise to marry
2. Claims arising from a divorce such as
Judging by the kinds of cases as listed in table 4 it can be said that almost all kinds of cases that come to court can be resolved by means of mediation. With the exception of application for divorce and confirmation of divorce, all cases will be referred to mediation first. Only if that fails to resolve will the case be referred to the court.
Mediation in Cases of Application for Divorce

In principle mediation is not applicable to a case of application for divorce under the Islamic Family Law Act (Selangor) 1984. A proceeding for divorce must follow the provision provided for under the Act. However the court finds that cases of application for divorce (s 47) and those of confirmation of divorce (s 45) are the most filed. Table 5 shows the kinds and numbers of divorce registered from Jan 2002 to October 2003.

Source: Statistic on mediation showing categories of cases managed by mediators of the Department of Syariah Judiciary Selangor.

Thus as seen in Table 4 and 5 these cases for dissolution of marriage number most i.e., 69.4% (958 out of 1381). The divorce by talaq (under s 45 and s 47) has the most numbers filed.

Through discussion and negotiation those requesting divorce by fasakh, ta’liq of khulu’ agreed to change to divorce by talaq. This is a development for the better.

Thus, in practice those filing for divorce under section 47 or confirmation of divorce under section 45 were scrutinized by the registrar to see whether parties agree to resolve their claims by means of mediation. If they do, will then be required to fill in the forms indicating their agreement to mediation. The mediation will be only on matters that are submitted for claims.

Mediation – Voluntary or Compulsory

In principle, it is the right of the disputants to choose the means of resolution of their disputes. However, disputants are encouraged to prefer mediation as it offers a better outcome for them.

The Selangor Syariah Court makes it a policy that mediation is compulsory before a case is submitted for trial in court excepting those cases submitted under section 45 and section 47 of the Islamic Family Law Act, 1984/2003. In other words, a trial in court will only take place after mediation fails to get the disputants to an agreed solution, whether on parts of the claims or the full claims. This is to ensure
that maximum efforts are taken to resolve the issues peacefully through negotiation between the parties thereby achieving agreement in the shortest possible time.

Be it compulsory or voluntary, a mediation process can only take place if the parties to the dispute agree to it. They (the parties) have a right to continue mediation till an agreement is reached in full or in parts, or withdraw and terminate the process at any point in the negotiation.

Therefore, a mediation process is compulsory in the sense that it is a must before the case is submitted to court for trial not in the sense that the proposed solutions must be accepted or the parties forced to come to an agreement.

**Positive and Constructive Impact of Mediation**

It is too early to see the effects of mediation in the management of family disputes in the Syariah Court. For this short period of a year and a half of its practice, some progress can be seen. They are:

1. **Mediation Shortens the Time Taken to Resolve Disputes.**

From the above discussion cases on divorce number the most i.e., 423 cases out of 500 cases studied (84.6%). The other 15% consisted of cases on matters related to divorce. The findings indicate that there is no significant difference in the times taken to resolve the different kinds of cases. Thus, different types of cases do not have an influence on the duration required to resolve disputes as 87.6% (i.e., 438 out of 500 cases) of the cases were resolved within the three month period.

That the period of three months is a short duration for resolution of divorce cases can be clearly seen in the findings of a study by a committee entitled “A study on the delay in the management of cases of divorce in the Syariah Courts of the State of Selangor (1997-2002)”.

This study reported that cases of divorce that are resolved within a year increased dramatically in the year 2002; the year mediation was put into practice. For the year 2002 the resolved cases were 36.8% whereas for the years 2001 – 4.1%, 2000 – 4.7%, 1999 – 4.3% and of these 36.8% (423 cases), 88.6% of them (i.e., 375 cases) were resolved within three months.

That, this three-month period is clearly a short period can be further elucidated by other studies. Sharifah Zaleha considered that it is usual to reach divorce settlement within a time period of ten to twelve months, after three courts sittings. Raihanah studying divorces in yet another State, Perlis found that most of the cases of divorce in that State took about six months to resolve. This is possible because the court gave priority to cases that had undergone some prior negotiation

---

7 A study on the delay in the management of cases of divorce in the Syariah Courts of Selangor (1997-2002) Reported by Syaria Courts of Selangor, Department of Syaria Judiciary of Malaysia, Office of Legal Advisers of Selangor, Islamic Religious Department of Selangor, Legal Aid Bureau of Malaysia, International Islamic University Malaysia

8 Sharifah Zaleha Syed Hassan (1986), Women, Divorce and Islam in Kedah, Sojourn 2, p. 195

and the court utilized the agreement reached, thereby shortening the duration. Nik Roslina\textsuperscript{10} in her study stated that the Syariah Court took an average of six and a half months to settle a divorce application pending on several factors, the most important of which is the attendances of both parties in court.

It can thus be said that the Syariah Courts in the State of Selangor are successful in shortening the duration of the divorce dispute resolution.

2. Reducing the Numbers of Backlog

From May 2002 to December 2003, 1748 cases i.e., 68% (out of a total of 2555 cases) were successfully resolved by means of mediation. 666 cases i.e., 26% opted for court proceedings, and only 141 cases i.e., 6% postponed (constituting a backlog). Clearly this shows the positive impact in the management of family cases in the Selangor Syariah Court where the numbers of backlog are reduced.

3. Reducing the Cost Borne by the Client

The only cost incurred in the resolution of family cases by mediation is the registration fee. No other fees are charged. This means that the mediation service offered by the Syariah Court (in court mediation) is free. This is stated in section 9 of the Civil Procedure Rule (Sulh), 2001 as “no costs are to be incurred for the proceeding in the mediation sessions.”

If the case is successfully resolved in one session it reduces the traveling costs to and from the court. For the ancillary claims that are filed together with the claim for divorce, cost is also saved as there are no separate registration fees for them.

This can be compared to those cases preferring court adjudication where there will be a separate registration fee for each of the ancillary claims made besides the divorce claim. The separate trips to the court required for each of the cases mean extra traveling cost; and there will be further expenditure if a lawyer is needed to represent a client. Hence the advantage in terms of cost is obvious.

Conclusion

The above arguments so far, provide evidence that mediation as a methodology to resolve family disputes in the Syariah Courts of Malaysia is capable of overcoming certain weaknesses present in the current court system. Obviously further studies and improvements are necessary to further alleviate the management of family disputes as a whole.

My paper deals with a cross-cultural issue that is concerned with the notion of the womb space. While being attentive to the pathological dimension of the representation of the womb space in the psychology of Sigmund Freud and Otto Rank, which has informed the interpretation of, for instance, the residential architecture of Richard Neutra (1892-1970), my research investigates a different tradition of the representation of the womb space as influenced by Esoteric Buddhism in East Asia. This tradition emphasized the sensorial experience of the world, the synaesthetic depth of the experience as the path to reach the spiritual and enlightenment, and the concordance between the objective cosmology and the subjective experience, while confronting the intellectual elitism of other Buddhist sectors such as Zen Buddhism. This tradition opens a new hermeneutic opportunity for modernism (in architecture) by challenging the views that define the architectural act as the degenerative representation of the womb space in order to compensate the trauma of the birth. Strategically, my research illuminates the interstitial conflicts evident in the match between the modern Western psychology and modernism, and formulates a new tripartite dynamic that injects into the current discourse the Buddhist notion of the womb space. The architect to be investigated is Neutra, who worked for Frank Lloyd Wright in his formative years, traveled to Japan and wrote about East Asian culture. My paper adopts his writings and architectural examples not only to verify the insufficiency of the Western psychological references in understanding his architecture, but also to enoble the significance of his architecture embodying the space of flow.

Abstract

Emotion and topic were manipulated in original song lyrics. Batcho’s (1995) and Holbrook’s (1993) nostalgia surveys, Lee, Draper and Lee’s (2001) revised Social Connectedness Scale, and Lee and Robbins’ (1995) Social Assurance Scale were completed by 97 undergraduates, who rated the lyrics for happiness, sadness, anger, nostalgia, meaning, liking, and relevance. Results are discussed in terms of theories linking nostalgia to pathology and theories relating nostalgia to social connectedness. Batcho’s construct of personal nostalgia is distinguished from Holbrook’s construct of historical nostalgia.
Nostalgia and Song Lyrics

Although nostalgic sentiment appears in literature since ancient times, the term *nostalgia* itself was not coined until the physician Hofer used it to designate a disease originating from the desire to return to one’s native land (Hofer, 1688 in Anspach, 1934). Based primarily upon military data, Hofer observed that recovery from symptoms such as sadness, insomnia, fever, loss of strength, loss of appetite, anxiety, cardiac palpitations, or stupor was reported upon patients’ return home (Havlena & Holak, 1991; Rosen, 1975). With the development of psychiatry as a medical specialty, theorists began classifying nostalgia as a form of melancholia (Hilgard, 1987). Tuke wrote, “Nostalgia always represents a combination of psychological and bodily disturbances, and for this reason it must always be defined as a disease.” (as quoted in Jackson, 1986, p. 380). Other theorists, however, began to apply the distinction between organic and functional disorders to nostalgia. For example, Griesinger observed, “Naturally, homesickness is not always a mental disease . . . [and] ought *in foro* to be regarded as a mental affection only when it presents the usual signs of insanity.” (1867/1965, pp. 245-246).

During the first half of the 20th century, nostalgia had begun to lose its place of interest in psychiatry, and the term *nostalgia* had acquired meanings broader than homesickness. Whereas in 1933, *The Oxford English Dictionary* still defined nostalgia as “severe home-sickness,” by 1976, the *Supplement to the Oxford English Dictionary* (Burchfield) added, “Regret or sorrowful longing for the conditions of a past age; regretful or wistful memory or recall of an earlier time.” Ordinary household dictionaries included the broader meaning by 1966. For example, *The Random House Dictionary* offered “a desire to return in thought or in fact to a former time in one’s life, to one’s home, or to one’s family and friends.”
Together with the growth of psychology as an empirical science, the psychoanalytic movement contributed to shifting the understanding of nostalgia to a psychological rather than a psychiatric construct. The centrality of constructs such as early experience, symbolism, and conflict in Freud’s framework influenced 20th century theories of nostalgia (1899/1968c, 1916/1968b, 1917/1968a). As summarized by H. Kaplan (1987, p. 466), “In a psychoanalytic context, the meaning of nostalgia changes to become a variant of depression, an acute yearning for a union with the preoedipal mother, a saddening farewell to childhood, a defense against mourning, or a longing for a past forever lost.”

The importance of the loss of union with the preoedipal mother introduced an association of nostalgia with the process of individuation. Neumann posited that nostalgia is a reaction to the potential alienation of individuation, “being oneself is still a wearisome and painful experience” (1949/1971, p. 16). In Peters’ (1985) view, nostalgia “aims toward individuation” (p. 145) providing the motivation to persist in “the gruelling work of individuation.”

Conflict and ambivalence, central to Freudian constructs such as screen memories and melancholia, are clearly evident in the psychoanalytic constructions of nostalgia (e.g., Kaplan, H., 1987; Werman, 1977). Kleiner (1970) distinguished the nostalgic individual from the homesick, the sentimental, and the romantic by nostalgia’s “peculiar combination of sadness and pleasant reminiscing” (p. 15), and proposed that nostalgia’s distinctive “bitter-sweet flavor” (p. 29) results from trauma in the nostalgic’s early life history. Similarly, H. Kaplan (1987) distinguished nostalgia from depression and argued that for nostalgia to be normal it must contain both pleasurable and depressive affect. Werman (1977) agreed that nostalgic affects are characteristically “bittersweet, indicating a wistful pleasure, a joy tinged with sadness” (p. 393).
Castelnuovo-Tedesco (1980, p. 122) explained the genesis of nostalgia’s bittersweet characteristic in terms of conflict, “It is sweet because the original object or event gave pleasure and because the pleasure is enhanced through idealization. It is bitter not only because it cannot be made to come back but also because, even in its original setting, it contained conflict and disappointment.” This designation of bittersweet as the distinctive characteristic of nostalgia has become widespread, though not dominant, among contemporary theorists (Bassin, 1993; Batcho, 1998b; Castelnuovo-Tedesco, 1980; Cavanaugh, 1989; Havlena & Holak, 1991; Hertz, 1990; Kaplan, H., 1987; Mills & Coleman, 1994; Peters, 1985; Stern, 1992).

An emphasis on conflict advanced the notion of nostalgia as a mechanism for dealing with loss and transition. For example, L. Kaplan (1984, p. 150) explained this role during adolescence, “The depressive moods, grief reactions, and profound anxiety states so typical of adolescence are manifestations of the inner struggle to relinquish the past and at the same time never let it go. As an expression of this struggle a new, bittersweet emotion comes into existence. During adolescence the child can for the first time experience nostalgia for the lost past and a sense of the irreversibility of time. What has once been is gone. It cannot be brought back — except in memory.” Romanticizing the infantile past helps the adolescent cope with the difficulties of her present by instilling a sense of worthiness based upon “memories of having been an infant or child who was once perfect and absolutely adored” (p. 151). In such a way, nostalgia “takes the sting out of the sense of loss . . . Time is irreversible, but the goodness that was serves as incentive for aspiration” (p. 151).

In 1979, Davis pointed out that today only a minority of speakers would consider nostalgia to be homesickness per se. In illustration, Davis reported that several dozen college
students he surveyed associated words such as “warm, old times, childhood, and yearning” with the term nostalgia much more frequently than they did homesickness (p. 4). H. Kaplan offered the contemporary definition of nostalgia as “warm feelings about the past, a past that is imbued with happy memories, pleasures, and joys” and identified it as “a universal affect that results in a heightened mental state, an enhancing, uplifting mood related to particular memories of the past.” (1987, p. 465).

The more positive approach to nostalgia influenced both theoretical and applied lines of research. Researchers began investigating the role of nostalgia in memory and have proposed nostalgia as an appropriate vehicle for the study of the interaction between cognitive and affective processes (Batcho, 1995, 1998b; Cavanaugh, 1989; Ross, 1991). Cavanaugh (1989) proposed nostalgia as “one of the ways that one develops and maintains identity” and reminiscence as “the primary means by which one maintains relationships with old parts of the self and by which one measures personal change over time” (p. 603). Cavanaugh argued that “nostalgia represents a cognitive attempt to recapture a time when life was good, safe, secure, and contented” (p. 603).

From a sociological perspective, Davis (1979) conceptualized nostalgia as an attempt to help the individual to adapt to discontinuity in life and noted that older people are especially likely to be nostalgic. Similarly, Cavanaugh (1989, p. 604) cited a “growing suspicion” among researchers that memory is more closely linked to affect in older than in younger adults. Hertz (1990) researched the ability of aging Holocaust survivors to cope with the extreme traumatic stressors they had suffered in the past. Finding increased reminiscences and nostalgic longings with advancing age among the survivors, Hertz placed nostalgia within a framework of adaptive
mechanisms used to cope with major challenges. Exploring the role of nostalgic memories in elderly sufferers of dementia in a psychogeriatric setting, Mills and Coleman (1994) concluded that nostalgia can serve to maintain or restore a sense of self-identity by “reweaving the broken threads of life history” (p. 215) and can enhance personhood by enabling the individual to remain connected to others.

Recognition of positive aspects did not totally displace the negative connotations of nostalgia, and the adaptive view of nostalgia has not achieved universal acceptance. Nawas and Platt (1965) argued that nostalgia is better characterized as a concern over or dread of the future. Peters (1985) characterized nostalgia as a yearning the intensity of which varies from a fleeting sadness “to an overwhelming craving that persists and profoundly interferes with the individual’s attempts to cope with his present circumstances” (p. 135).

Two major obstacles to progress in understanding nostalgia persist. Despite many years of theoretical work, very little empirical investigation has been undertaken. Empirical studies require operational definitions and methods of measurement. Greater definitional clarity can be gained by distinguishing between two types of nostalgia. The distinction between historical and personal nostalgia is evident in the empirical work by Holbrook (1993) and Batcho (1995; 1998b), who began exploring the relationship of nostalgia to other psychological variables.

Holbrook and Schindler (1991, p. 330) had defined nostalgia as “a preference (general liking, positive attitude, or favorable affect) toward objects (people, places, or things) that were more common (popular, fashionable, or widely circulated) when one was younger (in early adulthood, in adolescence, in childhood, or even before birth).” By extending the definition to include even
events “before birth,” Holbrook’s (1993) understanding emphasizes feelings toward the social and historical past, even beyond an individual’s own past.

Adopting Davis’ (1979) use of the term to refer to feelings toward the past actually experienced by the individual, Batcho (1995; 1998b) developed a 20-item nostalgia inventory on which respondents rate the extent to which they miss each of the items from when they were younger. Stern (1992) articulated a distinction between the objects of the two types of nostalgia—a distant past perceived as superior to the present in historical nostalgia, and a personally remembered past in personal nostalgia. Consistent with Stern’s terminology, Holbrook’s research applies to historical nostalgia whereas Batcho’s focuses on personal nostalgia. Holbrook’s research has focused on the role of historical nostalgia in marketing (Holbrook, 1993; Holbrook, M. B., & Schindler, R. M., 1991), whereas Batcho’s research has focused on the role of personal nostalgia in cognitive and affective processes such as memory, music, and coping (Batcho, 1995; 1998a; 1998b; 2002; 2003; 2004).

Having defined nostalgia as missing various aspects of one’s personal past, Batcho (1998b) applied an empirical cognitive approach in a study of the relationship between nostalgia and measures of memory and personality in college students. Batcho found that individuals scoring high on the inventory of personal nostalgia were no more optimistic, pessimistic, or negatively emotional than less nostalgic individuals, but the high nostalgia subjects scored higher on Larsen and Diener’s (1987) measure of emotional intensity. Highly nostalgic individuals showed no advantage in a free-recall task, but in response to an open-ended instruction to recount autobiographical memories, they reported memories in which other people played more prominent roles. Batcho’s findings contradict the largely negative view of the nostalgic
individual as fearful, unhappy, or dependent and suggest instead a more flattering image of a person with the capacity to feel intensely and for whom other people are a high priority.

Given that the object of nostalgic feeling is the past, or something no longer present, memory is inherent in the construct of nostalgia. Castelnuovo-Tedesco (1980) distinguished nostalgia itself from reminiscence by defining reminiscence as the act of remembering the past and nostalgia as the bittersweet affect that accompanies certain memories. Therefore, one can remember without being nostalgic, but one cannot be nostalgic without remembering. In 2002, Batcho obtained data showing differences between autobiographical memories solicited by an explicit instruction to recall nostalgic memories and those elicited by a neutral instruction. Nostalgic memories were not rated as either happier or sadder than neutral memories, but they were rated higher in nostalgia, love, and contentment and lower in anxiety, anticipation and fear.

Batcho’s 1998b and 2002 findings suggest that nostalgia may not signify either depression or romanticized optimism but may facilitate or be facilitated by the sense of connectedness to significant others. Within this perspective, nostalgia promotes psychological well-being by countering alienation and strengthening community. In 2004, Batcho explored relationships between personal and historical nostalgia and psychological change following three target events—the terrorist attacks on 9/11/01; the onset of the 2003 Iraq war; and the neutral event of Halloween, 2003. Overall, results supported the potential for psychological growth in difficult times and highlighted the distinction between personal and historical nostalgia. Personal nostalgia was associated with changes that enhance continuity across time, connectedness to others, affiliation, identity, and belonging. Historical nostalgia was associated with less favorable changes in opinions of human nature and sociopolitical factors.
The 2004 findings suggest that highly nostalgic individuals may react differently to particular types of events. In 1998(a), Batcho explored the relationship between nostalgia and the perceived affect in songs. In two control conditions, participants rated the emotional tone of two original sets of lyrics (one happy and one sad). Overall, ratings confirmed that, as intended, the happy lyrics were perceived as happy and the sad lyrics were perceived as sad. Contrary to theories relating nostalgia to depression, high nostalgia individuals did not perceive the sad lyrics as sadder or the happy lyrics as less happy than did low nostalgia subjects. However, the particular content of the lyrics was not designed to elicit nostalgic sentiment. The happy lyrics described the beginning of a new romantic relationship and the sad lyrics described the end of one. In the current research lyrical content was manipulated to explore the relationship of nostalgia to stimulus characteristics.

Four sets of original song lyrics were rated on seven characteristics. All sets involved an individual’s recollection of childhood experiences but differed in emotional tone and topic. Two sets recounted happy times—one focused on the joys and excitement of time spent with childhood friends, and the other focused on the excitement of earning and enjoying a favorite bicycle. Two sets of lyrics recounted sad times in the past—one centered on being ostracized by schoolmates, and the other about loneliness while battling a serious illness. Batcho’s finding of greater emotional sensitivity among highly nostalgic individuals suggests that nostalgic participants may rate the happy lyrics as happier and the sad lyrics as sadder than will less nostalgic respondents.

More importantly, Batcho’s theory of personal nostalgia stresses the centrality of issues of identity and social connectedness in the nostalgic experience. Focused on aloneness, the sad
lyrics in this study should not appeal to nostalgic individuals. Holbrook’s measure, on the other hand, does not involve issues of personal identity and social relatedness, but centers on the relative inferiority of the present time. The view that conditions are getting worse over time might reflect a more cynical or pessimistic attitude among individuals high in historical nostalgia, who might consequently relate more closely to the tone of the sad lyrics.

The possibility that the construct of personal nostalgia is related to that of social connectedness was examined more directly with the inclusion of Lee, Draper and Lee’s (2001) revised Social Connectedness Scale (SCS-R) and Lee and Robbins’ (1995) Social Assurance Scale (SAS) as measures of social connectedness and assurance. Lee et al. (2001) define social connectedness as the emotional connectedness between self and others, including individuals and society in general. They developed the SCS-R to assess social connectedness as a sense of an independent self in relation to others distinguishable from closely aligned constructs such as belongingness understood as group membership or loneliness viewed as feelings of aloneness resulting from the loss of particular relationships. Lee and Robbins (1995, 1998, 2000) theorize that individuals with less well developed social skills and less confidence to function independently in the world need more reassurance from others to feel comfortable and a sense of belonging. They define social assurance as a sense of confidence in social situations reflecting appropriate social skills and the ability to function independently without the need for reassurance from others to belong and to feel comfortable in social settings. To assess social assurance, Lee and Robbins developed the Social Assurance Scale (SAS), comprised of 8 statements expressing the need for reassurance from others. Given that items are rated for disagreement, higher SAS scores reflect greater assurance or confidence in social situations.
If personal nostalgia represents primarily a sense of being connected to society at large, scores on Batcho’s Nostalgia Inventory could be expected to correlate with scores on the SCS-R. On the other hand, if personal nostalgia stems primarily from an individual’s history of specific relationships, scores on the two measures would be unrelated. If personal nostalgia reflects more competent social skills, scores on Batcho’s inventory would be expected to correlate with scores on the SAS. In contrast, defined as a preference for the way things were in the past, historical nostalgia is more likely related to feelings of not belonging or being disconnected from the current social world, and in such case, scores on Holbrook’s Nostalgia Survey would be expected to correlate inversely with scores on either the SCS-R or the SAS.

Method

Participants

A sample of 97 undergraduate students, 71 women and 26 men, completed nostalgia inventories and rated seven characteristics of each of the four sets of lyrics. Students ranged in age from 18 to 39 years old with a median age of 20 years (\(SD = 3.8\)). Participation was voluntary, but some students received optional course credit for their participation.

Material and Procedure

Batcho’s Nostalgia Inventory was included as a measure of personal nostalgia, defined as missing various aspects of an individual’s personal past. Respondents rate on a 9-point scale (1 = Not at all; 9 = Very much) the extent to which they miss each of 20 items from when they were younger. Holbrook’s Nostalgia Survey measures historical nostalgia, defined as a preference for objects more common when the respondent was younger or even before he/she was born.
Respondents rate agreement or disagreement with each of 20 items on a 9-point scale (1 = *Strongly disagree*; 9 = *Strongly agree*).

As a measure of social connectedness, the SCS-R includes 20 statements rated for agreement on a 6-point scale (1 = *Strongly disagree*; 6 = *Strongly agree*). An assessment of social assurance, the SAS is comprised of 8 statements expressing the need for reassurance from others. Respondents rate disagreement with each statement on a 6-point scale (1 = *Strongly agree*; 6 = *Strongly disagree*). As disagreement scores, higher SAS scores reflect greater assurance or confidence in social situations.

A musician was commissioned to compose original lyrics differing in emotional tone (happy versus sad) and in the presence or absence of relationships (related versus solitary), but similar in length and target audience appeal. The lyrics were written to be sung, but were not set to music for this project. Guided by the two content criteria, the musician wrote four sets of song lyrics in a two-by-two factorial design. Two sets involved happy memories and two sad memories. One of the happy sets described happy times spent with friends (Happy Related), whereas the other happy set described the solitary joy of owning and riding a special bicycle (Happy Alone). Similarly, one of the sad sets described rejection by classmates (Sad Related), and the other described loneliness while battling serious illness (Sad Alone).

After signing an informed consent form, participants completed Batcho’s Nostalgia Inventory, Holbrook’s Nostalgia Survey, the SCS-R, and the SAS and rated each of the four sets of lyrics. The order of materials was counterbalanced across participants with survey measures alternating with lyrics. Each set of lyrics was rated immediately after being read by the participant. Lyrics were rated on 9-point scales (1 = *Not at all*; 9 = *Very*) as to the extent to
which they were happy, sad, nostalgic, meaningful, angry, and to what extent the respondent related to them and liked them.

Results and Discussion

Intercorrelations among the four self-report measures (Batcho’s Nostalgia Inventory, Holbrook’s Nostalgia Survey, the SCS-R, and the SAS) will be examined. Developed to assess different psychological constructs, the four measures are expected to be relatively independent.

Participants will be classified as high or low in personal nostalgia on the basis of a median split on scores on Batcho’s Nostalgia Inventory. Each of the seven ratings of the lyrics will be analyzed in a 2 X 2 X 2 (Level of Personal Nostalgia X Emotional Tone of Lyrics X Relatedness of Lyrics) mixed analysis of variance, with level of personal nostalgia (High/Low) serving as the participant variable and with emotional tone (Happy/Sad) and relatedness (Related/Alone) serving as within-subjects variables. Similarly, participants will be classified as high or low in historical nostalgia on the basis of a median split on scores on Holbrook’s Nostalgia Survey, and each of the ratings will be analyzed in a 2 X 2 X 2 (Level of Historical Nostalgia X Emotional Tone of Lyrics X Relatedness of Lyrics) mixed analysis of variance, with level of historical nostalgia serving as the participant variable. Results will be compared for personal and historical nostalgia, and findings will be discussed in relation to theories that link nostalgia to pathology and theories that relate nostalgia to social connectedness.

6. Abstract: Women’s Experiences of Assisted Reproductive Technology in Regional Australia.

This paper provides an overview of the current Australian context of Assisted Reproduction (AR), from a social work perspective, and explores women’s actual experiences of AR procedures and service provision. In-depth qualitative interviews with women in non-metropolitan areas were conducted using a semi-structured interview schedule. The emergent themes from the data were analysed and information on a range of issues affecting women were identified. In particular, women spoke of the adequacy of information on AR, their perceptions of success rates, the impacts of involuntary childlessness, their support needs during treatment, access issues, physical, financial and psychosocial impacts of AR procedures. The findings are of relevance to infertility counsellors, women’s health practitioners, and AR service providers in general.

Abstract

Since the 1990s liberal and democratic reforms in Sub-Sahara African countries, competitive independent and pluralistic broadcasting, particularly radio, have emerged and are providing channel and program diversity for the first time in these emerging democracies. Independent radio has become an entrée into civic discourse and socio-political awareness and a force for social and political integration and accountability. However, these positive developments have overshadowed the observation that Africa's emerging independent radio has become an avenue for corroding their societies' languages and cultures. While they have been insensitive to native languages, they are successful in domesticating the languages of their former European colonizers. Using the experiences of Ghana's radio, this article raises important questions about the relationship between Africa's native languages and the development of a true African broadcasting system. It calls for a reexamination of the belief that the multilingual character of African societies does not serve broadcasting well. It argues that a true African broadcast system that allows for mass participation can develop only if African broadcasters and policy makers address the native language deficiency in broadcasting. Finally, it calls for a deliberate and planned effort to promote the use of African native languages over the Euro-imperial languages in broadcasting.
INTRODUCTION

Language plays a very critical role in national broadcasting systems. While Western countries (Schudson, 1994; Grant, 1994) and Asian countries (Lee & Youn, 1995; Servaes & Wang, 1997) have relied on their own languages for broadcasting, Sub-Sahara African countries continue to rely overwhelmingly on Euro-imperial languages – English or French – for broadcasting even though the majority of their population does not comprehend these languages. African broadcasters, policy makers and media scholars have traditionally failed to examine the implication of the dependency on these foreign languages on the development of a true African broadcasting system. They also have failed to examine the role the dependency on foreign languages played in the failure of national broadcasting systems to encourage civic participation in the media. On the contrary, media scholars have typically attributed the failure of national broadcasting systems to heavy government and state control and censorship, inadequate resources, unstable political structures, and poor programming content (Ansah 1985; Bourgault, 1995). Using the experience of Ghana’s emerging plural and independent radio, its continued and overwhelming dependence on English, and its insensitivity to the country’s native languages, this article attempts to put the debate on the relationship between Africa’s native languages and its emerging pluralistic broadcasting systems on public and scholarly agenda. More importantly, it raises significant, yet unaddressed, questions that are applicable to other emerging democratic African nations reforming their broadcasting systems: To what extent should emerging pluralistic, commercial and independent radio in African societies be responsive to their national cultures and languages? What constitutes a “culturally appropriate” radio broadcast language in a multilingual society attempting to create a competitive and independent broadcast environment? What cultural task, if any, does commercial and independent radio have in an emerging democratic and liberal society? Should
developing countries reforming their broadcasting systems develop policies to safeguard against foreign language and cultural influences? Do private broadcasters in developing countries have the same obligation as public broadcasters to promote the culture and language of the society they operate in?

Using results from in-depth interviews with Ghanaian broadcasters, government officials, media scholars and journalists, and audience survey data (n=408) gathered in Accra, the capital city of Ghana, from 1998 to 2002, this article makes the following arguments: First, though the emerging independent and private radio have provided channel and program diversity, they have failed to reflect and promote their society’s cultures and native languages. Second, their insensitivity to their societies’ native languages and local cultural products is a consequence of the erroneous view of broadcasters that the public has a ‘need for entertainment and pleasure,” (see Senghor, 1996), which can be met by airing more foreign programs, broadcasting with foreign languages, and in some cases, mimicking foreign accents. Third, a culturally appropriate and true African radio broadcast can develop only if broadcasters and media policy makers develop deliberate policies that seek to encourage the use of native languages and promote local cultures and talents; something they have not paid attention to as they reform their public broadcasting. Such policies would ensure the ability of emerging pluralistic radio to communicate with the majority of the populace and encourage more participation in civic discourse in discernible languages. Finally, this paper calls on African broadcasters, media scholars and policy makers to re-examine the overwhelming dependence on Euro-imperial languages for broadcasting. This is important because with the exception of Sub-Saharan Africa, there is ample empirical and theoretical evidence to support the centrality of language to national broadcasting systems globally.

Centrality of Language and Culture in National Broadcasting Reforms: A Theoretical Framework
The centrality of language and culture in broadcasting reforms has been extensively researched in the United States and Europe (Schudson, 1994; Grant, 1994; Thomsen, 1989; Owen, 1977) and Asia (Kamin, 1996; Lee & Youn, 1995; Servaes & Wang, 1997). On the contrary, very little research has been done on similar broadcasting issues in sub-Saharan Africa (Leonard, 1996). Arguably, language and culture are the most visible and most problematic forces for societal integration. Schudson (1994:64) argued, “culture, that is, the way of life of a society, brings individuals and families of varying circumstances and backgrounds together in a collectivity with which people may strongly identify, take primary meanings from, and find emotionally satisfying.” This role of culture as an integrating factor is clearly evident in many African societies. These historically have developed and existed on the basis of strong cultural, linguistic and ethnic bonds. Culture is most visible in African societies because many nations self-consciously use language policy and mass media to integrate citizens and ensure their loyalty (Tomlinson, 1991). Likewise, the importance of language in any society can scarcely be overestimated. According to Anderson (1983:46) “the fatality of human linguistic diversity” has strongly guided the formation of nation states.

Broadcasting systems are by origin, practice, and convention very much national institutions that respond to cultural, domestic, political and social pressures and to the expectations of their audiences (McQuail, 1993). Ugboajah (1985) argued that the structure and content of broadcasting systems should reflect the cultural character of the societies within which they operate. Thomsen (1989) also noted that as broadcasting systems become pluralized they cease to reflect the culture and the circumstances of their intended publics and may even undermine the local language and cultural identity as a result of the transnational flow of content. Similarly, theories dealing with cultural integrity and imperialism typically have been concerned with matters of cultural quality of the content of media, its
authenticity in real life experiences, and the cultural task of broadcasting. Underlying these theoretical positions is a strong belief that languages and cultures are both valuable collective properties of nations and also vulnerable to alien influences (McQuail, 1993). Throughout the history of broadcasting development, we see these ideas deeply rooted in arguments for protecting national languages and cultural identities.

Culture and Language Issues in Broadcasting: Global Experiences

Strong cultural reasoning has permeated broadcast policy formulation, content, and structure in Europe and North America since the 1940s. Discussions about language problems, and of parties representing regional and cultural interests, were pivotal in broadcast reforms in many Western countries. European media scholars (e.g., Schlesinger, 1991; Drijvers, 1992) have argued that public service broadcasting was conceived of as a “cultural lever” in the hands of European states for the defense of their national cultures. On the national level, they argued, public service broadcasting sought to unite nations by ignoring local and regional differences and by presenting a unified national culture. On the international level they sought to defend national cultures against the growing threat of internationalization (Blanco & Bulck, 1995).

Belgium, Spain and Canada offer solid examples of the extent to which broadcasting language was a political and cultural matter. In Belgium and Spain, cultural and language concerns in broadcasting led to the development of independent French-speaking and Flemish-speaking channels, the creation of separate “cultural councils” responsible for “cultural matters” in the Flemish community and the French-speaking community, and the creation of regional broadcasting (Blanco & Bulck, 1995:245). In Canada, broadcasting began as an effort to assert cultural autonomy against the hegemony of the United States and to “create a national consciousness” (Schudson, 1994:74).
During the 1980s, several Asian countries also began to reform their public broadcasting systems by introducing commercial and pluralistic broadcasting (Straubhaar, 1995; White, 1996). Prior to the reforms, Asian broadcasters and government officials made deliberate policies to ensure that broadcast pluralism would promote program diversity without sacrificing individual national cultures and languages (Lee & Youn, 1995; Servaes & Wang, 1997). For instance, in Malaysia, Philippines, Thailand, and Singapore safeguards were made to ensure that national cultures were protected from foreign influences. A regional broadcasting union, Asian Broadcasting Union (ABU), was created to ensure that national cultures, languages, and local programming were protected and promoted as private and independent broadcasting developed alongside public broadcasting (Kamin, 1996).

Unlike their counterparts in Europe or Asia, African broadcasters typically have employed French or English, the languages of their former colonizers, for official communications and for broadcasting. However, prior to handing over political governance to African native administrators in the 1960s, efforts were made in some countries to indigenize broadcasting. Native broadcasters, administrators, and technicians were trained to take over from the departing expatriates (UNESCO Report No.33, 1961). Immediately following independence, post independence African governments realized that for national and rural development goals to be realized, and to reach the majority rural peasant population, radio broadcasting should accommodate itself to native languages and cultural differences within their societies. Thus in the 1960s some governments began to introduce native languages for radio broadcasting. For instance, in Zambia where there were about 20 major languages spoken by 73 ethnic groups time was allocated to seven native languages in proportion to the size of language communities in the nation (Mytton, 1983). Following President Kenneth Kaunda’s tribal balancing policy instituted upon Zambia’s independence, a variety of native languages including Bemba...
and Nyanja were added to English in 1967. In the mid-1980s, Kaonde, Lozi, Lunda, Luvale, and Tonga also received broadcasting time allocations. However, in 1988, all Zambian languages were removed from the general radio service. By 1990, Zambia’s Radio 2 and Radio 4 were broadcasting only in English. Seven Zambian languages shared equal airtime on Radio 1, although the languages representing the largest groups of people received the best times of day for broadcasting (Spitulnik, 1992). Similarly in Kenya, the Voice of Kenya (now the Kenya Broadcasting Corporation) used English to transmit its General Service program and Swahili for the National Service program. In addition, there were three regional services on which time for a total of 16 native languages was shared (Heath, 1986). Similar efforts to introduce native languages into radio broadcasting occurred in Ghana.

Efforts to Indigenize Radio Broadcasting in Ghana

In 1935, the British administrators introduced radio into Ghana. Despite the fact that Ghana had about 79 living native languages (UNESCO, World Communication Report, 1989), English was used to broadcast all radio programs. This was because English was adopted as the national or official language. However, the British administrators soon realized that radio broadcasting in Ghana must use vernacular languages if its programs were to be understood by the natives. So in 1939, the colonial administrators began introducing Ghanaian languages and personnel into radio broadcasting. Ghana Radio began to broadcast in Ewe, Twi and Hausa native languages. Two additional languages, Ga and Dagbani, were added during the 1940s (Kugblenu, 1974; Ansah, 1979). Of the 79 native languages, only nine were used by the state broadcasting system, the Ghana Broadcasting Corporation (GBC), to air different national programs. The native languages included Asante Twi, Akuapim Twi, Fante, Ewe, Ga-Adangbe, Nzema, Dagbani, Dagaari, and Kasem. The government also used Frafra, Buli, Kusaal,
Negotiating the Use of Native Languages in Emerging Independent Broadcast Systems in Africa

*Sisaala,* and *Gonja* in its non-formal radio education programs in the Northern and Upper regions of the country (UNESCO, World Communication Report, 1989).

The character of the broadcast personnel also began to change. In 1949, there were 13 native Ghanaian managers and 46 technicians working in the GBC. By 1956, these numbers had increased to 163 native managers and 445 technicians (Tudesq, 1983). In 1985, GBC had a total of 2,888 Ghanaian employees in both radio and television broadcasting. These included 404 program and journalistic staff, 1,473 technical staff, 751 administrators, and 260 supporting staff (UNESCO, World Communication Report, 1989).

The indigenizing of Ghana’s broadcasting intensified during the post-colonial period and well into the 1970s. The post-independence government of Kwame Nkrumah and the Convention Peoples Party (CPP) reiterated the importance of broadcasting in consolidating the new nation. In the early 1960s, the government, with the support of the United Nations Educational Scientific and Cultural Organization (UNESCO), launched development plans intended to expand radio broadcasting to rural areas (UNESCO Paper No. 51, 1968). Educational radio was established to promote rural education and development. Radio listening clubs in native languages were also established to bring about awareness among rural peasants of the new government and its development plans (Coleman & Opoku, 1968). Tudesq (1983) explained that the use of mass media, particularly radio, for development was a highly salable idea in the 1960s. The idea of rural radio broadcast in native languages appealed to the new elites in the new independent Ghana because it permitted the elites and government to communicate directly to the majority rural peasants and to re-orient them toward the central government and its policies. However, critics argued that the Nkrumah government’s efforts to indigenize broadcasting and
to establish rural radio projects in native languages were propaganda plots to politically sensitize the rural populations (Ansah, 1979, 1988; Coleman & Opoku, 1968).

By the late 1960s, the novelty of rural radio broadcasts had begun to wear off. As more and more Ghanaians acquired radio sets, interest in group listening began to wane. Many of the rural radio projects began to fail due to poor conceptualization and implementation. For instance, some adult literacy programs were ill received by adult audiences who objected to literacy lessons originally designed for school children (Coleman & Opoku, 1968). In addition, most of the early rural radio projects were insufficiently integrated into the existing national broadcasting services. Consequently, the government abandoned most of the rural radio services.

Nonetheless, radio broadcasting continued to expand, albeit slowly, in the 1970s and 80s because it was too important a tool to be ignored. In the 1980s, Ghana Broadcasting Corporation (GBC) increased its radio transmitters for its regional FM services. The transmitters were provided through bi-lateral aid in support of rural-based community education projects (Amakyi, 1988). During the same period, GBC focused also on using native languages and programs in its regional FM services. A UNESCO survey of the broadcasting content of Ghana from 1975 to 1988 revealed that news bulletins produced originally in English language were increasingly translated into rural languages (UNESCO, World Communication Report, 1989). By the late 1970s, news on GBC Radio was translated into six native languages -- Akan, Dagbani, Ewe, Ga, Nzema, and Hausa (Ansah, 1979). News represented at the time close to 50 percent of broadcasting on radio. The UNESCO survey on Ghana again revealed that cultural programs (dealing with traditional Ghanaian festivals and folklore) represented less than 15 percent of broadcasting in the 1980s; educational programs occupied about 20 percent of radio broadcast time; religious broadcasting by major Christian and Muslim groups averaged
less than 5 percent of broadcast schedules; advertisements carried on GBC radio services, in order to help stem budget deficits, took up an average of 2 percent of broadcast time (UNESCO, World Communication Report, 1989).

The development of radio broadcasting in Ghana has not occurred in a smooth political environment. In the early 1960s, political pressures began to mount against President Nkrumah and his Convention Peoples’ Party (CPP) government as the population increasingly showed their disappointments with the unfulfilled promises of the early post-independence era. The government began to find means to curb media access and to consolidate central power through repeater stations that disseminated messages from the capital cities where broadcasting could be more carefully monitored and controlled. Ultimately, a pattern emerged in Ghana that favored direct government control of broadcasting and the use of broadcasting to disseminate government propaganda (Ansah, 1985; Bourgault, 1995). By the 1970s, the state-owned Ghana Broadcasting Corporation (GBC) had been firmly placed in control of the government. This control and GBC’s monopoly were broken in 1995 when the erstwhile government of Jerry Rawlings and the National Democratic Congress (NDC) liberalized the Ghanaian economy and allowed for broadcast pluralism and privatization.

The Development of Private Radio Broadcasting

In the mid 1990s, Ghana’s structural adjustment policies turned into a long term goal of establishing a democratic, liberal and free market economy (Gyimah-Boadi, 1999). The public broadcasting system also came under intense criticisms and ultimately to its reform. The reform was the result of external and internal pressures. Externally, it was associated with a new era of political pluralism and neo-liberal economic policies that swept across the sub-Saharan African continent in the
decade following the collapse of the Soviet Union. After decades of state control and limited choice of media, liberal rhetoric that associated democracy with private media and a free market was particularly attractive to both the general public and business community (Heath, 1999, 2001). In addition, there was pressure from international donor agencies such as the IMF and the World Bank who made democratic and liberal reform a condition for continued external loans (Gyimah-Boadi, 1999).

The internal pressure came mainly from the Ghanaian academic community in the form of organized conferences that aimed at putting democracy and media liberalization on the public agenda (School of Communication Studies, 1993). For example, at the opening ceremony of a conference organized by the Unda/OCIC (International Catholic Organization for Cinema and Audiovisual) in Accra on September 6, 1992, the academic community realized a change in government attitude towards the media in a speech delivered by the Information Minister of Ghana when he declared a major policy change:

> The political changes taking place on the continent are likely to lead to the review of state monopoly in the electronic media. We in Ghana have, within the framework of our national communication policy, proposed a degree of deregulation in the electronic media set within clearly defined guidelines (Bonnah-Koomson, 1994:85).

This official policy declaration signaled a change in the attitude of the government of Jerry Rawlings and the National Democratic Congress (NDC). It also inspired the School of Communication Studies, University of Ghana, with support from the West Africa Regional Office of the International Development Research Center in Dakar, Senegal, the Friedrich Ebert Foundation, and the Panos Institute, to organize two conferences, first in March 1993 and a follow-up conference in November 1994, on broadcast pluralism and privatization. The conferences highlighted the need for broadcast pluralism and publicly criticized the government for its disregard of the constitutional rights of Ghanaians.
by not allowing for press freedom and independent broadcasting as guaranteed by the 1992 Fourth Republic Constitution of Ghana (Bonnah-Koomson, 1995). Article 162 of the 1992 Constitution guaranteed freedom of expression and forbade the licensing of any medium of mass communication, including radio and television. It stated:

There shall be no impediments to the establishment of private press or media; and in particular there shall be no law requiring any person to obtain license as a prerequisite to the establishment or operation of a newspaper, journal, or other media for mass communication or information (Republic of Ghana, 1992 Constitution, Article 162 [3]).

The conferences also set a public agenda around arguments for and against the introduction of independent and private broadcasting in Ghana. Proponents urging constitutional rights and broadcast liberalization, mainly from the academic community, argued that independent broadcasting was needed to assure genuine pluralism, social development, and national unity. They further claimed that broadcast pluralism would promote program diversity and competition and encourage the development and use of Ghanaian cultural products and languages. But those opposed to broadcast pluralism, mainly government officials, invoked a cultural argument and expressed concern about the negative effects commercial broadcasting could have on Ghana’s culture, local talents and native languages (see Ansu-Kyeremeh, 1995; Bonnah-Koomson, 1995; Heath, 1999; Karikari, 1994).

Nevertheless, in 1995 the National Democratic Congress government reluctantly authorized private ownership and operation of broadcasting (Blankson, 2000; Heath, 1999, 2001). This action broke the decades of monopoly enjoyed by the state-owned Ghana Broadcasting Corporation (GBC) and set a pace for the establishment of independent private radio in Ghana. By late 2002, 14 new private FM radio stations had received licenses and were operating in Accra alongside the state owned stations: the short wave stations Radio One and Radio Two, and the FM service Radio GAR. The
private radio stations included Joy FM, Radio Gold, Radio Univers, Choice FM, Radio Atlantis, Groove FM, Radio Vibe, Peace FM, and Channel R. Several other applicants were awaiting approval and licenses from the Ghana Radio Frequency Distribution and Registration Board (GRFDB).

These private stations began to provide channel and program diversity for the first time in Ghana’s history. However, they were very similar in many ways and followed almost the same broadcast format. Music, particularly Western and Caribbean music, interjected with talk accounted for between 75 percent and 80 percent of the radio air time (Blankson, 2000). Though the radio stations played a number of “hip-life” (Ghanaian version of rap music), noticeably absent were traditional Ghanaian folk music such as “boboobo,” “kpalongo,” and guitar music or “highlife.” The Ghana Broadcasting Corporation continues to be the primary source of local and foreign news. However, some of the private radio stations retransmitted foreign or world news through exchanges with international stations such as the Voice of America (VOA), British Broadcasting Corporation (BBC), and Radio Netherlands. Almost all stations aired their local and foreign news in English. Besides music and the news segments, the stations introduced a variety of interactive phone-in or talk programs that actively engaged the public. These addressed a wide array of social, health, environmental, and political issues. Others engaged in mobilizing citizens for community work.

Despite the diverse, interactive, and entertaining content of the emerging radio stations, their overwhelming dependence on English and the relatively limited use of Ghanaian native languages and cultural programs are issues that need to be addressed.

**Insensitivity of Radio to Ghanaian Culture and Native Languages**
Ghana has about 79 living native languages. However, English has historically been the predominant language for broadcasting since the colonial days. Though post colonial governments introduced native languages into broadcasting, for years the predominance of English over native languages and its possible effects on native language use in broadcasting were ignored. As broadcasting pluralism became a reality in 1995 and more vibrant and competitive commercial radio stations emerged for the first time in Ghana’s history, Ghanaians hoped (as was promised by proponents of broadcast pluralism) that their native languages and cultural talents would be promoted and utilized by the new radio stations. On the contrary, the emerging radio stations, earlier in their operations, opted to broadcast solely in English. Both the public and private radio stations neglected to use any of the country’s 79 native languages solely or predominantly to air their programs. Ghana’s radio environment began to experience what the former Deputy Minister of Communication, Commander (rtd) Griffith, described as the “foreignization” of Ghana’s radio broadcasting. The Minister observed that some of the radio stations, particularly Vibe FM, were so dominated by English when they started that listeners phoned in to inquire whether the stations were foreign (personal communication, 22 October 1999).

By late 2000, none of the Accra radio stations was broadcasting solely or predominantly in any Ghanaian native language. However, in response to public criticism, some stations began to develop and air one or two programs in a native language. Stations like Radio GAR, Radio One, Radio Two, Joy FM, Radio Gold, Peace FM and Radio Univers began re-broadcasting their news bulletins in either the Twi or Ewe native language. Between 1995 and 2000, all the stations that had developed audience participation programs used predominantly English. Early in 1997, the University of Ghana station, Radio Univers, successfully introduced a Twi talk-program ‘Obiara Nka Bi.’ Following its success, Radio GAR developed an Akan talk program, ‘Agoro Na Me Pe,’ that received public acclaim.
Others such as Vibe FM, Groove FM and Joy FM followed the successful lead provided by Radio Univers and introduced similar audience participation programs that actively engaged the public. For instance, Radio Gold developed an *Akan* program that discussed the *Akan* culture and traditions. By late 2001, Peace FM and Radio Gold had begun to air their news in English and two native languages *Twi* and *Ga* in response to public criticism. Radio Gold and Joy FM also started airing some of their phone-in programs in *Twi*. However, few stations allowed their contributors to use their native languages though the program host spoke in English. This format required the program host to be multilingual. It also required the listeners to have the ability to comprehend what the host said in English. The state-owned Radio GAR did not have an audience participation program aired exclusively in any of the Ghanaian languages until mid-2001, though its policy guidelines called for 80 percent of programming in vernacular languages. The public expectation that their emerging radio stations would encourage the predominant use of more Ghanaian native languages in broadcasting was, however, thrown into question.

**Discussion**

The emerging cultural and linguistic character of radio broadcasting in Ghana, and many other African societies, raises important issues. Does the emerging character of radio pose a threat to the cultures and languages of the societies within which they operate? Is there a culturally appropriate broadcast language in multilingual African societies? Is there a justification for the continued overwhelming reliance on Euro-imperial languages in Africa’s radio? Or does such dependency prevent the development and use of native languages in broadcasting?
The importance of national languages in broadcasting systems globally cannot be disputed except in Sub-Saharan Africa, where broadcasting relies heavily on foreign languages. This raises concern over the effects the continued dependence on foreign languages have on the continent’s emerging broadcasting, particularly radio. Schudson (1994) reminded us that language is itself the fundamental human mass medium. It is the mass medium through which all other media speak. No other medium is so deeply rooted, so emotionally fraught, so insistently the basis for political aspirations, or so much an impediment to the efforts of states to use modern media for hegemonic control. Thus, in Africa, as in other societies, the use of a native language should not be seen as neutral medium for communication but a highly charged cultural object to be harnessed for development and civic participation. How has this characterization of language played out in African broadcasting systems?

Some media critics have charged that the emerging private stations have become “Trojan horses of Anglo-Saxon culture and music and, thus, for hastening the disintegration of local cultures” (Senghor, 1996:97). Others disagree. Senghor (1996), for instance, claimed that the success enjoyed by radio stations bears witness to listeners demand and need for entertainment and pleasure, something that the state-run stations did not know how to address. However, evidence from Ghana, Burkina Faso, and several other African societies does not support Senghor’s claim. In Ghana, radio stations had become competitive grounds for program hosts and news readers to prove who could speak with the best foreign accent. Consequently, a phenomenon known in Ghanaian popular culture as LAFA (Locally Acquired Foreign Accent) had emerged where program presenters and hosts, who had never traveled to the United States or the Caribbean, were mimicking American and Caribbean accents. In their attempt to do so they mispronounce common Ghanaian names and words. Not surprisingly, the Ghanaian youth picked up on it and begun to mimic foreign accents and American slang (Blankson,
Negotiating the Use of Native Languages in Emerging Independent Broadcast Systems in Africa

2000). Similarly in Burkina Faso, Horizon FM’s musical programs, mostly reggae, rock, and pop music were hosted by a disc jockey, who, wearing a baseball cap spoke in a jargon of “franglais” (Senghor, 1996:97). Nevertheless, some contemporary African private broadcasters and media scholars have refused to acknowledge the negative effects these developments have on the societies’ languages and on broadcast professionalism in general. Perhaps, African private and commercial broadcasters should begin to acknowledge that they have the obligation, as do public broadcasters, to protect and promote their societies’ native languages and harness them to encourage more public participation in the media.

Like their African counterparts, Ghana’s radio broadcasters have downplayed the importance of local languages. Their insensitivity to native languages has contributed to the erosion of early post independence efforts in the 1960s and 70s to intensify the indigenization of broadcasting. This raises the critical question of what constitutes, if any, an appropriate broadcast language in developing African democracies that are reforming their broadcasting. This issue is even made more critical because it is asked in the context of societies that are multilingual, that has for decades depended on Euro-imperial languages, English or French that are unintelligible to over half of their populations.

Interestingly, some Western media scholars have defended the predominant use of Euro-imperial languages as the most appropriate broadcast languages in African societies. For example, Spitulnik (1992) argued that English and French are the only languages that are “ethnically neutral” and, thus, non-native to the indigenous ethnic groups. He also claimed that English or French have become the predominant broadcast language of choice in countries colonized by Britain or France to resolve competition among linguistic groups. Unfortunately, these arguments have been used successfully to discourage African broadcasters and policy makers from promoting the development of their native
languages in broadcasting and as national languages. Some African broadcasters and media scholars are convinced that Africa’s diverse native languages do not serve its broadcasting institutions well since it excludes minority languages (see Senghor, 1996). Using Senegal as an example (Senegal uses six of its twelve spoken native languages to broadcast radio programs), Senghor for example argued that the exclusive use, on national radio, of widely spoken local languages excludes linguistic minorities from the audience. She further claimed that in broadcasting systems where several local languages are used, the dominant local language (that of the largest population group or that of the most powerful social group) tends to overshadow the other languages. Therefore, she cautioned, “imagine the situation in other African states, with their multitude of languages” (Senghor, 1996:85).

Unfortunately, this negative view towards the use of native languages in Africa’s broadcasting is shared by many broadcasters and media policy makers in Africa. This view has affected African broadcasting development in significant ways. First, for decades it succeeded as a valid justification for efforts to deepen what Mazrui (1996:4) called the “domestication of Euro-imperial languages” in African broadcasting. And, secondly, it succeeded in discouraging legitimate attempts to promote the use of more native languages in broadcasting on the grounds that using a native language would exclude other linguistic minorities from the audience. But how valid or legitimate are these arguments? Those who hold such a negative view towards native language use in broadcasting fail to realize that these arguments can also be used against the use of English or French in African societies. The case of Ghana, though not unique in Africa, provides a good illustration. In Ghana, Akan, one of the major native languages, is spoken by 44 percent of the over 19 million Ghanaians (Nkansah-Kyeremateng, 1996; Akan Dictionary Project, 2001) compared to functional English which is spoken by only 36 percent of the total population (UNESCO, 1996). Yet some Ghanaian broadcasters and media scholars continue to
believe that the use of a native language like *Akan* for broadcasting would exclude more linguistic minorities from the audience. It is clearly obvious that the use of English in Ghana’s radio actually excludes more minorities, including the majority of the 65 percent rural peasant population, from participating in radio broadcasting. According to UNESCO, over 60 percent of Ghanaians were illiterates in 1996. Literacy rate was 36 percent. It is quite obvious that the majority of Ghanaians does not, and cannot use English to participate effectively in civic discourse on radio.

Evidence from Ghana, Namibia, Mali, and other countries suggests that African radio audiences actually prefer programs aired in their native languages over those aired in the languages of their former colonizers. They also feel more comfortable participating in programs that are broadcast in a native language. In Ghana, for instance, my investigation revealed that the most popular programs were not the “entertaining and pleasurable” musical programs Senghor (1996:97) claimed. Rather they were the interactive programs that engaged the audience in discussions on social, health, economic and even political issues in one or two native languages (Blankson, 2000). Stations like Joy FM, Radio Gold, and Radio GAR were popular because of their interactive talk programs in native *Akan* languages. Radio Univers particularly attracted listeners with its educational and news bulletins and press reviews in *Ewe* and *Twi* native languages. It was no surprise that over 65 percent of the audiences surveyed (n=408) disliked the predominant use of English on the radio airwaves. The majority of them considered the dominance of English as a hindrance to both the promotion of Ghana’s native languages and the participation of many Ghanaians in radio discussions. Only 28 percent of those surveyed considered English language appropriate for radio broadcasting. These cited the country’s multi-lingual character and the neutrality of English language to ethnic boundaries to justify their response. The remaining 17 percent respondents were indifferent.
Senghor (1996) even acknowledged that the popularity of Namibian Broadcasting Corporation since its transformation in 1993 was the result of the successful interactive programs it developed in various national languages to encourage open public debate among Namibians and their leaders. The programs were broadcast (via satellite) over a larger area to reflect the country’s multicultural nature. Similarly in Mali, Radio Bamakan, which started to broadcast in September 1991 without authorization, immediately aroused the enthusiasm of the people of Bamako because it translated simultaneously in the local language, Bamanan, the debates of the democratically elected parliament, conducted in French, which less than 30 percent of the people of Bamako understood. It even broadcast every week, also in Bamanan, a review of the national and international press with equal success (Senghor, 1996). Finally, the popular Senegalese station Sud FM exhibited considerable multilingualism that it was common to hear a listener, as well as the host, switch languages in one and the same show.

Unfortunately, many contemporary African broadcasters and media scholars have confused what they perceived as the audience’s need for entertainment and pleasure with foreign programming and the use of foreign languages and accents. Others have even characterized Africa’s emerging radio as a factor of cultural change because they not only record, preserve, and file traditions particular to the territory, land, or community in which they broadcast but they also manage to create or encourage the creation of new and popular verbal or musical forms (see Senghor, 1996). Furthermore, it has been argued “by preserving and creating local popular culture, radio stations succeed where the state and the elitist civil society of experts and intellectuals seem to have failed” (see Senghor, 1996:81).

Though these characterizations are interesting my research in Ghana suggests otherwise. In Ghana the overwhelming majority of the radio stations have not succeeded in appropriating, preserving or creating cultural forms and languages indigenous to the people. Rather, they have collectively
succeeded in fortifying the domination of English over native languages, and in mimicking foreign accents at the expense of broadcast professionalism. Though it is important to acknowledge the positive developments associated with the emerging radio stations as pointed out by Senghor, it is equally important to critical examine their failures, especially at it relates to the use and promotion of more native languages in broadcasting. After all, this is one of the major arguments raised in support of the development of independent media in many African countries, including Ghana. (see Ansu-Kyeremeh, 1995: Bonnah-Koomson, 1994, 1995). In a sense, what African societies need is a broadcasting environment that would provide multiple forums for its people to freely engage each other in languages that the majority, if not all, would understand and feel comfortable with. They also need a broadcasting environment that would recognize the importance of local languages as well as protect and promote their culture and languages, something that Africa’s emerging private radio collectively have failed to do.

**Conclusion**

Undoubtedly, in Ghana and other parts of Africa, radio broadcasting is more competitive and diverse in terms of program and channel choice. Radio broadcasting has become an entrée into civic discourse and socio-political awareness. It has also become a powerful force for social and political integration. Through the efforts of private radio, politics has become nationalized and civic discussions on varied issues intensified. But on a more critical level, Africa’s emerging radio has become avenues for corroding their societies’ languages and cultures. While they have collectively been insensitivity to their native languages and cultural talents, they have been successful in domesticating English and Western broadcast content. Thus, for Africa’s broadcasting to be useful to the majority of its people, and for it to develop an identity of its own, the language and cultural policy question must be seriously addressed.
Clearly, what is happening in broadcasting is a reflection of African governments’ failure to provide broadcast policies that seek to protect their cultural integrity and promote native languages. It is also a consequence of the negative views broadcasters and media scholars have on the multi-linguistic character of African societies, especially as it relates to broadcasting. Thus, African broadcasters, both private and public, should have a mandate to protect and promote their societies’ cultures and languages. This is important because culture is a means of communication that provides language (Mazrui, 1996) for meaningful interactions. The potential of indigenous African languages as cultural expressions and identity formation cannot be overlooked by media policy makers in this critical time of broadcast transformation. Contemporary African broadcasters cannot continue to rely overwhelmingly on Euro-imperial languages for their discourse if they hope to engage the majority of the people. It is even doubtful that a “true” African broadcasting system would emerge if it continues to be so tightly held hostage to the languages of their former colonial powers. Mazrui (1996:4) reminded us that “no country has ascended to the level of economic power by excessive dependence on foreign languages.” The claim that broadcast pluralism and independence in emerging African democracies would automatically encourage the growth of local cultures and the use of native languages cannot be realized unless private broadcasters realize they have the same obligation as public broadcasters to promote the culture and languages of the societies within which they operate. It can also be realized only if emerging African democracies reforming their broadcasting systems towards commercialism develop deliberate policies to promote their native languages and cultures. African broadcasters and media policy makers should be mindful of the experiences of Asian countries where deliberate language and cultural policies successfully guided broadcast reforms and protected Asian languages from domination of Western languages and cultural products (see Lee & Youn, 1995; Servaes & Wang, 1997). As media scholars concerned with
the cultural and language direction of Africa’s broadcasting systems, we cannot but raise these issues at a critical time that African broadcasting is at its early stages of transformation towards pluralism and privatization.

Abstract:

What’s in a Name?
Investigating the effect of explicit naming on cognitive representation

The cognitive representation of perceptual phenomena requires the activation of features across a distributed network of conceptual and perceptual domains. These features include concrete modality-specific representations appropriate to the perceptual features associated with the target, as well as abstract representations specifying its conceptual properties. The present experiment is aimed at assessing the degree to which lexical representations differentially activate conceptual vs. perceptual features of the categories they reference. Subjects were asked to name triplets of figures (naming task) and judge their similarity using an alternative forced choice paradigm (similarity task), with task order manipulated across subjects. Triples were constructed such that each contains two perceptually similar targets (e.g. a pear and a light bulb) and two conceptually similar targets (e.g. the pear and a banana). As predicted, subjects who explicitly named the figures prior to judging their similarity were subsequently more likely to group the conceptually similar pair as compared to subjects who performed the similarity task first. Conversely, subjects who performed the similarity task prior to naming the figures were more likely to utilize superordinate category labels (e.g. “fruit”) than were subjects who performed the naming task first; the latter overwhelmingly preferred basic level names (e.g. “pear”). These findings are attributed to a model of cognitive representation in which category activation by way of explicit lexicalization (e.g. naming, reading, hearing) privileges the conceptual features associated with the target over that of their perceptual features. Such a model can provide the groundwork for a causal mechanism able to explain socially relevant phenomena—notably racial stereotyping. For example, it may help explain findings that young children—though aware of racial categories—appear to understand relatively little about the perceptual correlates of those categories and learn them primarily on the basis of verbal cues. The present experiment suggests a clear explanatory mechanism for such findings in terms of differential activation of perceptual vs. conceptual features as a function of whether targets are explicitly named. This differential activation should be observable in terms of disparate patterns of neural activation, suggesting avenues for further research utilizing brain-imaging techniques.

Waikiki Beach Marriott
HONOLULU, Hawaii
(June 13-16, 2005)
Ideally, natural resource wealth should help, not hinder economic performance, yet a body of empirical evidence from some developing nations has revealed negative correlation between natural resource abundance and economic growth. As such, during the last several months, a great deal of attention has been paid to what has been referred to in the literature as resource curse as found in some developing countries, especially those in Sub-Saharan Africa (Afty; Collier, P. et al.; Collier & Hoeffler 2000). The characteristics of this phenomenon include:

- Endowment of natural resources considerably increases the chances of civil conflict in a country.

- A country that has little or no natural resources faces an insignificant probability of conflict, and has a better chance of economic growth.

- Economies experiencing natural resource booms, either through price increases or new discoveries, appear to experience unsustainable economic growth rates.

- As such, natural resources appear to be detrimental to institutional quality, and so may have a negative impact on growth rates.

The paper attempts to critically examine the relationship between endowment of natural resource boom and increased chances of civil conflicts and/or unsustainable economic growth. Using Botswana and Ghana as an example, an effort will be made to find out the reasons why some economies with a high ratio of natural resource exports to GDP tend to have low growth rates, while others escape the so-called resource curse.
Title: WILLING SUBJECTS: Academic Africana Lesbians "Out" And About

Presenter: Angela Bowen
Department of Women's Studies
California State University, Long Beach
522 Lime Ave. Long Beach, CA 90802
abowen2@csulb.edu
Workshop Presentation/discussion

The purpose of this workshop is to discuss the phenomenon of black lesbians being out within academia: how black lesbian professors make the decision to be out within academia and how that decision affects them in three professional areas:

1) research
2) pedagogy
3) career
This study does not address the participants' personal lives.

1) In the area of research, the workshop leader will involve participants in a discussion exploring the phenomenon of whether being out affects the choices that black lesbians make in regard to the topics/areas of their research, and if so, what that effect may be; how their methods in conducting their research might be affected by their (in) visibility as out lesbians; and the effects that their (in) visibility might have on their access to publishing opportunities.

2) In the pedagogy area, the discussion will address whether the subjects/informants teach lesbian issues and if so, whether they address experiential and sociological as well as theoretical lesbian issues in the classroom; whether they incorporate political and philosophical discussions also; and whether they reveal their sexual orientation within the classroom--and if so, what methods they use in their approach; and whether those discussions affect their relationships with students, and if so, how.

3) In the career area, the workshop leader will relate how being out affects black lesbians' relationships with colleagues and administrators, and consequently and ultimately, their careers within academia.

This workshop is based on an ongoing set of interviews which will culminate in full individual essays by a number of "out" academic Africana lesbians whose total number of years laboring in the "knowledge factory"* number 76, with the number still climbing.

An Empirical Analysis of Attitudes toward Women as Managers in the People’s Republic of China

Abstract

China has become a popular host country for multinational corporations since joining the WTO in 2001. However, there is a general lack of understanding of the Chinese culture and lack of empirical study on perception of women as managers in China. This study provides historical, cultural, social, and legal contexts of the Chinese society and empirically compares attitudes toward women as managers among students and workers. Results show significant gender and sample effects. Further analysis revealed that the gender effect was stronger than the sample effect. Women have a much more positive, liberal, and egalitarian attitude toward women as managers than men. Implications of these results are discussed based on the cultural and social contexts. Managerial implications are provided.
Women managers who wish to attain senior level positions in multinational corporations (MNCs) find that international assignments provide the visibility required for advancement (Caligiuri & Tung, 1999). The host country’s attitudes toward women managers are among the four important predictors of success for women managers on global assignments, along with individual characteristics, organizational policies and practices, and family adjustment (Caligiuri and Cascio, 1998). Unfortunately, there are few empirical studies on attitudes of women as managers in non-English speaking countries. China is, without a doubt, the most powerful and mysterious one among them.

China is changing very rapidly. With a population of 1.3 billion, and a GDP of 1.2 trillion dollars, its emergence as an economic power is having a huge impact on global trade. China’s accession to the World Trade Organization in December 2001 not only provides the world with unprecedented access to China’s markets but also turns it into the biggest manufacturing base in the global economic chain (China Survey, 2002). China has become a popular host country for many MNCs; however, there is little empirical research on the Chinese people’s attitudes toward women as managers. This study is specifically designed to fill this gap by providing empirical evidence on attitudes toward women as managers in China. Attitudes toward women as managers in China can be understood only through an appreciation of the larger historical, cultural, social, and legal contexts in which they live.

Historical Background of People’s Republic of China (PRC)

The Communist government established power in 1949 and attempted to eradicate poverty, illiteracy, and premature mortality through modernization, land reform, and abolition of
private ownership. The All-China Women’s Federation (ACWF) was also established in 1949 at the national, provincial and local levels to oversee policies targeted specifically at improving the status of women. ACWF continues its fight to improve women’s equal access to education, training and employment (Korabik, 1993). Although there has been a long-standing constitutional commitment to sexual equality, the Chinese Communist Party has not successfully eliminated the remnants of feudal thinking. Stereotyped views about the nature of women and men are still ubiquitous and often serve to perpetuate discrimination and keep women in inferior positions (Xi, 1985).

The economic reform launched in 1978 shifted the basic economic unit from the people’s communes back to families, thus intensifying the traditional triple burden of women: jobs, housework, and caring for both children and the elderly. With the increasing privatization of state-owned enterprises starting in the 1980s, the status of women in Chinese organizations has deteriorated. The combination of traditional attitudes toward women and increasing economic pressures to enhance efficiency led to discrimination against women in terms of layoffs. Official state statistics from the middle of the 1990s indicate that 63% of employees laid-off by state-run enterprises were women and that, once laid off they had only a one-in-three chance of finding a new job (Plan to Fight Discrimination, 1995). Laid-off female workers were told that they could best serve the state by tending to the needs of their families at home (Reese, 2003).

**Chinese Culture**

Confucius was born in 551 B.C. but, his far-reaching and unquestionable influence is still felt strongly in the daily lives of ordinary Chinese people. The Chinese communicate with each other not only through a shared, standard written language but, more importantly, through a shared, common world-view based on Confucianism (Mah, 2001). Confucius is partially
responsible for women’s status today. The clear and explicit preference for male children contained in his teaching remains a fundamental aspect of Chinese society. This may be seen for instance, in his famous adage that, ‘Only women and petty men are difficult to deal with. Be close to them and they are not humble. Keep them at a distance and they complain.’ Confucius clearly viewed and treated all women in the same category as petty men, back stabbers, or men with inferior qualities.

‘One of the most serious violations of filial obligations is not having a male heir’ is also rooted deeply into Chinese mentality. Continuing the family name is still of paramount importance and only a son is able to do that. This undoubtedly helps in large part to explain the skewed sex ratio observed in China. The ratio of males to females worldwide is 101:100 while in China it is 107:100 (World Population Prospects, 2002). The deleterious effects of this powerful ancient teaching are multiplied by the Chinese government’s “One-Child Policy” in which each family is only allowed to have one child, and any additional child will result in loss of health care, education subsidy, and other benefits. With the help of advancement in modern medical technology, such as the gender selective conception and gender selective abortion that are widely available in urban areas on one hand, and widely alleged female infanticides in rural areas on the other, the patrilineal system lives on.

Another famous common saying which could be attributed under Confucius’ influence is ‘A woman’s virtue relies on her lack of talent.’ A woman is thus held in high regard as long as she manages the household well (i.e., her husband and the in-laws are served, children are fed, and the house is clean). At the same time, she is positively discouraged from pursuing any intellectual development.
The Nu Erh Ching (The Classic Women’s Guide), composed in the Han Dynasty (206 B.C. – 221 A.D.), listed ‘Three Obediences: When she is with her family, a woman obeys her father. When married, she obeys her husband. When widowed, she obeys her son’ (Lin, 1938). Women are socialized to modestly yield to others; respect others and put others first and themselves last. Such cultural stereotypes not only are socialized into how women perceive themselves but, also how parents treat their female offspring. Due to the Chinese feudal tradition, women are less likely than men to get educated, especially when family financial resources are limited. Education is considered a form of investment. The family invests in male children, where the payoff will continue over time, because males will remain in the family to continue the patrilineal tradition whereas females will marry out and leave to become part of a new – via the husbands – economic unit (Hildebrandt & Liu, 1988). The effects of this differential treatment between girls and boys can be seen in Table 1, which shows the gender ratio of enrollment in different levels of schooling. The trend is clear that the higher the education level, the more disparity women face. Even taking the gender ratio (male: female) of the overall population (107:100) into consideration, the gender ratios of high school enrollment (138:100) and college enrollment (144:100) still clearly show that women are less likely than men to get educated beyond the mandatory nine-years of education (Educational Statistics Yearbook of China, 2000).

For those girls who are fortunate enough to graduate from high school, more obstacles lie ahead. A quota system exists in university admission policies to make sure that the ratio of male to female students remains favorable toward males. For instance, it is not uncommon for universities to require women to achieve higher scores than men on the university entrance examinations to gain admissions (Günthner, 1995; Pearson, 1995). Higher education is an important factor in an individual’s career potential and personal development, therefore stunting
or obstructing women’s entrance to higher education may have severe consequences for women’s career development later on.

In short, traditional Confucius teaching, low perceived value of female offspring, gender role socialization, and fewer educational opportunities all contribute to the difficulty women have to endure in Chinese culture.

**Chinese Social Norms**

The traditional division of labor within the Chinese family is that men are in charge of outside affairs and women are in charge of household chores. Women are left solely responsible for the entire family while men run businesses, society, and even the country. Family becomes an integral part of women’s identities. It is socially unacceptable for a woman to refuse taking on family demands, such as cooking, cleaning, raising the young, and tending to the old. Both men and women accept this is the way things should be (Günthner, 1995). Therefore, a career is considered more important and appropriate for men than women. A woman’s career ambition is tolerated only when she can find a way to satisfy and balance the work and family demands simultaneously.

Advancement in career is related to advanced degrees. In addition to institutional obstruction of women’s opportunities to enter into higher education, women frequently decide not to pursue advanced degrees. One reason is that it is difficult for highly educated women to find a husband. ‘Male superior and female inferior’ is maintained by the common practice of a woman marrying a husband who is more educated and has a higher income (Bowen, 2003). Most Chinese men do not want to marry a woman who is more intelligent or better educated than they are. Remaining single is just not a feasible alternative for Chinese women in a society.
characterized by extremely high levels of conformity to well defined, commonly shared social norms.

**Chinese Legal System**

The legal position of Chinese women has improved considerably since the fall of the last empire in 1912. Laws and regulations were established to grant women equal rights in the family and society, which they were deprived of by the feudal tradition. Article 48 of the Chinese Constitution states:

*Women in the People’s Republic of China enjoy equal rights with men in all spheres of life, political, economic, cultural and social, including family life. The state protects the rights and interests of women, applies the principle of equal pay for equal work for men and women alike and trains and selects cadres from among women.*

However, the Constitution and its amendments, including the Law for Protection of Women’s Rights and Interests established in 1992, have been criticized for their lack of penalties and general imprecision (Pearson, 1995).

Although the Constitution expressly stipulates the state’s obligation to ensure wage equality, and the slogan “equal pay for equal work” is often cited, a women’s social status survey conducted in 2000 by the All-China Women’s Federation and the National Bureau of Statistics painted a different picture. Women’s income improved dramatically between 1990 and 2000, however, the gender gap in pay widened. The working women in urban areas earn about 70.1% of what men earn and working women in rural areas earn about 59.6% of their male counterparts (*The Second Phase Chinese Women Social Status Survey Main Statistics Report*, 2001). Paid maternity leave has been increased from 56 to 90 days with 70 to 80% of their wages. Although some actions such as dismissing women or cutting their wages in connection with pregnancy,
delivery, and breast-feeding are illegal, in reality the constitution’s equal rights protection does not adequately help women’s status in the workplace. These supposed protections actually work as a double-edged sword, especially in a workforce where supply is greater than demand (i.e., as a consequence, employers often see women as less productive and less desirable employees). In 1984, 30% of all work units wanted to accept only men; frequently, even less qualified men are preferred to women (Borchard, 1995). Korabik (1993) reported that 80 to 90 percent of women college graduates had difficulties securing work assignments. Hiring women was viewed as a costly and ill-advised practice for both public and private employers.

On the home front, the marriage laws of 1950 and 1980 stipulate a woman’s right to obtain a divorce and to choose her mate freely. A widow’s right to remarry was explicitly guaranteed. The inheritance laws of 1985 also stipulate a woman’s right to inherit property (Borchard, 1995). These women’s rights to start or end a marriage and to obtain inheritance were deprived from them before.

In summary, the historical background of the political and economic systems of China, deep-rooted Confucius’ influence on favoritism over boys, widely accepted and rigidly defined social norms, on top of the weak and vague women’s rights protection laws all contributed to women’s bleak status in China. In addition, institutional obstruction of women’s opportunities to higher education and stereotypical preference over male employees make women managers few and far between. Women hold only 11% of the managerial jobs in China, and negative attitudes are common regarding women as managers (Honh, 1995).

Women as Managers

Despite the implementation of equal employment laws in the PRC, and the Communist ideology of gender equality, women are covertly prevented from advancing to powerful positions
in the Communist Party, government, and businesses (Ebrahimi, Young, & Luk, 2001). In state-owned business, access to managerial positions may be conferred as a reward for Party loyalty. But this route into management has been less available to women than to men: 86% of Party members are men, (Korabik, 1993).

Another discriminatory practice also impedes women managers’ chance of making it to the top. The mandatory retirement age for civil servants, as stated in ‘The Ordinance of National Civil Servants for the Present,’ established by the Ministry of Labor and Social Security, August 14, 1993, is 55 for women and 60 for men. Private corporations and non-government organizations usually refer to this ordinance to decide non-entry level employees’ retirement age. Entry-level workers’ retirement age is 50 for women and 55 for men. In every position, women are forced to retire five years earlier than men. The women’s early retirement age truncates their career advancement and may prevent them from reaching senior management levels (Borchard, 1995). Even for the few women who do climb to the top, the early retirement age ensures that they will not stay there for long.

Many men and women believe that women bosses are unfair, disorganized, narrow-minded and hard to work with, compared to men (Wolf, 1985). Stereotypical perceptions of gender differences in competence, commitment, and work attitudes – particularly those held by men, who are predominantly the managers making personnel decisions affecting women’s careers – appear to underlie much of the sex discrimination in the workplace (Bowen, 2003). Unfortunately, Chinese men tend to hold significantly more traditional views of gender roles than Chinese women (Yang, 1987). This pattern applies to employment roles as well as education roles, marital status roles, parental status roles, and social roles. Male recruiters are more likely than female recruiters to base their selection decisions on gender stereotypes (Tang,
Women tend to hold more liberal or egalitarian views than men toward women as managers (Pek & Leong, 2003). Men viewed advancement of women’s status as a threat while women viewed advancement of women’s status as an opportunity.

In Chinese society, women are expected to carry the primary family responsibilities. They are the ones who leave work behind when their loved ones are sick or need their help. Women are thus seen as less committed to their careers and more likely to quit or be absent from their jobs due to family crises, and are less likely to be rewarded or promoted for their job performance (Chang, 1995).

Overall, Chinese women are facing overt discrimination in the workplace. First, women are less likely to be hired by work units. Once they get hired, the law truncated their career by five years compared to men in the same positions. Stereotypical perceptions and expectations for women to solely shoulder the family responsibilities interfere with their career commitment and advancement. Despite all of the literature on the stereotypical perceptions of Chinese women in general, empirical evidence of perceptions of women as managers in the People’s Republic of China is lacking.

This current investigation is specifically designed to measure the perceptions of women as managers in the People’s Republic of China, and to provide empirical evidence to show how people view women as managers. Attitudes toward women are influenced by age, sex, education, and socioeconomic status (Spence & Hahn, 1997). Sex discrimination in educational institutions creates severe consequences for women’s career advancement in the workplace. Sex discriminations in academics and industry are disparate but, interdependent. Careful comparisons of perceptions of women as managers between these two sectors are essential to shed some light into the reality of the workplace and assist future managers to better equip themselves for the real
world of business. Today’s college graduates are likely to become tomorrow’s managers. Understanding the differences between students and workers can provide insights into attitudes toward women as managers from diverse perspectives. Understanding the perceptions of college students might help to understand the leading edge social perceptions for years to come. It is also probable that differences in work experience and life experience may reshape people’s attitudes toward women as managers. Based upon this backdrop of previous research on the PRC and women as managers in the PRC, the following two hypotheses are proposed:

\( H_1: \) University students’ attitudes towards women as managers are different from workers’ attitude towards women as managers.

\( H_2: \) Females’ attitudes towards women as managers are more positive than males’ in both student and worker samples.

**Method**

*Student Sample*

There were 502 students from four different universities in Beijing who participated in the study. The age distribution of the students was concentrated with a mean of 20.38 and standard deviation of 1.56. The majority of these participants were full-time students and did not have work experience. The mean reported work experience was 0.10 year and standard deviation was 0.92. Four hundred seventy-six students were single, three were married, and two were divorced. There were more female students (n = 271) than male students (n = 203) in the sample. The number for each answer did not add up to the total of 502 due to some missing data for each demographic question.

*Worker Sample*
Workers participated in this study through training sessions conducted by one of the authors and most of them were employees of the People’s Bank of China (PBC) which was established in 1948. Participants completed the questionnaire during the training sessions and returned it at the end of the sessions.

A total of 385 workers completed the questionnaire. Forty percent were female (n = 132), sixty percent were male (n = 198). The age distribution of workers was much wider than the student sample with a mean of 32.88 and standard deviation of 8.85. The workers’ education background was diverse. There were 24 workers with a high school diploma, 57 with a community college degree, 206 with a bachelor’s, 32 with a master’s, and 8 with a doctorate degree. The majority of workers were married (73.3%), 25.1% were single, and 1.6% were divorced. The number for each answer did not add up to the total of 385 due to some missing data for each demographic question. The work experiences of the participants were wide spread with a mean of 11.54 years and standard deviation of 9.50.

Translation Procedure and Instrument

The 21-item ‘Women as Managers Scale’ (WAMS; Terborg, Peters, Ilgen, & Smith, 1977) was translated into Chinese using the translation and back translation procedure (Brislin, Lonner, & Thorndike, 1973; Candell & Hulin, 1987; Hwang, Yan, & Scherer, 1996). First, two bilingual (Mandarin Chinese – English) members of the research team independently translated the WAMS to Chinese then the two researchers reviewed their translations to assure equivalency of some words and phrases in Mandarin Chinese. Any discrepancies were discussed and resolved between the two researchers. Second, a third bilingual member of the research team translated the WAMS from Chinese to English. All three bilingual researchers reviewed discrepancies in the back translation with the original scale to assure equivalency. Third, the WAMS was piloted
on a small group of workers in Beijing whose only language was Chinese. These participants were interviewed by one of the bilingual researchers to determine the ease of comprehension of the Chinese WAMS. Minor adjustments to the Chinese WAMS were made before administration to the entire student and worker samples.

The WAMS was used to measure stereotypic attitudes towards women in managerial positions. The WAMS contains 21 items, 11 positively worded and 10 negatively worded. Responses were collected using a seven-point Likert format ranging, from 1 (strongly disagree) to 7 (strongly agree). Negatively worded items were reverse coded so higher scores reflected more favorable attitudes toward women as managers.

Results

To test the first hypothesis, ‘university students’ attitudes towards women as managers are different from workers’ attitude towards women as managers,’ we used a principal components analysis with varimax rotation as the primary analytic technique to determine the dimensionality of the WAMS scale. The resulting principal components were used to test the comparability of attitudes towards women as managers in student and worker samples. Based on the Rotated Component Matrices, we found that Factor 1 in the student sample had almost the same items as Factor 2 in the worker sample, and Factor 2 in the student sample had the majority of the same items as Factor 1 in the worker sample. The items that loaded on Factor 3 were identical in both samples. Table 2 contains the results from the principal component analysis and provides rotated matrices for student and worker samples with the number of components limited to three. Similarities and differences of these matrices were further analyzed.

The three components in the student sample explained 51.15% of the total variance of the WAMS, and the three components in the worker sample explained 44.94% of the total variance
of the WAMS. The three components were labeled as ‘Ability,’ ‘Acceptance,’ and ‘Physical Constraint’ (see Table 3). Ability is defined as the perceptions of women’s abilities to succeed as managers. The ability component includes items such as ‘women are not ambitious enough to be successful in the business world,’ ‘women are not competitive enough to be successful in the business world,’ and ‘women are less capable of learning mathematical and mechanical skills than are men’ (with 8 items, Cronbach’s a = .85 in the student sample, Cronbach’s a = .80 in the worker sample). Acceptance is defined as the society’s acceptance of women as managers. The acceptance component includes items such as ‘society should regard work by female managers as valuable as work by male managers,’ and ‘the business community should someday accept women in key managerial positions’ (with 5 items, Cronbach’s a = .85 in the student sample and Cronbach’s a = .84 in the worker sample). Physical constraint is defined as perceptions of women’s unique reproductive functions as road blocks to their success as managers. The physical constraint component includes items such as ‘the possibility of pregnancy does not make women less desirable employees than men,’ and ‘problems associated with menstruation should not make women less desirable than men as employees’ (with 4 items, Cronbach’s a = .69 in the student sample, Cronbach’s a = .60 in the worker sample). Cronbach’s a usually needs to be higher than .70 to be acceptable. In this exploratory study, WAMS was first tested in China. To avoid losing valuable information, we continued the analyses of the physical constraint component even though the internal consistency was marginally acceptable in the student sample yet questionable in the worker sample. The complete WAMS items are listed in the Appendix.

To test the second hypothesis, ‘females’ attitudes towards women as managers are more positive than males’ in both student and worker samples,’ we used t-tests. Table 4 shows the
results of t-tests on Ability, Acceptance and Physical Constraint in both samples. Significant and consistent gender differences persist across all three subscales with more favorable attitudes toward women as managers from females than males in both samples.

So far, principal component analysis and t-tests supported both hypotheses and showed consistently significant main effects of ‘sample’ and ‘gender’ for ‘Ability’, ‘Acceptance’ and ‘Physical Constraint.’ A multivariate analysis of variance was conducted to investigate the interaction of these two independent variables: sample and gender. The results of the MANOVA (Table 5) revealed a significant interaction between gender and sample on ability, acceptance and physical constraint. Gender explains 22.8% of the variance for the three dependent variables and is a much stronger predictor than the sample which only explains 2.8% variance. Further analysis reveals that Gender has a significant main effect on all three dependent variables and that the sample’s main effect is only significant on ability, but not the others. Further univariate analyses showed that female students have the most favorable attitudes toward women as managers, and female workers have the second favorable attitudes, while male students and male workers do not differ from each other and both have the least favorable attitudes toward women as managers. The differences between female students and male students are much wider than those between female workers and male workers.

Discussion

The first hypothesis, ‘students’ attitudes toward women as managers are different from workers’ attitudes toward women as managers,’ was supported by the results of the principal components analysis. The similarities of the factor loadings on the first three components between the two samples demonstrated that students and workers were indeed from the same ‘population.’ After all, both students and workers were from the same culture, sharing the same
tradition, using the same language, and governed by the same laws. Although the first three components were similar in both samples, their prominence in terms of explained variances was different. The most important component in students’ attitudes was ‘the perception of women’s ability to succeed as managers’, but the most important component in workers’ attitudes was ‘society’s acceptance of women as managers.’ Students are young (average age 20), and idealistic and have not been through the anguish of harsh reality in the workplace. They are more likely to think that as long as women have ‘what it takes’, they can climb up the corporate ladder just as men, and only abilities will set the limits on how high women can go. Workers on the other hand, are older (average age 32), more experienced and understand the reality of office politics and practices. They tend more to think that the collective perception of society’s acceptance of women as managers is the determining factor of women’s success in the workplace. ‘Physical Constraint’ is the third principal component in both samples.

The first two components were identical to Cordano, Scherer and Owen’s (2002) factor analysis on WAMS using U.S. and Chilean samples. The physical constraint component was unique in the Chinese culture. Because of the maternity leave law, female reproductive function is viewed by employers as an obstruction to young women’s work commitment and an obstacle to their promotions.

The gender effect is much stronger compared to the sample effect according to the MANOVA results. The gender gap in attitudes toward women as managers observed in the student sample is wider than the gender gap in the worker sample, which deserves further speculation. One possible explanation is that young full-time male students who are mostly single do not have much exposure to women as managers. Their attitudes are formed mostly from stereotypes, traditions, and social norms. The feudal system has worked to men’s advantage
for centuries, especially for the privileged young and educated men. They simply do not perceive any need to challenge the traditional thinking about what women can and should do in society. They would even fight to maintain that status quo. On the other hand, young educated women who are more liberal in their thinking about gender roles and have fought the odds against them to be admitted into a university, observe and perceive the inequality and disparity in the society. They are highly motivated to improve the attitudes toward women as managers, probably even idealize such perceptions. Therefore, the naïve perceptions of young educated college students create a more extreme dichotomy between female and male students.

The second explanation of the narrowed gender gap in the worker sample should be focused on the fact that there are no differences between male workers’ perceptions and male students’, but significant differences between female workers’ and female students’. As female workers enter the workplace, get older while gaining more experience, they go through the struggle with harsh reality regarding what women can and should do in the workplace. Female workers adjust their attitudes toward women as managers. Female workers still have high aspirations but just not as idealistic as those of female students.

**Limitations**

There are still different perspectives from which to interpret the results. Since the data collection was done in a one-time cross-sectional manner, we are not sure which way the future will lead. We would prefer a forward looking point of view in which students are seen as change agents who in their future roles as managers and workers will improve the lot of women in the workforce. It may be more realistic, however, to take a more backward looking point of view in which workers are seen as former idealistic students whose ideals have been tamed by the harsh reality of office politics and practices.
Most of the workers’ data were collected from the PBC whose employees were in the financial services from a public sector. Whether the same pattern holds for the private sector employees or other public sectors remains unknown.

Suggestions for Future Research

Longitudinal research is needed to investigate the social trend of attitude change toward women as managers in China. The scope of the investigation also needs to be broadened to cover different jobs from different geographic areas. Empirical research investigating potential gender differences in actual job performance may be used to correct stereotypical perceptions in the long run.

Managerial Implications

Overall, the attitudes toward women managers in China were much lower than the attitudes toward women managers in the US and Chile (Cordano, Scherer, & Owen, 2002). Female expatriates must recognize the differences that exist as a result of the Chinese culture, social norms, and legal system. Such deep-rooted sex stereotyping as occurs in China cannot be emancipated overnight. Women managers from other countries working in China are apt to experience much more difficulty and be far less effective in China without adequate training and understanding of Chinese culture. The negative gender stereotyping of women’s abilities and physical constraints due to reproduction as well as society’s lack of acceptance for women as managers could be corrected slowly through individual interactions, persuasion, policy changes, and upgrades in society’s awareness about the damages resulting from discriminatory and biased hiring, compensation and promotion practices (Bowen, 2003). The bottom line is that Chinese society simply cannot expect to make great progress by leaving its women behind.
The remarkable gender difference in the attitudes toward women as managers may be unique to the Chinese culture. The difference is expected and can be explained by the Chinese historical, cultural, social, and legal systems. It seems to fit the political motto ‘One Country, Two Systems’ perfectly, one for the men and the other for the women though the motto was not originally intended to refer to gender. The ‘Two Systems’ refers to the Chinese society where women are required to have higher exam scores to get admitted to universities, less likely to be accepted to work units, more likely to be laid off, and by law, forced to retire five years earlier than their male counterparts. All the disparate treatment against women leads to the differential attitudes between men and women. This sharp contrast of men and women’s attitudes toward women as managers needs to be handled carefully. The status quo that makes men comfortably numb and women struggling with the basic rights to be equal need not last for long and it is in the best interest of China, and its people, to be completely reformed.

Appendix

WAMS Scale Items

1. It is less desirable for women than men to have a job that requires responsibility. (R)
2. Women have the objectivity required to evaluate business situations properly.
3. Challenging work is more important to men than is to women. (R)
4. Men and women should be given equal opportunity for participation in management training programs.
5. Women have the capability to acquire the necessary skills to be successful managers.
6. On the average, women managers are less capable of contributing to an organization’s overall goals than are men. (R)
7. It is not acceptable for women to assure leadership roles as often as men. (R)
8. The business community should someday accept women in key managerial positions.
9. Society should regard work by female managers as valuable as work by male managers.
10. It is acceptable for women to compete with men for top executive positions.
11. The possibility of pregnancy does not make women less desirable employees than men.
12. Women should no more allow their emotions to influence their managerial behavior than would men.
13. Problems associated with menstruation should not make women less desirable than men as employees.
14. To be a successful executive, a woman does not have to sacrifice some of her femininity.
15. On the average, a woman that stays at home all of the time with her children is a better mother than a woman who works outside the home at least half the time. (R)
16. Women are less capable of learning mathematical and mechanical skills than are men. (R)
Appendix (continued)

WAMS items

17. Women are not ambitious enough to be successful in the business world. (R)

18. Women cannot be aggressive in business situations that demand it. (R)

19. Women possess the self-confidence required of a good leader.

20. Women are not competitive enough to be successful in the business world. (R)

21. Women cannot be assertive in business situations that demand it. (R)

Cellmate Suicides:
A look at current treatment programs for adolescents in correctional and detention facilities

Abstract

This paper provides a double case-study of the suicides of two incarcerated adolescents at the California Youth Authority (CYA) in Ione, California. Drawing from information published in six privately-funded evaluative reports on the Preston Youth Correctional CYA facility commissioned in response to ward suicides, as well as legal documents pertaining to lawsuits against the CYA on behalf of the families of the deceased, I outline and discuss the implications of two particular suicide cases to encourage future research dealing with the safety and rehabilitation of juvenile detainees. This study examines the design and use of current behavior modification treatment therapies given to incarcerated adolescents, and reviews media coverage surrounding the deaths of two youth offenders receiving these treatments. I provide definitions and explanations of psychological theories as applied to juvenile recidivism and rehabilitation to illustrate the need for improved treatment programs in juvenile correctional and detention facilities.
I. INTRODUCTION: OVERVIEW

Juvenile crime is a frustrating and often depressing topic in the academic and professional fields. As populations grow, so increases crime rates, incidents of violence, drug use and delinquency. The most recent published statistics from the U.S. Department of Justice showed that nearly 2 million children and adolescents in the United States were involved in the juvenile court system in 1996 (Calhoun, 2001). Minors within the system are often times housed in detention facilities over capacity. In 1995, just over 56 percent of youth admitted to detention centers for holding and treatment procedures, entered overcrowded and understaffed facilities (Wordes, 1998).

Overcapacity inhibits education services for inmates, more or less negating the prime mission of “correction” through “correctional facilities” as offered by the Department of Justice and the Federal Bureau of Prisons. Overcrowding depletes budgets, forcing institutions to discontinue treatment programs and specialized therapies for inmates. Removal of funding from departments in charge of delinquency prevention initiatives and behavior therapy treatment programs in youth facilities inevitably diminishes the undeniable human rights of incarcerated adolescents by reducing their opportunities for rehabilitation. While incarcerated, low budgets and past-capacity facilities deny juvenile detainees access to even the most basic human liberties. Youth in one jurisdiction audited by the U.S. Department of Justice (Office of Justice Programs) in 1997 discovered that youth were forced to sleep on mattresses pulled out on the floor in dayrooms. Further investigation linked crowding of centers to increases in staff/youth altercations and increased rates of injuries to the youth (Wordes, 1998). More recently, officials of the California Youth Authority (CYA), an institution overseeing ten juvenile prisons, four youth camps and sixteen parole offices across the state of California admitted to feeding minors
in solitary confinement what are known as “blender meals” (Broder, 2004). A bologna sandwich, an apple, and a carton of milk are pulverized and fed to the inmates by straw through a slit in the cell door.

Actions such as this mentally and emotionally degrade the children who witness and receive such punishments. Psychologists use the theory of “learned helplessness” to account for the psychological and emotional damage an individual develops after a repeated failure to have any control in absolving the emotional distress of an unfavorable situation (Davison, 2004). This effect leaves adolescents housed in inadequate facilities at an extreme risk for the onset of psychological mental disorders. The concept of attribution, the process by which a person evaluates his or her own behavior and thus produces an explanation for that behavior plays a large role in accepting responsibility for one’s actions. Rehabilitation from a psychological standpoint serves to manipulate and redefine a person’s perceived self-efficacy, their understanding and belief that they can achieve desired goals (Davison, 2004). It is this willingness and desire of the adolescent to abide by stated rules in the future that is the goal of psychological behavior modification. Treatment programs for youth offenders must take into account the psychological effects of incarceration when determining which programs work best.

Typically, evaluative reports on such programs and services provided by institutions such as the California Youth Authority are authored by internal researchers, staff and administration. One federally funded evaluative report on the Preston Youth Correctional Facility confirmed that “procedures for peer review, quality assurance, quality audits, and quality management had not been developed to adequately assess the competence, practice, or quality of services provided” (Trupin, 2003). Investigations by expert psychologists, government officials outside the realm of juvenile jurisdiction, medical practitioners and public advocacy groups are conducted as a form
of peer review and to supplement audits from an unbiased perspective, however, they seem to garner media attention only under severe circumstances of violations to the juvenile detainees. Under such severe circumstances, the failure of the treatment programs may be fatally obvious.

The National Juvenile Detention Association, in an attempt to rectify the reputation of juvenile incarceration, released a revised definition of the term “juvenile detention” by declaring,

“Juvenile detention is the temporary and safe custody of juveniles who are accused of conduct subject to the jurisdiction of the court who require a restricted environment for their own or the community’s protection while pending legal action” (Wordes, 1998).

Numerous legal, social, psychological and practical variables add to the already complex and entangled process of providing juvenile offenders with a safe yet restricted environment, such as that offered by the National Juvenile Detention Association. The research and discussion presented in this paper attempts to further dismantle the complexity of the issue by focusing on one facility, the Ione, California CYA center and the suicide deaths of two adolescents in custody.

This paper questions the effectiveness of large-scale treatment programs in high-population institutions in their attempt to rehabilitate youth offenders. By isolating this paper’s focus to the factors involved exclusively in the suicide deaths of Deon Whitfield and Durell Feaster, I examine the treatment programs mandated through juvenile detention centers, particularly the Preston Youth Correctional Facility as a compound of the California Youth Authority. I investigate how youth recidivism might be reduced through effective behavior modification therapy. What personality factors differ or remain constant throughout diverse samples of juvenile offenders, and how do these factors facilitate or negate the effectiveness of behavior modification therapies? By discussing the environmental variables surrounding Deon
Whitfield and Durell Feaster at the Preston Youth Correctional Facility, as well as the personal factors each teen faced before and during his incarceration, I emphasize the need for program directors and facility therapists to better serve the youth within their centers.

II. METHODOLOGY

An overview case study is presented in this paper of the suicide deaths of 18 year old Durell Tadon Feaster and his 17 year old cellmate, Deon Whitfield. The case study is qualitative in nature and draws from a collaboration of information regarding the dual case as well as information from past suicide cases. News media and press releases published immediately following the suicides provide environmental clues regarding the Preston Youth Correctional Facility in which the boys were housed and treated.

A more general overview of the state of the Youth Authority juvenile corrections system is provided through state-funded reports by medical, psychological, and arbitrary legal experts. Previous psychological research on juvenile behavior, criminal recidivism and Cognitive Behavior Therapy (CBT) is included in this research as a comparative platform from which treatment therapies implemented at the California Youth Authority have been measured against standards available from the United Nations, the Welfare and Institutions Code, the American Correctional Association, the Council of Juvenile Correctional Administrators, and the National Institute of Corrections (Krisberg, 2003).

Finally, a brief analysis of litigation documents filed on behalf of families of suicide victims at the California Youth Authority will be used to highlight various treatment and supervision deficiencies found in Youth Authority centers across the state.
III. THEORETICAL BACKGROUND: TREATMENTS FOR JUVENILES

Psychological evaluations and individual screening tests on each detainee upon their entrance to a facility is extremely important in the classification and assignment of the adolescent to the correct department and treatment programs within the correctional facility. Extensive research has been done on such screening instruments and risk-assessment models to ensure the accuracy of their results. Misdiagnosis could potentially deny a child the treatment they need to rehabilitate, and the assignment of a detainee to the wrong department of a detention facility could put the safety of other detainees in jeopardy.

Ashford and LeCroy (1990) compared three such risk-assessment models which were routinely used by corrections departments to predict recidivism in incarcerated juveniles within the Juvenile Justice system. By looking at later reports of the individuals’ re-incarceration rates following release, Ashford and LeCroy were able to measure the prediction accuracy of the three risk-assessment scales. Recidivism, or criminal re-offense, is closely related to rehabilitation through treatment programs in that if a treatment program is successful the offender will be less likely to re-offend. The accuracy of a risk-assessment model which measures recidivism then, is equally important in assessing the success of treatment programs. Ashford and LeCroy’s study examined one-hundred and seven records for juveniles from the Arizona Department of Corrections. The risk-assessment models used to score the individuals upon incarceration between 1963 and 1967 were then analyzed against statistical recidivism 20 years following their release, to determine which model had most accurately predicted criminal re-offense of each of the participants. Variables measured by each of the three models included demographic information, school performance as measured by grade point average (GPA), and self-reported
criminal activity prior to incarceration. While two models were successful in predicting recidivism, the success of both models failed to be statistically significant (1990).

More recent research by Katsiyannis, Zhang, Barrett and Flaska (2004) extended the scope of variables included in such risk-assessment scales by identifying psychosocial traits found in 299 incarcerated male adolescents which contributed significantly to the prediction of recidivism in youth crime. Psychosocial personality traits isolated in the research by Katsiyannis et al. included person-variables such as cognitive structuring among the adolescents and the concept of succorance, or the act of alleviating distress through consolation and reassurance. By taking into consideration a diverse range of individual personality traits, rather than focusing solely on more demographic-type variables, and adding these measurements to the models already being used to predict recidivism, corrections departments became more able to identify and target youth who were at the highest risk for recidivism. Research along these lines has added tremendous exploration and literature to the topic of preventing juvenile re-offense. The increased knowledge has also provided guidance for improving treatment programming within juvenile detention centers and rehabilitation facilities.

A meta-analysis of numerous recidivism predictors was conducted by Kingree, Phan and Thompson (2003) among 272 adolescent detainees in Georgia. The researchers attempted to narrow the growing list of predictors used to anticipate recidivism to a more concise and efficient list of successful predictors. Participants completed multiple personality and experience tests to measure risk factors of recidivism. Tests included the Problem Oriented Screening Instrument for Teenagers (POSIT) and a condensed version of the Weinberger Adjustment Inventory. Results revealed that emotional neglect of the adolescent, broadly including child maltreatment prior to and throughout their incarceration, was the greatest predictor of juvenile recidivism.
These findings advance a complex, yet logical description of the failure of juvenile treatment programs currently in use. Kingree et al. offer,

If negative associations between physical neglect and recidivism continue to emerge in future studies, then attention can be given to the possibility that the adolescents with physical neglect [might] have lower rates of recidivism because they [would] receive relatively high levels of therapeutic attention in the juvenile justice system. In contrast, it seems the needs of emotionally neglected adolescents are not being fully recognized and addressed in this system (2003, emphasis added).

It is my hope that this paper offers a vivid representation, through the suicides of Deon Whitfield and Durell Feaster, of the effect each factor of juvenile incarceration has on adolescent rehabilitation. Therapeutic attention must not be neglected to children detainees. Diagnostic screenings upon incarceration and consistent re-evaluation of treatment effectiveness and psychological needs throughout the youth’s sentence will ensure successful rehabilitation.

Federally hired evaluators reported in 2003 that a focus on rehabilitation as a means to reducing recidivism was duly needed yet severely lacking. Trupin and colleagues reported:

“We observed youths that were in clear distress and, in a few cases, mental health staff who recognized this distress attempting to address the youth’s issues, only to have the custody response be based on ineffective punitive approaches which only altered the youth’s non-compliant behavior temporarily and did not reduce the likelihood of a re-occurrence” (Trupin, 2003).

While most research to date attempts to measure levels of recidivism directly, it is important to note that lower recidivism comes only with better treatment programs.
IV. CASE STUDY: A PARENT'S WORST NIGHTMARE

On the afternoon of January 19, 2004, a prison guard at the California Youth Authority’s Preston Youth Correctional Facility in Ione, California, east of Sacramento, found two wards hanged together in their cell by their bed sheets (Chong, 2004; Mercado & Paz, 2004). The deaths of seventeen year old Deon Whitfield, committed to the CYA facility in August 2003 for possession of hard narcotics and attempted burglary, and his cellmate Durell Tadon Feaster, 18, committed in October 2001 for grand theft, fraud, auto theft and receiving stolen property, highlight the importance of providing adequate treatment and counseling to vulnerable juveniles while incarcerated.

An emphasis on the legal action behind suicide cases such as those of Deon Whitfield and Durell Feaster advance an increased timeliness in policy change and facility reform as more and more government pressure is placed on juvenile correctional facilities to meet and surpass their missions of safely and effectively supervising and rehabilitating youth offenders. Legal action for injunctive and declaratory relief filed in 2003 against Jerry Harper, then Director of the California Youth Authority, filed by Margaret Farrell, a relative of CYA ward Edward Jermaine Brown, compelled defendant Harper to “remedy the illegal, inhumane, discriminatory and punitive conditions that exist throughout the CYA [through] wasting of taxpayer funds on illegal policies, practices, and procedures” (Specter, 2003). Ms. Farrell further sought an injunction requiring defendant Harper to meet his constitutional and statutory obligations in providing resources, staff and management controls to maintain appropriate assistance, services and treatment programs for the state wards (Specter, 2003).

The failures of rehabilitative treatment programs within the juvenile justice system are more strikingly illustrated, and are conveyed to the mass public more often than civil lawsuits.

Eric Trupin and colleagues documented in 2003, long before the suicides of Deon and Durell, the specific shortcomings of the Preston Youth Correctional Facility’s Suicide Prevention Program. The release stated:

“The suicide prevention program, although improved, continues to need system-wide implementation. There have been efforts by the CYA to develop standards for suicide assessment, suicide watch, and post-suicide management. The post-suicide management process has not yet been effectively instituted but is in the process of implementation across institutions” (Trupin, 2003).

Reviews of CYA suicide-watch policies regularly deemed the procedures inadequate and improperly implemented (Krisberg, 2003; Trupin, 2003; Specter et al., 2003; LAO, 2004). One report advanced that the development, implementation and consistent monitoring, supervision and quality assurance needed to sustain [a post-release follow-up] policy in practice at a high level of performance compliance was vital to the CYA’s plan for an aftercare (after suicide watch) component (Trupin, 2003). The component was never successfully implemented, thus denying those youth whose scores on psychological evaluations designated them “high-risk for suicide” as well as youth who had actually attempted suicide while incarcerated, from receiving important mental health screening and treatment attention.
Unfortunately, the currency of Deon and Durell’s case, and legalities protecting the confidentiality of the records of the deceased, prohibit access by the media and the general public to most of the information particular to their case. Investigative reports and research in this paper in particular, employ litigation and expert testimony from previous suicide cases as a generalized backdrop for the particular case studies of Deon and Durell.

V. COMPOUND EVALUATION AND DISCUSSION

Six federally and privately funded reports by numerous experts in a variety of fields were commissioned from 2001 to 2003 to investigate the suicide deaths of wards housed throughout the California Youth Authority institution, preceding the deaths of Deon and Durell. These reports investigated each of the adolescent suicide deaths, and subsequently criticized the Authority for “falling short of meeting many recognized standards of care for youth with mental health … disorders” (Trupin, 2003). Criticism in one report on mental health treatment services to youth in CYA facilities traced the institution’s failures to the initial screening and entrance procedures where psychological testing is executed on each adolescent to identify emergent suicide risk, psychiatric, medical, substance use, or developmental and learning disorders (Trupin, 2003). When a child is rated a “high-risk candidate” in any one of the above categories, a fully competent facility will design and implement a proactive treatment regime for the adolescent’s health and protection.

Ninety-seven percent of the wards housed within the CYA have one or more mental health problems, according to the Legislative Analyst’s Office, a nonpartisan fiscal and policy advisor to the state of California, making the need for proactive treatments and adequate therapy
essential (LAO, 2004). Expert evaluations prior to the deaths of Deon and Durell found the CYA only partially meeting this standard:

“Information [collected through psychological testing of the entering adolescents] was often not communicated to the youth’s case manager in a way that would allow the development of a practical intervention plan” (Trupin, 2003).

While the files of each detainee labeled a “high-risk” for suicide may in fact spell out the necessity of 24 hour surveillance and consistent therapy, important information useful to youth correctional counselors (YCCs) and case workers is often not shared due to perceived confidentiality issues (Trupin, 2003).

Case management involving such conflicts prevent the security officers and day guards who in reality have the most day-to-day contact with the wards from ever knowing which youth are at high-risk for various psychological conditions, including suicide. A review completed at the request of the California Attorney General to examine issues cited in federal and state court lawsuits found that the initial screening reports completed by Reception Center staff “were very comprehensive, and potentially of great value in determining institutional placements and treatment planning” but perceived as unclear whether or not the “excellent diagnostic and assessment effort was readily and routinely utilized by those YA staff who supervise the wards on a daily basis” (Krisberg, 2003).

Trupin’s 2003 report criticizing mental health care also denounced the actual physical supervision of youth considered high-risk for suicide by making apparent questionable safety issues concerning detainee surveillance. Areas of concern included the poor utility of video observation systems in cells with video monitoring, undersized observation panels in cells, and inadequate lighting. Installing surveillance cameras in areas with less than effective fields of view, or simply not using video surveillance cameras at all, which is the case for the majority of
cells assigned to youth who are not considered high-risk for suicide, places vulnerable youth at risk for self harm. Such was the case for Deon and Durell who were not evaluated as high-risk suicide cases upon initial screening at the time of their entrance to the Preston Youth Center. Basic video surveillance providing constant observation of their cell would have alerted staff immediately and thus prevented their successful suicides.

According to a state-sponsored report on the Youth Authority’s infrastructure, which was commissioned immediately following their deaths, the department issued a plan to construct and/or modify hundreds of new cells in order to prevent ward suicide attempts (LAO, 2004). Interestingly, the department had already developed an implementation plan titled *Strategic Plan 2001-2004 Mental Health Services for Wards and Parolees: Creating a True Continuum of Care System* three years prior to the suicides in January 2004 (LAO, 2004). The plan was authored to guide the department’s expansion of mental health services which would have renovated existing space for 400 beds in which to house wards in need of special mental health treatment and suicide-risk supervision (LAO, 2004). The department’s organization at the time of the deaths of Deon and Durell required staff and administration in charge of making decisions and requests to transfer youths to more restrictive settings (in certain cases where youth were overtly displaying warning signs of suicide) to probe large and cumbersome files for each ward. The disarray of information pertaining to a single case required institution committees to puzzle over when and where certain events, such as attempted suicides, took place (Krisberg, 2003).

In addition to heightened cell surveillance and detainee supervision, consistent and systematic check-ups on the adolescents throughout their entire incarceration sentence would enable a more fluid and successful case management structure. At the time of Eric Trupin’s report, the CYA’s case management infrastructure entailed “the coordination and monitoring of
all rehabilitative needs [of the adolescent] identified in the findings of the court, as well as the treatment and educational needs accessed through screenings and assessments” (2003). These standards were found to be inconsistently applied across facilities, questioning the accuracy of the management of ward cases such as that of Durell Feaster. Initial screening tests upon his entrance to the system in 2001 may have identified educational needs, as well as psychological needs, specific to that time of his life, but with inconsistent management of his care and no re-evaluation of his psychological needs, there would be no way of knowing if the treatments mandated upon his arrival were still having a positive effect on him three years later.

VI. CONCLUSION: MODEL FOR IMPROVEMENT

My research petitions scholars and professionals in the future to explore delinquency prevention and youth treatment programs in more depth as a means to an end. Juvenile recidivism will decrease only when youth offenders achieve complete rehabilitation. Complete rehabilitation depends on a complex system of cooperative and interdependent strategies. Families, schools and communities represent the first step in promoting positive youth development and perpetually thirst for ways to combat juvenile delinquency. Detention and correctional facilities, who are next in line to receive troubled youth, incessantly seek effective behavior modification techniques, successful therapeutic treatment programs, and dependable methods of detainee supervision to ensure ward safety. It is not enough to statistically analyze the criminal records of individuals from youth through adulthood and tally up the number of reoffenses. It is much more important to develop and utilize intervention plans immediately following the first offense.
The literature referenced throughout this paper reveals a trend in most academic and professional work dealing with juvenile detention and corrections methods. To date, such research focuses almost exclusively on reducing offender recidivism upon release. Fluctuations in the rates of recidivism are widely used as measurements of the success or failure of treatment programs in detention facilities. The cellmate suicides of Deon Whitfield and Durell Feaster illustrate the deficiency of this model and further solicit a shift in academic and professional attention. If youth in detention facilities continue to take their own lives, how accurate will rates of recidivism be? It is impossible for a deceased adolescent to commit crimes in the future; disturbingly, it is also impossible for a deceased adolescent to ever get a second chance at living without crime. It is necessary for researchers to convert from seeing youth offenders as simply numbers, to perceiving youth offenders as living, breathing, resilient adolescents.

Abstract

The evidence is overwhelming that African American children are overrepresented in the foster care system in the United States as well as in the state of California. The record shows that of the children in foster care in California for more than three years, over 44 percent are African American. In both the national and the state data, African Americans account for the largest percentage of children in foster care. In 1986, there were 280,000 children in foster care in the United States. That number had increased by more than 200,000, to 486,000 in 1995. In September 2001, the number of children in foster care in the United States was 565,000 (U.S. Department of Health and Human Services 2002).

In an executive report that examined the foster care system over a 15 years period, (Matlick 1997) the conclusion was reached that the state had failed in its efforts to improve its foster care system. The annual expense of the child welfare system has risen to $1.7 billion. Since fiscal year (FY) 1988-89, overall funding of child welfare services has risen by 80% over the 15 years period. He further argued that foster children remain in the system for too long. In addition to the failure of the family preservation services, he pointed out that since FY 1988-89, the amount spent by the system on family preservation services has risen by 450%.

From the beginning, the social work profession has been concerned about issues of social justice and the plight of the poor and less fortunate (Bremmer 1956). Dependent children were cared for in orphanages even before the establishment of an independent America (Zietz 1959). Even in those early years, black children were treated differently
than their white counterparts. Those children that escaped being sold into slavery were
cared for by local almshouses rather then orphanages where children were only placed
with other children. After facilities were created for these black children, some were
destroyed by rampaging white mobs (Billingsley 1972).

Over the years significant efforts have been made to foster family preservation.
This was done primarily through the passage of historic legislation (Beardslee 1989).
Despite the efforts to encourage family preservation, African American children are
significantly over represented in the foster care system at both the national and state
levels. Some have argued (Bart 1997) that strong evidence suggests that two decades of
family preservation efforts have not resulted in increase in adoptive placements for
African American children. As the issue of African American children in foster care is
discussed, one factor related to placement that is evident is the idea that there are many
African American children in the foster care stem because they do not exit proportionally
with their entry.

Entry and exit rates are influenced by factors such as social worker’s discretion,
family functioning, as well as perception about family resilience. This study will examine
the extent to which social workers, supervisors, and managers in the public child welfare
system recognize or identify worker discretion and family resilience as contributing to the
number of African American children entering and exiting the foster care system this
study will also examine the recommendations for reducing the number of African
American children in the foster care system as offered by the same workers.

The history and tradition of the social work profession is replete with stories
about the pioneers working for the relief and betterment of the disadvantaged (Zastrow
The current crisis involving the large number of African American children in the foster care system, the level of discretionary decision-making by workers at the various levels of the system, as well as the challenge to examining the concept of resilience in the family of the African American children being placed in the foster care system all form part of the basis for this research effort.

The research design consisted of a self-designed 120 items survey instrument entitled “Social Worker Recommendation Survey”. This survey was distributed for self-administration by public child welfare social workers, supervisors, and managers in four Northern California Counties (County A, County B, County C and County D). Because of the low response rate from Counties B and D only the data gathered from questionnaires returned from Counties A and C were used for this study. The instrument consisted of 9 items to elicit demographic data and 112 items on a 5 point Likert-type scale addressing the two main questions. There was also a section on the questionnaire where respondents were able to write their own opinion and recommendations.

The study involved an examination of factors identified by the social workers as contributing to the overrepresentation of African American children, as well as their recommendations for reducing the number of African American children in the California foster care system. The study also examined the written recommendations that were made by the social workers to identify the extent to which they recommended solutions that considered family resilience as well as worker’s discretion in the decision making process.

In the globalised capitalist economy union membership is declining but the numbers of women employed in paid work is growing, particularly in non full-time, insecure jobs, many of whom are not unionised. Women workers internationally have a long history of involvement in unions either as members of mixed unions or by forming separate women-only unions. Women-only unions formed in countries including Australia, Canada, Denmark, England, the US and Ireland as early as the 1880s but were generally short-lived. A ‘second wave’ of women-only unions reformed once again in Canada, the United States and India in the 1970s. In 1990 women-only unions formed in Japan and Korea, and by 2003 twelve women-only unions had formed throughout Japan with the largest Josei Union, organising 250 members. In Korea there are 3 women-only unions all of which formed in 1999. The Korean Women’s Trade Union is the largest comprising 9 regional branches and approximately 4200 members. Why have women workers in Japan and Korea formed women-only unions?

This research is part of a much larger project looking at the development of women-only unions in Japan and Korea, and in this paper I analyse their formation and compare them with contemporary women-only unions in Denmark, the US and India. By comparing women-only unions in Japan and Korea to women-only unions existing in other countries allows for an understanding of whether the formation of women-
only unions in diverse cultural contexts reflects women workers broadly similar experiences of unions. In conducting this research I interviewed union officials and members of two unions in Japan, and two unions in Korea in 2003 and 2004, as well as interviewing an official from KAD in Denmark in 2003. I conducted participant observation of bargaining sessions and union meetings (Japan) and recruiting campaigns (Korea). An examination of women-only unions and particularly those in Japan and Korea is significant because it focuses on women workers creating union strategies rather than having them imposed by male union leaders. The research also contributes to dispelling the notion which has developed in industrial relations literature that women workers, particularly women workers in some Asian countries, are passive, docile and disinterested in industrial issues and union activity.

Women-only unions in Japan and Korea are smaller in membership than their longer established international counterparts and their status as ‘second’ unions exacerbates the difficulty for their ability to expand into unionised workplaces and gaining recognition by employers. Their focus on unionising non full-time workers and unemployed workers, the majority of whom are women, and workers who are not organised by existing enterprise-based mixed unions still provides a large pool of potential members. By organising greater numbers of women workers into unions run by women with a women-centred focus the impact of politicising women workers is significant for the form and configuration of social and welfare policies. Women-only unions increase the number of unionised workers and thus raise awareness of collective organisation as well as the conditions experienced by women workers which may have a transformative effect on the broader existing union movement.
**Problem Statement and Literature Review**

Traditional retailing formats (in-store) are growing at a stagnant rate while non-store retailing formats (Internet, catalog, TV home shopping channels) are growing exponentially (Dickson, 2000; Mathwick, Malharta, & Rigdon, 2001; Scally, 2000; Sim & Koi, 2002). Retailers are realizing that the retail format in which the shopper first sees a product may not necessarily mean that the purchase will be made through that retail format (Noble, 2001; Sim & Koi, 2002). Now, more than at any other time, retailers are aware that integrating two or more retail formats is their best chance for longevity and profitability (Reda, 2000; Scally, 2000; Sinioukov, 2001; Thomas, 2001). Non-store retailing formats are being adopted by some retailers in order to generate additional sales, offer additional benefits and build store loyalty without detracting sales from the existing core business (Hanover, 1999; Reda, 1999).

Regardless of the retail format used, it is the shopper who ultimately determines the retailer’s success. A retailer is successful when shoppers’ perceptions of the store’s products and services lead them to make a purchase. Understanding the social and psychological motivations
behind a shopper’s purchase behavior is the key to better meeting their wants and needs. Traditional retailers who are considering adopting some type of non-store shopping format in conjunction with their in-store format need to know what shoppers want and expect prior to embarking on the expansion.

Because shoppers have different attitudes and perceptions it stands to reason that different types of retail formats will appeal to different types of shoppers. The question becomes one of which differences are key to understanding purchase behavior. Segmentation is one way that researchers can distinguish types of shoppers based on purchase patterns, attitudes and preferences (Shim & Bickle, 1994). Several researchers have used shopping orientation as a conceptual framework and method of segmenting shoppers based on similarities in consumer characteristics and market behavior (e.g., Burgess, 2003; Bellenger and Korgaonkar, 1980; Hennerberg, 1993).

Although much research has been conducted on attitudes of shoppers, little is available regarding a comparison of traditional and non-store shoppers in terms of their perceptions of the benefits of one type of shopping format over the other. Using shopping orientation as the framework, the purpose of the proposed research is to determine whether shoppers can be distinguished according to purchase behavior and attitudes regarding retail formats (traditional and non-store) and to then compare the types of shoppers based on their perceptions of the benefits of each format. To guide the study the following research questions have been constructed.

1. What attitudes do shoppers hold regarding traditional retail formats, non-store retail formats and retailers who employ a combination of the two?
2. Can shoppers be profiled based on traditional and non-store shopping behavior? And if so, do the resulting shopper types differ based on perceived benefits of those formats and do the general attitudes of the resulting shopper types differ for traditional and non-store retailers?

**Methodology and Data Collection**

A pretested quantitative survey will be mailed to 6,500 randomly selected female consumers (aged 18 and older), selected from the National Demographics & Lifestyles (NDL) survey population. Two techniques will be used to maximize the response rate. First, survey questions will be formatted in the appearance of a booklet. This format has been used in previous research and is believed to have enhanced the response rate (e.g., Bickle, Eckman & Kotsiopoulos, 1998). Second, three weeks after the first mailing, consumers who have not responded will be sent a reminder letter and survey.

An extensive review of the literature as well as the researchers’ previous research on traditional and non-store retailing will act as the foundation for the development of the survey. The survey will be divided into five parts, each focusing on a construct under investigation. For part one a series of recall questions relating to past shopping experiences will be used to ascertain shopping behavior. These questions will center on information specifically related to behavior in traditional and non-store retail formats and is likely to include information search, browsing habits and purchase habits. Part two of the survey will focus on general preferences for traditional and non-traditional formats and will likely include items related to specific characteristics of each format. Part three will measure shopper’s perceptions of benefits of traditional and non-store formats including services, products, ease of shopping and completing the transaction. Measurement items regarding shoppers’ attitudes will comprise part four of
the survey and will focus on general shopping attitudes as well as attitudes specifically related to traditional and non-store shopping formats. The final section of the survey will include demographic statements. With the exclusion of the demographic section each construct will be measured through the use of likert-type scales, including some reverse scored items to reduce response bias.

**Planned Statistical Analyses**

To analyze the data a variety of statistical tests will be employed. Consumer shopping experiences and general preference items will be reduced into more closely relate constructs through the use of principle components analysis with varimax rotation. This test will produce sets of characteristics that can be identified as typical of shoppers of traditional formats, non-store formats or combination of the two. As a result, shoppers will be categorized into groups according to similarities between their answers. Cronbach’s alpha tests will be used to determine reliability. Resulting shopper types will then be compared to identify similarities and differences based on perceptions of benefits, attitudes and demographics by using Kruskal-Wallis tests. Descriptive statistics will be used in providing a general description of the sample.

**Anticipated Outcomes and Practical Conclusions**

Implications resulting from this study will directly benefit the retail industry by providing insight into shopping behavior. More specifically, this research will provide retailers with descriptions of shopper segments who possess similar qualities which will assist retailers in adjusting or generating plans for expanding into a non-store shopping format. Implications regarding resulting shopper types in relation to perceptions of the benefits associated with the retail format will also be examined in an effort to produce findings with practical implications.
Additionally this study will serve as a foundation for future research, lending a better understanding of shopping as a socio-psychological behavior and uncovering additional directions for future study.

**Proposed Timeline**

Following is a timeline for the completion of the proposed study.

Abstract

The main objective of this study was to explore clothing trends and attitudes of Southeast Asian students in an American university with the purpose of determining areas for future research. Of primary interest was whether students’ attitudes relating to wearing their culture’s national dress was related to their association with American students and western media. A group of 150 Southeast Asian students of an American university completed a written survey. The survey questions related to students’ attitudes toward national heritage and dress, interaction with American students and western media usage. Results showed significant negative correlations between wearing national dress and two variables: use of western media and interaction with American students.
Introduction

Until a few years ago the number of international students studying in the United States (U.S.) had been growing each year. Statistics show that the total number of in international students applying for visas to study in the U.S. has been adversely affected by the events of September 11, 2001 with a decrease of 27% between the years of 2001 and 2003 (“International Student Enrollments,” 2004). In 2003-2004 there were 572,509 international students enrolled in U.S. universities (“Surveys Show,” 2004). While India is the country representing the largest number of international students in the U.S. (“Surveys Show,” 2004), the greatest portion of international students attending the university used in this study were from Southeast Asia.

The purpose of this study is to identify areas for future research by exploring hypothesized relationships between international students wearing their national dress and their interaction with American students and western media. Findings from this study and the implications for future research may be beneficial to an institution of higher learning for a better understanding of the social and psychological makeup of international Asian students, their personalities, their development during their early university years, and how institutions could adapt and be aware to these intercultural issues.

Literature Review

Living and studying in another country involves many socio-cultural, environmental, and physiological adjustments. It is not unusual, during this process of adaptation, for international
students to experience stress-related psychological difficulties (Chen, 1999; Rahman & Rollock, 2004). For some stress becomes an unavoidable psychological factor for international college students, and has been shown to be more intense than stress experienced by their American counterparts (Ebbin & Blankenship, 1986).

Rahman and Rollock (2004) discussed how most international students enrolled in American colleges and universities have similar concerns and problems related to culture, language, academic background, and social customs. Newly arrived international students need to be informed about American customs and beliefs including clothing, food, and housing to assist them in acclimating to the culture and reducing feelings of stress and isolation (Dunnett, 1981).

Asian international students experience problems that, if not unique to Asian international students, are often amplified with them. These include language problems, culture shock, adjustment to social customs and norms and lack of self-confidence (Rahman & Rollock 2004; Yeh & Inose, 2003). When compared to other international students, Asian international students have been found to interact less frequently with Americans, handle stress less effectively, have more difficulty with language barriers and to rate their adjustment experience in the U.S. lower than Latin American and European students (Barratt & Huba, 1994; Rahman & Rollock 2004; Yeh & Inose, 2003).

Yeh and Inose (2003) suggested that foreign students need to learn how to communicate in a new culture. In order for there to be an effective line of communication, the individual must be able to understand cultural norms, nonverbal behavior and the intentions of others. One way to do this is through media usage (Woo & Dominick, 2003). Watching movies and television programs and looking at magazines are easy ways to learn about the culture
without having to interact. This may be especially important to students who are newly arrived or those who are self-conscious in their English language skills. These experiences can lend confidence to international students in developing interpersonal relationships with Americans.

Herskovits (1972) explains that for Asians friendship is reserved for a very few people since it is based on mutual love. In the United States, friendship has a meaning of doing things with other people whose company one enjoys. Therefore, both American and international students must understand cultural norms from the point of view of the other to communicate effectively. Since friends play an essential role in an international student's life, finding other international friends as well as American friends are important for understanding and knowing the new culture as a step toward making adjustment to study abroad life.

Studies have documented cross-cultural fashion interaction between the West and developing nations, in which indigenous clothing norms were preserved or abandoned to varying degrees based on the nature and background of the national struggle or the underlying perceptions associated with adoption of Western dress. Similarly, studies have recorded trends in modifications of indigenous dress in which there is a preservation of indigenous clothing styles while incorporating elements of the Western fashion (Craik, 1994). Most studies have concentrated on international contacts in developing nations, though some studies, however, have addressed the changes in clothing norms from short-term cultural contacts, such as international students studying in the West.

Due to the increasing complexity and diversity of international student populations in higher education in American universities and colleges most international students often experience stress and nostalgia for their native country when they could not fully adjust to their new environment. Wearing national dress can serve as a psychological link to home and family.
**Hypotheses**

Based on the literature review the following hypotheses were developed.

H1: There is a relationship between wearing national dress and Southeast Asian students’ interaction with American students.

H2: There is a relationship between wearing national dress and Southeast Asian students’ exposure to western media.

**Method**

**Instrument**

A written survey was designed to collect data and was divided into four sections. The first section asked six questions related to the student’s attitudes towards national/cultural heritage and national dress (Table 1). The second section included seven items related the Southeast Asian student’s use of western media sources including television, movies and magazines (Table 1). Section three was comprised of six items designed to measure Southeast Asian students’ peer interactions, whether with mostly American or other Southeast Asian students (Table 1).

Questions in these three sections were scored using Likert type choices ranging from one (strongly agree) to seven (strongly disagree). The final section of the survey was designed to gather socio-demographic information including age, gender and region/country of origin. Prior to administration, the survey was pre-tested for face validity by asking international students for their input on wording and layout to improve readability and decrease potential problems.
Data Collection

Subjects were randomly selected from a list of currently enrolled international students at a small Midwestern university. This list was reduced to include only students of Southeast Asian origin. The expected age range of these college-enrolled individuals was approximately 20 to 35. Using the list, the researcher contacted each student individually by email and asked them to participate in the study. Students who agreed to fill out the survey were asked to come during specific hours to the university library to participate. During the course of time students were filling out the surveys, a researcher was present to answer any questions that arose.

Sample

Of the 310 students identified as Southeast Asian, 150 agreed to complete the survey. All returned surveys were complete and usable for a response rate of 48.39%. The sample consisted of students representing seven countries. The greatest number of students was from Malaysia, at 33%, followed by Thailand and Indonesia, which each represented 23%. India was the home country of 10% of students. Pakistan and the Philippines tied with 3% each.

Fifty-six percent of the respondents were female while 44% were male. With respect to income, most of the students served were categorized as moderately high to high-income backgrounds in their home countries. This could be explained by the high cost of education for most international students coming to the U.S. for higher education. Most of the students (93%) were completing graduate degrees.

Results

To test each hypothesis the items representing each variable were combined, giving each subject a mean score for “national dress,” “peer interaction,” and “media usage” (Table 1).
Hypothesis 1

H1: There is a relationship between wearing national dress and Southeast Asian students’ interaction with American students.

To test the first hypothesis, a Pearson’s correlation test was used. The variables were “peer interaction” and “media usage.” The test revealed a correlation coefficient of -.1943 and a p-value of .018, lending significant support for the hypothesis. There was a significant negative relationship between wearing national dress and Southeast Asian students’ interaction with American Students. It appears that as interaction with American students increases, wearing of national dress decreases.

Hypothesis 2

H2: There is a relationship between wearing national dress and Southeast Asian students’ exposure to western media.

To determine if exposure to western media was related to wearing national dress in the U.S., a Pearson’s correlation test was performed. The variables used were “media usage” and “national dress.” Results showed a correlation coefficient of -.2856 and a p-value of .000. This shows a significant negative correlation between wearing national dress in the U.S. and the use of western media by the Southeast Asian students. It appears that as the use of western media increases, the wearing of national dress decreases.

Discussion/Implications for Future Research

The purpose of this study was to identify possible areas for future research by exploring the relationships between national dress, peer interaction and western media usage. The findings showed that Southeast Asian student’s attitudes toward wearing their national dress were related
to their use of western media including television, movies and magazines. Additionally, findings showed that wearing national dress was inversely related to interactions with American students.

By confirming relationships between the variables of study (i.e., wearing national dress, media usage and interaction with American students) several questions were raised. Of primary interest are mediating and other factors that affect the found correlations. First, further study is needed which distinguishes separate cultures within Southeast Asia. Different countries and cultures have quite distinctive national dress, related to their long histories. It is likely, and should be expected that culture will have differing affects on international students’ desire and willingness to adapt national dress and interact with Americans and western media. One cultural influence that may be especially telling is religion. In some cultures religion is strongly related to national dress and may greatly impact the findings of future studies.

Secondly, international students of many countries are influenced by western culture (media and dress) prior to studying abroad. For these students interaction with American students may be more related to differences in political, economic and social systems stemming from ideological differences (e.g., communism versus democracy, controlled economy versus free economy). These factors may greatly influence international students desire to interact with their American counterparts. Related to this is the idea of fashionable dress. Although international students’ daily dress in their home country may have strong western influences, there still may still be concerns, such as dressing fashionably by American standards, which future study could address.

A third avenue for research involves language. Living and studying in a foreign country with unique cultural traditions and customs and studying with people from different cultures is not easy or simple. The short-term adaptability and acculturation process of international
students should also be examined in relation to English language proficiency. For instance, students of some nationalities may arrive in the U.S. with proficiency in English while others, who have more language barriers, would have show the different progress of adaptation. This may greatly impact their desire to form American friendships.

Finally, the Southeast Asian students surveyed in the current study represent a small number of international students in general. The results may differ in the case of different cultures, as the dress standards may vary from one culture to another. In order to obtain accurate representations of the international student’s attitudes toward clothing, it is necessary to conduct a study that gives more students of that category an opportunity to respond. The small number of students surveyed in the current study may not provide the true responses of all student groups of similar backgrounds, thus the findings should not be generalized beyond this sample.

I build on Anthony Giddens’s and Charles Tilly’s theories, which emphasize the importance of war in the origins and transformation of states. The Tilly-Giddens thesis has found strong support for European cases, but as of yet, it has had promising, but limited tests outside of the European instances. I also rely on Weber’s two major historical works on Monsoon Asia: The Religion of China, and the Religion of India in building my theory. Weber, employing secondary historical sources, particularly the work done by historical specialists of the societies he was studying, used these materials to theoretically reconceptualize the dynamics of the societies he was investigating. I use a similar methodology in this paper in developing my theory. Given his preoccupation with the rise of capitalism in Europe, Weber tended to underestimate the degree of political change in Asia: Giddens’s and Tilly’s social dynamics theory of state formation gives an engine of social change to the largely social statics theory of Weber. Likewise, Weber develops a theory of states in Asia, which stresses the importance of religion, in legitimizing political structures. The approach offered in this paper deals with the empirical quandary posed by Weber’s formulation of the concept of religion. In Weber’s work it is not clear as to what exactly makes a creed religious. I replace Weber’s theoretical concept of religion, with the theoretical concept of religioethical system. A religioethical system refers to the profound and fundamental Weltanschauungs, philosophies, rituals, moral principles, rules of conduct, and practices that are embraced by the state, state challengers, state builders, or societies under investigation. Unlike the concept of religion, religioethical systems may or may not encompass a belief in one or more deities. Additionally, I define ethic-making as the enforcement or promotion of these specific beliefs and
practices of religioethical systems in their political contexts.

Drawing on the Tilly-Giddens principle and the neo-Weberian concept of religioethical system, the theory that I develop, is that the interaction between war and religioethical systems, at the micro, societal, and world societal levels, across time, formed Asian states, Asian empires, and the modern Asian state system. Using ideal-typical constructs, I theorize, throughout this analysis, that the interaction between warfare and religioethical systems, within Asian societies, among clusters of Asian societies, and outside of Asia, causally built the modern Asian state system consisting of India, China, Japan, Korea, and the states within Southeast Asia. I examine the way in which external and internal war-making and religioethics interacted with the dynamics of classes, genders, societies, and institutions to form the modern Asian state system. I hypothesize, moreover, that the victorious war-making forces do not invariably thrust a hegemonic cultural religioethical system on the subordinated society. To be sure, the general tendency of the conquering groups is to have the advantage in the political and cultural restructuring of the societies they conquer. Nonetheless, both groups, the conquered and the conquering societies, through their struggles and interactions, determine the structure of states.
Title of the Submission: “Cognitive Processes: Their Influence on Varying Pathways to Recovery”

Abstract:

Cognitive processes have been known to have a significant impact on recovery from alcohol and other drugs. From a study of self-changers (natural recoverers) without treatment or self-help groups, analysis of the data has identified beliefs that influenced the change experience---from the evaluation of reasons for drinking and the consequences that instigated the motivation and determination to take action, to the individually-conceived strategies to implement and maintain abstinence, and the perceived consequences of abstaining. Belief systems and strategies of recovery are compared across three pathways to recovery---self-change, cognitively-oriented treatment, and Alcoholics Anonymous.

Factors Associated with Anti-War Sentiment in Military Families and Implications for Coping Skills

The psychological impact of war on soldiers has been studied from WWI, where it was termed battle fatigue, through the PTSD of Viet Nam, up to the combat stress of today’s Iraq War. The military now deploys teams of combat stress units in the field with the realization that addressing problems in situ assists soldiers in dealing with their emotions and reduces later psychological problems. But families, waiting at home, receive little if any assistance beyond support groups facilitated by non-professionals. During previous wars, there have been some anecdotal references made to the possibility of psychological and social consequences to family members who have loved ones involved in war. Recognition of this problem is slowly gaining momentum partially due to that fact that the Iraq War has several characteristics which make it even more difficult on military families. For example, in previous wars, approximately ten percent of the military were on the front line at a given time and this provided a modicum of relief for those at home that the soldier was not always in imminent danger. However, in this conflict, there is no discernable “front line” as those serving are in danger of being injured or killed at any time. Convoy truck drivers, guards at check points, even soldiers sleeping in barracks are all in peril. This vulnerability of loved ones exposes more families to their own form of combat stress. Another factor is the uncertainty and anxiety caused by stop-loss, tour extensions, and re-deployment. An increasing number of families are finding themselves opposing the war while at the same time supporting their soldier. This dichotomy of emotion, and society’s reactions to it, necessitates examining what factors are associated with anti-war sentiment and the identification of coping mechanisms for the military family.

Characteristics of Military Families Who Oppose the War

While supporters of military action tend to accept the moral rationales provided by politicians and believe that war is a moral option, military critics frequently reject these arguments for initiating war. (Calhoun, 2001). In a study
conducted on one hundred and forty military families by the author, the most common reason for opposing the war given by military families was that they felt the original justification for the invasion, the threat of weapons of mass destruction, was a lie. In European intellectual tradition, war is to be justified only when it is necessary for the maintenance of peace and order. This is known as the “Just War” tradition, generally expressed as a set of rules stating: (1) war must be fought for a just cause, (2) it must be conducted by proper authority, (3) it is to be proportional to the ends it seeks to achieve, and (4) it must be conducted in a just manner, with discrimination between those who are subject to attack and those who are immune (Stroble, 1996). These rules are commonly known as jus ad bellum (justice to go to war) and jus in bello (justice in war). For those who follow this doctrine, a just war must be “publicly declared by a legitimate authority, for a just cause in the interest of peace and only after non-violent means to resolution of the dispute have proven infeasible” (Calhoun, 2001 p. 37). Anti-war military families do not believe the Iraq War meets the jus ad bellum and jus in bello criteria.

Doty et al, (1997) examined how personality factors shapes political attitudes, and found that those who demonstrated aggressive support for U.S. policy, (up to and including using nuclear weapons), during the Gulf War tended to score high on the authoritarian scale in contrast to those who scored lower and were against the war.

Those who score high on authoritarian scales, according to Altemeyer(1988), display three basic characteristics: conventionality, acceptance of authority and aggression. Winter (1996) suggests that, “these characteristics may arise from a fundamental sense of threat, which arouses intolerance of ambiguity leading to a more simplistic outlook which differentiates good ‘leaders’ and ‘bad’ enemies, finally permitting the ‘good’ to punish the ‘bad’ (p228). Conversely those who score low tend to be non-conventional, question authority and be non-aggressive. Studies suggest that authoritarianism is associated with moralistic hostility toward unconventional points of view ( Winter, 1996). To those who are authoritarian, military families opposing war is the epitome of unconventional thought.
One of the major factors isolating anti-war military families is the attitude by some that they are unpatriotic. Statements by pro-war activists like, “when American troops are in harm’s way, true patriots will be hard-pressed to stand shoulder to shoulder in demonstrations with those who hate this country and all it represents” (Chavez, 2003), attempt to equate anti-war sentiment and anti-Americanism, further alienating and denigrating pro-peace families.

A survey was conducted by the author of families who had soldiers, marines, and navy personnel currently stationed in, or recently returned from, Iraq. Characteristics of the families who stated they were against the war included: feelings that it was very likely that their loved one would be injured; constant, sometimes debilitating fear for the combatants safety; helplessness and loss of control over the situation; substantial increases in their levels irritability and anger; a majority reported crying frequently; and most responded that they had not found effective support systems or resources to help them with their emotional stress.

Implications for Counseling Approaches and Coping Mechanisms

Most Westerners believe at some level that war is justified only when it is absolutely necessary and it presents the lesser of two evils. A major basis for anger and sense of futility in the anti-war military families is that they also adhere to the Just War theory but do not find the rules being met in the Iraq War. A treatment approach in assisting them to cope would be to help them understand their underlying belief (it is not always readily apparent to the client) and to realize there is another philosophical attitude toward war. The Confucian school views war as not being instrumental in creating social order, (which should instead be derived from the prior establishment of cultural and political authority. This ancient Chinese philosophy views war not as a means to create social order, but instead as a sign of the failure to achieve such order. If the client can reframe their anger that the war is not justified to accepting that this war is the failure of having a “well-ordered concord” (Stroble, 1998), they can direct their anger at a more tangible source and therefore focus actions on correcting that source. This
activism is more positive and provides a sense of action, and possibly some sense of control in determining the outcome of the situation. Becoming involved in positive actions is one of the most beneficial therapies for those who suffering from grief, lack of control or feeling of powerlessness.

The client who demonstrates low authoritarianism will need to address the complex uncertainty resulting from being told a mixture of lies and truths. Time will have to be spent sorting out fact and fiction, looking for the “just” points and dealing with anger toward the unjust lies.

Educating the client on the differences between the authoritarian and non-authoritarian personality would serve two purposes. First it will normalize the fact that questioning authority and low aggression are correlated behaviors. Secondly it may help families to understand the authoritarian personality and why they react the way they do.

Studies have shown that people who score low in authoritarianism are more likely to be able to express regret about war and its effect and are more likely to verbalized the damage done and sadness over loss of life. (Doty, 1997). Counselors can help the family recognize that this is strength, not a weakness.

Also from the strengths perspective, counselors should point out that the family has the ability to deal with the ambiguity of supporting their soldier and at the same time being against the war. It is their critics, with authoritarian, pro-war personalities that avoid ambiguity and therefore are intolerant of those who can accomplish this.

Realizing that there is a phenomena of “rally forces” to which many people respond with non-critical support for governmental policies, can help the anti-war family to understand that criticism toward them is not personal, but a social/psychological response to a situation. De-personalizing criticism assists in dealing with adversarial comments.

Another frustration for anti-war families is their inability to comprehend how pro-war supporters seemingly accept the administrations rationale for the Iraq war and how it is progressing because they view much of that rationale as exaggeration or lies. Hannah Arendt (2001) states that lies frequently tend to be
more appealing than reality if the public is confronted with issues or facts that are not what they want to hear or are not prepared to hear. If anti-war families are made aware of this phenomena it could help them to understand why so many have a different view than they have.

Calhoun (2001) views “rallying events”, (exogenous shocks such as wars) as situations that invoke feeling of allegiance, loyalty, and promoting patriotism. In this state, citizens see policies and public officials in a more positive, less critical light than a non-emotional examination would allow. Families can be made aware how by taking more rational approaches are not as susceptible to the rallying effects.

One problem with much of the information and suggestions proffered to families by the government and some agencies is that it tends to be platitudinal, and is not specific enough to provide concrete transitional steps to help a person go from what they are experiencing to where they can actually apply the suggested actions or thought processes. Guidelines given to families who feel helpless often include such vague advice as to detach themselves from things they cannot control (Quick, 2003). While this would work if they could achieve it, most find it very difficult to do. Several behaviors can create some feelings of control: establishing a daily routine and modest to-do lists; working with groups to collect needed articles for soldiers; and volunteering to baby-sit for soldiers’ spouses result in feelings of accomplishment and usefulness. One group of parents established an anti-recruitment program in which they talk with high school students who have been solicited by recruiters and share their experiences having a child involved in war. Their actions served to give them a sense of accomplishment and control in the situation.

Conclusion

Military families opposed to the Iraq War suffer the pain and anguish of having a loved-one in a war zone. In addition, they are also subjected to criticism by pro-military factions who question their patriotism and motives, resulting in emotional stress and dysfunction. By examining factors associated with how
others view anti-war families, and how these families perceive themselves, counselors can help instill viable, positive coping skills, and restoration to emotionally healthier lives.

ABSTRACT

Factors Associated with Anti-War Sentiment in Military Families and Implications for Coping Skills

As the conflict continues, an increasing number of military families have become opposed to the Iraq war. This opposition creates additional stressors on the anti-war military families, often resulting in social isolation and psychological trauma. Traditional support groups and therapy are not meeting the needs of this population. The purpose of this paper is to identify the factors that create anti-war sentiment in military families and develop interventions and skills that can help them cope.

Objectives for this presentation:
- To identify factors associated with anti-war sentiment in military families
- To determine how these factors exacerbate social isolation of the anti-war military family
- To identify coping skills that will reduce isolation and negative emotions
Abstract. This research was based on the conceptual framework that students’ low mathematics achievement in school is related to their poor study habits. Thus, the intervention titled Mathematics Self-Regulated Learning Program aimed to help selected children from Southeast Asia (the Philippines) improve their Mathematics achievement, Mathematics self-regulated learning, and Mathematics school grade. This research focused on the following difference scores: 1) Mathematics achievement, Mathematics self-regulated learning, and Mathematics school grade between experimental and control groups (N = 60); and 2) Mathematics achievement, Mathematics self-regulated learning, and Mathematics school grade between younger and older groups (N = 60). The main result supports self-regulated learning theory which states that when students are given opportunities to self-regulate and explicitly taught of self-regulated learning strategies, academic achievement is more likely to be positively affected. The presenter would like to content that students as active agents of their behaviors can be trained to be responsible learners and thus acquire the goal of life-long education which is learning not just what to learn but more importantly how to learn. Insights of the presenter about the behavioral self-regulatory response of Southeast Asian children will be described during conference presentation.

Why do some people approach learning tasks eagerly while others avoid them or work half-heartedly? Why do some seek and enjoy learning, while others are afraid to learn?

Educators and parents long have been plagued by the problem of students’ low achievement in school. Many have had the frustrating experience of watching a child undermine his or her chances for a good performance simply by not trying. A student who performs poorly as a consequence of not studying or not completing assignments is usually perceived by his teachers as a hopeless case.

Many students who encounter achievement problems in school frequently warrant the concerned scrutiny of teachers and parents alike. They are victims of pre-judgment that they can do no better.

The researcher in her three years of teaching in the elementary grades encountered colleagues and parents who have lost hope in teaching children who were branded as “lazy”; “just don’t like to try”; and “take for granted studying.” This experience served as a challenge to the researcher. She likes to contend that children can be taught of self-regulated learning skills and thus improve their performance in school.

Teachers have the responsibility to teach students not just what to learn but more importantly how to learn. Teaching students of self-regulated learning strategies is reflective of the life-long goal of education which is teaching students the will as well as
the *skill* in learning (Pintrich & de Groot, 1990). As the old aphorism would say “… teach a man how to fish and you have fed him for life.”

This study helped students realize that it is possible for them to generate and direct their own learning experiences rather than act in response to external controls. That they are self-initiators who can exercise personal choice and control of the methods needed to attain the learning goals they have set for themselves. That they function as *origins* of their own behavior rather than *pawns* controlled by outside forces (de Charms, 1987). In this way, their fullest potential will be developed.

Teachers can use self-regulated learning strategies on their students and therefore change the traditional perception of teachers that some students just cannot learn what they teach. The researcher hopes that the teachers will internalize within themselves that students come to school to learn and should be taught how to learn. The teacher should contribute to the development of student’s positive self-image, rather than to the establishment of a self-defeating behavior.

| PERFORMANCE OUTCOME |

Figure 1. Self-Regulated Learning Program
Research indicated that students’ low achievement in school is related to their poor study habits. Figure 1 illustrates that training the students to be self-regulated learners through the Self-Regulated Learning Program (SRLP) will help them improve their Mathematics achievement and study habits.

The SRLP, conceptualized specifically for this research project, is a training program consisted of four main components. The first component refers to the knowledge and beliefs of the subjects. Subjects introduced to the learning goal (Dweck, 1986), attribution to effort (Weiner, 1979), and self-efficacy (Bandura, 1986) are hoped to be oriented to the idea of self-direction (Bandura, 1989), self-responsibility, personal causation (de Charms, 1987), and self-regulation (Zimmerman, 1989) of their own learning. The orientation also includes knowledge of what, how, why and when to use the learning strategies needed to become self-directed, self-responsible and self-regulated learners. The second component refers to the explicit instruction of the self-regulated learning (SRL) strategies. This learning strategies are based on Zimmerman’s (1986) SRL strategies which encompass both the cognitive and metacognitive aspects of the learning process. Zimmerman (1989) identified 14 self-regulated learning strategies which were derived from the social cognitive theory (Table 1). The purpose of each strategy is to improve students’ self-regulation of their a) personal functioning, b) academic behavioral performance, and c) learning environment. For example, the strategies of organizing and transforming, rehearsing and memorizing, and goal setting and planning focused on optimizing personal regulation. Strategies such as self-evaluation and self-consequences were designed to enhance behavioral functioning. The strategies of environmental structuring, seeking information, reviewing, and seeking assistance were intended to optimize the students’ immediate learning environment.

The third component is the SRL opportunities given to the subjects which parallels the conceptual definition of self-regulated learning (Zimmerman, 1994). Subjects must be given the opportunities to freely use and have the appropriate environment to practice the SRL strategies to qualify as self-regulated learners. The fourth component states that with the use of SRL strategies, subjects’ performance outcome must be consistently monitored (Butler and Winne, 1995). Monitoring generates feedback that provides information for confirming or re-examining and modifying strategies, thus, select and use more productive procedures.

Subjects

The subjects for this study were selected by purposive stratified sampling from a suburban private school in Southeast Asia (the Philippines). Sixty elementary grades four and six students with low grade point average in the third quarter of the school year 1998-1999, low mathematics achievement score and poor study habits were chosen from four heterogeneous classes.

Grade four subjects have a mean age of 10.62 years while grade six subjects are of 12.85 years. Both grade levels obtained below 50% mark in Mathematics Achievement Test and Mathematics Self-Regulated Learning Scale. Grade point average of grade four subjects is 75.40 while grade six is 73.44.

**Methodology**

A two x two factorial quasi-experimental design which consisted of two independent variables, namely: treatment (with treatment and no treatment) and grade level (grade 4 and grade 6) was used. The purpose of the research design is to investigate the effects of Mathematics Self-Regulated Learning Program on the Mathematics achievement, Mathematics self-regulated learning and Mathematics school grade of low achieving students.

In a private school, the research drew a sample of 60 students matched by socioeconomic backgrounds, location, teacher qualifications and skills, school evaluation procedures, physical facilities and degree of parental involvement. Fifteen students were randomly selected to comprise the experimental group for each grade level and the remaining 15 into the control group of each grade level. Two grade levels were chosen, namely: grade four and grade six.
From the population of 152 grades four and six students, middle-class socio-economic status, 60 subjects were selected using the following criteria: low Mathematics achievement score, low grade point average and poor study habits. These were measured using instruments specifically designed for this study. After the treatment was completed, post-tests using Mathematics Achievement Test and Mathematics Self-Regulated Learning Scale were used to determine the effect of experimental manipulation.

Data Gathering Procedure

This study took effect on the Fourth Grading period of the school year. Data for the baseline past of the research design were collected on the first three days of the said period. Grades from the report cards were gathered through the coordination of the subject teachers with the permission of the school officials. Parents of the chosen subjects were given letters asking their permission to include subjects for the experiment.

The pre-tests for Mathematics Achievement and Mathematics Self-Regulated Learning were given by the School Guidance Counselor inside the classroom during the Mathematics class.

The experiment proper was conducted in the school’s elementary library after regular classes in the afternoon. The Mathematics Self-Regulated Learning Program was used by the researcher for one and a half months time, everyday from Monday to Friday, grade four sessions were conducted at 2:00 – 3:00 p.m. while grade six sessions were at 3:00 – 4:00 p.m.

The School Guidance Counselor administered the post-tests using the Mathematics Achievement Test and Mathematics Self-Regulated Learning Scale when treatment was completed.

Mathematics Self-Regulated Learning Program

The Mathematics Self-Regulated Learning Program designed and facilitated by the researcher was done within 6 weeks time, for a total of 30 sessions. Detailed lesson plans for 30 sessions were also written to ensure effective implementation of the program.

Learning strategy instruction started with the development of the students’ self-regulation belief system. The facilitator helped the students develop the important belief orientation to understand, acquire and execute target learning strategies. The purpose of self-regulated learning strategies, how, and when to use them were discussed and explained by the facilitator. The facilitator explicitly taught and demonstrated how the strategies were used with the aid of the appropriate self-instructions techniques. The self-instructions included the combination of problem definition, planning, strategy use, self-evaluation, coping and error correction, and self-reinforcement statements. Collaborative and independent practice of the students were used to monitor the efficient use of the self-regulated learning strategies.

The first five sessions oriented the students to the value of personal responsibility, self-efficacy, learning goal and attribution to effort. The facilitator delivered lectures with the aid of story telling, picture presentations and group sharing of ideas. Participants were asked to share their goals and ambitions in life through the lessons discussed.

Sessions six to eleven were conducted to formally introduce Zimmerman’s (1989) 14 self-regulated learning strategies. Each strategy was explained emphasizing its use and
importance to learning. Participants were given opportunities to practice each strategy on their own. They were explicitly taught how to write learning goals as well as how to properly pace, sequence and plan activities. The facilitator demonstrated the think-aloud strategy for rehearsing and memorizing information and then asked volunteers to do same. The students collated records of quizzes, seat works and assignments to monitor their performance and progress in schoolwork. A self-evaluation form was provided to help them assess how they were doing in their Mathematics class. A discussion about strategies to remedy low performance was initiated by the facilitator. The value of rewarding oneself when a task was accomplished was taught through games and with the use of the “If-then Contract.” The “If-then contract” made the students thought of the rewards they would like to give themselves on certain conditions. The facilitator guided the students for the self-consequating to be fair and to call for and reward accomplishment rather than simply obedience. As for the last strategy, students were encouraged to seek assistance from their peers, parents, teachers, and tutors as well as to use the school library to seek additional information.

Sessions 12 – 30 were facilitated for the participants to apply the self-regulated learning strategies in their Mathematics lessons. During the remaining sessions, students were guided to monitor and evaluate their own progress with the proper use of self-regulated learning strategies. Each week they have to complete forms for goal setting, self-evaluation and self-consequating. In each session, the facilitator observed the students in terms of how they performed during the class activity. A case report was provided for each student.

Results

As predicted, there are significant differences in the Mathematics Achievement between treatment and no treatment groups, F (1, 56) = 15.51, and between younger and older groups, F (1, 56) = 7.26, p < 0.01. There are significant differences in the Mathematics Self-Regulated Learning between treatment and no treatment groups, F(1, 56) = 132.99, p < .01 and between younger and older groups, F (1,56) = 5.59, p < .05. The result shows no significant difference in the Mathematics School Grade between treatment and no treatment groups, F (1.56) = 0.08, although there is a significant difference between older and younger groups, F (1, 56) = 32.02, p < .01.

Fifteen grade four and fifteen grade six students were observed during the 6-week training program. Each student was observed and interviewed in terms of their progress in the use of self-regulated learning strategies. The results for each student’s case were reported on the bases of their improvement or decline in Mathematics Achievement Test (MAT), Mathematics Self-Regulated Learning Scale (MSRLS) and Mathematics School Grade (MSG) scores; behavior during the sessions; attitudes toward learning Mathematics; and use of self-regulated learning strategies. Table 2 shows the summary result of the case reports in terms of the number of students who improved and did not improve in Mathematics achievement, Mathematics self-regulated learning and Mathematics school grade.

The performance of the students in the experimental group, using the three measures: MAT, MSRLS, MSG, generally improved. Improvement in grade six cases is on MAT, MSRLS, and MSG. However, in grade IV, five and six cases showed no improvement in terms of MAT and MSG, respectively. A remarkable result in the MSRLS shows improvement in both grades four and six cases.

Discussion

A. Differences in the Mathematics Achievement, Mathematics Self-Regulated Learning; and Mathematics School Grade Between Treatment and No Treatment Groups.

The results show that there is significant improvement in the Mathematics achievement and Mathematics self-regulated learning of the students in the experimental group after thirty sessions of training in the use of self-regulated learning strategies. This supports Zimmerman’s theory that when students are given opportunities to self-regulate and explicitly taught of self-regulated learning strategies, academic achievement is more likely to be positively affected. Similarly, this finding confirms the results of studies (Hattie, Biggs & Purdie, 1996; Schunk, Hanson & Cox, 1987; Zimmerman & Martinez-Pons, 1986; Bandura & Schunk, 1981) done with the use of the theory of self-regulated learning.

This implies that when students were taught to focus attention on the processes and strategies that help them acquire knowledge and skills, they tend to engage in activities they believe enhance learning such as: exert effort, persist and use effective strategies. As a result, students were observed to exercise control over their learning as they acquire knowledge and skills. This further indicates that students remember and learn more when given the opportunity to use deep processing strategies that enhance conceptual understanding and require cognitive effort, such as integrating information and monitoring comprehension.

The results also support the theory that individuals are considered to be active agents of their behaviors, which mean that students can manipulate and control their own behaviors. Thus, students in the experimental group were able to achieve the desired goal of learning mathematics. It was observed that students were influenced by the major sources for the development of self-regulated learning. It can be inferred that Bandura’s (1989) interaction of the personal, environmental and behavioral factors allow opportunities for the students to exercise control over their own learning. At the personal
level, students were seen to exercise self-directedness, they selected, influenced and constructed their own study habits. Students become origins of their own behavior rather than pawns controlled by the external factors in the environment (de Charms, 1987). The metacognitive strategies were manifested through the use of self-instruction strategies of the students. Strategic planning guided students’ efforts to control learning and was affected reciprocally by feedback from these efforts. This is the same with the use of self-observation and self-judgment as behavioral processes of self-regulation. Students monitored their own progress through keeping records of quizzes, assignments, and examinations. They used self-evaluation by checking procedures, such as re-examining their answers to mathematics problems. With all these, the type of environment, particularly the structure of the learning context, triadically reciprocated with the expected personal and behavioral self-regulation of learning and performance.

During the training program, as a student progresses, he gradually realizes his capability to do better, thus enhances his interest, attributional beliefs to effort, self-efficacy and performance. The chain of effects appeared to be cumulative in effect. Aside from self-assessment, subjects learned how to observe behaviors of their peers. By unintentionally comparing their performance with those of others in the treatment group, they were made to believe that they could do the tasks. Likewise, personal choice and goal setting engaged students’ involvement and interest and gave them more responsibility for their own behaviors. It helped students learn how to set realistic goals which is considered as an important skill in achievement settings (Schunk, 1989). They involved themselves in selecting and administering their own reinforcements by praising or rewarding themselves.

The results which show improvements in the Mathematics achievement and Mathematics self-regulated learning further imply that low achieving students are possible to be equipped of self-regulation. Low achievers who are deficient in all of the essential defining attributes of good information processing, can be trained to be task-oriented with strong motivational beliefs about the importance of learning. Students in the experimental group were told that effort is responsible for their successes, thus, they overcome prior difficulties in learning mathematics skills by simply not giving up to be able to accomplish the assigned tasks. This is a fascinating picture that confirms social cognitivists’ claim. This states that adopting personal challenges in accordance with one’s perceived capabilities and seeing oneself make progress toward the hoped goal endure self-regulation.

The findings in terms of the significant improvement of scores in the Mathematics achievement and Mathematics self-regulated learning are in line with the assertion of self-regulated learning theorists that students can be developed and have the capacity to:

a. discover, develop and apply their own strengths and capabilities;
b. identify and set personally meaningful goals for their own learning;
c. work independently and/or with others to achieve their learning goals;
d. develop and use wide range of learning strategies appropriate to different learning tasks;
e. understand, plan, monitor and evaluate their own learning;
f. access and apply knowledge sources and information systems;
g. persist and overcome obstacles to achieving their learning goals; and
h. apply new skills and knowledge appropriately in practice.
Inconsistent with the hypothesis, the result shows no significant difference between treatment and no treatment groups in terms of Mathematics school grade. This can be explained through the consideration of several other criteria in the grading system of the school. The classroom environment is also a factor to examine if it provides self-regulated learning opportunities. Research (Ames & Archer, 1988; Zimmerman and Martinez-Pons, 1986) discussed that teachers’ role is a big factor in enhancing students self-regulated learning. Although intervention programs have focused on enhancing students’ use of learning strategies, these efforts may have short-term benefits for students who have motivational problems or skill deficits. They are likely to have a limited impact unless teachers can create a classroom environment that supports principles of self-regulated learning.

Classroom studies have noted the strong emphasis on memorization and rote-learning, even at the upper grade levels (Eccles & Midgley, 1989). Instructional practices that involve simple transmission and recall of facts are not conducive to the development of self-regulation. Based on the instructional plans used by some teachers, the researcher observed that almost all activities do not provide opportunities for students to initiate and to direct their own learning. There was little evidence of allowing students to develop questions for class discussions, to design class projects, to choose learning patterns or to decide on how to complete their work.

Considered as the weakest of the three measures used in this study, the Mathematics school grade result shows implications on the way Mathematics is taught inside the classroom. Emphasis on speed and accuracy creates the view of mathematics as an answer-centered rather than process-centered subject. Instead of learning mathematics, students develop skills in copying and memorizing answers. This implies that a traditional classroom teacher as information giver creates a learning context wherein knowledge flows only one way, from the teacher to the student. Mathematics teachers should adopt methods used in a collaborative classroom and emphasize shared knowledge and decision making. This requires the teacher to share authority with students allowing them to have a voice in setting goals, deciding and planning on activities, as well as evaluating their own performance. This implication also fits the conceptual definition of self-regulated learning, which states that self-regulation of learning is possible only in the contexts that provide for choice and control. If students do not have options to choose among or if they are not allowed to control critical dimensions of their learning, such as what topics to pursue, how and when to study, and the outcomes they want to achieve, regulation of thinking and learning process by the self is not fully possible. Externally imposed conditions then regulate the content, structure, and process of learning. The argument goes on, that is, if students are not allowed to have choice and control, they are not likely to learn strategies for regulating strategy training or willingly self-initiate and control the use of various strategies. Results of this study show that training in such self-regulation strategies as monitoring one’s comprehension while learning, setting learning and performance goals, and controlling negative emotions and cognitions enhance school achievement and performance. But if the major conditions required for self-regulation are not present, schools will actually work against helping learners want to learn and self-regulate learning. Furthermore, reference to teachers’ methods of stimulating student self-regulation to learn, whether in the context of developing or activating it, implies not only methods of inducing students
to adopt mastery of content or skills as a goal, but also methods on inducing students to activate needed cognitive and metacognitive strategies.

B. Differences in the Mathematics Achievement, Mathematics Self-Regulated Learning; and Mathematics School Grade Between Younger and Older Groups

The results show that older students obtained significantly higher means of difference scores in all three measures, Mathematics Achievement Test, Mathematics Self-Regulated Learning Scale and Mathematics School Grade.

Although the Mathematics achievement tests were made to be comparable in terms of content and level of cognitive domains, the result seems to reflect the developmental theorists’ claim that as children grow older they become more capable of understanding concepts and ideas. It can be inferred from the result of the study that because of the spiral elementary mathematics curriculum which was patterned on the country’s National curriculum, older students become more knowledgeable and familiar about the topics covered in geometry, measurement, maps and graphs because they have taken the preliminary concepts during the previous years. This is in contrast to the younger students, in which most of the topics in their lessons were new and were not yet taken from their previous years of schooling.

The result in terms of older students’ higher mean of differences scores in the Mathematics Self-Regulated Scale seems to reflect the theory of Brown and Pressley (1994) that the use of self-regulated learning strategies is coordinated with other knowledge possessed by the students. For example, part of planning for writing is searching prior knowledge for what one already knows about the topic. This seems to be also true in mathematics, which requires the connection of the old knowledge to the new information for the students to successfully perform the tasks. This also confirms Garcia and Pintrich’s (1994) consideration that declarative knowledge about the actual content of the tasks is one of the major components in the conceptualization of academic self-regulation.

This finding also confirms the study of Paris and Newman (1990) which states that age influence how learners regulate their learning. It can be assumed that older students experience more autonomy-oriented activities (Ryan, Connell, & Grolnick, 1992) and are given more freedom, autonomy, and independence to control and direct their own learning thus are more likely to manifest self-regulated skills. It can be inferred that parents, teachers and other adults have a significant impact upon the development of self-regulatory capacities and adjustment in school. As what the developmental theorists claim, each experience brings with it new challenges that directs us to learn strategies for coping with difficulties in life. This returns us to the idea that self-regulation is a developmental achievement that can be either facilitated or forestalled by the interpersonal environment. With the opportunities of independence and autonomy given to children, this study suggests that grade school period is the best time to introduce the training of self-regulatory skills.
Conclusion

The findings support self-regulated learning theory which states that when students are given opportunities to self-regulate and explicitly taught of self-regulated learning strategies, academic achievement is more likely to be positively affected. The results also support the theory that individuals are active agents of their behaviors, which mean that students can manipulate, control, direct, and be responsible for their own learning.

Low achievers who were trained to be self-regulated learners were able to overcome prior difficulties in mathematics skills. Subjects used in this study were able to adopt personal challenges in accordance with one’s perceived capabilities. The self-regulated learning strategy instruction engaged students’ involvement and interest and gave them the opportunity to monitor and evaluate progress of their work; organize and transform information to improve learning; set goals and plan for activities; review, rehearse and memorize information; seek social assistance; as well as select or arrange physical environment to make learning easier.

Inconsistent with the hypothesis, the result shows no significant difference between treatment and no treatment groups in terms of Mathematics school grade. This can be explained through the consideration of several other criteria in the grading system of the school. This also implies that the classroom environment is another factor to examine if it provided self-regulated learning opportunities.

Older students’ higher means of difference scores in all three measures give the conclusion that self-regulated learning can be attributed to developmental factors such as, age and prior knowledge. Social assistance seems to be a contributing factor for older students who were given more independence and autonomy in terms of school related work and decisions.

Recommendations

On Self-regulated Learning

Self-regulated learning should receive more attention as a topic for further research. Its theoretical and educational relevance should not be underestimated. As a theory, it presents linkages of the different components of learning, thus, suggests an integrative framework. Its practical value stresses the importance of personal efforts, self-direction and personal responsibility of learner to their own behavior. This is also worth exploring to determine how self-regulatory processes affect learning and performance.

On Self-regulated Learning Strategy Instruction

The researcher sees the need for continuing the use of self-regulated learning strategy instruction as an intervention to help low achieving students. The use of these strategies will develop a sense of ownership and commitment to the youths of this country. This will help students realize that it is possible for them to generate and direct their own learning experiences rather that act in response to external controls. That they are self-initiators who can exercise personal choice and control of the methods needed to attain the learning goals they have set for themselves. Intervention programs involving
self-regulation needs to move more firmly to the mainstream of school and educational research.

Although the findings imply that grade school period is that best time to introduce self-regulated learning strategy instruction as an intervention strategy, the researcher also recommends the use of self-regulated learning strategy instruction to high school and tertiary levels. Teaching students of self-regulated learning strategies is reflective of the life-long goal of education which is teaching students the will as well as the skill in learning.

On Teaching and Learning

An important maxim in self-regulated learning is that people learn by doing. Mathematics learning will undoubtedly be inhibited if the environment does not provide the opportunities to exert strategic control over personal, behavioral and environmental influences. Instructional activities should provide avenues for a dialogue about the lesson. The instructional conversation elicits social interaction among students, in that it contains the transfer and acquisition of knowledge and skills. Through this, the student enters into the reciprocal interaction resulting in a mutual learning system as opposed to the traditional method of merely accepting information.

It is recommended that, aside from Mathematics, academic self-regulated can be applied to other subject areas. In this way, more students can be benefited in terms of academic deficiency coping and/ or academic achievement.

To the Mathematics Teachers

It is recommended that teachers use self-regulated learning to their students and therefore change the traditional perceptions that some students just cannot learn. Teachers are recommended to consider learning as a process, thus make and encourage students to use self-regulated learning. Teachers can help students maintain a mastery focus and meaningful learning by supporting students’ independent learning efforts. This happens only if teachers reward self-improvement and use a variety of non-controlling type of evaluation. Teachers should also make students benefit from opportunities to work with their peers in the classroom.

Much remains to be done on the part of the teachers. The researcher recommends fellow teachers to exert effort to modify student’s academic motivation and achievement behavior in the classroom. Let us make our students acquire the learning goals orientation rather than the performance goal orientation.

To the Parents

Parents need to be aware of the practical use and value of self-regulated learning. They are recommended to help their children’s progress in school by developing them as self-regulated individuals. This is because parents are the primary source of motivation for self-regulated learning.

Based from the Mathematics Self-Regulated Learning Program facilitated by the researcher, parents seldom assist their children in their studies at home. Most of the time, they hire tutors to guide their children. It is recommended therefore that parents at least should check and monitor if tutors and their children are using principles of self-regulation to facilitate optimal learning.
On Research

Although the researcher sees the need for continuing descriptive research about self-regulation, she recommends further research on self-regulated learning to test its effectiveness in learning and performance outcomes. The researcher recommends more intervention research with students in actual learning settings facilitated by trained teachers.

Case studies involving only one or few students with significant self-regulatory problems should be investigated, in which changes in performance are assessed over time, along with continued use of self-regulatory activities after training is discontinued. This type of investigation will also explore individual differences in covert processes and determine why students with similar attributes and experiences diverge in self-regulation. With respect to strategy use, students may differ in their knowledge of strategies that can be applied, as well as attributions to successful strategy use.

Another recommendation is for greater emphasis on longitudinal studies. Long-term studies are needed to chart the course of development of self-regulatory skills. This particular study made by the researcher limits the teaching of self-regulated learning strategies because it does not guarantee that students will continue to use them. Maintenance and generalization of self-regulatory gains brought about by short-term interventions may require periodic refresher instruction.

Abstract:

This paper presents the findings of completed surveys from 2,000 Kentucky teachers, grades K-12. The survey focused on understanding current environmental education practices and identifying resources and professional development opportunities that will help teachers incorporate environmental content into their current teaching practices. Because environmental topics are often not a direct component of the curriculum, individual teachers must develop their own ways to incorporate this content if it is to be included in their teaching.

This survey was conducted in cooperation with the Kentucky Department of Education Environmental Education Council and the Kentucky University Partnership for Environmental Education (KUPEE), who will use the survey results to develop appropriate resources and professional development opportunities that will help teachers across the state expand and improve the environmental content incorporated into current teaching. The survey results will help ensure that the new resources and opportunities are consistent with the expressed needs of classroom teachers.

The survey was web based. The all-electronic format enabled branching for contingent questions, ensuring that teachers would only see questions that are relevant to their teaching. This minimized errors that would otherwise result from confusion over which questions to answer. All school districts in Kentucky and all grade levels were sampled.

Answers to the following questions are discussed:

- What environmental topics are currently taught in Kentucky?
- Why do teachers include or exclude environmental content in their teaching?
- Where do teachers obtain environmental teaching materials?
- What methods do teachers use to incorporate environmental content into current teaching?
- What professional development opportunities relating to environmental content would be helpful to teachers?
- What additional resources relating to environmental content do teachers identify as valuable?

I would like to acknowledge Dr. Tom Greider for providing funding for this research and assistance in facilitating cooperation with KUPEE and the Kentucky Department of Education for this project.
The Reinforcement of Opposition

(A) Opposition
(B) Resistance

Opposition reinforces a previously dislocated stand. By outlining a case against that which originally stood firm (reinforced by free demonstration or communication).

The *opposing factor (A) must compensate and reinforce its position by counteracting and putting forth a method of retribution that would weight out the *resistance (B).

Thus, forming a steady equilibrium between both forces.

This law influences all aspects of... human existence, animal instinct and nature.

The law of opposition however is a relatively used detail of human existence that influences discipline by providing one access and ability to use this law to generate a feasible explanation to life and self discovery.

When understanding the laws of opposition one must identify and form an equation as to what the outcome may be or what the outcome of the opposite encounter may not be. Nevertheless, the forces are endless rivals that will continue to resist as long as one is presumably ahead of the other...

- Two likely daily psychological interactions that are effected by the reinforcement of opposition are:

Right/Wrong (society)
Evil/Good (religion/personal beliefs, morals)

* One natural resource of influence to all aspect of existence is:
Life/Death (Individually)
These factors can remain independent or can be coordinated to form an ideology with the human mind's defined perception of its meaning as a whole. Outside of our realm of comprehension these are labels of a much larger universal law that result from the resistance of life/death of all.

This law does not judge beliefs one way or another... it just provides a fundamental baseline for the birth of such requisition.
The ultimate purpose of existence.

At its peak each side may assume to have overpowered the other. However, that would be impossible when speaking generally about the laws of opposition... considering that once the perception of disadvantage by a resistance occurs, the presumably struggling opposition will take necessary actions to again 'regain the perceptive idea" ("idea" can be defined in a general universal concept...biological/logical/ systematic because our ability to identify and label such explanation is again merely an interpretation of a much larger scale of information therefore, an explanation to the laws of opposition can be applied and defined through many avenues of exploration) that it has overpowered the other in whatever attribute it may consider it so... of course for a limited time because consequently this effect has once again reinforced the opposition.

Focusing on detailed forms of debatable questions, does not make an overwhelming effect on the law it is just a basic outline of a much larger picture.

One can only participate in the reevaluating methods of the struggle for power. Wining is viewed on individual bases and it is not the overwhelming effect of the natural process of opposition resistance. For one to gain power from the other opposing factor all detailed relative to the opposition must coincide simultaneously... which consequently will end all opposition making the so called enforcer non-existence. Because one cannot exist without the other.

Example: Good is defined by the understanding of what is bad. Without "bad" good would not be good, it would just be. Good" as defined by humans is a way of separating two factors of existence. With the ability to label to the extent that we are capable of, what is defined as good and/or bad depends on again the reinforcement of "life and death" and personal interpretation of the label itself.

The opposition's label is originated by the resisting factor that identifies that which is not coinciding with the stand point of it which was previously non-existent. Though it may seem as one may have existed before the other, again, we must recognize that the laws of reinforcement have always existed... we just adapt these laws into our life and outlined a matter of opinions of two oppositions that are formed simultaneously.

In all that one experiences and demonstrates their can be a distinguished label defining it as the right/wrong-good/bad-life/death... course of action in the beginning or at it's conclusion depending on what institution one uses to identify the opposing
reinforcement. As individuals perception may differ from that of society and/or religion and vice versa...

As we all know for every action there is a reaction. For every position stands a disposition challenging it. This epic reinforces the nature of the majority one side or the other.

At a higher scale both opposition continue the struggle for power. A never ending struggle because one is what it is because of the other's position. Though it may not seem the case the cause of either side is suspended in time as long as the challenge stands firm on each side. We as humans have learned to use these laws as a survival tactic to overcome previous unknown obstacles.

Life reinforces death because all that lives must die. Death reinforces life because all that lives is not dead. Once we no longer reject death we are no longer alive. Thus, consequently death indirectly reinforces life by those that continue to live.

This is due to the resistance between both forces, as long as there is a resistance to the opposition; the strain prevents its union.

*However, when a union occurs of two resistances they evaporate and/or disappear. Until an opposition is in need of reinforcement emerges again.

Also with or without our labels or definition the process of the law continues to occur until one of the oppositions no longer exists.

There are many experiences in life that promote a sense of existence in human kind. One emotional aspect that we have adapted to reinforce life is the concept of perceptive fear. Because of what we know as perceptive fear we have learned to reinforce our position on death and in doing so we also reinforce our want to live. Again as shown here one cannot be without the other.

All is constrained in oppositional reinforcement. The end of existence can only end with the end of all life and death.

In life we have merely adopted the concept from the laws that exist beyond our control. In the meantime one is in correlation with the other regardless of our understanding of it or not.

These factors have been used by implementing it in daily interactions within society, culture and of course politics also in explaining scientific phenomena.
a. Title: Cross Maternal and School Language Learning: A review of Recent Research of Children with Foreign Mothers from Working-class Families in Taiwan

b. Topic area: Ethnic, social, and educational study

Abstract

In Taiwan, more and more working-class men get married with women from south-eastern Asia. Since mothers are not Mandarin native speakers, and are affected by socioeconomic and sociocultural factors, these families face another challenge after the children begin their education cycle. This paper is a case study based on the problematic and increasing phenomenon described above. This paper will demonstrate how the influence of maternal speech in child language development plays an important role in the exclusion of these minority students in the mainstream of the Taiwanese educational and social system. Furthermore, this paper brings to the attention of the educational community the problematic concerned with this particular population, and to make people more conscious and more involved in the education of minority students in Taiwan. For further inquiries, well-organized language developmental plans and counseling for parents and children should be considered.

Key words: maternal language, language development, SES
1) Critical Reflections on Freedom in Education

4) Antonio Causarano 208 Columbia DR#25 Albuquerque, NM 87106 U.S.A.

5) causarano@hotmail.com

6) This paper is a critical reflection on the concept of freedom, its paramount implications for education in the U.S. educational setting and for scholars concerned with the importance of critical thinking and agency of students in school and the larger society. Therefore, this reflection aims to be a place where educators can dialogue on the idea of freedom for the empowerment of students in educational settings. The paper will be centered on the analysis of the concept of freedom as elaborated by three major critical scholars in the arena of critical pedagogy: (a) Maxine Greene, (b) Paulo Freire, (c) and Asante in order to allow the reader to look at these “canvas” and compare and contrast the positionality of these educational thinkers on the importance of power and practice of freedom in schools and the larger social system in the U.S.

THE ATTRACTION OF LONDON ONTO YOUNG SICILIAN IMMIGRANTS

Bénédicte CHAIX

_English Department University Stendhal Grenoble3, FRANCE._

**Introduction**

Although the Italian population is embedded in a long tradition of migration around the world, the push and pull factors have been evolving towards diversification. Whereas in the past, Sicilians tended to leave their native land because of economic problems – forty years ago rural Sicily was a very static and barren society offering no future –, young Sicilians of nowadays consider their migration as a choice of life. Miscellaneous push and pull factors – be they on a cultural, academic or personal level – that trigger departures towards a foreign place have been evolving throughout the XXth century and some of them are deeply intertwined.

In this paper we will present you with one of the pull factors in relation to young Sicilian migrants: the genuine representation of the city of London in the migrant’s psyche. This pull factor represents a very original element insofar as it remains unknown except in the case of a fieldwork on the verge of ethnological research. Because of this hidden characteristics, it probably IS today the most interesting pre-conception in the mind of young Sicilian migrants.

This cultural explanation of such a human trend, on which we shall draw your attention, has been discovered in the scientific frame of a PhD research led by the cited author and supervised by Professors Jean-Pierre Simard (English Department, University Stendhal
Grenoble3, France) and Christophe Mileschi (Italian Department, University Stendhal Grenoble3, France). The experimental study of individual paths, which shall allow us to provide common readers and field researchers with an authentic testimony of the phenomenon, has been carried out both in the host city of London and in Sicily.

The first step of the analysis, as a theoretical starter, will be to present readers with the main sociological views on the concept of the ‘city’ (Durkheim, Marx, Weber, Simmel). Which shall lead us to the following question: what does a ‘city’ represent for young Sicilian migrants? Then, we shall point out the mythical image that the city of London conveys for young Sicilian immigrants today.

At this point, many other questions could be raised because of the feeling of complexity revealed through the diversity of reasons for migrating, such as: can a specific factor have a more or less powerful influence on the migrant’s trajectory? Or else to which extent do the migrant’s aspirations match reality?
Sociological background

So as to be able to give some valid explanation of a specific social and cultural tendency such as the attraction displayed by a city onto a particular category of the population, we shall first provide readers with a theoretical starter, such as the main sociological views on the concept of the ‘city’, so as to reach a clearer idea on what a city can represent for the young generation of Sicilian migrants.

Indeed, one of the many cultural reasons likely to prompt migration towards a specific location seems to be the existence of the urban space with the concept of the ‘city’ giving birth to several aspirations. This scientific exploration of the urban space shall be built on the basis of different historical backgrounds developed in sociology. As a matter of fact, it would be difficult to undertake any analysis on the migration of young people towards cities without even taking into deep consideration the problem of the representations of the city to be found among the young. Once those mental representations established, researchers should be able to reveal some specific conditions for individual choices.

Emile Durkheim’s vision\(^1\) of the city is based on the idea of a changing world and therefore on the interlinked notion of human adaptation. Urban life is always more part of our contemporary reality and the young migration towards urban centres embodies a societal tendency, which leads us as early in time as the 18\(^{th}\) century to find this phenomenon already existing. Basically, this phenomenon stands as a marker of evolution: evolution of our societies leading to the evolution of the individuals as direct components. However, Durkheim emphasizes the patent paradox at the very heart of this tendency: whereas the growing cities gather and blend human beings from here and there, they also tend to separate the citizens in the name of individualism. The subject is not a deliberate free actor, he depends on the structure as the manifestation of social determinism (very close to Marx’s theory).

To some extent, the representation of the city among young Sicilian migrants has appeared because of the modernization and industrialization of the urban world. There is still in Sicily a

deep rift between rural life *di campagna* and urban life *di città*: the former with a negative connotation and the latter with a positive and modern connotation.

Georg Simmel exposed another view of the problem as based on historical reasons for this phenomenon. The difference for him is that the subject has the power over his destiny and actually makes it real. Which could be put in parallel with a rather functional approach in which the actor actually adapts himself to reach a better individual state without any kind of rationality. Such a functional interpretation considers the roles as defined by the system and imposed to the individual. Integrating urban society means accepting the rules to become a constituent element.

Thus, the quest for individuality is a *sine qua non* condition to reach a higher standard of urban life. Indeed, most of the many individual quests for autonomy and self-assertion take place in cities: it is the will to assert one’s own life and the will to differentiate oneself from the others. This distanitation from the others is seen as a positive tool to reach individualisation. Migrants can’t therefore be seen as victims any longer, but as direct decision makers of their own lives.

This sociological trend is opposed to that Durkheim’s in terms of actors, but can also be considered as a complement to the historical and structural backgrounds of a city with the introduction of the notion of the free acting subject.

Max Weber, who proved very interested in the matter of the city especially through his essay *La Ville*, puts forward another dimension of the city though very close to Durkheim’s in terms of social relations and economical evolutions which both influence urban components. He gives a greater role to the individual seen not as a Simmelian actor but as an agent, that is to say that his actions influence the overall society; in addition to that, the city is the embodiment of a modern world which provides a wide range of freedom for actions, and this is an important parameter that could give an explanation for the attraction of London onto young Sicilians. This sociological trend of methodological individualism consists of

---

analyzing the agent’s behaviour to see how they assume their roles and develop their aspirations. Its aim is to explain a social phenomenon, such as the attraction of the city of London onto young Sicilian immigrants, as the consequence of individual behaviours. In other words, it implies the analysis of individual acts so as to understand a social tendency. To some extent, the situation we intend to study here corresponds to this theoretical approach.

As a final example, Karl Marx explains the phenomenon of rural exodus and urban attraction through the antithetical vision opposing the city to the rural space. His representation of the city is based on the socio-historical context (from which Durkheim and Weber partly drew their inspiration to establish the notion of a modern world) influenced by the capital and giving birth to the powerful relationship established between capitalist leaders and poor workers. The latter actually follow the development of modern industries, organizing their migration in parallel with capital migration. This specific aspect of economic needs can stand as an explanation to rural exodus and urban attraction. The problem of employment – seen both as an economic push and pull factor – has always been at the very centre of the questioning of migration and inevitably works as an influential element in the destination choice. However, for Marx, urban citizens can’t evolve in a situation that is totally devoid of free will, insofar as their actions are actually the consequence of external constraints: this is the socio-determinist theory according to which the mock freedom is nothing else than a conditioning which eventually leads to alienation. He considers the large industrial city as the place of dependence and a place where the so-called liberties are only illusions and where poverty is an interlinked consequence of capitalist laws. This is the Marxist answer to the urban myth with which our analysis is not at all embedded.

Theoretical comparisons of city representations represent a compulsory stage in a research on migrations and allow us to remind the readers that the city representations display a complete

---

5 Ibidem
6 This determinist notion makes him closer to Durkheim’s view. Marx and Durkheim are intellectually far from Simmel and Weber who consider the existence of an interactive relationship of the constituting elements, which means the recognition of free will. For our analysis, we shall however find Durkheim and Weber as complementary.
7 According to Pierre Bourdieu’s thoughts.
variety among the thinkers, just as among the migrants, which eventually makes the approach even more delicate. Although the intellectual basis must be taken into serious consideration, our interest in the attraction of the city of London onto young Sicilian immigrants shall be developed on Weber’s ground which is close to Bourdieu’s structuralist trend in terms of relationships to be studied and also close to Claude Levi-Strauss’ methods through the emphasis on monographies offering many an example of paths of life. Which paves the way for an authentic conceptualization of the phenomena of migration.
The representation of London among young Sicilians

In the twentieth century, the phenomena of massive emigration and rural exodus towards foreign countries have triggered the particular interest we have today in the cultural stakes belonging to the migrating process of populations. Sicily has aroused many scientific questionings owing to the history of the Italian nation and people which is representative of the experience of migration.

It seems difficult however to define precisely how much the sociological meaning of the urban space has been evolving for the new generation of Sicilian migrants. We can take as a starting point the theories developed by Durkheim and Weber who regarded the city as the embodiment of a modern world in perpetual movement; indeed, we know that cities have kept transforming under the effect of industrialisation and the modernization of ways of life; yet, the existence of the urban myth among young Sicilians as a cultural evolution allows us to analyze the phenomenon of rural exodus to the urban space under a definitely less determinist light.

Nowadays, different cultural dimensions (in addition to the economic aspect which belongs to the structural vision) happen to be central in the diversification of individual migratory decisions. The understanding of a migratory process from and to a specific place can’t be reached without taking into consideration the miscellaneous cultural elements gravitating around the process itself and influencing to a certain extent the migrant’s trajectory. Individuals are the very core of the analysis and the study of their individual behaviours should lead to grasp the social tendency that they contribute to feeding. The real fascination that young Sicilians express towards England belongs to the cultural parameters and proves the existence of a mental representation of the host society, which plays an important role in the phenomenon we are studying here. This approach alludes to the notion of cultural clash seen as a positive and sought situation. From the very beginning of the previous millennium, Great-Britain has always proved to be a multicultural nation. Invaders have changed the face of the country and have also contributed to dividing the country with the assertion of regional
identities. Paradoxically, Great-Britain is divided in its unity because of the mixture of people and the blending of cultures. For young Sicilians, this ideal which colours the image of England hides a true inclination to prefer London instead of any other European destination. But the following question remains: why such a specific infatuation for London? Our intent here will be to bring elements so as to bring some examples of answer to the problem.

Whereas the rather complex link between England and Sicily has long remained prisoner of a stereotyped image associated with poverty, new cultural characteristics have been gradually appearing in the past years and now stand as a motivation for choosing London as a host city. Nowadays, Britain holds a particular significance on the scale of attractive places: it is still an island, though larger, which ensures anonymity and a margin of action for migrants.

? Cultural Quest

The Sicilian society is a very particular one: it is an island where every district displays a large and striking variety of populations, but where paradoxically each social category remains rather closed. Young Sicilians deplore this (cultural) homogeneity within age groups. Thus, London as a cosmopolitan city presents characteristics that young Sicilians actually look for. A Sicilian engineer named Rosario once confessed while we were talking about Sicily:

“I perfectly know how Sicilian girls work in their head; I know everything they may think and what they like; yet, you can find something else abroad, other spirits, other states of minds, other visions and this is what is truly interesting where you go to another place.”

These words can testify very well one of the many reasons for migration: it is aimed at bringing forward what one’s own society lacks. This cultural quest finds a hallow in the British and London society, insofar as the multicultural side implies a variety of possibilities to find what one may look for in cultural terms. It can be due to a search for a specific way of life that fits you, or else the propensity to meet the others so as to grow richer. Furthermore,
we can deduce from this testimony that young Sicilians look for a clue to the deep cultural problem of sexual relations: the interviewee evokes the opportunity to meet girls who are free from any kind of cultural burden as an impediment to sexual life. This could be understood as a will to put religious, moral and familial determinism (as Durkheim alluded to it) away. In other words, it is the quest for difference in terms of demeanour added up to the large urban space which appears as the key to their previous situation: the geographical distance leads to creating a mental and symbolical distanciation from their original identity; as Maria Antonia once declared:

“You’re on your own, there’s nobody else, so you are free!”

The erasing of authoritarian power over oneself is part of this process of distanciation, both geographical and symbolical. And all these allow young migrants to remain anonymous and decide for themselves as an experience of freedom. A lighter note should be added to this concept of freedom: it is not intended here that young Sicilians are not free in Sicily, most of them go out more often that we actually do here in continental Europe. However, they probably feel bad in front of their parents if they behave differently from the ideal. Living abroad is just a way of avoiding the taboo by hiding them from the parents’ eyes. It may seem hypocritical, but it is also very respectful to the traditional representation that their parents cherish.

It should be reminded at this point that migrants can often “be those who do not fit into their original society (for anthropological, physical, moral, intellectual or psychological reasons) and who endeavour to come closer to another population to which they can identify better. Often, migrants already feel strangers in their home country and the choice of the host country depends on their own adapting characteristics. This type of migrant, who actually chooses his

---

8 On this subject, see E.W. Hofstee, Some remarks on selective migration. The Hague, 1952.
migratory status for reasons of adaptation, seeks the society which shall correspond better to values he has already interiorized.⁹

? Economic quest
The youngest Sicilian migration happens to be deeply linked to the economic and technological role hold by the British capital city. The London area is attractive for its status as financial centre (which offers a wide range of activities belonging to the third sector) and as European capital Today, a high increase in the services has been reported with a gathering of nearly 65% of the working population in this field. We understand better why the majority of immigrants are to be found in the Greater South East (such as the South East, South West and East Anglia): this region gets higher economic and demographic ratio compared to the national average. 81% of jobs in London City and up to 75% of jobs in Greater London directly or indirectly belong to the sector of services. The economy of the South East is run by services which represent for the whole region about 80% of the local working population, in other words 4 persons out of 5. As a consequence, the type of migrants has changed into a variety of professional categories: many workers in the fields of banks or insurance, but also culture and science, choose England as a host country. Another domain could be added, that of catering with the miscellaneous paninerie, caffeterie, pizzerie, ristoranti, gelaterie,¹⁰ which become always more numerous in England.

When regarding the contemporary experience of Sicilians in England, the conception of the European America, which appeared at the beginning of the century in several European countries (France, Germany, Switzerland), is no longer alluded to; indeed, the overall expression of the eldorado in reference to the host country no longer means what it used to mean, even in the collective spirit where England, just like the other European countries, has

¹⁰ Restaurants like Metrogusto in Islington, Osteria Basilico in Portobello, Cecconi in Green Park, XXX in Darlington.
never belonged to the category of countries which allowed to make a fortune very quickly like in North and South America. England just stands as a real and concrete alternative to a non satisfying situation in the original place. Indeed, “the static, poverty-stricken and highly stratified rural society of southern Italy bears very little resemblance to the frequently changing, more prosperous and comparatively open society” of England. Migrants develop successful business and this professional activity allowed him to climb up the socio-economic ladder and to enter society as an entire participant of local and British life. This tendency is also called brain drain. Indeed, hi-tech sectors and enterprises offered young southern European graduates the career possibilities they can’t reach in their original country for many a reason (economic problems in the country, little development, corruption, nepotism, etc.). As Alain Parent, head of National Institute for Demographic Studies, declared in the famous magazine *Capital* in June 2000:

« Le Sud pauvre a longtemps fourni une main d’œuvre peu qualifiée ; il possède aujourd’hui une armée de réserve hautement qualifiée. »

This « professional » or « qualified » migration from southern Europe has developed and then increased for some years now, and can naturally be added to the already existing part of low qualified workers who move to England in search for a job. In other words, Sicilian migration has evolved towards a more elitist side and the tendency is open to diversification: among young Sicilian migrants in London, we now have urban Sicilians, graduate Sicilians, qualified Sicilians, who sometimes have a job in Sicily, but who try to find a better professional situation; we also register semi-urban Sicilians who are not graduated yet, but wish to find a good professional opportunity or wish to improve their level of English so as to have wider professional horizons.

---

11 Ibidem.
13 Although manual emigration has become more and more marginal in Sicily: the ‘so-called little’ jobs young Sicilians refuse to have at home are nowadays held by immigrants. It is a phenomenon of turn-over that now reaches Sicily, just as many European countries, which all become a sort of haven for the forgotten of poor countries.
In other words, England is the place of possibilities. It should be added at this point that the organization in British society has contributed to the very process of social and economic mobility; British society has always maintained the tradition of opportunity and openness to new ideas which may have triggered somehow the incredible development of the third sector of the British economy. The miscellaneous career possibilities immigrants have in another place lead to what is called ‘promotional migration’\textsuperscript{14}. Job markets open towards the international owing to globalization, which gives a myriad of chances for workers.

\textit{\textbf{? Academic quest}}

Another ‘model’ in terms of patterns of immigrants can be drawn and is linked to the academic quest. Indeed, the market of studies has been constantly rising in the past years. The area of Cambridgeshire has become a leader in the different fields of culture, research, sciences and high technologies. Nowadays, professionals actually go abroad and specialized workers just export their \textit{know how} and offer it to their host country.

The number of Sicilian migrants who head for London to improve their English represent a large of majority of young nationals. Obviously, the brilliant situation of the sector of services, added to cultural places and seasonal jobs, reinforces the attraction of London onto young Sicilian migrants. The geographical situation very close to the continent contributes to developing tourist migration together with the infrastructures (Eurostar, ferries, London airports like Heathrow, Gatwick, Stansted, Luton) allowing migrants to reach cultural points.

This trend usually means short-term migration; however, many interactions (personal elements, opportunities) take place to influence this trend and make it become long-term stays sometimes.

Whereas in the past the aim was that of having a total sterile situation into a bettered economic state – which matched the ideal of the American Dream – , the tendency today is that of the building of career plans for national brains or else the finding of special land-off occasions (like learning English or having a training course) so that they could realize projects in the future, be it in England or in the home country.

? Paths to reach the quested aim

In an attempt at understanding better how the London myth was born among young Sicilians, the different paths towards its creation in collective imagination should be listed.

First and foremost, we could mention the reality of the fashion phenomena which plays a primary role in cities like Palermo or even in rural places. Fashion (be it concerning clothes or even their colours, restaurants, pubs, technologies, or trip destinations) rules the market and the customs. Fashion imposes some level of standardization. Some traits of the culture of being fashionable precisely nurtured the aspirations or goals towards which the migrant strives. English music, English ways of partying have become increasingly accepted as the right fashionable trend.

Secondly, the construction of an ideal also depends on concrete data – historical, statistical or else – conveyed through the media. Indeed, it seems that the power of the media has been central in its creating a multicultural and liberal image of the city. This gave place to a true London myth among young Sicilians for whom London remains the first destination in Europe with 5 to 6 millions Italian visitors yearly.

Finally, the communication sphere among immigrants – from past migrants towards migrants-to-be – through letters, calls, internet, summary of life experience, etc., has highly contributed to the construction of the myth. Current statistics have proved that about 63% of the Italians

registered in the Italian consulates gather around London (including Wales, South England up to Birmingham).

No matter the research field in terms of individuals or representations of the city, the starting question is interlinked with that of the choice of destination, which remains a fundamental element in the understanding of migratory dynamics. However, it proves difficult to determine and assess the real influence of those many representations for young migrants.
CONCLUSION

Studying migration in time also means studying and analyzing the individual dynamics where personal needs, aspirations, vulnerabilities, family and social life all come together to reach the choice of a path of life, that of migration.

The several reasons for migration mentioned in this work are obviously not exhaustive, the area is just as large as that of interpretations, but shall be completed throughout the final writing of the PhD research led by the author and which should be over within the end of year 2005.

The defining of some of various reasons for the attraction that a city like London has on Sicilian immigrants shall help us understand the choices and schematize contemporary migratory processes. We will thus be allowed to realize to which extent the schema of migration can differ in accordance to the interaction of various types of factors: the push factors – economic, cultural, demographic, family, academic – ; the pull factors – social, economic mobility, cultural aspirations – .

The essential point in the experience of migration and insertion is the ability to give a meaning to the migratory project. Therefore, we understand that the psycho-sociological state of the migrant (how he considers both national and host society; what identity consciousness means for him) happens to be at the very heart of the matter because it eventually influences the final judgment of the migrant on his migration and partially explains the diversity of human trajectories. Cultural liberalism of the 1960s in Great-Britain has revealed the notions of migration with push and pull factors, the concepts of identity and cultural shock, bringing forward moral and societal questionings and calling into question the idealistic conception that people had of their country. The study of the parameters in immigration allows a gradual awareness of the complexity of migrations.

DAMS AND SOCIAL DAMAGE:
EXPERIENCES OF INDIAN COMMUNITIES

The fundamental principle of the development is 'sustainability' in the present day context. Development should be open and a participatory process of environmental, social, economic, cultural and political changes that can be achieved through preservation and conservation of ecosystems. The contention of Brundtland Report that development should meet the needs of the present without compromising on the ability of future generations to meet their own needs is the ideal situation that any welfare state should be aiming to achieve. But, the ongoing process in the name of 'development' seems to be going against this definition. The development process, proposals and projects of recent times are in fact facing strong resistance from people since this development is contributing to disturbance and destruction also.

Although the concept of development has been invading the world from different directions, the resistance seems to be more in the case of big dams. Because, construction of major dams causes the disturbance of ecological balance. Secondly, it contributes to dislocation and displacement of millions of people. Now, India has over 4,000 large
dams. Most of them were built after Independence. In 1950 there were only about 300 large dams and the rest were undertaken in the second half of the 20th Century. It is also noted that most of the large dams were undertaken in the period 1970-1990. Powerful voices and arguments have strengthened the anti-dam movements in India. People-oriented research projects have questioned the so-called ‘development’. In this process contributions made by Indian activist scholars for ‘World Commission on Dams’ in the form of independent papers and reports threw light on the darker side of the lives of dam victims. A close examination of these details raises the debate as to whether these dams are temples or graves.

While displacement itself leads to a traumatic and chaotic situation, rehabilitation becomes another major problem for people because the rehabilitation policies are neither thoughtfully and thoroughly planned nor implemented. Throughout the world, well-meaning intellectuals, scholars and activist social workers are vehemently opposing the construction of major dams and the destruction caused by them by debating on environmental, economic, cultural and social loss. World Commission on Dams (WCD) even compiled a report of these concerns by gathering information throughout the world from independent researchers and experts.

People's resistance, civil society campaigns, NGOs and academic researchers no doubt succeeded in articulating their concerns and creating awareness among people to some extent about these issues. In India too, it is a fact that no other movement in recent times has gained momentum and got the people's support as the issue of dams has. No other campaign was covered by print as well as electronic media as extensively as the issue of dams and displacement was. While the work done by these groups is commendable, a serious examination of the same will also raise an important question, that is whether the assessments and analyses of the destruction are examined from all the possible perspectives or not, giving voice to all the social, cultural and ethical issues related to displacement and rehabilitation.

Taking a stand that the debate over development, dams and damage is neither comprehensive nor inclusive of all social, cultural and community perspectives, this paper makes an attempt to highlight the damage and disturbance caused by the displacement in a rural community life which is based on co-existence and mutual dependence. The cultural, economic, ecological and environmental issues related to displacement are being thoroughly discussed and debated. However, it is also important to discuss how displacement and improper rehabilitation can lead to loss of livelihood, identity and professional security in a closely-knit rural situation thus leading to forcible migration. This paper specifically attempts to explain the damages caused to a village community, its life and livelihood which were shaped in the process of civilisation, by examining the past and present of a project-affected village in India. The paper strongly advocates that not only ecology, environment, ethnicity, wild life but also social ecology, community coexistence and professional security are equally important and are threatened much more in the process of displacement.
State Policies:

In post-Independence India, the thrust of development forced Indian leadership to adapt a development model of economic prosperity. In the first phase India felt that the development essentially means economic development and economists focused their attention exclusively on economic growth. The social conditions such as hunger, poverty, unemployment and other rural issues favoured a development model of accelerated economic growth. The rulers and policy makers proposed mega projects like big dams, steel plants, and mining excavations and projected all these major projects as symbols of development and progress. The rulers used to repeatedly tell the people to prepare for ‘sacrifices’ in the interest of nation. Dam building was considered synonymous with nation building.

Politicians played with the emotions of people in order to shape their minds. Jawaharlal Nehru, India’s first Prime Minister, for instance, described big dams as ‘secular temples’ of modern India. On another occasion, he viewed the dam as legitimate and inevitable cost of development, to be accepted in the larger national interest. While laying the foundation stone for India’s first major river valley project, the Hirakud Dam in Orissa in 1948, Nehru gave a message to the people “If you have to suffer, you should do so in the interest of the country” (quoted in Roy 1999). The same sentiments were echoed for 36 years after Nehru’s comments in the words of Indira Gandhi. She wrote a letter to India’s most respected social activist Baba Amte in which she said, “I am most unhappy that development projects displace tribal people from their habitat, especially as project authorities do not always take care to properly rehabilitate the affected population, but some times there is no alternative and we have to go ahead in the larger interest” (quoted in Kotari 1996; 1976). Thus, the rulers motivated the nation towards big dams, diverted all the energies by pumping huge funds into irrigation projects.

Displacement Discourse:

Concentration shifted from environmental issues to individuals in the second phase of the discourse. Probably it is because the western ideology and west-based funding agencies such as World Bank conditions that specifically emphasised the ‘indigenous people's rights’. In fact, the funding agencies were forced to include such a clause owing to the pressure of the global civil society and people's initiatives. The focal point of this pressure is displacement of people. The new development projects particularly in the developing world have caused dislocation of large number of people. The extent and implications of such forced evacuation and relocation are diverse, depending on the nature of the project and density of population, which is being affected. The size of a displaced population may vary from country to country. It is more in the developing countries because of the density of population.

According to some estimates, in India alone around 50 to 60 million people have been displaced in the name of development projects. It is four times the estimated 15 million people exchanged between India and Pakistan at the time of the Partition of the
The subcontinent in 1947. The two countries are yet to get out of that trauma but there is very little consciousness about four times that number of DP/PAP in the name of national development in India alone (Mankodi 1981: 150).

The main problem that arises consequent to displacement is relocation of people. In India, the unfortunate situation is that there is no comprehensive rehabilitation policy. In the absence of statutory rehabilitation laws or even national policy on rehabilitation, there is no legal imperative for state governments or project authorities to integrate comprehensive rehabilitation planning into the planning of a project. More often than not, project authorities are interested mainly in the relocation rather than the rehabilitation of project-affected people, for their primary concern is their physical transference from the submerged zone thus making space for the project rather than the long term welfare of the displaced people. In most cases the social fabric of the rural areas is destroyed when they are relocated in alien surroundings or in a fragmented manner. Most of the studies in India that focussed their analysis on DPs, identified tribals as the worst sufferers because they are the people who directly depend on the natural resources particularly on forests and water sources. In Indian population, tribals were around 8.5% but were estimated to be 40% of the PAPs (Fernandes 1988: 251). In Andhra Pradesh they were 6.6% of the population (1991) but over 27% of PAP and in Orissa they were 22% of the population but 42% of PAP.

The attention and concern of the researchers is more on tribals because of their number and cultural significance. Tribals are less in number, unique in culture including language, settlement, social life and economic activity. Mostly they are "primitive" in lifestyle and distinct from the rest of the society. The second reason could be the compensation package. In India, the only significant reparation for displaced people guaranteed by law is the payment of monetary compensation for the acquired individual assets, particularly the immovable property. However, the manner in which the law is framed and interpreted ensures that the displaced landowner or house owner is always the loser. Lokayan, a well-known organization documented the trauma undergone by 21,094 families in the 100 villages submerged under the Srisailam project in Andhra Pradesh. The report (1982) states: "the government has conceived and executed the Srisailam project...without taking into consideration the human problem seriously.... The disbursement of compensation (in cash) did not encourage plans for settlement...large rich farmers managed to receive compensation, for both houses and land lost, at reasonably competitive terms; people with low economic and social status did not get their compensation for the property lost. The people were neither educated nor taken into confidence regarding the various issues involved in computing compensation, evacuation and rehabilitation."

Compensation for the lost immovable property is paid for at the alleged market rate rater than according to the replacement value thus leading to the devaluation of compensation. Another implication is that the compensation is paid only to the people possessing undisputed legal title and most tribals do not have a land of their own at all. Even if one owns a piece of land, holding a legal title is next to impossible. This problem is not confined to tribals alone. In Indian villages, most of the small and marginal farmers
and agricultural communities are in a similar condition. Particularly Dalits and other lower caste groups who were originally landless or owned very little land, have suffered drastically and are eventually pushed into the category of migrant labourers and construction workers. (Parasuraman 1999: 177)

Particularly in India, individuals and communities are bound together in webs of social and ecological relations. Individual and community life are closely linked particularly in the areas where people live close to nature, more specifically rural areas and tribal communities. This is most typically exemplified by people who are displaced by the projects, whose habitations and lands are submerged, and whose sources of livelihood (non-land based) are threatened. The very important and notable fact about Indian village is that more than 60 per cent of the village population is landless and live in the villages by providing various services. These service castes, artisan communities, agricultural labour castes and other traditional hereditary based occupational castes live in the villages by extending their skills and services to the village communities including farming communities and landlords. Carpenters, blacksmiths, rope makers, cattle breeders support agriculture by providing various instruments and other inputs to farmers. Similarly, potter men, washer men, barber and other ‘service castes’ serve the village with their traditional duties. Even now in most of the villages there is no fixed and standard wages for their services. Generally the farming community compensates or attends to the food needs of the people who serve them by providing goods and services on token and lump sum basis. Thus, the village communities are linked with one another with very deep-rooted and inherited relations based on mutual support and co-operation. In a village, for example, landless labourers who worked on the lands that have been acquired for the project, artisans or petty traders and various other occupational communities such as cattle grazers, liquor brewers and rope makers are displaced after relocation.

This paper focuses on the experience of a Blacksmith from Yaswada a submerged village to reflect on the trauma of a community after displacement. Yaswada is one of the 12 villages fully affected by Lower Manair Dam (LMD) near Karimnagar, a District Headquarters in Andhra Pradesh, one of the best growing States of India where World Bank designed development activity is in swing. LMD is a component of Sri Ram Sagar Project (SRSP), Stage I. SRSP a major irrigation project across the river Godavari which commenced in 1963 with an originally projected cost of Rs.40.10 crores, was revised in March 1994 to Rs.1,519.15 crore and again updated as of November 1998 for Rs.2,425 crores. The project is envisaged to provide irrigation facilities to 3.92 lakh hector of land in Nizamabad, Karimnagar, Adilabad and Warangal Districts of "backward" Telangana region.

World Bank entered into the project funding after completion of the first component of SRSP (main project) on River Godavari and financed two separate packages from 1971-79 and 1987-94 in first phase. The second phase aid sanctioned in 1997 is still in progress. LMD project work started with the first phase aid in 1971 and was completed by 1981-82 and the project came into full utility by 1986. The purpose of LMD is to augment SRSP water supply by capturing the run off from Manair river’s free
catchment and serve as a balancing reservoir for SRSP main reservoirvi. LMD was built on Manair a tributary of river Godavari with a catchment area of 6.475 Sq. Km. And 680.46 M. storage capacity. 18 villages were affected by the project where 12 villages were fully submerged and 6 were partly affected by the dam. Almost 7424 hectares of agricultural land was submerged under the dam, which displaced almost 80,000 people. Let us here the agony of the affected in his own words:

"I am Narayana, Kammari Narayana. I am a blacksmith by caste and I belong to Yaswada village, which was submerged under the Lower Manair Dam. The Dam forced us to leave our village and to flee from our own homes and hometowns like birds without destination. We left our places where our forefathers and we lived with pride and dignity as skilled professionals. Our family used to serve the agricultural needs and supply iron-made tools to the entire village. As a young professional I started my traditional career at the age of 8 years. I won the hearts of more than hundred farmers for more than fifty years. Suddenly they announced the construction plan of Lower Manair Dam and a little compensation was thrown on us like alms to beggars. With that meager compensation, along with my wife and only son, I wandered here and there as a beggar and finally settled here.

After a decade of the settlement in this village, I am a stranger; no one recognizes me and my skills. They still look at me with suspicion doubting my skills and credibility. No one comes forward to give me the carpentry work. My own caste people also do not allow me to take up the works from the local farmers because the village is their Vathan. Traditionally the rights have been assigned to their families for generations. In my village I was a king, Every morning dozens of farmers used to wait in queue before my house to sharpen their instruments. Now I am helpless just sitting outside my hut with my dried up furnace and waiting for a customer who visits once in a blue moon, that too, not to sharpen the iron bars or spades but to dig the graves."vii

Narayana left his native village Yaswada where he enjoyed a very ‘secure’ life. As a traditional blacksmith he used to extend his services to about hundred farmers and in turn the farming community supplied food grains and other utensils to Narayana’s family. This kind of traditional arrangement of goods and services is known as ‘Jajmani’ system, which is an ancestral right of a community over other communities. After the displacement, the traditional arrangement broke down due to the dispersal of the farming families to different places. Narayana with his meager compensation amount could settle in a new village but the village was failed to provide him any work. He struggled for a decade or more and visited the local farmers, but they refused to give him work because they cannot disown their own blacksmith ignoring the rules of “Jajmani” system. All these days every morning Narayana used to sit in front of his firm/furnace with a hope that some one may visit him for his services. Now Narayana is no more. His only son is working as a daily wage labourer in an electrical welding and iron moulding shop in Karimnagar town and struggling hard to feed his wife and two children.
This is not only the story of Narayana of Yaswada but also of many of traditional occupational communities of project affected villages of India which are in a similar miserable condition.

In India, life and life chances are shaped by the caste and community rather than individual capabilities and skills. Indian society cannot be compared with Western or any other modern society as far as the social structure is concerned. The structure and composition of Indian society is entirely different and unique in its nature. The society is divided into number of castes. The people of India are widely divided on the basis of community, occupation and tradition. Each caste is an occupational group and a source of survival. Caste in India is not merely a division of society but each division has a social value. Caste in other words is a ‘real group’ that is to say a sort of social substance existing independently in the system, like a modern individual. Besides, one can only succeed by attaching primary importance to certain features like endogamy, administration of justice, specific customs, etc. But caste and its occupation are very much attached to village and ‘Jajmani System’ where exchange of goods and services are hereditary. Because of this relationship, the sociologists and anthropologists who attempted to analyse Indian social structure considered the village as a unit. The sociologists recognized caste and village and their role in conceptualizing the community structure in India. Caste and village both play a very significant role in providing a space to ‘individual’ in Indian society. Without these two the survival of community cannot be imagined.

The story of Narayana clearly shows the contradictions of ‘development’. At the core of these contradictions is a fundamental disconnection. It shows how the economic development initiatives could be indifferent or hostile to social and sustainable development of a person or a community. It further explains how the development paradigm ignores basic human rights considerations, such as the interests of local communities directly depending on the village and natural resources. Economic development still appears to be promised on theoretical models that subordinate social and human rights concerns to development outcomes.

**Disappeared Village: Consequences**

In India village is not a simple settlement of people. For them, it is life, livelihood, culture, and civilization: it not only provides occupation and income but also a sense of solidarity, support, security and simply it is their own world. In the village social setting people shape their thoughts, traditions, ideas, attitudes, skills, knowledge and lifestyles. It gives position, social status whether it is lower or higher to each person. Each person in the village has concern for others, each activity of village community builds unity and integrity. People share and celebrate each occasion collectively. But displacement simply disturbs the entire fabric of human relations. It destroys the existing modes of production and ways of life social, economical, cultural and political: it affects kinship and community organisation and its networks. It threatens the identities of people, castes and religious practices. The forced evacuation leads to increased socio-cultural and psychological stress and higher morbidity and mortality rates. Population displacement,
therefore, disrupts economic and socio-cultural structures of the village. People who are displaced undergo tremendous stress as they lose productive resources, traditional occupations, livelihood sources and common property resources.

The field observations of Yaswada village (submerged in LMD project) reveal the pathetic condition of the Project Affected People. People who shifted to 15 nearby villages in the district are still suffering from various problems and most of them are not yet settled. After 20 years of their settlement, the ‘host village’ still considers them outsiders. The following major problems were identified in the resettlement of the PAPs of LMD.

1. Inadequate Cash Compensation:

The project authorities pushed the people out of Yaswada from their village by paying inadequate cash mode of compensation. For agricultural lands the project authorities paid Rs. 1360 per acre of dry land and Rs. 2800 per acre of wetland, whereas the oustees have to spend about Rs.10000-20000 per acre in their resettlement villages. The evacuated appealed in courts against the inadequate payments but the cases are not yet settled even after two decades of their displacement. On the other hand, the story of landless communities and dependent castes of the village is more pathetic. There is no such compensation for them except meager amounts for their house sites. The project authorities estimated the market value at the rate of Rs. 40 per square yard of house site, which is less than a US dollar as per today’s currency value. Apart from the compensation, Rs. 5000 was paid to each family as a package of rehabilitation. How can one expect to settle a family with these meager amounts and what would be the future of these families in the process of resettlement?

Most people used this money for the repayment of their old debts and a lifetime of livelihood security or shelter is squandered before they settle in a new place. Thus, most of the villagers were forced into irrevocable destitution. In Yaswada village, out of 587 families only 300 families had own land and rest of the families were landless. Half of the landed families were small and marginal farmers who had less than 5 acres of land. In this project, it is found that more than 60% of families are still vulnerable and unsettled.

2. Disturbed Social Fabric:

The major and unnoticed loss of displacement is disturbance of social fabric. Formation of any village is a historical process and part of civilisation. No doubt, it is the result of people’s effort over hundreds of years to shape a village, its culture and tradition. Accordingly, co-existence, mutual dependency, hierarchy and understandings are evolved. A project simply disturbs the well-built social structure and makes the arrangement vulnerable by dislocation of the village.

People of Yaswada suffered from several such problems. The project not only disintegrated the historical arrangement but also disturbed the economic security of its people. The main source of the village income was its land and agriculture. The farming
community of the village mostly from Reddy, Kapu and Velama castes used to produce various crops not only sufficient to the village but also surplus to supply to the nearby Karimnagar town. The farming community comprises of 119 Kapu, 105 Reddy and 23 Velama caste families who were the main producers of food grains, vegetables, milk and other agro products. They used to supply the surplus to nearby town every day. Since the village was on the banks of Manair, the farmers used to irrigate their lands through canals and streams managed and maintained by the community. The agriculture of the village was not only self-sufficient but also natural means of production systems were used. For these three major farming castes another set of artisan castes used to support in agriculture. About 36 families belonging to carpenters, smiths, basket makers, and rope makers were fully dependent castes on farming community used to live as cluster groups. These caste groups used to supply various instruments used in agriculture like plough, bullock cart, water pumping machines, ploughshares, pots, baskets, leather articles, ropes etc.

In India every occupation is allotted to a particular caste group. That means every caste group will have its own occupation, which is exclusive and hereditary to that particular caste. No other individual or group should take up a similar job. Adopting, imitating and practicing such profession is not only a taboo but also a crime under the sanctions of village Panchayat (court) norms. Each village in India has its own Panchayat where all these traditional rights of the communities are protected and regulated. The blacksmiths, carpenters, rope makers and potters are traditional artisans who supply goods they make to the farming community and in turn the farmers will shell down some food grains to these artisans in each crop season. This relation is almost permanent and comes from one generation to another on hereditary basis. But, after displacement they have lost their protection and the resettled village neither recognised them nor assimilated them.

3. Eco-system and Occupation:

The village eco-system plays a very crucial role in shaping the community and its activity. People and communities depend on village ecology for their activities both for farm and off-farm income generation. Most of the communities survived by extracting the resources surrounding their villages. Fishing, seasonal fruit gathering, toddy tapping, basket making and several such activities supplement the village economy. Since the village was on the banks of Manair with greenery around the riverbed, there were thousands of wild date and palm trees along the Manair. The toddy brewers used to extract hundreds of litres of toddy from those trees. About 66 families of Goud community of the village who enjoy the hereditary rights over these trees used to supply toddy to villagers as well as the liquor lovers of nearby Karimnagar town. Generations together these families were dependent on the profession and their only source of livelihood has been toddy tapping. Similarly, Medari and Madiga communities of the village used to make baskets for agricultural use by collecting raw material from the trees around the village. Generally, the wild date and palm leaves are used in rope making. In Yaswada 9 Medari and 58 Madiga families were engaged in basket making and rope making respectively. The fishing community is also one of such communities, which live
on ecology based resources. As the village was on the riverbank Tenugu community people used to collect fish, gather fruits from the river and its banks.

All such communities simply lost their livelihood after displacement. None of the resettled villages have such ecosystem and no other village accommodated in its fold because the rights over these resources are considered hereditary. These communities have to wait for more than a decade in their resettled village to get the work allotted. In some places the PAPs are still waiting for an assignment related to their community. A skilled person in a specific activity waiting without work for more than two decades can be considered a loss of generation.

4. Loss of Service Rights:

Service rights are primary community rights in Indian village. Each caste will have certain hereditary rights over the families of the village to serve them. For instance a washer man family will wash cloths of several other families in the village by which they earn their bread. This is a traditional arrangement, which cannot be denied or violated from both. For the service rendered by them the community will get an annual payment mostly in the form of kind. In a way it is a structural adjustment, which guaranties the livelihood. Similarly barbers. As a community barber attends the needs of villager and get his annual lump sums. These communities generally distribute the households proportionately and extend the services accordingly.

In yaswada village there were 28 washer men families and 9 Barber families, which used to attend the needs of 587 families of the village. After the submergence of the village the village household were dispersed and resettled in different villages according to their convenient. The service community also dispersed by choosing their convenient place and settled there. But in the new village they faced very tough time to get work. Since every village has its own workmen to serve them these newly settlers could not get household to extend their services. In Malkapur village where two washer men settled after the displacement of Yaswada village were have to wait for a decade to get work allocations.

5. Loss of Common Property Resources:

The rehabilitation packages may compensate for the loss of individual properties but not for common property resources like waterbeds, grass lands, forests etc. Particularly sheep breeders, cattle breeders and fishermen suffered a lot because of the loss of the common property resources. In Yaswada, there were about 35 shepherd families and they have resettled in six different villages along with their sheep. The unfortunate situation is that the host villages never allowed them to share their common property resources like grazing lands and waterbeds, which are essential for sheep grazing. The shepherds were forced to sell their sheep and choose some other occupation. Most of these traditional sheep grazers converted into wage labourers and agricultural labourers. Some of them acquired a piece of land by selling the sheep.
A shepherd is not a simple breeder of sheep. He has the knowledge of sheep breeding; he knows how to feed them and how to protect them from certain diseases. After the shift from his occupation, his experience and knowledge become useless and more over he has to train him-self in new occupations. The forced change of occupation and methods of earning a livelihood can be a source of trauma. In fact, people prefer to follow professions they are familiar with. Where changes are made they are usually made on a voluntary basis, especially in the middle of life it is not easy to give up their old talents and adopt new. There is also an additional trauma of having to adopt a profession in which they are not trained or which does not suit them.

6. Insecurity and Trauma:

Moving to an alien land from their own land is nothing but an adventure. Particularly the rural communities that have never had such exposure to the outside world are placed in a very insecure position. It further forces them to re-socialise according to the conditions and relations in the settled village. Although people of Yaswada settled in different villages as groups (at least 5 to 10 families), they have faced several problems related to adjustment and adaptation. People of the host village used to suspect them for years together and avoid them in social gatherings. In most of the villages, the oustees stated, they were not allowed to take water from village well or pond for decades. They had to wait till the last person of the host village takes the water. There have been many clashes between the host community and the PAPs for simple reasons. This kind of insecurity, problems and conflicts developed certain level of inferiority, submissiveness and social alienation among the settlers.

7. Denial of Basic Rights:

The social tensions and settlement problems adversely affected the living standards of the displaced people and consequently their future prospects. After resettlement, getting an admission in a local school was a major issue for the children of the migrants. Since local schools did not accommodate their children, the settlers had no other option except to stop their education. Although there is a provision to provide certain amenities like schools, dispensaries, roads, community centres etc., the adequacy and appropriateness of these amenities could not be determined. For instance, these facilities were not provided in the villages where people from Yaswada settled.

Ironically, the settlers were denied democratic rights like voting and participation in the electoral process for more than a decade because their names were not entered in the electoral lists. They were denied ration cards on which the subsidised food grains were supplied. The PAPs had to wait for years for electrification, water connection and several such minimum facilities. Central Water Commission, the supreme authority of water resource development in India itself reported that the provision of amenities left much to be desired (CWC 1995).
Conclusion:

In the light of these experiences, a thorough study is needed on the project-affected people in India. Especially, caste and community should be considered important along with the category of tribe. As a principle, large scale displacement should be avoided. If it is really needed the displaced people should be rehabilitated in their chosen livelihoods as far as possible. Where land is available, even landless agricultural labourers have to be assured and given land on relocation. One important mechanism for implementing the land strategy is to identify several possible relocation sites to provide alternative choices to the displaced.

The productive potential, quality of soil, availability of irrigation water and locational advantages of new relocation sites should be ideally better or equivalent to the lost sites in order to make it comfortable and attractive to the settlers. Furthermore, in selecting sites attention should be paid to possibility of ecological resources to suit and relocate the communities depending on traditional eco-based occupations. For this, a clear understanding of and concern for social structure of the village and its cultural, social and economic systems is inevitably required. To minimise the loss, the project authorities should adopt community perspective and recognise the importance of each community in a village social set up.

**World commission on Dams** (WCD), (2000)

(ii) *Dams, Displacement, Policy and Law in India*: Ravi Hemadri, Harsh Mander, Vijay Nagaraj

---

i  Annually about ten million people around the world are being displaced as a result of development projects. In India, latest estimates (Fernandes: 2004) conclude that the number is certainly tens of millions and estimates of dam-caused and project-affected displaced people alone is about 40 million since independence. It is claimed that many of these people have never been rehabilitated. Thousands of villages submerged under these dams have never been rebuilt.

ii  In fact the country lacks a database on number and type of project-affected, displaced and rehabilitated people. This researcher had to depend on estimates based on secondary sources for the data. They begin with an estimate of 185 lakh DP/DAP in 1951-81 which became 21.3 millions in 1951-1990. They then extrapolated data procured from comprehensive primary data based studies on all displacement from 1951 to 1995 in six states and preliminary data from six others and arrived at a probable figure of 50-60 millions till today (Fernandes 2004: 1193).

iii  Because of this, only a third of the DPs/PAPs of planned development have been resettled. The studies on resettlement pattern of DAPs statewide show the implications of resettlement. In Orissa, a state where large dams were built in 1950-60, only 35.27% were settled (Fernandes and Asif 1997: 135). In Andhra Pradesh 28. 82%of the displaced people 1951-1995 have been resettled and in Goa they are 33.23% 1965-1995DP (Fernandes and Naik 2001: 62). In Kerala, the state known for its natural resources a very low 13.18 % DP were resettled (Murickan 2003: 185-189).

v  To consider a typical example, the fact finding committee on Srisailam project 1986) found that the replacement value of one acre of dry land was around Rs. 5000, and for one acre of wet land was Rs. 13,800. In this way, the amount paid as compensation was five times less than the amount that would be required by the oustees to purchase agricultural land of equivalent quality and quantity.

vii  Kammari Narayana cried loudly narrating his story when the researcher visited his place in 1996, as a part of his fieldwork for a documentary on ‘Displacement’ of Lower Manair Dam outskirts in Malkapur village near Karimnagar town.
Successful Response to Crime on National Forests in the U.S.

Deborah J. Chavez  
USFS, Pacific Southwest Research Station  
Joanne F. Tynon  
Oregon State University, Department of Forest Resources

Though crime has been the subject of much study, including statistics by type of crime, cities where crime is most likely to occur, impacts to victims, and characteristics of criminals, there is surprisingly little in the natural resource and recreation literature about the nature of criminal activity on public recreation lands and how to manage for it. Yet, crime is a part of the forest setting (Chavez & Tynon 2000; Tynon et al. 2001; Pendleton, 2000). Federal land managers are compelled to be alert to incidents ranging from timber theft to methamphetamine manufacture to more violent crimes like arson, homicide, and threats against federal personnel and property. In 2000 the U.S. Forest Service (USFS) dealt with 285,000 incidents, ranging from car accidents to major drug-related crimes. They reported that crime had increased an estimated 200% in the past decade. And, evidence suggests that crime in federal recreation land settings is underreported (Fletcher, 1984; Chavez & Tynon, 2000; Manning, Bacon, Graefe, Kyle, Lee, & Burns, 2001). Crimes and acts of violence make the work of public land managers more hazardous and they jeopardize the safety of recreation visitors to our Nation’s public lands. A good deal of media attention has focused on the safety of the recreating public, yet there is a paucity of peer-reviewed research on this topic. This makes it difficult to determine whether crime on federal public lands and adjacent National Forest communities is a growing problem, is relatively random, or is merely sensationalized by the media.

In addition, success in managing for crime is understudied. In 2001, we conducted three case studies to examine successful management of crime and violence on USFS lands. In the first case study we examined a site that was recovered from criminal elements/crime or violent events, in the second we examined a site of best practices of crime prevention that primarily addressed excellence in communication, and in the third one we examined hot spots and hot issues. Some of the actions taken to manage for crime and violent acts and events were development of sites and the addition of barriers. Control of parking and motor vehicles were enacted at two sites. At all three sites specific actions included adding law enforcement, having closures as needed, and checkpoints. We characterized these actions into key characteristics of success in law enforcement: force of personalities, resources, persistence, collaboration, and communication.
We recognized the need to launch a nationwide research effort to identify and classify the kinds of crime and violence that are occurring on federally managed lands like the USFS, identify successful strategies being used, and disseminate that information to all federal land managers. In 2005, we contacted 400 law enforcement officers on National Forests across the U.S. to further examine successful management of crime and violence on public lands.

Specific research objectives were to: (1) develop, pretest, and administer a quantitative survey instrument at randomly selected USFS sites nationwide to gather information from law enforcement officers, managers, and knowledgeable others about crime and violence; (2) determine the types of crimes and acts of violence occurring on the sites, the extent of crimes, and the impacts they have on public land management, forest management and public safety; (3) determine whether USFS personnel (e.g., law enforcement officers, managers, and knowledgeable others) at the sites perceive that acts of crime and violence are changing, and why; (4) determine USFS personnel (e.g., law enforcement officers, managers, and knowledgeable others) perceptions of the impacts of crime and violence to recreation visitors, and substantiate with on-site evidence, if available; and (5) identify successful strategies used by USFS personnel (e.g., law enforcement officers, managers, and knowledgeable others) to deal with crime in forest settings.

Results from this research will provide significant advances in scientific understanding of the problem. Results will have practical utility resulting in recommendations to federal land management agencies and improved public safety. Public land managers owe recreation visitors a higher level of safety from criminal offenders. Short of not having recreation areas, not feeling safe while on public lands is about as big a threat to recreation as one might imagine.
Abstract
This paper explores the role of faith-based organizations in the development of social capital in ethnic communities, specifically Korean-Americans in Southern California. I address what is the role of Korean Christian churches in forming social capital in the Los Angeles Korean community. This study uses descriptive analysis based on multiple methods including qualitative and quantitative data. I argue that Korean congregations play a pivotal role in building community social capital in the Los Angeles Korean community. While some inner-city local governments are suffering from a lack of other types of capital, the embedded assets in the society may improve the community’s quality of life and safety, and expand business opportunities. The study provides policy implications for minorities and low-income people, the role of faith-based organizations, and the creation of more livable communities.

Introduction
This paper discusses the role of Korean congregations in building social capital. To answer this question, I review the history and organizational capacity of Korean Christian churches in Los Angeles area. I discuss the dimensions of social capital – social networks and trust – found in the Korean congregations in the Los Angeles Korean community. In this analysis, other secular community organizations are compared with Korean Christian congregations. Also, other community assets are described around social capital in the Los Angeles Korean community. I argue that the Korean congregations have been playing a pivotal role in building the community’s social capital through its diverse activities.

This paper uses descriptive analysis based on multiple methods including qualitative and quantitative data. In addition to the existing literature and archival sources, the following data have been collected and analyzed: first, a spatial analysis of the U.S. census and the Korean business directory. Second, the research uses an ethnographic approach that includes close observation and in-depth interviews of pastors and members in select Korean churches and Korean small business owners’ association. The collection of primary data for this study was
conducted over the course of one year. Field work for the research was carried out from October 2002 to May 2003. In this period, I also conducted a literature review, archival research, spatial analysis, and observations.

This spatial analysis is intended to analyze the distribution of the Korean population and their institutions in the Los Angeles area. This analysis maps out Korean enclaves in the Los Angeles metropolitan area, and compares them to diverse Korean institutions. This quantitative and geographic data provides the necessary basic information for further researches. This spatial analysis uses the following data: “The Zip Code Databook for Service Planning Areas 1999,” by the United Way of Greater Los Angeles and Census Data; “The Korean Business Directory 2000-2001,” by the Los Angeles Korea Times; and the U.S. Census in 1980, 1990, and 2000.1 The spatial analysis was conducted with computer-based software, such as Excel spreadsheets linked to a Geographic Information System (GIS) program. This analysis was intended to plot the location and density of ethnic organizations including churches, businesses, and community organizations. Even though this study focuses more on Mid-Wilshire Koreatown, the analysis reviews the entire Los Angeles and Orange Counties.

Ethnographic methods, close observation, and in-depth interviews were conducted in conjunction with an institution-based survey. I participated in and observed some Sunday services as well as other kinds of formal and informal meetings in four selected Korean congregations. The four churches selected for the survey and in-depth interviews were chosen to reflect diversity in congregation size and stature in the Korean-American community. Two large churches, one medium one, and one small one were chosen. The Oriental Mission Church (OMC) and the Los Angeles Young Nak Presbyterian Church (YPC) have over a thirty-year history in the Los Angeles area and over four thousand active parishioners for each church. The Joy Fellowship Church (JFC) has three hundred members with a five years history. The Gospel Church in His Heart (GCH) is new. Created in Torrance, it has less than one hundred members. The ‘snowball chain’ method began by contacting key persons in each church. During my primary field study, I met with members or pastors of each church, and they introduced me to some survey or interview subjects.

History of Korean Christian Church in Los Angeles

One unique and distinctive characteristic of the early Korean immigration history was Christianity. Korean immigrants prior to the immigration law of 1965 did not have enough social networks in the United States, but they had strong religious connections, especially through Protestant churches. Moreover, due to their background and efforts of missionaries, many of them had strong Christian connections in Korea. This early Korean immigrants were recruited in the urban and northern regions of Korea, where Christianity had made inroads. Also, many of non-Christian Korean immigrants gradually became Church members or Christians due to the efforts of American missionaries and Korean Christians. While the highest Christian rate among the population is only twenty five percent in South Korea, almost forty percent of the early

1 This business directory mainly includes Korean-owned businesses and institutions. However, some small number of businesses owned by members of another ethnic group may be included in that list.
immigrants to the U.S. were Christians when they lived in Korea. For these reasons, Korean Christian churches became centers of the social, cultural, and political activities of the early Korean community in the United States. This role of Korean churches continues to the present in diverse and contingent forms.

Source: The Oriental Mission Church 30 Years History 2002

Before 1965, five Korean congregations already existed in the Los Angeles area, as you can see in Table 1. Most early Korean immigrants in Los Angeles eventually became involved with one of these churches, as Givens (1939) describes in her study. “The entire Korean community is of the Protestant faith, with no Catholic affiliates whatever. The original immigrants were for the most part missionary converts in Korea and Hawaii.” (Givens 1939, 36) The churches became the centers of social, educational, and community affairs.²

The emergence of the Bunker Hill and Jefferson Era of Los Angeles Korean Community was closely allied with the presence of Christian churches. The first Korean church was the Los Angeles Korean United Methodist Church (Table 1). This church had a weekly gathering for

² According to literature, the churches provided schools or education entities to teach the immigrants and their children to read and speak Korean. Also, the churches taught elements of Korean culture such as traditional songs and dances to the younger generation. The churches also provided the community with information by publishing newspapers and magazines. During this time, the churches proved effective in perpetuating the traditional values of Korean society. In addition, many ministers became cultural intermediaries serving as interpreters and social workers between the immigrants and American society. Moreover, of equal importance was the fact that the churches were centers for Korean national independence movement, the principal thread unifying the community prior to 1945.
Christian worship and English class starting in 1904. In 1906, a group of eighteen Koreans led by Pastor Augustus Prichard started a Presbyterian gathering on Hill Street near Bunker Hill Avenue in Los Angeles Downtown. Later, this church became the Jefferson Korean United Presbyterian Church in Los Angeles. On March 10, 1957, the Los Angeles Korean Baptist Church was established. It became a good helper and community center for Korean immigrants, businesses, and other churches that moved to the Olympic area. Nowadays, we call this church the Berendo Street Baptist Church, which has become a large Korean church. The first Korean senior pastor was Reverend Dong-Myung Kim. The church and Reverend Kim helped new Korean immigrants, Korean businesses, and new Korean churches. For example, Pastor Kim supports the establishment of the Oriental Mission Church.

The number of Korean churches increased remarkably in the 1970s and 1980s. While fifteen more Korean churches were established from 1965 to 1970, the number increased to over two hundred before 1980. In addition to Christian services, Korean churches in the early 1970s provided important services and a strong social infrastructure during the initial stage of development of the Los Angeles Koreatown community. As more Korean immigrants come to the Los Angeles area, the number of Korean congregations grew to almost one thousand in 2003.

According to the Korea Times Korean Business Directory, 2000-2001, the Los Angeles Korean community has over seven hundred religious institutions and more than four hundred service organizations including governmental institutions and functional associations (Table 2). The number of Protestant Christian churches is larger than other types of institutions in the Los Angeles Koreatown community. Since the last century, when the first Korean Christian church was established in the Los Angeles area, the number of churches has grown to about one thousand. According to the business directory of 2000-2001, five hundred and eighty local Korean congregations and about one hundred twenty other types of Christian institutions existed. As shown in Table 3, Presbyterian denomination is dominant in Korean ethnic congregations. More than sixty percent of Korean Protestant churches are inside Presbyterian denominations in the Los Angeles metropolitan area. However, this business directory, which I use in this research,

3 This gathering was operated by Mrs. Florence Sherman, a retired Methodist missionary in Korea, at 1620 Magnolia Avenue near the USC campus. Later, this gathering became the first Korean United Methodist Church in Los Angeles.

4 This church still exists at its present location on 1374 West Jefferson Boulevard, near USC. Givens (1939) describe this church as the first Korean church in her research.

5 This church still exist in the Olympic area with over six hundred members.

does not necessarily cover all Korean churches, since churches have to pay fees or participate in the procedures for registering in the directory. Some small Korean congregations, perhaps, did not register with the directory. One interesting characteristic of these ethnic congregations is their small size. Many of the churches may have fewer than one hundred members.

Korean congregations have been the focal points of social interaction for the majority of Korean immigrants and the center of their community life. Through congregational meetings, Korean immigrants made friends, and exchanged information regarding employment, business, social service benefits, and education facilities. As more Koreans immigrated to the new world, many of them faced serious questions and substantial difficulties. The churches were seen as the best place where people could ask questions and receive thoughtful guidance. According to observation and interviews, the primary problems facing Korean immigrants centered on green cards and citizenship issues, locating educational resources for their children, learning English, finding employment, and obtaining insurance. Pastors in Korean churches were charged with helping Korean immigrants. Today, Korean congregations continue to play the above roles, and serve more diverse people as more Korean immigrants coexist.

Nowadays, Korean congregations serve roughly two major Korean groups. First, new Korean immigrants, both illegal and legal, who continue to come to the United States. Since the number of new immigrants remains large, the churches need to continue to provide services and information for them as they did with the earlier immigrants. Second, for many Korean Americans who have lived in the United States for some period, including the foreign-born first generation, the 1.5 generation\(^7\), the 2\(^{nd}\) generation, and the 3\(^{rd}\) generation, Korean churches need to deal with new issues that include the generation gap and inter-racial relations.

\(^7\) The 1.5 generation of Koreans is not America-born. However, since they came to the States at a young age, they have been educated and socialized in American ways.
On this point, I asked two questions. First, “Can Korean immigrants have real faith?” “Are they converted into real Christians?” According to the above historical review, we can see that many Koreans came to Korean churches for socio-economic reasons. Thus, can they have real Christian faith or is the church just a source for social connections? Second, does the Korean church have any problems? Until now, we have discussed only the positive aspect of the Korean church. However, does the Korean church have any negative impacts on the Korean community? Actually, the Korean church may have some negative impacts on the Korean community because of some problems.

When asked the first question, I met with accounts from pastors similar to the following:

    I think that some Korean immigrants come to church because they want to have social connections and business opportunities. But, I can see that some of these newcomers are converted to real Christians. Maybe, one fifth of new-comers keep participating in our church. (Interview with a Korean pastor in Los Angeles, September 2003)

Since our church is located in the middle of Koreatown, I can say our church is one of the churches where many new Korean immigrants can easily visit the first time. Normally, fifteen new families come to our church every week. I can see a quarter of the new comers to our church are new immigrants. (Interview with a Korean pastor in Los Angeles, September 2003)

According to their accounts, they could see that some new-comers showed signs of real Christian faith. Some other pastors and members just told me ‘yes,’ ‘sure.’ The interviewees said not more than the above words. Thus, I can say that many of non-Christian new-comers are converted into real Christians.

In addressing the second question, I overhead and observed negative comments and reports of Korean churches. After the explosive development of the 1970s and 1980s, some damaging things happened, especially, around the conflicts between pastors and members or among members over leadership, and ownership of church property. I met an interviewee who already has changed churches several times, after having encountered the same problems at various churches. His statement shows tensions between members and pastors.

    It's so shameful! How greedy the pastors are! We members gave all our donations and volunteered our labor. What have churches and pastors been doing for the people and God? I don't know how they budget things. But, I hope that the church can spend some of its budget for its members and people in transparent ways, not for the pastors themselves. (Interview with a Korean church member, September 2003)

Since some pastors or core members control the planning and expenditure of congregations’ budget, Korean ethnic newspapers have unceasing news regarding conflicts or litigation around management or property ownership of congregations.

---

8 I could meet easily with Korean church members or Christians who had changed their churches.
Interviews and newspaper archives uncover several reasons for these negative happenings inside Korean congregations. First, there is a lack of negotiation and discussion between members and pastors. Since many Koreans do not have enough experience with democratic procedures, it seems that many Korean churches suffer from a lack of democratic management skills, preserving instead the authoritarian culture and tradition of South Korea. This causes conflicts regarding the church’s operation and the property management between pastors and their parishioners or between members. Second, the Korean churches are divided into thirty-five denominations in the United States. The variety of denominations sometimes results in a lack of communication and a failure to create unified community activities. Sometimes, pastors of different denominations become too competitive with each other, rather than work together.

However, positive changes have been implemented to overcome these problems. For example, younger pastors, and even pastors from the 1.5 and 2nd generation have begun to supplant the former authoritarian leaders of Korean churches, bringing with them transparent budget and management systems with a “discussion culture.” This shift has occurred churches of different denominations, helping to unify community activities. For example, the New Hope Chapel in Los Felitz has a 1.5 generation senior pastor. The church’s congregation has been rapidly expanding. More than one thousand adult members now participate regularly in Sunday services. Also, recently The Oriental Mission Church and The Los Angeles Young-Nak Presbyterian Church, two major Korean churches in Los Angeles, have appointed comparatively young senior pastors.

Churches and Other Community Institutions

In addition to religious institutions, other community institutions play a role in social capital. I ask how these other institutions work in forming community social capital within ethnic congregations. This section describes the general development and contribution of Korean community institutions other than Korean congregations. I discuss also the general relations between the major community institutions and the churches.

Community Organizations and Ethnic Media

Various community organizations and ethnic media emerged in response to the rapid expansion and development of Koreatown. The growth of the Korean population in Southern California created the need for community institutions to provide services and to help their members deal with the problems of rapid social change.

---

9 However, the number of denominations of Korean churches is much bigger. Even the Presbyterian denomination in South Korea has over fifty different patricians. Thus, due to some reasons, the Korean churches have too many denominations in the U.S. and South Korea compared to their size.

10 In this research, the ‘community organizations’ include nonprofit, social service, and political organizations. A number of major community organizations have emerged since the end of 1970s and early 1980s.
Map 1. Distribution of Korean Associations in Los Angeles

In 1990, the Los Angeles Korean community had approximately one hundred-fifty social organizations, about ninety alumni associations, eighteen Buddhist temples, thirty-two newspapers, three TV Broadcasting services, three radio stations, and five hundred Christian churches. In 2000, the number of these types of institutions increased dramatically, especially the ethnic media and alumni associations as shown in Table 4. In terms of their distribution, the organizations are mainly concentrated in 90010, 90006, 90005, 90020, 90019, 90004, 90057, 90015, 92844, 90703, and 92111 zip codes (Map 1.). Their distribution is heavily concentrated in the Los Angeles Koreatown area rather than churches and businesses.

As indicated in Table 5, Protestant churches tend to be scattered more outside Los Angeles Koreatown. While about forty percent of the churches are concentrated in the Koreatown, only fifty percent of Korean businesses and alumni associations are in Koreatown. Moreover, due to their special characteristics, sixty percent of community organizations are located in Koreatown.
Inside Los Angeles Koreatown, non-profit organizations including churches are more concentrated in 90010, 90006, 90005, 90020, 90019, and 90004 zip codes. These zip codes have more than fifty Korean non-profit organizations. Churches are more located in 90006, 90010, and 90020. When we see the Los Angeles County, non-profit organizations and most businesses have same densest zip codes as the Koreatown's (Table 6).

(1) Community Organizations
The Korean community has three major community organizations. The Korean Federation – Haninhoe founded in 1965 - is the political organization of first generation Koreans. The president of the Federation speaks for the Korean community, and is selected through community election. The Federation has its own office building on the corner of Olympic Boulevard and Western Avenue in Koreatown. The building has been registered as a landmark with a mural painting on a sidewalk. Although the Federation still has symbolic representation in the Korean
community, this organization does not have high trust and support. Since the Federation focuses more on the political issues of South Korea and Los Angeles rather than the real community issues of the Korean immigrant population, the Federation is somewhat distant from people’s lives. Second, the Korean Senior Citizens Association – Hanin Rhoin Hui - was established in 1967 with the full support from the Korean immigrant elderly. The association sought to mitigate the restricted living conditions of the Korean elderly in American society. In spite of the importance of the association, this organization has undergone some internal-conflicts regarding property ownership, which has limited its role in Koreatown society.

Third, the Korean-American Coalition (KAC) – HanMi YonHapHui which was founded in 1983 - is a new political agency of 1.5 and 2nd generation Koreans. The goals of the KAC are to educate, organize, and empower Korean American society. The KAC attempts to represent Koreans to American society, in terms of some limited fields, through its relations with other ethnic groups and their human resources. Especially during the 1992 riot, the KAC played a significant role in speaking for the Korean community to the American media and public. However, all of these organizations deal only with limited issues due to their capacity and needs. Moreover, the organizations do not represent the seven hundred Christian churches, which over two-thirds of the Korean immigrants regularly attend, and the diverse Korean business and professional associations.

(2) Associations
The Los Angeles Korean community has variety associations which provide a sense of identity and solidarity for their members: alumni associations, community service associations, business associations, professional tradesmen associations, musician and artist associations, sports and recreational associations, and political action associations. Alumni associations, in particular, occupy a special place in the immigrants’ community life. Both formally organized associations and informal gatherings composed of former high school and college classmates provide the basis for networks of primary relationships.

Diverse business associations also have been formed to create solidarity and cooperation. For example, a painter association was formed for information exchange and protection against dumping contracts. In other cultural, social, and political action associations a similar sense of traditional Korean values proved dominant. These organizations are mostly inward looking, and concerned mainly with the immediate needs of the group’s members and have yet to move beyond

---

11 The Korean-American Coalition, a new political organization in the Korean community, was launched in 1983 with its predominant support coming from this new generation. Initially, the Coalition created networks with diverse ethnic groups as well as with numerous other Asian-Pacific organizations.

12 South Korea is a small country, a quarter of the size of the state of California. More than half of the recent Korean immigrants have come from the capital city, Seoul. More than 80 percent of them completed their high school and/or college education in Seoul and other large cities. Thus, alumni associations play an important role in maintaining friendship networks among Koreans.

13 Some of these Korean merchants recognized the need to organize themselves in order to strengthen their business community. In the early seventies, Olympic Boulevard was not yet a Korean commercial strip, and was generally dilapidated in appearance. As a result of their efforts to organize, the Koreatown Association of Los Angeles was formed, with eight original members. Thus, the name, “Koreatown,” was first officially used by the Koreatown community itself.
their ethnic community boundary. Also, these associations may have more leadership on Korean community than general community organizations in terms of political and social assets.

(3) Media
The Los Angeles Korean community has three major daily Korean language newspapers: *Hankook Ilbo* (The Los Angeles Korea Times), *Joong Ang Ilbo* (The Los Angeles Korean Central Daily), and *Sports Seoul USA*. In addition, about fifty weekly or monthly newspapers and magazines exist in the Los Angeles Korean community. Two major Korean TV stations: Korean Television Enterprise (KTE) and the Korean Television American Network (KTAN) broadcast Korean news, films, entertainment programs, and daily dramas. Several cable television networks that mainly broadcast television programs imported from South Korea also exist. Furthermore, three major Korean radio stations are available in Los Angeles: Radio Korea, Radio Seoul, and Gospel Broadcast (*Mi-Ju Bok-Um Bang-Song*). All of them broadcast twenty-four hours a day, providing Korean immigrants with news and music from Seoul and their special programs at regular intervals.

These ethnic media have played an important role in integrating geographically dispersed immigrants by keeping them informed of what is going on in the home country and in the local community. The ethnic media play an important role in the Korean community because Korean immigrants use only one language. Thus, these institutions contribute in building ethnic resources in the Los Angeles metropolitan area.

The ethnic media have a close relationship with Korean churches in various ways. I heard the following oral account:

> The Korean congregation is one of their biggest sponsors because they used commercial advertisements and the churches’ special news in our paper. The Church buys many advertisements in our newspaper. They can pay the bill in cash. Since we know how important the Korean churches are, we produce a special religion section in every Wednesday newspaper. Yes, we deal with other religions, too. But, the churches and Christianity always cover most of the section. (Interview with a Korean Newspaper Reporter, September 2003)

The Korean Christian churches are not only some of the biggest sponsors of the ethnic media, but also an ethnic media itself. Since many Korean churches want to broadcast their sermons and news to the Korean community, they buy air time on radio and television in addition to advertising space in news papers. Some of the Korean churches have the ability to produce radio or television programs by themselves. In the night and morning, many special programs sponsored Korean churches air.

**Organization Capacity of Current Korean Church**
The organizational capacity of Korean congregations is a good source to understand the role of the congregations in building social capital. This description of their capacity also provides a

---

14 In 1969, The Korean Times was established.
15 Sports Seoul USA was established in 2002 by Radio Korea.
good comparison to other institutions described above. We cannot deny the important role of other ethnic organizations, associations, and media, but Korean churches have primacy in the Los Angeles Korean community. To assess this capacity, I consider their membership, budget, staff, and structures, based on literature, interviews, and observations. I want to start with one good observation in front of one major Korean church in Los Angeles.

On a Sunday in May 2003, more than ten parking assistants were helping people to park for the Oriental Mission Church Sunday service near the main sanctuary area. Even though the church has over one million square feet of parking lot and fourteen different services including four major adult services, the parking lots and streets around the church filled up quickly. The streets had traffic jams. The parking lot was busy all day.

(Observation, OMC May 2003)

The above description is a typical picture of The Oriental Mission Church on Western Avenue. Every Sunday, many Korean congregations experience similar situations in the Los Angeles area. This image shows how many Korean people gather and share at these faith institutions. This gathering is a part of the organizational capacity of Korean churches.

Membership numbers show how many people are affiliated with churches. When describing religious affiliation, Min and Bozorgmehr (2000) argue that the Korean immigrant community has three subgroups: Protestants (60%), Catholics (20%), and people with other religions or no religious affiliation (20%). Many previous studies show a similar proportion. Generally, we can estimate that over fifty percent of the Korean population attends Korean Protestant churches. These religious proportions are similar to the results of previous studies. Even though this result mainly reflects the first and 1.5 generation perceptions, I do not have doubts that many of the 2nd and 3rd generations are also affiliated with the congregations. These generations are less active in churches, but many of them still have a Christian background. There are some discussions and research on the disappearance of 2nd generation Koreans in Korean churches. I can agree with some parts of these arguments. However, it seems that the younger generation is still strongly affiliated with Korean churches, in spite no longer being active members.

More than half of the Korean population in Southern California is affiliated with an ethnic congregation. As an example of the outstanding membership size of Korean churches, the sixteen largest Korean churches in Los Angeles have over thirty one thousand registered members. In terms of the average member size of Asian churches including Korean churches, the KCCD survey shows that the average membership size of the respondent churches is four hundred fifty-seven. In terms of their budgets, the sixteen largest Korean churches had budgets of about

---

16 Hurh and Kim (1990) and Min and Bozorgmehr (2000) assert that between sixty and seventy percent of the aggregate Korean population in the United States is affiliated with a church. Only eleven percent of the Korean immigrants in the Los Angeles area are affiliated with Korean community organizations other than their church. This low level shows the significance of the church in the social and community life of the Korean immigrant community. All Korean immigrants share values and customs associated with Confucianism and common historical experiences. Confucianism had a powerful cultural influence in Korea for several centuries before Christian religions were adopted in the early twentieth century.

17 The Los Angeles Korea Times (January 2, 2001).
$51,000,000 in 2001. The KCCD survey shows that the average budget size of the responding Asian churches is $450,000.

Source: The Oriental Mission Church 30 Years History 2002, Young-Nak Presbyterian Church 20 Years History, and Interview

<sup>a</sup>This number means average participants in weekly services of each church.

According to interviews and church documents, the budget of The Oriental Mission Church (OMC) has grown from $45,000 in 1973, to more than $4,000,000 per year in the first decade of the 21<sup>st</sup> century. The number of participants attending weekly service has increased from 450 in 1973 to around 3,500 in 2001 (Table 7). Moreover, this church has a large property located in Los Angeles. The lot size is almost two million square feet, and the building size is almost one million square feet. This remarkable growth is deeply related to the growth of Korean immigrant community. The Los Angeles Young-Nak Presbyterian Church (YPC) had about one hundred weekly participants, with an annual budget around $15,000 in 1973. By the 21<sup>st</sup> century, this church grew to have almost five thousand weekly participants and over seven million dollars in their annual budget. The YPC also has a large lot with buildings near Los Angeles’s downtown and just beside Chinatown. In their remarkable growth, these churches have followed the growth of the Los Angeles Korean community.

The churches in Los Angeles Koreatown have even come to wield considerable political power in community affairs. For example, many local politicians visit Korean congregations. Also, the churches have been playing key roles in community, city, or national issues, such as in 1992 Riot and 9.11 Terror.

2,500 Korean pastors and staff members work for 1,200 Korean churches in California. This ratio between churches and pastors reminds us that most Californian Korean congregations are small. The average staff of each church may be only one or two persons. The small size of Korean congregations suggests that senior pastors alone are operating most churches. In the cases of the four churches in this study, the OMC has thirty-four full time clergy and staff, and many part-time employees. The YPC has over thirty full time clergy and staff including four clergy and staff

<sup>18</sup> However, there are numerous future Korean pastors who are studying in Fuller Seminary, Claremont Seminary, and others. Also, many new pastors are coming from South Korea.
for their English Ministry. The YPC also has many part-time staff and janitors. Compared to these big churches, Gospel Church in His Heart has only one part-time pastor and no full-time employees.

The Los Angeles Korean churches provide diverse religious and social activities based on their own organizational structure. These activities have created social networks and trust, and this social infrastructure actively works with their private lives and business patterns. The OMC provides fourteen different Sunday services including an English language service, and has five different services every Friday. In addition to the services, the church also has prayer meetings, such as its daily morning prayer meeting\(^{19}\) and several other special meetings on Wednesday, Friday, and Sunday. The OMC has seventeen parishes to reach members based on geographic location. Within this main structure, the church has a large educational unit including a Sunday school, pre-school, and after school, four different choir groups, and thirteen bible study meetings.\(^{20}\) The YPC has similar activities. The church has sixteen parishes based on geographic location, which are being changed into a cell church structure in 2004. The cell church is a kind of home church with more autonomy. Members are supposed to attend another worship service meeting during the weekdays in addition to attending Sunday service. The YPC started to hold this new and dynamic system instead of the geographic based static structure in an effort to provide members’ social and religious events. The YPC also provides many services, prayer meetings, education programs, and community programs.

While the large churches can provide diverse activities, the medium and small churches can only provide limited ones. Normally, the small churches provide a Sunday service and a few other programs along with Wednesday or Friday service, bible study, prayer meetings, and parish or small group meetings. Despite their limited programs, these Korean churches having penetrated into many suburban satellite Koreatowns, are much closer to their members, and contribute a great deal to the people and the community. Thus, the small churches seem to be more important than distant large churches for many people’s everyday life.

**Community Capitals in Koreatown**

Community social capital cannot work without other community assets, or types of capital. Thus, we must ask how church-based social capital works with other community assets in the Los Angeles Korean community. Ferguson and Dickens (1999) suggest five basic community assets that are reasonable to use in community research, as shown in Table 8.

\(^{19}\) This early morning prayer meeting starts at 5:30AM everyday. According to an interview with a pastor in The Oriental Mission Church, over two hundred people come to the meeting. Moreover, for some special events, the number is significantly higher.

\(^{20}\) The OMC conducted its own internal surveys in early 2000. About 2000 members participated in the survey. Members were mainly in their 40s to 60s, and had been attending the church for five to ten years. 63% had generally a positive participation level in church-sponsored events. They were 51% satisfied with life in the U.S., and 58% are still concerning Korea. (OMC, 2002)
The Los Angeles Korean community seems to have developed based on moderate physical capital, high human capital, and high social capital. Also, this community has benefited from an increase in financial capital, despite its low political capital. In this development, religious-based social capital has played a very vital role in helping to circulate human capital and financial capital. I asked the following questions: What does social capital of this community mean compared with other kinds of community capitals? And, how do the Korean congregations work for these capitals?

(1) Physical Capital
The physical capital of Los Angeles Koreatown consists of a well developed built environment and relatively poor community facilities. Community service facilities are in short supply in comparison with population size. For example, this area has extremely small green spaces for parks and recreation facilities, and lack schools and libraries. This ethnic community has only one small community park, a library, and two elementary schools. The park, recently renamed Seoul International Park, is located on the corner of Normandie and Olympic Boulevard. This is the only park with a small green area. This lack of community facilities can harm community social capital. Koreatown has a well-developed high-rise commercial building district along Wilshire Boulevard.

The area is home to a variety of commercial shopping malls, supermarkets (grocery markets), hotels, retail shops, and numerous restaurants along with Olympic Boulevard, Western Avenue, and Vermont Avenue. During the 1990s, the real estate market boomed, and some significant commercial shopping centers were built. These developments include Koreatown Plaza, Galleria Shopping Mall, and Assi Shopping Mall. Korean-Americans have not only operated businesses

---

21 The Los Angeles Unified Education District is working on several new elementary schools plans in this area.
22 The major Korean markets are California Market (Kaju Market), Hankuk Market, Hannam Chain, and Assi Market. California Market and Hankuk Market are located on Western Avenue at 5th Street and 1st Street. Hannam Chain is located on Olympic Boulevard near Vermont Avenue. Assi Market is located on 8th Street near Oxford Street.
23 Hotels like New Seoul Hotel, New Garden Hotel, and Oxford Palace Hotel were constructed on Olympic Boulevard, Western Avenue, and 8th Street.
24 Among these, Koreatown Plaza was the leading innovation to Koreatown's new appearance. A beautiful arcade-type building, Koreatown Plaza is a real, full-sized shopping mall with 490,000 square feet of building space on one underground floor and two floors above ground, as well as offering four floors of parking. It has ninety stores inside, including a market, a bank, additional stores, and restaurants. The Plaza opened in the spring of 1988, after two years of construction. Besides Koreatown Plaza, several mini-shopping malls were constructed such as the Blue Roof Tile Plaza and Oxford Plaza.
in Koreatown, but they have also purchased properties.\(^{25}\) After 2000, some larger real estate development companies emerged, and they are aggressively expanding outside Koreatown. For example, Jamison Property, which was established by Korean professionals at the end of the 1990s, owns almost forty commercial buildings in Los Angeles Koreatown and the Mid-Wilshire area in addition to some other properties in downtown Los Angeles and Long Beach. As many Koreans and their businesses expanded to suburban areas, the physical capital of the Los Angeles Korean community also expanded.

In the Los Angeles Koreatown, Korean churches own as well as rent space. Some major Korean churches have their own church property including a main sanctuary, an education center, and even other commercial buildings, such as apartments and parking lots. Thus, Korean churches are one of the major users of real estate in the Los Angeles Koreatown and in other suburban areas. Korean churches also play another special role. Since Korean churches and their properties are distributed in every corner of the Koreatown, the churches have become the biggest provider of physical facilities for people. This alternative supply may mitigate inconveniences from the short supply of public community space. These church facilities are often shared with other racial groups.

(2) Intellectual and Human Capital
Korean immigrants, like many other Asian immigrants, have high educational and occupational backgrounds. According to the 1999 United Way data, almost thirty-five percent of Koreans have bachelor's degree or higher in Los Angeles County. The total population of Los Angeles County has twenty-three percent in that category. In terms of skill and experience, according to Min and Bozorgmehr (2000)’s research, fifty-four percent of Korean respondents in Los Angeles had held professional, executive and managerial positions prior to immigrating, and only four percent had blue-collar jobs. These professional skills may be not fully utilized in the United States because of the difference in economic systems, cultures, and languages. However, since many South Korean educational and social institutions are similar to the United States, the professional skills of Koreans can be applied in many fields.

This high human capital is one of the main community assets for economic development. This asset is mainly distributed through the social network pipeline in this ethnic community. When people are looking for jobs or business opportunities, they can get information and opportunities through these networks.

(3) Financial Capital
The Los Angeles Korean community has both formal and informal financial capital markets. Korean Americans have established banks and other financial institutions since 1967. There are also strong informal financial associations, such as Kye, and other family networks. The Los Angeles Korean community founded its first formal financial institution, a branch of Korean Foreign Exchange Bank that was invested from South Korea, on July 3, 1967. The first Korean bank was located in downtown Los Angeles, and targeted Korean customers who were working

\(^{25}\) In the early 1990s, Koreans owned 42% of commercial lots, 40% of the office buildings, and 41% of the shopping malls in Koreatown (The Korea Times, April 9, 1988). Korean businesses expanded beyond the boundary of small businesses, and now include large-scale real estate ventures, construction, and banking.
in the garment industry. Financial capital has flowed actively in the Los Angeles Korean community since 1980. At the time, more investment capital flowed from South Korea to Los Angeles Koreatown. This accumulated capital helped stimulate the community economy. Many Koreans invested in real estate in the 1980s. Now, ten Korean banks exist with many branches.

There are several reasons that account for this opportunity to build financial capital in the Los Angeles Korean community. First, as noted before, in 1984, the City of Los Angeles hosted the Olympics. This international event spurred economic development in Los Angeles and among Korean immigrants. Second, the Korean government loosened restrictions on foreign investment in the early 1980s, so people and institutions started to invest in foreign countries including the U.S. Third, Korean newspapers and media actively introduced the Los Angeles Korean community to South Korea. Many high-ranking government officers visited Los Angeles. A lot of ‘Made in Korea’ goods were imported to the U.S. including Korean cars in 1986. Right now, more than ten Korean ethnic banks exist with many branches all over Southern California and in other states.

Informal ethnic credit associations also met the community’s capital needs. Kye is a typical example in the Korean community. The Kye association is a rotating credit association, which consists of a group that leads members’ credit until all members have received the aggregate amount in each month. The Kye association represents an ethnic response to individual financial limitations. These informal associations have been established based on family, alumni networks, and church members’ networks.

(4) Political Capital
The political capital of the Los Angeles Korean community is poor in comparison to other types of capital. Since the Koreans have been focused on economic success in this new world, they have not considered political engagement. However, since the 1992 Civil Unrest, Korean Americans have paid greater attention to increasing their political capital. The Korean American Coalition (KAC) and some other new community organizations contributed to developing this community asset. However, according to interviews conducted for this study, these 2nd generation community organizations have not had much support from the general Korean population. Koreans can learn about these community organizations in the ethnic newspapers and on television, but many of them are a way distant from direct relations.

In comparison to these organizations, Korean churches may be the most potent institutions for political capital. Many local politicians have visited the larger Korean churches, and have tried to maintain close relationships with them. In the Korean community, the churches are the only Korean ethnic institutions that can easily mobilize people in response to political events, and have a significant fund raising capacity.

---

26 This is a branch of the Korean Foreign Exchange Bank. Since Korean immigrants were not familiar with borrowing money from banks or formal institutions, the Bank asked Korean immigrants to lend their money. Often the bank treated their clients to lunches.
Role of Korean Churches: Social Networks and Trust

We can see that Korean ethnic churches in Los Angeles play a pivotal role in sustaining Korean ethnicity by helping Korean immigrants in the history. Also, according to their organizational capacity, Korean churches have many members and provide diverse activities. Now, we can discuss directly people’s lives in terms of their social networks and trust, based on Korean congregations in the Los Angeles Korean community.

When new Korean immigrants arrive in Los Angles, or other cities in the United States, they can hear advice similar to the following from other Korean immigrants who came before them.

As you know, there is a well-known maxim among Koreans. “If you want to meet people, you’d better go to church. If you want to do business, you’d better go to church.” I think there is no place better than church to develop relationships for Koreans in America.

(Interview with a Korean church member, September 2003)

The Korean congregation is the place where Korean immigrants build their social network.

Map 2. Distribution of Korean Churches in Los Angeles
The locations of Korean churches enhance their role in building relations among people. As people moved from Mid-Wilshire Koreatown to suburban cities, Korean churches have followed them. There are twelve zip codes with over ten Korean churches: 90006, 90010, 90020, 90004, 90005, 90019, 90057, 90703, 91748, 90247, 90026, and 91745. According to this spatial analysis (Map 2), this migration and distribution of the churches shows a similar pattern to population migration than do other community or non-profit organizations. While most community organizations and alumni associations have remained in Los Angeles Koreatown, people and churches have migrated to some suburban cities, or so called satellite Koreatowns. This spatial distribution enhances the role the churches play in producing social networks for Koreans in Los Angeles. This migration may cause the new locations of some Korean churches. Once established, the locations of the churches influence the next migration patterns of Koreans. According to some interviews, Korean Americans tend to relocate mainly to be closer to better education facilities and safer neighborhoods for their children. However, the location and migration of Korean churches have also been important factors in making Korean people migrate and tolerate a long commute to work. For example, All Nations Church recently moved from Los Angeles Koreatown to Tujunga. In this movement, I could hear that considerable number of members migrated to the new church location.

The social networks of the Los Angeles Korean community have been gradually formed based on ethnic resources and diverse institutions. More than fifty percent of Korean immigrants in Southern California tend to make friends, exchange information regarding business and employment, and get advice about social services and children's schooling through churches. With their size and capacity, the Korean congregations have helped maintain group characteristics, norms, and values of the Korean community, through social meetings and programs including philanthropy, missions, choir rehearsals, informal associations, sports meetings, social activities, diverse newsletters, and weekly formal meetings based on location, in addition to Sunday service.

The ethnic congregations have contributed to community trust. Koreans trust members of their ethnic congregations more than any other group. This trust on church produces more community trust in Los Angeles Korean community. Korean people trust their fellow parishioners more than other people. Except for within the family, the next highest trust level is given to people belonging to the same religion and church. They do not place much trust in politicians, business people, or surprisingly among other Koreans. Unexpectedly, Koreans have low trust level regarding other Koreans (Table 9).

However, because of this high trust within Korean churches and among its members, the Koreans tend to overreact against any news against the congregations. While Korean churches build general community trust, Koreans may have too many expectations, as the following statement indicates:

Korean people expect too much from churches. People get angrier at any bad news regarding churches and pastors, than other community organizations' or private companies.’ I think this is because people have much more expectations from churches.
than other secular organizations. These expectations stem from their real trust of churches.
(Interview with a Korean church pastor, September 2003)

Note: Since the Christian respondents are forty-three among the total number of forty-six, the total number related to church are adjusted.
* N=46
** Please refer to the questions and scales in the footnote and appendix.²⁷

We can see churches as essential venues for the formation of social networks and creation of trust for over fifty percent population of the Los Angeles Koreatown community. If the proportion of Christian population is too small, we can regard this result as a high bonding social capital of a group. However, these numbers suggest the importance of Korean churches in building social capital in Los Angeles Koreatown.

Findings and Lessons

This paper reviews the history and organizational capacity of Korean ethnic congregations focusing on community social capital building in the Los Angeles Metropolitan area. We can see the primacy of Korean congregations’ role in building community social capital in the Los Angeles

²⁷ Trust: How much do you trust different groups of people?

Korean community. The church reinforces the generalized norms and values of the immigrants by, building and strengthening their ethnic solidarity. In comparison to other community organizations, the Korean congregation is the single most effective community organization for establishing relationships and social networks for many immigrant Koreans. I want to call this social asset ‘religious-based social capital.’

This paper addresses the people and the institutions around social infrastructure. It explores how Korean Americans through their ethnic congregations create social capital that aids community economic development. Using qualitative and quantitative data, this study discusses the role of faith-based organizations in forming social capital, and the diverse roles of this religious-based social capital in sustaining community economic development and improving inter-racial relations in the Los Angeles Korean community. In addition, this study sheds light on how other ethnic communities build their social capital. This particular case can give more meaning to community development, urban planning, and international development fields. For further research, I want to ask what is the beneficiary role of this religious-based social capital. In the following researches, we need to discuss this social asset and its relationship to small business development and general community development issues.

In Korean Christian congregations, seniors, adults, youths, children, 1st generation, 1.5 generation, 2nd generation, business owners, workers, professionals, wives, and husbands gather together to develop strong interpersonal relationships. The strong ‘energy’ around their activities enhances their neighborhood’s economic development while sustaining the community, not only for Koreans, but also for their neighbors.

Children for Sale: the Traffic of Eastern European Children in Western Europe

The Case of One Romanian Girl

The sight of beggars, both adults and children, is all too common in the major cities of Western Europe. Tourists toss a coin into a cup and walk on. Very few realize that their coin becomes part of a business in the traffic of human beings, the vast majority of them children. The most common assumption is that the beggars are Roma, and indeed many of them are. Roma film directors Kusturica and Mihic have eloquently exposed this tragedy in the film *Time of the Gypsies*. The film is about their own people, but the buying and selling of human lives is not a “Rom problem”. In the last several years, according to studies by UNICEF, there have been a steady influx of clandestine children being introduced in Italy and other Western European countries from Romania, Albania and other Eastern European countries. Paradoxically, the admission of Eastern block countries into the European Union has made the abuse easier, since there is no easy way to check the legitimacy of the travelers. The efforts to protect these children are many, yet the traffic goes on and on.

I have followed the adjustment of Eastern European Roma in Italy for a few years, but since 2002 my interest in this matter has taken a specific face. I have seen the effect of a life on the streets in a young girl from Romania, and what I have seen haunts me.
In a first paper published in Harvard’s magazine *Bhumi* I called her Milena, but that was not her real name. Perhaps she was Rom, perhaps not. She would never walk: her club feet were horribly deformed, her legs atrophied. She was precariously perched on a skateboard, her legs thrust in front of her, her deformed feet bare, in summer and winter. She pushed herself around with a hand stuck in a sneaker that she will never wear. A couple of streets away a boy, bearing a striking resemblance to Milena, and also deformed, hobbled on crutches. Evidently their club feet were the result of a disorder that runs in their family. They were obviously relatives, perhaps brother and sister, taken from their family in Romania and put to beg in the elegant streets around the *Piazza di Spagna*. Their case is not isolated: in October 2004 Italian television reported on several crippled young people that were smuggled in Italy from Romania and other Eastern European countries and put to beg in the streets. Most often their families release their children to people that promise to take them to a hospital, but some evidence suggests that impoverished families will sell their children to organized crime, into a life of begging and prostitution. In 2002 Milena had still a simple trust about her. When I dropped a couple of Euro in her cup she had a ready smile. Her name was Milena, she said, she was from Romania. When I asked if she was Rom, she nodded. Somebody had put highlights on her brown hair. In 2002 she still wanted to look pretty. When I asked if I could take a photo, she asked me for a copy. I said no, it would be complicated, and she nodded with a smile and a shrug, and pushed herself away with that sneaker she would never wear. I stood there looking at her. She would never see a hospital. What would happen to her? Why was the police blind to her misery?

I got an answer to my questions during another visit to Rome, in the fall of 2004, when I saw her around *Fontana di Trevi*, and I hardly recognized her. She has lost a lot of weight, so much that at first I thought it is a boy. But no, I recognized these feet, the skateboard and the hand stuck in
the sneaker. Her hair was bleached yellow, a short dry crop on top of a gaunt face. That simple trust of two years before was gone; her eyes were dulled with resignation. Not even bitterness, just the resignation that comes with the same routine day in and day out.

Once more our dialogue took place: what is your name, where you come from, here are two Euro. But when she saw my camera, she pushed herself away.

I was on my way to the Roman headquarter of the Italian League of Human Rights, and Milena became the topic of our meeting. The League’s President put things in motion, there is indeed a traffic of human flesh coming from Romania that needs to be stopped. We made plans.

On the way back I decided to buy Milena some lunch, perhaps a slice of pizza. I passed by Fontana di Trevi, but she was nowhere to be seen. I walked along the surrounding streets, but she was gone. She had learned her lesson well. I plan to look for her in a few months, when I will be in Rome once more. I know that I will see other young people, perhaps crippled, begging for a few coins in the lovely streets of my city. I know that many, indeed too many children wander the street of European cities. And the questions remain unanswered.

The very few agencies that attempt to address the problem are under funded and understaffed. Refugees and Roma camps are crowded. This was evident to me during a field research I conducted in Italy in September 2001. I visited a camp located in the outskirts of Rome, at the Testaccio locality. Don Bruno Nicolini, a Catholic priest in charge of Roma affairs in Rome, had introduced me to Mirko, a Bosnian Rom who has been living in Italy for 30 years. The camp was located outside the city, tucked away in the fields and accessible only by dirt roads. A high metal fence surrounded the camp, split in two by another fence. I asked Mirko why the division. On one side, he told me, lived the Christian Roma. On the other lived the Muslim. There are several camps outside Rome. Yet the city government, in its wisdom, has recreated a Bosnia situation. I
asked Mirko the reason for the fence. Were there difficulties among the two groups? With the utmost courtesy, and firmness, he declined to answer. Yet there are some localities where progress is clearly possible.

I have followed the progress of one agency, the *Opera Nomadi* of Latina, a town some 50 km south of Rome. The *Opera Nomadi* deals primarily with Roma, mostly Italians, but there is an increasing number of immigrants from Eastern Europe. The *Opera*’s primary goal is to keep the children in school in the morning and off the streets in the afternoon. This is achieved by patiently making sure that each child has school books and supplies, that their parents will trust the school system enough to send their children there instead of taking them to beg in the streets. After school the Roma children gather in the *Opera*’s small house and yard where they can do homework, learn about each others culture, and play. The problem facing these children, and the host schools, are many. The schools are chronically understaffed and totally unprepared for the challenges from this alien subculture. Some of the children bring to school a distrust ingrained from generations of mistreatments, that they manifest by “acting out” in class. This in turn reinforces the hostility of the Italian children and their families. But progress in undeniable: when the children go to school and the parents obtain housing, the cycle of poverty, and crime, will eventually be broken: there are virtually no beggars in Latina. Unfortunately, Latina’s example is so far the exception rather than the rule. And the tasks facing the agencies are overwhelming, particularly in the cases of organized crime, where the young beggars are intimidated into silence by their exploiters. In many cases, the existing agencies are designed to deal with Roma refugees, and lack the proper training and…paperwork to address the newer influx of illicit immigrants. While efforts are been made to address the problem in the countries of origin, Italian authorities grapple with possible solutions to this new influx. Meanwhile
extremist newspapers, and politicians, clamor for the enforcement of law and order, which means the arrest of the beggars and their exploiters. This is a dubious option at best, since sadly the “supply” of living and suffering human flesh seems to be endless. And young people like Milena keep wandering in the streets of European cities.

A Community Outreach Program to Minimize Risk of Cardiac Disease in a Rural Environment

Barbara Cliff
Cheboygan Memorial Hospital
748 South Main Street
Cheboygan, Michigan 49721
United States of America
barbara.cliff@cheboyganhospital.org

Abstract

Cheboygan ACRES is a pilot program that was established in rural northern Michigan in January 2005 to study the impact of a nurse-managed community outreach program involving Additional Cardiac Risk Education and Support. Coronary heart disease is one of the most prevalent and preventable forms of heart disease and continues to be a leading cause of death in this country and around the world. Unfortunately, there are huge gaps in available resources to focus on primary prevention.

A research study in Cheboygan, Michigan is just underway at this time to test the hypotheses that 1) there is a positive relationship between additional education / support and prevention of disease in clients with cardiac risk and 2) an outreach program will be effective in decreasing the ten-year risk of developing heart disease by 5% in six months. The specific research questions and aims incorporate the behavioral outcomes (related to smoking, diet, stress, exercise), as well as the physiological improvements (regarding blood pressure, weight, cholesterol, blood sugar). This is a causal, longitudinal study with pre-test and post-test quantitative and qualitative measures. Data will also be gathered throughout the study period. This study uses an experimental design with randomization of qualified participants to the control group or intervention group.

Several methods of community involvement and physician engagement were utilized in setting up the study. This session will further discuss the measures of a successful design as applicable to this study, as well as other community outreach programs that address disease prevention and health promotion. A program such as this can be replicated to other populations anywhere in the world in which the leaders have the passion to make a positive difference in the health of a community!
ISLAM AND DEMOCRACY: FRIENDS OR FOES
James W. Corey
High Point University

A paper prepared for presentation at the Fourth Annual Hawaii International Conference on Social Science meeting at Honolulu, Hawaii June 13-16, 2005. The paper is a work in progress which is evolving and does not represent a finished work.
ISLAM AND DEMOCRACY: FRIENDS OR FOES

In 1993, Harvard professor Samuel P. Huntington published an article in *Foreign Affairs* on the possible clash of civilizations which was later expanded into a widely acclaimed book “Clash of Civilizations and the Remaking of World Order”. In this book, Huntington identifies 9 contemporary civilizations and indicates that future conflicts may be more between civilizations than nation-states. He also indicated that one possible civilizational clash would be between the Western civilization and the Islamic civilization. One first question is: How inevitable is this civilizational clash?

Among the more recent reasons advanced for the U.S. invasion of Iraq is the desire to bring democracy and democratic government to the area. The rationale is that if the seed of democracy is planted in Iraq, it might spread throughout the Middle East. Critics indicate that this scenarios is a long shot at best. So another question is: Is democracy compatible with Islam or are the inimical to each other?

One of the first challenges in addressing the subject of this paper is to determine the extent of the Muslim population in the world and the current state of freedom in the Muslim world. In 2003, there were 1.485B Muslims in the world which represented about 23.52% of the world’s
In Oceana (ocean island nations), there are virtually no Muslims while in Africa almost a majority of peoples are Muslim (48.1%). The largest Muslim nation in the world is Indonesia with over 194M Muslims. Many people associate Islam with Arabia, but Arab Muslims are a minority of the overall Muslim population. Counting the Muslim population of all Arab nations (including the Palestine Authority) indicates there are 349.36M Muslims or 23.53% of the total world Muslim population (author calculations).

In terms of political and civil freedoms, Freedom House provides an authoritative compilation of world data. In 2005, there were 89 free countries (46%), and 54 partially free countries (28%) with a remaining 49 countries (26%) rated as not free. In terms of population, 44% of the world’s population lives in free countries, 19% in partially free and 37% in not free countries (http://www.freedomhouse.org/ratings accessed 1/13/2005).

However, in looking at Muslim populations, only two countries are rated as free, 17 as partially free and 28 not free. Thus, about 60% of Muslim nations are rated as not free. In terms of Muslim populations, 13%
live in free countries, 44% in partially free countries and 43% in not free countries. Thus, about 60% of Muslims live in countries with some degree of freedom. With both calculations being about 60%, it is obvious that there are a few countries with large Muslim populations which are free or partially free (http://www.freedomhouse.org/ratings accessed 1/13/2005).

The following table shows countries which are not free and the percent of the Muslim population in each non-free country. This shows that there are 3 nations with a Muslim population of 100% which are not free- Mauritania, Saudi Arabia and Somalia. It also reveals that there are 18 countries with a Muslim population over 80% which are not free. Freedom is a precious commodity absent in most Muslim countries.
The incongruity between Arab and non-Arab states with respect to democracy was also studied using one factor of democratic governance: competitive elections for high office holders. Stepan and Robertson noted that 16 Arab Muslim countries “underachieve” in this factor and non-Arab Muslim countries “overachieve” in this category. Not a single Arab-Muslim country is an “overachiever.” Thus, the Muslim religion does not explain the presence or absence of competitive elections. Further, neither does per capita income explain well electoral competitiveness. Seven Arab-Muslim
countries exceed $5,500 per capita income, but have never had a competitive
election (Stefan and Robertson, 2003: 30-36). (This level of economic
development is assumed as the floor necessary for democratic development.)

The authors classified the 16 Arab-Muslim countries into three
categories:

- **Autocratic states**—Saudi Arabia, Libya, Syria, Tunisia and Iraq (under
  Saddam Hussien)
- **Liberalizing, but not democratizing states**—Qatar, Kuwait, Bahrain
  and Oman
- **Once free and fair—now not**—Lebanon, Yeman, Morocco and Jordan
  (36-38).

Naturally this classification has been modified by some recent
developments—Iraq is a case in point>

As Fareed Zakaria noted: “The Arab world today is trapped
between autocratic state and illiberal societies, neither of them fertile
ground for liberal democracy. The dangerous dynamic between these
two forces has produced a political climate filled with religious
extremism and violence.” (Page 3). This assessment is pessimistic.
Yet at the beginning of Islam, there was not this dangerous dynamic. The Islamic scholar Louis Cantori has noted that the Islamic state began in Medina with the signing of a Charter by the prophet Muhammad and the fourteen main non-Muslim tribes (Jewish) who chose not to convert to Islam. The Charter emphasized two key points: in matters of religion, each person was accountable to God and not the state; and all citizens of Medina were equal, regardless of religious affiliation. Cantori strongly believes that Islam is compatible with democracy and notes that the Quran emphasizes the importance of shura (consultation), value of diversity and peaceful co-existence between different religious traditions. And Cantoni further argues that the Quran clearly supports democracy in one form or another.

The United States Institute of Peace Special Report 93 on Islam and Democracy states that the explanation of why so many Muslim countries are not democratic has more to do with historical, political, cultural and economic factors than with religious ones. In essence, many Muslim countries are ruled by dysfunctional, corrupt and repressive regimes which provide fertile ground for the rise of radicalism. That is to say, that it is not Islam that impedes the development of democracy, but rather
corrupt, divisive secular regimes that misuse Islam as an instrument of subjugation and repression. As Fareed Zakaria notes:

By the late 1980s, while the rest of the world was watching old regimes from Moscow to Prague to Seoul to Johannesburg crack, the Arabs were stuck with their corrupt dictators and aging kings. Regimes that might have seemed promising in the 1960s were now exposed as tired kleptocracies, deeply unpopular and thoroughly illegitimate. In an almost unthinkable reversal of a global pattern, almost every Arab country today is less free than it was forty years ago. There are few places in the world about which one can say that.

This author also notes: “Most Muslims’ daily lives do not contain the idea of a faith that is intrinsically anti-Western or anti-modern.” He also noted that the largest Muslim nation in the world, Indonesia, has had a secular government since its independence in 1949 and now has embraced democracy and elected a woman as president. The next three largest Muslim nations—Pakistan, Bangladesh and India have had experience with democracy and all three have elected women as prime ministers.

Furthermore, it could be argued that there is strong popular support for democracy in most Muslim countries as the graphic below illustrates. Respondents were asked whether democracy could work in their country and the graphic shows positive responses to this question. Most also supported a role for Islam in their countries; however, are also supportive of keeping government policy and religion separate. When the question was asked
whether religion is a personal matter and should be kept separate from government, only 55% of Americans completely agreed with the statement. Actually, in Muslim societies, support is even stronger or at least equal.

But Zakaria notes "But for the Arab world, modernity has been one failure after another. Each path followed-socialism, secularism, nationalism-has turned into a dead end. People often wonder why the Arab countries will not try secularism. In fact, for most of the last century, most of them did. Now Arabs associate the failure of their governments with the failure of secularism and of the Western path. The Arab world is disillusioned with the West when it should be disillusioned with its own leaders." (Page 11)

Leadership is the key to understanding why democracy has not taken root in Arab countries. Autocratic, corrupt leaders are not interested in democracy. Nor are they faithful followers of Islam. Rather they use Islam as a weapon or tool to control the masses and focus popular anger not on their own corrupt regimes, but towards the West. As Robin Wright writes: "Extremists have manipulated, misconstrued, and even hijacked Muslim tenets."

Abdou Filali-Ansary notes that more and more fundamentalists accept the idea that Islam is not opposed to democracy: some argue that by embracing the principle of Shura (consultation), for example, Islam has
always favored the kind of relationship between rulers and ruled that democracy entails. He also noted that the renowned contemporary philosopher Mohamed Abed Jabri has said that democracy is the only principle of political legitimacy which is acceptable nowadays in Muslim societies.

Figure 2
Muslim Popular support for Democracy
Islam teaches that all “men are substantially the same and no tangible and actual distinction can be made among them, on account of their accidental differences such as nationality, color or race. Every human being is thereby related to all others and all become one community of brotherhood.” (Institutive of Islamic Information and Education). We can see then that Islam looks at all human beings as creatures of a supreme being.

Further Islam does not recognize positive human rights. “When we speak of human rights in Islam, we really mean that these rights have been granted by God; they have not been granted by any king or legislative assembly. The rights granted by kings or legislative assemblies can also be withdrawn in the same manner in which they are deferred. The same in the case with rights accepted and recognized by the dictators…but since in Islam human rights have been conferred by God, no one on earth has the right or authority to make any amendment or change in the rights given by him. No one has the right to abrogate them or withdraw them.” (Institutive of Islamic Information and Education).

These then are the human rights in a true Islamic state:

♦ SECURITY OF LIFE AND PROPERTY. The taking of life of even a non-Muslim living in a Muslim state is forbidden.
THE PROTECTION OF HONOR. Muslims are forbidden to make fun of one another, defame, insult, backbite or speak ill of another. This would be an affront of their honor.

SANCTITY AND SECURITY OF PRIVATE LIFE. Muslims are forbidden to spy on one another or even enter the house of another without consent.

THE SECURITY OF PERSONAL FREEDOM. No citizen can be imprisoned unless adjudged guilty in an open court.

THE RIGHT TO PROTEST AGAINST TYRANNY. This is a right given by God.

FREEDOM OF EXPRESSION. Freedom of thought and expression for the sake of virtue and truth; but not for spreading evil and wickedness.

FREEDOM OF ASSOCIATION. Permits freedom of association and formation of parties and organizations, subject to certain general rules.

Robert Dahl who has studied democracy for many years compiled a list of requirements for a democracy among a large number of people. These can be summarized as follows:
But what about the underlying values of democracy and Islam. Is there any similarity between the two or are they completely foreign to each other? Perhaps the best way to compare would be to provide a side by side list of values:

We can see that there are a great number of commonalities between the different systems and a few distinct differences.

One of the most fundamental differences between the West and Islam is between a monotheist and polytheist supreme being. Islam recognizes only a one person supreme being-Allah. In this sense, it shares this belief with members of the Jewish faith whose sole God is Yahweh. Only Christians believe in a three person supreme being-God the father, God the son and the Holy Spirit. This triune God then is a point if separation;
However, the Jewish and Christian faiths now live in peace with this difference and there is no reason to believe that the differing beliefs would prevent any meaningful relationship between Christians and Muslims.

One further point is the separation of church and state prevalent in most Western countries and the Muslim belief that the Koran should guide any secular Muslim state in its policies. But this distinction is more transparent than real. In the West, religion plays some role in most governments. A political leader does not leave his religious beliefs outside his office door. One current example is the President of the United States. A Muslim society in a secular state following the precepts of the Koran could still be a democratic society with free elections and political parties.

Fundamentally, there are more common threads between Islam and democracy than thorns. Abdul Karim Soroush argues there is no contradiction between Islam and the freedoms inherent in democracy. Islam and democracy are not only compatible, their association is inevitable” as quoted by Wright (p. 224). Sheikh Rachid al-Ghannouchi advocates an Islamic system that features majority rule, free elections, a free press, protection of minorities, equality of all secular and religious parties, and full women’s rights in everything from polling booths, dress codes, and divorce
courts to the top job at the presidential palace as quoted by Wright (p. 229). Both of these clerics are considered as reformers.

While democracy is on the march in other areas of the world, its progress in the Muslim world is lethargic. But given the popular support of democracy in the Muslim world, autocratic and corrupt leaders are on the defensive, as never before.

Author Richard W. Bulliet writes: “Looked at as a whole, and in historical perspective, the Islamo-Christian world has much more binding it together than forcing it apart. The past and future of the West cannot be fully comprehended without appreciation of the twinned relationship it has had with Islam over fourteen centuries. The same is true of the Islamic world.” (43). The author further advocates “incorporating Islamic political movements and parties into liberalized political systems structured on open elections is the best tactic for undermining the appeal of transnational jihad.” (p. 156).

To sum up, there are a few observations that can be made:

A. Democracy cannot be exported of the shelf. It must grow within a country. Certain conditions must be present for its growth. These include: moderation, conciliation, cordial communication, etc.
B. Radical fundamentalists do not represent the overwhelming majority of Muslims.

C. Constitutional liberalism is a step towards a more complete democracy.

D. A democracy in a Muslim country may be very different than in a Western country. Islam may play a major, even predominant role in the government. There may not be a clear separation of church and state. But this is OK, so long as democratic freedoms are respected and protected.

E. The role of women must be protected and natured. The use of religion to subjugate and suppress women must be recognized for what it is - male dominance, not Islamic teaching.

F. A clash between the West and Islam is not inevitable unless radicals silence the majority and dominate the dialog.

G. Democracy is not an alien concept for Muslim societies. Presently, it is an alien concept for rulers of Muslim countries. This dichotomy between the Muslim masses and rulers cannot endure much longer. The world is smaller because of modern communications, transportation and overall technology. More and more Muslims are aware of the dichotomy and this growing awareness will eventually result in fundamental change.

“The Project IRPOR
(International research program of oral rehabilitation)"

Massimo Corigliano; Mauro Mazzocco, IAIO
Giovanna Anselmi, ENEA/UDA/Advisor

ABSTRACT

The IAIO (International Academy of Implantoprothesis and Osteoconnection), represented by the President Dr. Massimo Corigliano and by the Vice-President Dr. Mauro Mazzocco, is going to develop the integrated research project “The Project IRPOR (International research program of oral rehabilitation)” involving the Havana University (Cuba), the Tirana University (Albania) and the Pontificia Universidad Católica Madre y Maestra (República Dominicana) to carry out experiments on the physical and biological reactions to osteoconnected implantoprothesis.

The approach of the project consists in the use of technologies already existing to study innovative solutions aimed to improve their effectiveness and to cost reduction.

The Project estimated time is three years. Some multinational firms, residents in Germany and in Israel, are engaged to propose, test and improve ad hoc new biomaterials, surgical instruments and technological systems like laser technologies, to improve the bone surface repairation around the implantoprothesis surface.

New Implantoprothesis Surfaces will be tested to improve the biocompatibility: the innovation will consist in a different design implant and new implant components. The new materials (such alloys and ceramics) and new surgery tools as well as new components (abutments) will be studied to reduce the gap existing between the physiological movement of implants (5 microns) and of the natural teeth (30 microns: in fact the first (implant) is in ankylosis and the second (tooth) has periodontal legament.

The last generation of fixture via bone connection technics, is emerging as an important market area and the studies on biocompatible materials as well as on surgery tools have to be extended and further developed.

The intended target markets include essentially new biocompatible materials and physical equipment using standards functions and data, adding value to the current products, defined in this project, to bring on to the market.

All the above mentioned activities are carried out aiming to introduce, at a large scale, the implants in the national public and private health care systems of the participants countries.

The relevant information on the definition of the sample to examine during the experiments in Cuba, Albania and Dominican Republic are included, as well as some economic implications.

In the paper are examined too the main benefits expected: in the scientific field: better knowledge of cells reproduction in the integration between biocompatible materials and human bone, new system in which new materials and appliances are strictly integrated with the protocol of care, taking in great relevance the cell reactions of the bone and of the living tissue around the dental implants, better integration between the knowledge of dental and of orthopedic scientific research areas.

In the economic general and dental health expenditure saving, speed up the implantoprothesis production processes and costs reduction, enlarged markets and employment growth.

Permanent Training Courses will established for medical (odontological) surgeons, for oral hygienists, for odontotechnicians and health managers, in order to improve the implantoprothesis service in the different countries, to transfer the knowledge and to promote, on the territory, the scientific and clinic abilities of the operators.

1. Introduction

The IAIO (International Academy of Implantoprothesis and Osteoconnection), represented by the President Dr. Massimo Corigliano and by the Vice-President Dr. Mauro Mazzocco, was founded in Roma, Italy, in June 2000, by a group of scientists, researchers, dental surgeons, hygienists and

---

1 Massimo Corigliano; Mauro Mazzocco, IAIO (International Academy of Implantoprothesis and Osteoconnection) are di authors of the part regarding the medical experimentation

2 Giovanna Anselmi, ENEA/UDA/Advisor (Italian Agency for New Technology, Energy and Environment) is the author of the part on socio-economic impact evaluation
odontotechnicians, with the aim to improve the knowledge on the osteoconnection processes in implantology and spread out the results of researchs and scientific experiments in the fields carried out by the team of the Academy.

For this purpose, research institutes, SMEs, multinational firms and several University of Medicine and Dental Surgery Departments in the world, were associated to the team.

The web sites http://www.iaio.org/ and http://www.dentista.it and support the Academy and the initiatives taken to enhance methodologies, technologies and biocompatibility of the materials used in implantoprothesis and osteoconnection operations.

“The Project IRPOR (International research program of oral rehabilitation)” starting now by initiative of the IAIO President Dr. Massimo Corigliano and of the Vice - President Dr. Mauro Mazzocco, is the first large scale international action of the Academy, involving developing and developed countries of different world areas, regarding multidisciplinary objectives and, among them, not least, the integration between the knowledge of dental and orthopedic surgery, as to physical systems, materials and implant systems able to induce a rapid bone repair and healing of regenerated bone.

2. The Project IRPOR

“The Project IRPOR has the main objective to improve the implant systems both in dentistry and in orthopaedics and consequently, to improve significantly the populations quality of life of developing and advanced countries. It is subdivided in two strictly connected projects, both submitted for funding within the FP6, with, respectively the names of IRPOR I° and IRPOR II. IRPOR I° has the objective to deeply involve local authorities and professionals in a feasibility study centered on the reality of Habana (the EU related funding are specifically reserved to Cuba). The results of the IRPOR I° Project are expected early, before the start of IRPOR II°, planned for the second half of 2006, and will be used to better define the institutional frame of the wider IRPOR II° Project, in the following generally identified as The Project IRPOR.

Partners of IAIO in The Project IRPOR are SMEs in Italy and in Germany a medium firm producing biomaterials, the multinational Savyon in Israel, the dental surgery departments of the University of Sassari (Italy), the University of Havana in Cuba, of Tirana in Albania, of Santo Domingo in the Dominican Republic. The management of the IRPOR Project will be carried out by the ENEA (Italian Agency for Energy, New Technology and Environment), public research institute having competences in cell medicine, biomaterials and biocompatibility.

Being the Project multipurpose, it is useful the outline is subdivided in sections related to the work area: α) fields experiments, methodologies and adopted technologies: actions in Habana, in Santo Domingo; in Tirana; β) social and economic impact, γ) international cooperation; δ) further development

α) fields experiments, methodologies and adopted technologies

3 IAIO - Italy V. J.F.Kennedy, 98 00015 Monterotondo

The object will be reached with further studies of new implants and techniques aimed to get a better healing of periimplant tissues to carry out experiments in the osteoconnection (a new philosophy of bone integration around the implant).

As for periimplant tissues, particular attention will be done to the fillings, called osteoconducters in bone neoformation around the framework, as well as to the growth factors (endogenic obtained by harvesting of bone tissue from the implant hole and exogenous like morphogenetic proteins in lab). Resorbable membranes for GBR (guided bone regeneration) will be further studied.

Particular attention will be done to the amount and quality of bone milling (with a destruction as little as possible of osteoblastic cells useful for bone repair), to the design and the configuration of the fixtures (Conical fixture in bone section, Fig. 1), to the materials with which the screws and endoosseous prosthetic systems interface with the bone.

The systems of various components like abutments and screws (Fig. 2; Fig. 3) in dentistry and stabilization systems in orthopaedics will be considered as well. Physical energy systems will be adopted for experiments to improve bone regeneration both in quantity and in quality reducing too the time of bone repair. In this field IAIO is already working and the acquired knowledge will be used and enhanced in the Project.

The application of magneto-electric radiations on hard and soft tissues healing, of the laser radiations on hard (Erbium-YAG) and soft tissues (CO2), of laser techniques for the bio stimulation (soft diods), of piezoelectric energy for osteotomy without any bone damage (Fig.4), as implant system (Fig.5) based on microinvasivity will be employed.

The Project will have at least three Phases, located in the developing Partner Countries Cuba, Dominican Republic and Abania, to better define the needs in Caribbean areas and in Europe due to the geographical position, the economic and social development and the standards of living.

**Actions in Habana**

In Cuba, with the help of public and private research institutions (University Department, local Authorities, dental surgeons private studios…) will be carried out the following actions:
- Definition of oral health indicators for Caribbean Areas Countries & for EU Countries, “Health Divide” and disparities
- Definition of a local population sample by age (25-35)
- Submission of the sample to Oral Rehabilitation Care & Implants
- Comparison with the european standard sample

**Actions in Santo Domingo**

- Definition of a local population sample by age (35-55) or more and submission to the care
- Definition of a Protocol of Care for Caribbean areas and EU Countries resuming the results of experiments in Cuba and in Santo Domingo
- Presentation of the scientific results coming from the use of the adopted methodologies, new materials and technologies
- Definition of the training needs for the health operators

**Action in Tirana**

- Definition of the Program for post-graduated Masters for Dental Surgeons, Hygienists, Odontotechnicians and Oral Health Managers for the Caribbean Area and for the EU: common areas and differences
- Analysis of the experiments carried out in Habana and in Santo Domingo
- Definition, with the involved SMEs & Multinational Enterprises, of the New Products needs for oral rehabilitation, coming from the Scientific Results of the experiments in Havana and in Santo Domingo, to launch on to the market
β) socials and economic impact

More difficult is to find generic outline for the socio-economic impact of all the countries, depending it by a relevant number of factors: first by human factors and institutional rules, then by starting health conditions and by the cultural background of the country. Often the main barrier to reach a higher level of living standards is the defiance to face with the “new” coming from abroad. So to spread out to all the populations involved, the benefits produced by an international initiative, it is necessary to build up campaigns explaining to the population, but to the local authorities too, the specific purposes.

In any case the social expected benefits are, certainly:
- A more healthy and informed population not only in Caribbean areas, but in the EU too
- The diffusion of an enhanced Protocol Care common to different geographic areas
- A lowered “Health Divide”
- New Care Pattern to replicate
- New rules for both developed and developing countries for a better oral rehabilitation and health

The economic impact can be measured at two level:

1. analysing the starting conditions of the national public and private dental health care systems in the emerging countries, with the aim to introduce, at a large scale, the osteoconnected implants and to modify the rules on dental care. It will considered the relevant information on the definition of the sample to examine during the experiments, as well as same economic implications (such public expense for health, public expense for dental care pro-capita and requested expenditure for treatments, number, age, sex of people being under treatment, the number of persons concerned by the experiments scheduled for the Project and the related costs etc...) and the actions required to involve the local authorities and professional organizations in the process.

   Same scenarios will studied to optimize the resources allocation in the health public expenses

2. through the attractivity level of FDI induced in the involved developing countries by the actions carried out by the Projet.

Dynamic emerging countries characterized by a strong interest in high-tech products, scientific research, low costs of production and low cost of manpower, are very attractive for foreign investors.

The benefits for the FDI host countries are certainly the increase of the employment level, the speed up of economic development, the improvement of the efficiency and the productivity of the local firms, the introduction of financial services and a better local bank management.

Infrastructures transformation in transports and communications are generally induced in the host country by the enlarged trade relations.

For the firms of the developed countries, investing in developing areas, the economic benefits are coming mainly from the relevant production costs reduction, the manpower low cost, higher profits, incentives measures decided by the local governments and finally from the new share of market acquired.

The participation of SMEs (of the Caribbean and from the European areas) in the project has an important and dominant role, connected to the improvement of the products for implants, biomaterials and appliances in accordance to clinic purposes, and coordinated, for the scientific researchs realization, by the IAIO, who, with their enlarged scientific collaborations can realize prototypes for industrial production, and by means of the previous commercial relations, has the charge to promote too all the actions for the exploitation of the new products.

γ) international cooperation
Having IAIO intensive links of international cooperation (Cuba, Albania, S.Domingo, Israel and Germany) to study and experiment the mentioned new methods and systems in dental implantology, the Academy will actively collaborate to disseminate in all the countries of the involved areas, a better scientific education and a deeper cultural background about oral rehabilitation, implants and implantoprothesis establishing permanent training courses for the several categories of medical operators and health managers, profiting by the teaching of international scientists and operators.

δ) further development
The Project is aiming to build up a world permanent international Network of Excellence among the most important research institute, Universities, professionals, scientific operators, SMEs and multinationals firms, operating in the sector, for further development of scientific results of the experiments carried out in the Project.

On two ways the research have to go ahead:
A) On the definition of new systems to insert implantoprothesis into the bone using advanced physical equipments (Erbium-YAG Laser) and piezoelectric device
B) On the employ of materials (nano-crystal of hydroxyapatite or highly purified tricalcic phosphatase) instead of the human bone, Morphogenic Micro-Prothesys stimulating the bone regeneration before and during the insertion of the fixtures in presence of bone lack.

The third way could offer the opportunity to coagulate the various plans of researchs and coordinate the large scientific-technological evolution of the last years carried out without any integration.
This kind of researchs, in fact, require a strict collaboration with institutional partners and SMEs, operating in the fields of orthopedic, having the purpose to integrate their experiences with the odonthoiatric fields of research to develop methodologies and technologies reducing both healing time and costs of any kinds for patients too.

3. Conclusion
“The Project IRPOR (International research program of oral rehabilitation)” as announced in the point 2 is starting now with the Feasibility Study, named “The Project IRPOR 1.”
IRPOR 1 was conceived with the help of the EU Program, Cooperación Descentralizada - Acciones en Cuba Línea presupuestaria 21-02-13 (ex-B7-6002) - EuropeAid/121019/M/G/CU, and the Non Governative Organization IAIO has submitted to the Department in Cuba of the European Commission a proposal to define the frame and the features of intervention at the Habana, for the oral rehabilitation.
The Feasibility Study will explore the condition of the national public and private dental health care systems in Cuba to compare them with the standards of the EU countries to introduce, at a large scale, the osteoconnected implants in the country dental care system and to modify the related rules.
The intervention pattern defined by the Feasibility Study in Cuba, will adopt in the subsequent Project extended to Dominican Republic and Albania, and, where necessary, modified on the base of the conditions of other countries partners.
The “Project IRPOR”, as submitted to the EU FP6 in the area of the program 3.4.4.6 (biomaterials for implants), moving a high amount of funding from FP6, from firms and international research boards, is one way to consolidate the experiences and to move up economic operations. It is the immediate reponse to the need to perpetuate the initiatives in oral rehabilitation.
In particular, as scientific conclusion, it is possible to assert that through “The Project IRPOR” all the partners will cooperate to research and experiment new technologies for implantology addressed to speed up the healing time and to improve the quality of the healing of the tissue around the implant.
The patients will benefit by the availability of systems, enhanced equipments and products to ameliorate the post-surgical course and to increase, during the time, the stability and the life of the fixtures. 
SMEs and Multinationals Firms could use the scientific results of “The Project IRPOR” to enhance their products for implantology and to bring on the global market the more competitive as far as the relation efficacy/cost reduction is concerned. To this purpose high quality solutions will be studied at low production costs. 
“The Project IRPOR” will put in relation science areas having high scientific affinity like as dental implantology and orthopedic surgery, that will surely bring synergies in the research for new shared technologies overcoming the interdisciplinary barriers.

CURRICULA

Dr. Massimo Corigliano graduated in Odontoiatry at the University La Sapienza of Roma, is PhD in Odontostomatology, scientific coordinator of the oral rehabilitation in the odontoiatric sector of A.N.T.H.A.I. (National Association for tutory of Invalid and disabled people), Professor of Implantoprothesis at the University of Pittsburgh in Buenos Aires, Co-director of the Master in Odontostomatology at ASAS (Academy of the story of Health Art ), is Member of the Scientific Board of the PRI ( Primate Research Insitute di Buenos Aires). Actually is in charge at the
Prothesys Department of the Hospital S.Giovanni Calibita Fatebenefratelli of Rome. His professional interest is carry out researchs in the field of advanced surgical methodologies and technologies in implantoprothesys and bone cell growth and soft tissue stimulation around implant, and of the early load on bone primary healing implants. He is titular of patent of a new implant system, author of more than 90 scientific studies and publications, speaker in National and international Congress (in Italy, France, Great Britain, Scottland, Germany, Spain, United States, Argentina, Russia). He studied and realized too new implantoprothesys components.

**Dr. Mauro Mazzocco**, graduated in Medicin and Surgery at the University of Roma “La Sapienza” specialized in Odontostomatology, is Vice-Presidente of the IAIO (International Academy of Implantoprothesis and Osteoconnection). He is specialized in laser surgery and Professor of Laser Therapy in Odontostomatology in several post-graduate scholarships. He is teachear of Gnatology in the Master at the Accademia di Storia dell’Arte Sanitaria in Roma and in several private specialization training courses in Gnatology for odontologists around in Italy. He is author of several scientific articles published on national and international scientific revues. Since 1980 is involved in studies on clinic gnatology and operate as odontologist in the study located in P.zza di Spagna 66 a Roma.

**Dr. Giovanna Anselmi** graduated in Political and Social Sciences at the Catholic University of Milan in 1970. Until 1983 she conducted research into Economic Planning and Social Politics at ISPE (Italian Economic Planning Studies Agency). Since 1983 she has been Senior Technologist Researcher at UDA/Advisor Unit at ENEA (Italian Agency for Energy, Environment and New Technologies), where she has been responsible for several research activities and evaluation in national and international projects. Her professional interests concern the Impacts and Changes in Economic, Social and Cultural Scenarios of IC Technologies, Technology Assessment and Sustainable Growth Studies.

IDENTITY AND ANCESTRY:
STICKS & STONES & BUFFALO BONES

Foreword

Introduction

This chapter comprises three sections—foreword, narrative, and afterword. The second section, “Sticks and Stones and Buffalo Bones,” is a three-part, first-person, autoethnographic narrative. “Afterword: Subjective Interpretation and Theoretical Ground” is a contextualizing discussion that explains the organization and substance of the narrative and grounds it in the literatures of identity.

The personal narrative precedes the theoretical discussion to create a certain dramatic and cognitive effect. Engagement with my personal experience before stepping back for intellectual analysis is intended to create a distinct effect akin to “seeing the movie before reading the book” or “reading the book before the review.” This approach derives partly from the postmodern idea that colonized people need to be heard in our own language, “to say our own word” (Lee, 2000, p. 60), ahead of academic or “professional” dissection. By “suspending disbelief”—holding rational predispositions in abeyance—the reader encounters the person first. The backdrop of the personal voice predisposes the analysis instead of the usual other way around.

The narrative is about my progress toward ethnic identity achievement as a First
Nations Mixedblood. That process was slow, halting, and fraught with the misgivings and anxieties typical of the forms of identity diffusion—ethnic ambiguity, passing, negative identity, and submersion, which I have discussed at length elsewhere (Cotrell, 1993).

**Historical Context**

The phenomenon of ethnic identity development exists in the United States because racism is intrinsic to its history. Without racism, the concept of race would not exist and conflicts based on skin color and culture would be nonexistent. In the case of First Nations, colonial conquest and genocide began with first contact and has persisted these five hundred years.

Over the centuries, the U.S. government devised a series of “federal-Indian” policies, all concerted attempts to uproot, remove, disband, deculturate, and dispossess First Nations peoples so as to change them culturally into White people or exterminate them from the face of the earth. Despite and because of official policies, the “blood” of Whites and Natives became intermingled from the outset, through rape, voluntary association, and love. Consequently, a third “race” of Mixedbloods evolved, who were variously accepted or rejected by one group or the other. As often as not, they were caste out by both because of the mutual Native-White hostilities that stemmed from White conquest and genocide.

The belief that Mixedbloods represented the worst aspects of both worlds became prevalent in nineteenth-century White America. They threatened White racial purity and epitomized Native savagism combined with the depraved “dark side” of White “civilization” (Pearce, 1953; Scheick, 1979). The historian Francis Parkman (1849) called them “half
Indian, half White man, and half devil” (Parkman, as cited in Scheick, 1979, p. 18). Among
Whites, they were commonly and pejoratively termed halfbreed and breed.

In the late nineteenth century, the U.S. government instituted the allotment and
assimilation policy (1887-1934) in conjunction with the Dawes Allotment Act of 1887, whereby
Native people were classified by “blood quantum” or degree of Native descent in order to
reduce U.S. treaty obligations to tribes by dissolving tribal memberships, thus dissolving tribes
and reservations and dispossessing them of their lands (Officer, 1971). The U.S. stands in
historical company with Nazi Germany and apartheid South Africa as the only western nations
to use the racist blood quantum system to classify Native peoples as a tool of colonization and
genocide.

Individual tribal members were allotted reservation lands and acceptance of land
constituted forfeiture of tribal membership and benefit of U.S. government goods and services
theretofore rendered as historical treaty obligations. From 1917 to 1920, a forced fee patent
system was established, whereby “competent” individuals were required to accept a land
allotment. “Competence” was based peculiarly on the notion that the more “Indian” one was,
the less competent she was. The “blood quantum” of each tribal member was determined by a
confused and inconsistent measure based on anecdotal and presumptive information about
one’s ancestry. Persons of less than one-half Native blood quantum were deemed to be more
competent than those with more than one-half; the “competents” were forced to accept fee
patents to land allotments and terminate tribal membership (Kinney, 1937).

The “more-than-one-halfs” were carefully investigated; if determined competent, they
too were forced to accept allotments not exceeding forty acres. Students who graduated from Government schools [i.e., Christian boarding schools] and were deemed competent were awarded land allotments at age 21 (Kinney, 1937).

The federal government assumed ownership of remaining unallotted reservation lands and opened them to White settlement. Untutored in real estate law and, by and large, lacking the skills, economic resources, and motivation to become farmers, the Native people were defenseless against the connivance and exploitation of realtors and land-hungry settlers. Between 1887 and 1934, White settlers took over 91 million acres of Native lands, which declined from 138 million to 47 million acres (Debo, 1970).

Whole tribes, clans, and families were broken up and devastated because of the blood quantum system. Heirship—land allotment eligibility—was commonly awarded to one sibling but not the other because of different parentage, often caused by the high Native mortality rate brought on by the intense U.S. colonial siege from the Civil War until the 1950s. White officials, ignorant of First Nations family systems, frequently misconstrued family relationships, which made a sham of heirship determinations and precipitated disputes and chaos among families and tribes fearful for their survival (Kinney, 1937; Debo, 1970; Vizenor, 1981, 1985 (personal communication, Spring, 1985).

Native people by the thousands, accustomed to communal life, forfeited tribal membership against their will. This episode was another in the long series of sociological disasters perpetrated against the First Nations by the U.S. government and White populace.

The blood quantum system persisted throughout the tribal reorganization period (1934-
1953), the next federal-Indian policy scheme to further reduce tribal numbers and U.S. treaty obligations, requiring each tribe to establish a blood quantum membership minimum. One-fourth became the most common stricture on whether one could be recognized as a “real Indian” by the government and the tribe. The fact that one was a Native person, born and raised, (how could one be other?) was disregarded. From the Native perspective, one was Native because of one’s family and cultural connections and way of life, unmeasurable by the harebrained idea of blood quantum. To be “Indian” in the racist White world was highly stigmatic, regardless of blood quantum; Mixedbloods were at high risk for rejection in both milieux. U.S. officials had no interest in the facts and proceeded with their ruinous scheme. Thus, thousands of Native people found themselves in “no-mans land,” unacceptable to either world.

Thus, in the early twentieth century, the stage was set for mind-boggling adaptation decisions and identity conflicts for succeeding First Nations generations. This was the situation into which I was born in 1945.

**Personal Context**

My greatest struggle was against complete submersion, which, paradoxically, might indicate successful identity *achievement* or structural *assimilation* into the dominant Euroamerican world, as Gordon (1978) notes. Such “success” would require that my Native heritage had no significance to me or others in my environment. It would have literally disappeared. No emotional conflict would exist, no identity decision would be necessary, and I would not be the object of racial prejudice or discrimination (Gordon, 1978). However, my childhood circumstances lacked those requirements, saving the latter. I experienced marked
emotional conflict, observed my father’s similar conflict, and both parents enforced a taboo on the subject within and outside our home. True to their calculation, I did not feel the sting of racism, as long as I kept quiet about my Native connections.

Although others have discussed partial or complete submersion (Park, 1928; Stonequist, 1937; Erikson, 1959, 1968; DeVos & Romanucci-Ross, 1975; Gordon, 1978; Westermeyer, 1979; Logan, 1981; Vizenor, 1985), my own experience inspired me to enlarge upon their explorations. I resonated with Ortiz’ view that to be Mestizo or Mixedblood is not an ethnic choice. Rather, born a Mixedblood, one is likely to be “de-Indianized” at birth by historical events and achieves First Nations identity through recovery of ethnicity—a “re-Indianization” or “recouperation of the Mestizo” (Ortiz, 1984, p. 86).

It finally dawned on me that I had been colonized, that no one in my world recognized this, and that if I ceased my identity quest and resigned myself to silence, colonization would be complete. My keen awareness of my Native heritage pushed me forward from a morass of puzzlement and doubt toward affirmation and connection. I could not be at peace with the loss or negation of half my ancestry, cultural deprivation, identity foreclosure (Marcia, 1980). In late adolescence, I felt compelled to choose to be other, in defiance of parental constraint and censure.

Identity Research Import and What Remains to Be Done

Exploration of the psychology of First Nations peoples is a relatively new area of academic interest, including the social work/social welfare disciplines. Until the late twentieth
century, most resources had been applied to economic subsistence and community development (AIPRC, 1977) and most social science researchers on First Nations peoples were non-Native anthropologists (Berkhofer, 1978).

Since circa 1900, scholars have recognized that biracial/bicultural or multiracial/multicultural birth in the United States could have troubling consequences for individual identity development, but the few studies of this phenomenon treated mixed African American-White children, in the main. Social work research on First Nations had barely begun by 1980 and focussed on practice issues. Identity has been rarely studied, least of all the identity issues of First Nations-Euroamerican Mixedbloods. This is attributable to the scarcity of First Nations social work/social welfare scholars before the 1980s (Cotrell, 1993).

Furthermore, before First Nations perspectives began to surface in the 1980s, popular and institutional belief systems continued to reflect adherence to the vanishing race thesis that the indigenous peoples of North America were dead or dying and would shortly disappear altogether (Berkhofer, 1978). Thus, it is no wonder that little interest in Native identity, especially the First Nations-Euroamerican brand, existed among non-Natives scholars. However, the few psychology and social work students (Native and non-Native) of Native identity of this period did note consistent themes of racial and ethnic ambivalence and negativity. Such identity conflicts were found to be significant underlying factors of suicidality, substance abuse, family violence, acculturative stress, social alienation, and related dysfunctional phenomena (Wostermeyer, 1979; Lefley, 1982, 1982; May, 1981; French & Hornbuckle, 1980; Jenkins, 1982; Jones & Korchin, 1982; Kitano, 1982; Gibbs, 1987; French, 1987;
In 1982, Beiser and Attneave noted that Native psychology had been little studied to date and that a complete model of Native mental health had yet to be developed. When I began my doctoral work on the subject in 1984, I found no significant published research on First Nations-Euroamerican Mixedblood identity issues. A 1986 Congressional study noted increasing rates of outmarriage and inter-tribal marriage among First Nations and projected that only 2% would be Full Bloods by 2080, and that over 50%, or approximately 5 million people, would be one-fourth or more Native “blood quantum” (sic) (Indian Health Care, 1986). First Nations heritage is thus enduring. On the other hand, the continuous increase of Mixedbloods suggests a potentially increasing number of individuals at risk for conflicted identity development.

According to the U.S. Census of 2000, the wives in 46.6% of First Nations households were White (U.S. Bureau of the Census, 2000).

In a climate of persistent racism and a general ignorance of First Nations experience, Native people tend to be invisible to non-Natives, even educators and health care professionals. Because of their special circumstances, Mixedbloods are even less recognized or understood. Much more research and education is needed on First Nations identity development, in general, as related to numerous issues: cultural persistence despite acculturation and assimilation; cultural disruption, trauma, and destruction due to colonization, especially relative to the parenting cycle destruction of the boarding school system and tribal dissolution; the connection of identity conflict to economic stress, decreased physical health, and sexuality and sexual identity conflict
(Cotrell, 1993). Hence, consistent with a postcolonial liberatory perspective, the present chapter—a first-person narrative and postcolonial analysis of a mixed heritage identity developmental process—contributes a documentary example of this little studied phenomenon.

---Red Cotrell

_History is a nightmare from which I am trying to awake._
---James Joyce

Part I

For some of us, as kids, being “part-Indian” was like being in a satire no one bothered to tell us about. All I knew was that I wasn't supposed to talk about it. Having a halfbreed father was unseemly, even in Indian Country. By the time I got so I couldn't stand the silence any longer, I'd been simmering in the melting pot for seventeen years. Maybe it was too late, maybe not.

I'm part-White, really—Halfbreed, Metis, Mixedblood, Chippewa-Sioux, Chippewa-Cree, Renegade Cree, _and_ Cherokee—take your pick. I grew up on the Flathead Indian Reservation, home of the Salish-Kootenai Tribes, in Western Montana. My mother was White and my father was Indian. They taught me to act White and be White and back then no one seemed to know the difference, except in mysterious little ways.
This theme is ancient, like that old wagon tongue out there in the weeds. Long disconnected from the body, it is still. And yet the daily sight of it is a barb on the cloak of forgetting.

I could never forget. I didn't want to. In fact, I tried to remember—that is, I tried to find someone who did, tried and kept on trying to get the silent ones to talk.

******

The first time I remember thinking about Indians was in the spring of ’49 or ’50. I was four or five. We were driving up Mission Canyon to the First Falls for a picnic. It was a sunny day, but as the canyon narrowed, the shadowy forest drew close. I kept my eye on the treetops and worried that the Indians were hiding up there, waiting to attack. After all, Dad took us to town every Saturday night to see the latest movie about cowboys and Indians. By that time, I must have seen scores of them. John Wayne, Buffalo Bill, and Cochise were already in my repertoire.

Another time, at age five or six, I was riding with Dad and his cousin, Gene, in our old Studebaker pickup. We were going up St. Mary's Canyon to get wood at Wheeler's Mill. Gene was part-White, too, but in that era he was a halfbreed. He just showed up one day and had been staying with us for a couple of months. When I got older, I found out he'd left Oregon in a hurry and was hiding out at our place because the law was after him for beating his wife.

Dad and Gene would sit around and talk for hours, which made Mom mad. She couldn't stand to see anyone doing nothing or having too much fun when it was daylight and people were supposed to be working. She always made you feel like you should be doing something, cleaning the cupboards, washing the walls, moving the ash pile. She never had to say a word; you just
knew. But she had her beautiful, gentle side, too. I loved her then and I understood her better when I got older. I wish I could remember what Dad and Gene talked about.

Anyway, we were on our way to Wheeler’s Mill. I remember looking out at the shale canyon wall on Dad’s side—he was driving—and the river on the other side, and the huge, thick pine trees as far ahead as you could see. Part of me felt like running out into that wildness, but the other part was glad to be safe in the truck. I asked Dad, "Where are the Indians?" I couldn't understand why they looked at each other and laughed.

I felt ridiculed and excruciatingly bewildered. At that point, I was unaware that I was Indian, though it wasn’t long before I learned that I was. This was but one in a long series of childhood incidents wherein my parents met my questions about Indians and our Native heritage with evasion, embarrassed silence, or warning against pursuing the subject or bringing it up in the future. At such times, I felt misunderstood, frustrated, very small, and alone. Why, I asked silently, can’t I know what tribe I’m from, why can’t I know my Native relatives, why is it all right to be White but shameful to be Indian?

*******

One time my sisters and I were playing by the back porch and the folks were sitting on the steps. Dad grinned and said proudly, "Look at those little Indians," and Mom made a face and said, "Red! Don't say things like that!" I couldn't figure it out, but I knew better than to ask.

*******

For most of the fifties we didn't have a TV, but we had plenty of things to do, living out in
the country, with 140 acres to farm and anywhere from forty to a hundred cows to milk. I always remember Dad saying proudly that we ran a Grade-A dairy. One of his favorite things to do on a Saturday or Sunday, after we finished the morning chores, was to take us for long drives around the countryside, sometimes as far as two hundred miles. He took us to places where he used to live and places he'd hunted or ridden horseback. He always took us to somewhere we hadn't been before. My sister and I pretended we were explorers and always looked forward to new territory.

We especially liked to explore the junkpiles. It seemed like Dad knew every junkpile in western Montana, and on each trip we'd stop at a new one. He taught us to look for all kinds of gems that people threw away, like old books and magazines, pictures, Sir Walter Raleigh Tobacco cans (handy for fishing worms), ball bearings to use for marbles; shoes and clothes and horse harness pieces. A junkpile was a treasure-trove to Dad, and my sisters and I quickly adopted his enthusiasm.

Mom always stayed in the car. We'd come back excited, arms full, and Mom would protest and complain, "We don't need all this junk. Our place looks like a junkyard already!" But in Dad’s mind, a rusty axle was the promise of a new wagon and a pile of boards was a bench or a stool or a set of shelves for the shop. That's the way it was. It seemed that they rarely agreed about anything.

Dad told us that combing the junkpiles was a regular thing he and his folks did when he was a kid, because they didn't have much. He told us often that he and his brother, Tommie, used to play with broom straws, the closest thing to a toy that they had.

He took us to places where he and his folks had squatted—that’s what he called it—during
the Depression, in deserted log cabins with dirt floors. I remember one place, in particular, east of Ronan. We didn’t stop to explore it, although I wanted to. I couldn’t ask because Mom had insisted that we keep moving. But I can still see that place—a very old, desolate log house surrounded by tall grass that reached past the paneless dark windows. It looked big enough for only one or two rooms on the ground floor, plus an attic or loft, judging by the small window beneath the point of the roof.

I get the same hollow feeling inside every time I think about that place, the same feeling I got the first time I saw it, at the age of nine or ten. I felt sad for the little boy who was now my father, and puzzled over why he had to live in places like that, with no running water or things to play with.

They had lived all over the state and Dad knew the country like the back of his hand. He’d be driving along and pointing off in the distance at a hawk or a mountain or an old farmhouse, and Mom would be saying, "Red! Watch the road!" Or he’d say something like, "That’s where Chief Joseph cut up over the Divide and crisscrossed it like a jackrabbit and the whole goddamned U.S. Cavalry couldn’t catch up with him!"

Dad was a World War II veteran and read everything he could find on the history of war. He served in the U.S. naval campaign in the South Pacific. I grew up on his sea stories—war stories on the sea. He told cowboy stories, too, since his dad—they called him Pop—was one of the original cowboys, and one of the last. Actually he was an Indian who was also a cowboy, or a cowboy who was an Indian, take your pick. Anyway, Dad was fascinated with military strategy and especially interested in George Armstrong Custer. He read a lot of books about Custer when I
was young and he used to brag about Custer’s abilities as a general.

In my grade school years, I read everything I could find on the Old West, especially about the so-called Indian Wars. By that time, I was well aware of the fact of my Native heritage and I was eager to find out details about this subject that no one would speak of. The more I read, the more perplexed I became. I couldn't figure out why Dad admired Custer so much, while at the same time he seemed just as proud of Chief Joseph. I wanted to ask him, but I couldn't find a way to do it. I was afraid he'd get mad at me just for bringing it up.

*******

Dad liked to sing and tell stories. He'd come in from the barn and sing us to sleep with cowboy songs that he learned from his dad. My favorites were *Little Joe the Wrangler* and *The Streets of Laredo*. Or he would tell us stories about his dad's adventures or his own stories about World War II. He could go on for days about that and sometimes did. Maybe that's where I got the knack for listening. Of course, we weren't allowed to interrupt grownups when they talked.

The World War II story that I remember best is the one about the Battle of Santa Cruz, in late October, 1942. This was early in the war and the sea battles with the Japanese were constant and ferocious. Dad was in charge of the fire crew on the Smith, a naval destroyer. In the middle of the battle a crippled Japanese plane hit the deck right next to the powder magazine, full of ammunition for the one-and-a-half-inch antiaircraft guns that could fire two-pound projectiles two miles high. Orders came from the Bridge for all hands to abandon ship, so the crew began to run and men started jumping over the side. Dad was running with them when it struck him that he’d never make it home to his wife and daughter if he jumped. He was a Fireman First Class and
grabbed the nearest five guys and they turned around and headed for the magazine. Bodies were all over the deck and hanging off the side, and flames were everywhere. They knew they would all be dead ducks if the magazine went up, so they formed a line and Dad and another guy went in and picked up the smoking ammunition cases, and handed them out, one by one, to be thrown overboard. They emptied it just in time and then moved on to hose out the deck fires. They were all credited with saving the ship and won the Navy Cross for heroism.

When I was in the fifth grade, Dad taught the seventh-graders in the Methodist Sunday School. His class was very popular and each Sunday more kids showed up, and some came in from other classes. I could see them from my classroom and they seemed to be having more fun than I was. In our class, we had to read this boring book called *In Wisdom and in Stature*, but Dad's class seemed to be either laughing a lot or dead quiet. I couldn't tell what Dad was talking about, but he kept their attention.

One morning Mrs. Sulier, the Sunday School Superintendent, checked up to see why so many kids were packed in Dad's room and spilling out into the hall. When she found out he was telling World War II stories in weekly installments, she gave him hell, so he quit and never went back. I heard him tell Mom about it and I felt bad for him because I thought Mrs. Sulier hurt his feelings. I didn't like her very much after that.

*******

Around 1955, when I was about nine, I started reading a whole series of frontier stories. My heroes were Jim Bridger, Tom Fitzpatrick, Sacagawea, Baptiste Charbonneau, Crazy Horse, and Black Hawk. But *Friday, the Arapaho Indian* was my favorite book and my hero of heroes.
I read that book over and over and grieved every time when Friday led his people to surrender to the Whites, after the long years of struggle during the 1870s and '80s. I wondered why it hurt so much. The pictures are still in my mind, the people riding into the fort, stricken, starved, defeated. I lived in the Northern Rockies when I was reading these books. I felt the frontier all around me, the landscape of siege. I knew these were our people, even though we weren't supposed to talk about it in 1955.

After reading stories like *Friday, The Arapaho Indian* and *Fur Trappers of the Old West*, I'd ask Dad about his mother and her people. I always got the same answer. He'd look at the floor, shake his head, and almost whisper, "I dunno. They were Chippewa or Cree or both. My mother used to say we were French-Canadian, some kind of halfbreeds. I dunno. It doesn't matter anyway. The White man won and the Indians have about all died off now. It's just water under the bridge. It's history." He'd shake his head and stare at the floor. He wouldn't look at me, and then he'd get quiet and seem to go deep into himself, and I'd wander off, confused. I felt like crying. Sometimes I did.

*******

Mom and Dad just didn't want to talk about it. They'd get angry when I brought it up and explain that my sisters and I were really White, since we were only about a sixty-fourth Cherokee on Pop's (Dad's dad’s) side and no one knew anything about Gramma's (his mother's) family, so that didn't count. It wasn't until years later that I found out that she was almost a fullblood. She'd done such a good job of hiding it. They warned me that it wasn't a subject for polite conversation and I should never mention it in public.
Both of my parents’ families had lived in the Flathead Valley since around 1910, and they didn’t seem to notice that everybody knew that Dad was a halfbreed or part-Indian, as they used to call it. That meant that my sisters and I were Indian, too. But Mom and Dad decided we were White and they had me convinced for a while. I guess I believed that if I didn't speak of being Indian, I wouldn't be, and in a way I was right.

Dad hadn't kept in touch with his relatives, except for Uncle Tommie and Aunt Alice, his brother and sister. I was in my late teens before I found out that he had hundreds of relatives who lived all around us in Montana and Canada. So, for the most part, the only relatives I knew growing up were Massachusetts Puritans and Norwegian Lutherans from Minnesota. I used to watch them patronize my dad. I didn't know the word then, but I knew the feeling.

******

Dad didn't talk much about his mother, but he had a lot of stories about his dad (Pop). Uncle Tommie was the same way. He could go on and on about Pop’s cowboy adventures. One time I asked him to tell me about Gramma, and he said, "Oh, she was just a squaw." I felt my stomach turn and I wanted to run away. Until then, I'd pretty much worshiped Uncle Tommie. A few years later I wrote a poem about that incident and when he read it, he wrote me a special letter to tell me he was sorry. He said he had no idea why he'd said something like that to me and he really felt bad about it. I understood and, to this day, he’s still my favorite uncle.

I remember a couple of stories Dad used to tell about Gramma. One was about the time, when he was about five, he picked her a bouquet of mustardweed and she grabbed it, threw it in the trash, and yelled at him for picking weeds. He told that story many times. At first he would sort
of laugh, but I can't forget how he'd get the same sad, faraway look on his face. I can see him looking down, shaking his head. I got the idea that she was often harsh and mistreated him. But I could tell that he really loved her and looked up to her. He would talk about how hard her life was, and he seemed to understand why she wasn't always as loving as she might have been, otherwise.

Another story he told a lot was something that happened when he was about four years old. His mother left home. She just walked off down the road and wouldn't look back or say goodbye. He ran after her, crying and begging her not to go, but she sent him back and kept on going. He thought she was gone for good.

She and Pop had had a fight about her relatives. She wanted to have them for a visit, but Pop wouldn't let them set foot on the place anymore. He told her they were no-good Indians who ate them out of house and home every time they showed up. After a few days, Pop went looking for Gramma and brought her back. He found her down by Paradise, staying with her half-sister, Ruby. Dad drove off and left us a couple times, but he always came right back.

*******

I thought it was strange how Dad would clam up when I’d ask him about his mother and her people. And then at other times, he’d recall something out of the blue and make it a long story. Every once in a awhile, he’d bring up the fact that his Uncle Ed St. Germaine, Gramma’s half-brother, spent five years in Montana State Prison at Deer Lodge for stealing a sheep. It was during the Depression and his family was going hungry. Dad was a teenager and Uncle Ed sent him and Uncle Tommie presents he made in prison—pretty beadwork and leather belts. Dad said those were some of the nicest presents he ever got.
He said one of his best memories was the time they piled into an old jalopy they had and drove way up the Sun River from Choteau, where they lived at the time. They went to visit his mother’s people—her mother, sisters, brothers, aunts, uncles, and cousins. They were living in a teepee village on the river. Dad was pretty small and just remembered a lot of Indian people, a lot of teepees, and that he got to eat all the beef jerky he wanted.

Another time they drove from Choteau a long way up into the Cascade Mountains west of Great Falls to visit his mother’s grandparents. Dad said they drove all day and finally came to a place way back in the trees, at about eight or nine thousand feet. There was a cabin, a corral, three or four mean-sounding dogs, a couple of horses, and a big woodpile. They sat there waiting in the car for a long time. Finally, this great big redheaded halfbreed—“just like me”—as Dad put it, came out and asked them in. It was the first and last time Dad ever saw his great grandfather. He heard years later that the man died up there in those mountains, chopping wood. He was ninety-eight years old.

Aunt Alice told me that this grandfather’s name was McPherson and that some of his forebears were Scottish fur traders who had married into Cree and Chippewa tribes in Western Canada. I guess that’s where Dad got his freckles and bright red hair. He used to say, with a twinkle in his eye, “I’m a throwback”; then he’d throw back his head and laugh like hell. He liked to say, “My mother used to call me ‘Tete Rouge de Jab,’ which was Cayuse French for Red-headed Devil (tete rouge diable).”

Dad didn’t know why they were living way up there, but I found out later that they were hiding from the law. They weren’t U.S. citizens; they were Canadian First Nations refugees from
the last Riel Rebellion of 1885. Hundreds of Cree, Chippewa, and Metis people, who fought in the rebellion against the Canadian government, fled into Montana and the Dakotas to escape arrest for treason. They became known as the Landless Indians of Montana and, among the Whites, by other less savory terms, such as “renegade British Crees,” “Canadian beggars,” “renegade British Crees,” and “lazy halfbreeds” (Ewers, 1974, p. 117). Without land, reservation status, or other resources, they wandered from place to place looking for food in the towns and living off the land by hunting and fishing. The Montana ranchers rounded them up and herded them like cattle back to Canada, every chance they got. During the Great Depression, the Federal Writers’ Project, in a history of Montana, described their lives there between 1870 and 1916, when they were awarded a reservation of their own:

From deer and elk skins they made moccasins, shirts, and beaded belts, to sell to white men, until stopped by game laws. Then they lived by gathering thousands of tons of buffalo bones scattered over the plains and stacking them in immense piles at the railroad stations. When the bones were gone they gathered the horns, and polished them for souvenirs. When the horns, the buffalo’s last gift to them, were gone, they faced starvation. They built flimsy huts, and made stoves of iron washtubs taken from city dumps to save their scanty fuel. These stoves overheated, and made the air in the huts so foul that sickness followed. Harried by police and ruffians, the Indian women searched garbage cans, gathered offal from slaughterhouses, and even used the flesh of the occasional horse or cow found dead on the plains for food. (The Federal Writers’ Project, 1939, p. 350)
It took me a long time to piece together the story of Dad’s mother’s—Gramma’s—family. She was very secretive about who they were, their tribal connections, and where they came from. She taught her kids to “avoid being Indians” whenever they could—to pass. By the time she got out of the Indian boarding schools run by Catholic nuns at Fort Shaw, St. Peter’s, and St. Ignatius, she hated Indians and herself for being one. She would get furious if anyone ever brought it up. I didn’t learn this until much later.

But as far back as I can remember through my growing up years, I was bothered and confused by the tattered recollections, the fragmented story of the family lost to me, and the taboo against speaking of it. I couldn’t figure out what was so bad about being Indian and why I didn’t know most of Dad’s relations. I felt that he was missing something that I couldn’t put into words, a whole big part of himself that he couldn’t talk about, and so I had a piece of myself missing, too. The only thing I was sure of was that I didn’t know who I was.

I couldn’t get these questions out of my mind and I was determined to find out the whole story, if it was the last thing I did. It wasn’t until I got out of high school and away from home that I was able to talk to people about it without getting completely tongue-tied and upset, and to figure out how to get to the bottom of it all.

Part II

I’m going to tell you now what I found out from Dad’s brother and sister, Uncle Tommie and Aunt Alice, and some of the other relatives that I eventually tracked down.

Gramma (Dad’s mother) was born on the Ides of March, like Dad always said, in 1889, in
North Battleford, Saskatchewan. Her grandparents were Cree, Chippewa, Chippewa-Sioux, and descended from French and Scottish fur traders. Her name was Anna Marie Youpe (you-pee or you-pay). In the following year, Indian Territory was thrown open for White settlement and the land-crazed homesteaders staked out two million acres in one day. That was also the year that the great flu, whooping cough, and measles epidemic hit the Sioux people, and the Ghost Dance was catching on strong in Indian country all over the West. A couple of months before Gramma's second birthday, Sitting Bull was murdered and the U.S. Cavalry massacred Big Foot's people at Wounded Knee.

Gramma was four when she came to Montana with her mother, Angeline, and three brothers, Frank, Joe, and Louis. They came over in a wagon, probably what they called a halfbreed cart. Aunt Alice liked to tell the story of how Gramma remembered riding in the back of the wagon and drinking the baby's milk because she was so hungry. She told Alice that she felt guilty all her life for drinking that milk.

Gramma's father died in that wagon somewhere along the way. Aunt Alice, who was a registered nurse, said that the best she could make of her mother's story was that his kidneys must have stopped working for some reason.

Nobody knows for sure just where he died. Alice had the idea that he never made it to Montana—that he died somewhere around Swift Current, not far north of Cree Crossing, where the Milk River crosses the Montana border. But, according to another story that Dad told a lot, Gramma was evidently convinced that he died in Montana and was buried somewhere in the Flathead Valley. Dad had a vivid memory of a day in the dead of summer, around 1924, when he
went with Gramma to look for her father's grave. She searched all over the Catholic cemetery at the Flathead Mission, but they never found it. I can still see Dad as a little boy, about five years old, dragging around in the heat and dust behind his mother. He said that they spent that whole day going around to different cemeteries in the Valley, searching for that grave, and that Gramma was heartsick when she finally gave up.

As I said before, Gramma and her family were refugees from the second Riel Rebellion. That's another story. But her granddad, Louis Thomas, was killed in it. Neither Dad nor his brother and sister had ever heard of the Rebellion when I came across a book about it, poking around in a library, at the age of thirty-five. I was still looking for our history. Based on things some of the other relatives told me when I looked them up in the summer of 1980, I think Louis Riel was one of Gramma's heroes, even though she never spoke of it. She named her kids Thomas Louis, Louis Thomas, and Alice Relle, which was always kind of a family joke, until I came up with the theory that she was secretly leaving a message.

Pop and Gramma met at the Hysham Ranch in Eastern Montana, over toward Miles City and Custer Battlefield. Gramma worked there as the cook and housekeeper. As I mentioned, she was educated by the nuns at Fort Shaw and the St. Peter’s and Flathead Missions and finished the eighth grade, which was a good education for anyone at the turn of the century. Her folks left her and her brothers in the Indian boarding schools because they didn't have a place to live. The adults lived like nomads, fishing and hunting, living off the land. The Flathead was one of their favorite hunting spots, which was why—I figured out eventually—I came to grow up there. Gramma had a pretty good education, but she could get only maid work because she was an Indian—and a
woman. Dad liked to brag that she was musical. He'd say, "She could play the mandolin and piano like nobody's business, and she could sing like a bird!"

*******

Aunt Alice used to say, "Pop's mama wore blankets," then she'd laugh. Pop was a halfbreed, too, Irish and Cherokee. I don't like the word halfbreed, but that's what they were called in those days. He said he was born in Trinidad, Colorado, but nobody knows for sure. He covered his trail pretty well. No one knows for sure why. He and his brother, Watson, showed up in the 1910 census that said they were born in Minnesota, which never made any sense at all. But who knows? Uncle Tommie thinks he was an outlaw for part of his younger years before he met Gramma. It is true that he never sat anywhere with his back to the door. He always said that if he had ever killed a man, it was when he was twenty-one, when he and his partner were rustling cattle in Mexico. They had a shootout with some Mexican riders and got pinned down in a draw. They had to shoot their horses, and they escaped by sneaking away on foot in the middle of the night.

Pop never wanted to talk much about his past or his people. We don't even know his mother's name, but we think it might be Judith, because Uncle Tommie said that whenever they drove through Judith Gap—over on the other side of the Crazy Mountains, northwest of Billings—Pop would remark that it reminded him of his mother. Uncle Tommie looked through census and birth records in just about all the small towns from Trinidad to Tulsa, trying to track down Pop's family, but he never had any luck.

One thing Pop would talk about was his life as a cowpuncher. He worked on the XIT
Ranch, one of the biggest outfits in Texas. They used 1500 miles of barbed wire when they finally fenced it off. Also, Pop worked for Sam Houston’s son for a while. In Old Mexico, he worked for a man known as the Cattle King of Chihuahua, Don Luis Terrazas, which Uncle Tommie found out when he read *From the Pecos to the Powder*, the autobiography of an old cowboy named Bob Kennon. Terrazas owned a million head of cattle, three thousand horses, and eleven million acres in those years before the Mexican revolution, which “later broke him….” (Kennon, 1965, p. 53). Writing about the last great cattle drives from Texas to Montana, Kennon says that Tom Cotrell (Pop) was a good friend of his, a good cowhand, and one of the last cowboys:

Taking this job [with Terrazas] was the turning point of my life. I had only been working there a few months when Mr. Broadus and Mr. Hysham, two cowmen from Montana, together with their foreman, Mr. Baker, came down to buy steers.

They bought two thousand Mexican steers from Terrazas, and Baker was to trail them north to Montana. Baker asked Bill Nort and Tom Cotrell, a Terrazas cowhand, myself, and a few others to come along up the trail….If a fellow had never been up to Montana on a cattle drive, he wasn’t considered much of a cowman. I held back, though, until Mr. Broadus agreed to pay me a monthly wage of forty dollars for the trip…. On the whole, ours was a good outfit, agreeable and happy go lucky. Tom Cotrell and I became close friends. We stuck together, and believe me, we helped each other out of many a tough spot during the long drive north. There was also a one-eyed half-breed Mexican who used to stand guard with me at night. Sometimes he’d sing to us, and he had a fine
tenor voice. He knew how to sing to the herd, too, and seemed to have a knack of soothing them. Bill Nort, Tom Cotrell, and myself stayed in Montana. We had reached Miles City on July 4, 1897, and I was approaching the end of my twentieth year. (Kennon, 1965, pp. 54-62)

They arrived in Miles City about a month after Pop’s nineteenth birthday. By that time, he had already put in six or seven years as a cowhand. He stayed on in the Land of the Shining Mountains. That’s what they called Montana then and some people still do.

Pop also broke horses for Teddy Roosevelt's Rough Riders. Dad and Uncle Tommie used to laugh about that—how Pop would say they’d rope those wild broncos, one by one, and by the time they rode them a quarter mile into the corral, they were broke! They said Pop used to laugh like hell every time he told that story.

He was born on June 6, 1878, less than a year after Chief Joseph surrendered at the Bear's Paw and two years after the Lakotas and Cheyennes beat the hell out of Custer at the Little Bighorn. Evidently Pop left home when he was about twelve. Uncle Tommie says that Pop's parents were starving and couldn't take care of him. Maybe he ran away from an Indian school or a reservation. He never did want to be what he called a reservation Indian. In 1928, the Flatheads tried to get him to enroll Tommie and Dad and the whole family, but he ran them off with a shotgun. Mrs. Burgess, a friend of theirs, had told the Tribe about the Cotrells. She knew they were close to starving and could use some help. But Pop didn’t want to be ordered around; he despised the idea of having to have a pass every time he went off the Reservation. I can't blame him. But that's how I missed my chance to be a Flathead.
Pop went on his first cattle drive from Texas to Montana when he was thirteen. That would have been around 1891, right after the Wounded Knee Massacre. He rode that whole country from Miles City to Fort Peck to Great Falls. He was a friend of the western painter, Charley Russell, and one time, when Dad wasn’t much more than three, he sat on Russell's lap at the Silver Dollar Bar in Great Falls and recited one of Russell's poems that Pop had taught him. He used to recite it a lot when we were kids and I learned it by heart. It's called "Here's to the Days of the Open Range":

Here's to the days of the open range

When the grass God planted was free

And there wasn't a fence from the Mexican gulf

North to the Arctic Sea.

Those good old days are gone, boys,

The cowman's had his day.

The farmer's here with his fence and his plow

And it looks like he's here to stay.

*********

When Pop met Gramma, she already had Aunt Alice. Alice's dad was a Swedish stagecoach driver by the name of Dale. He deserted Gramma before Alice was born, so she never knew her real father. She was crazy about Pop, but she never got over how he left her for months at a time at the Indian schools at Fort Shaw and St. Ignatius, over several years during the Depression. She says they put her in those schools to save money on food.
Gramma got her naturalization papers when she married Pop, and they each got a 160-acre homestead on the Fairfield Bench near Bolle, outside of Choteau. They had about 300 head of beef cattle, but in the hard winter of 1919, the cattle froze to death and they lost everything. Dad was born that February. They packed a few things in boxes and got on a train heading northwest toward Glacier Park. Pop got a job on a fox farm and split ties for the Great Northern Railway. They lived in the timber for a couple of years. The way Dad tells it, "Pop cut down trees and sawed 'em into lengths, hued 'em with a broad axe, and carried 'em on his shoulder out to the road, where a sleigh picked 'em up. He did a lot of hard work to make a livin'."

Dad's folks died in 1946. He was twenty-seven; I wasn't quite a year old. Gramma went first; she was only fifty-seven. Pop died six months later. He was sixty-eight. Dad says Pop missed Gramma so much that he died of a broken heart.

Part III

This is what Gramma Brushhorn told me when I met her in 1980, in Poplar, on the Fort Peck Sioux Reservation in eastern Montana. She went to Fort Shaw Indian School with Gramma (Dad’s mother), and they were like sisters. Gramma’s brother, Frank Youpe, married Gramma Brushhorn and was adopted by the Fort Peck Tribe. Gramma Brushhorn was ninety-three when I met her. I'd driven up from L.A. by myself to meet all the relatives on the Eastern Side, the ones I'd never met and had wondered about all those years.

When I arrived, I went into the Tribal Office to find out where my Uncle Bill (Frank’s son) lived. I said to the receptionist, my name is Gretchen Cotrell and I’m looking for my Uncle Bill
Youpe.” She smiled and said, “Hi. My name is Gretchen Youpe. Bill is my father.” She offered her hand and I accepted it. Here’s what Gramma Brushhorn said:

"...the Chippewa...the Little Shell Band...they didn't have a place to go. Poor Annie (Gramma) worked in Culbertson. She was kind of smart. She worked as a clerk and stayed here with us for two or three years. Poor Annie...she was well-educated. I took care of her, after that guy deserted her....I said, ‘I’ll take care of you. You don't have to pay.’ She liked Culbertson. She was real nice. I liked her. She tried to pay me. She gave me ten dollars but I wouldn’t take it....

"We lived in the mountains around Great Falls when we were kids. I was called Helen Lester. I didn’t have an Indian name. I don't talk Indian that good. People laugh at me....

"I like the mountains the best. I like to live up there you know. We lived by a creek...a running creek. I don't remember the name. Our house was on top of a hill....The Chippewas and the Crees, they don't have a reservation...they just live anywhere. My man (Gramma's brother, Frank)—his folks lived near Choteau, right across the river. We lived there a couple of years. Annie, she was real nice. I never met Frank's father, never knew him. All my family liked Frank, so they adopted him into the Sioux tribe. All my fathers are kind of chieftains-like. They liked him. We used to go to the Indian dances. Frank danced. He liked it. And then we cooked grub and took it to the dances. Helped them with the grub. Them chieftains adopted him just like one of us and he can get payments....

"We went to school at Fort Shaw. We called the superintendent “Shoe-Pack,” “Yellow Leather,” and “Um-Zee.” We liked him so we went with him to Fort Shaw."
"In November they issue. We get shawls, blankets, all kinds of muslin, all kinds of cotton flannel, blankets, goods of all kinds. And you know these skirts with borders—two yards—the folks have to make them themselves. And they issue shoes, two pairs for one year. Stockings—we don't have to buy anything. The government furnishes everything. Gray flannel blankets with a black and navy border. We each get one in the family. My folks make three, four trips.

"Tom (Pop)—he was part-Indian, some kind of Indian anyway. He sure was a nice man. All the Indians always hire him for this and for that. He was a nice man. Alice, she became a registered nurse. She was real light. Her brothers told her not to send us money but she did. One time she said, ‘I don't like Uncle Frank—he called me a ghost.’

"Annie stayed with us quite a long time. She was welcome as long as she wanted to stay. Poor Annie. She had a tough time. Her mother, Angeline, lived right across the river from us in Choteau. On the west side, right across the bridge. She wasn't very old, a little over middle age. Annie was a kind-hearted woman. She always baked when she had time. We used to go to Glacier Park to get fish. We Sissetons, we eat fish. I always ride with Frank. Any doings there was, we'd go to it on horseback, before we had children. After we had children, we go in a sleigh or a wagon. At Sun River, Frank's mother (Great Gramma Angeline)—they always had fresh meat—deer meat, elk meat, bear meat...."
Afterword: Subjective Interpretation and Theoretical Ground

...consciousness is the historically concrete production of meaning, and every historical situation contains ideological ruptures and offers possibilities for social transformation.
Madan Sarup (1993, p. 187)

Contemporary feminist scholars have observed that many recent autobiographical writings of mestiza, mixedblood, and other mixed race women embody radical challenges to European or Euroamerican views of postcolonial realities. The stark differences between the self-perceptions of the conquered and their descendants and Eurocentric constructions of them constitute one of the most notable and important of these challenges. Corbett’s observation that it is "imperative to think about subjectivities as historically and culturally located in formations of gender, race, sexuality, nation, and class..." (1995, p. 481) is particularly useful to the project of elucidating mixed race identity and experience. This catalytic postmodern idea inheres in current feminisms prominent among a manifold interdisciplinary literature that has flourished in the past half-century, prefigured and pioneered by modern and postmodern thinkers--Kant, Nietzsche, Lacan, Foucault, Gramsci, Jakobson, Jameson, and Merleau-Ponty, to name a few.

Contemporary scholars and writers in the arts, humanities, and social sciences have produced a wealth of related academic and creative works spanning—indeed enlarging—the genre spectrum. Such works challenge the positivist scientific tradition and long-held Western academic and cultural notions about values and convention, the interpretation of human experience and expression, and, ultimately, the nature, source, and limits of knowledge.

During this period, subjective perception and implied multiple realities have become axial in critical studies such as critical race theory, and in the noticeable upsurge of critical perspectives such

In postmodern thought, the world is comprised of text, referring to all writings, architecture, painting, information systems and all forms of attempted representation. In the case of writing, according to literary phenomenology and post-structuralism, meaning is neither final nor universal nor wholly contained in a given text; rather, it is a temporal process that occurs within the reader in interaction with the text. It changes and develops in the course of that process, and depends on both the writer’s and reader’s unique frames of reference shaped by psychosocial, linguistic, and epistemological constraints— their cultural and historical contexts, personalities, genders, education, and experiences (Leitch, 1988; Ashcroft, 1995). In the words of Merleau-Ponty,

(t)he phenomenological world is not pure being, but the sense which is revealed where the paths of my various experiences intersect, and also where my own and other people’s intersect and engage each other like gears. It is thus inseparable from subjectivity and intersubjectivity, which find their unity when I either take up my past experiences in those of the present, or other people’s in my own. (Merleau-Ponty, 1973, p. 83)

In this vein, reading and interpretation constitute a relationship process between writer and reader in accord with our general “participation in the world [that] involves the projection of our deepest hopes, fears, and needs onto reality….” (McCaffery, 1982, p. 6). The reader of an autobiography,
personal narrative, or autoethnography is not exempt from this subjective/intersubjective process.

The foregoing autoethnographic narrative engages and challenges Euro-dominant constructs of mixedblood (First Nations-Euroamerican) identity, in the spirit of postmodern criticism of Grand Theories and decontextualized “objectivity” of traditional social science (Spry, 2001; Reed-Danahay, 1997; Denzin, 1997). By characterizing this work as autoethnographic in form and method, I call attention to it as a variant of—or synthesis of—autobiography and ethnography, as explicated by Pratt (1991) and Reed-Danahay (1997).

Pratt proffers the concept of authoethnography as a particular self-narrative that arises in contact zones, those historical and “social spaces where cultures meet, clash, and grapple with each other, often in contexts of highly asymmetrical relations of power, such as colonialism, slavery, or their aftermaths as they are lived out in many parts of the world today” (p. 34). Contact zones are elsewhere termed “planes of contest” (Ashley, 1987, pp. 109-110, as cited in Rosenau [1992]) on which the collision of polities produces inevitably the silencing, dispersal, and consignment of the conquered to the margins.

According to the cultural and literary critic, Frederic Jameson (1981), each of us “discovers” reality through stories or narrative. Or, obversely, reality come to us in the form of stories, which we, in turn, translate to ourselves through the linguistic meaning grid that we have been given by our first interpreters and teachers, usually parents or parental figures (Sarup, 1993). In the case of conquered peoples, this process requires “decolonization,” if one is to understand oneself and one’s life context.

Through autoethnography, as self-reflexive self-narrative, the author-subject examines her
experience and perceptions in relation to the hegemonized social world. One discovers and explores one’s own colonized consciousness and deconstructs its inherited “knowledge” and “reality,” established by pre-existing power, authority, and institutions (Kosasa, 2001; Gramsci, 1971). One decolonizes oneself by throwing off definitions of one’s self, one’s identity, imposed by colonial externalities. One replaces them with self-produced new knowledge based on the recovery, revaluation, and reclamation of indigenous validity and one’s own interpretations of experience in multivariate context—the contact zones of history, geography, language, culture, color, gender, and class (Irving & Young, 2002; Spry, 2001; Ferber, 2000; Flores, 1990; Jameson, 1981).

“Sticks and Stones and Buffalo Bones” depicts and reflects particular contact zones—First Nations / Euroamerican—in a narrative journey upstream through history, in which the writer explores, from the present into the past, word-of-mouth ancestral portraits, each of which illuminates and deepens the picture immediately preceding it. That is, the narrative segments are conceived as curtains behind curtains, or a series of pictorial backdrops, historically, culturally, and geographically located, and layered in time. In Part I, the narrator looks back to her childhood, then to her father’s memories and tales; in Part II, she goes further back to her grandparents’ history, through her memory of her father’s and his siblings’ memories; and in Part III, she recounts her grandmother’s life as remembered by her aged friend.

This is a first-hand account of the narrator’s evolving identity in postcolonial context, the aftermath of conquest. It is a story of loss—lost history, lost family, and lost connection with her paternal ancestry. Aware of her entrapment in a history of cultural destruction and the taboo status
of halfbreed, she retrieves the past through imaginative remembrance and reconstructs herself out of silence.

This is a true story of a contemporary First Nations mixedblood woman. It is my story. It is a story still in the making; parts are still missing, still to be discovered in fact and imagined through synthesis. I tell this story from the standpoint of an emergent postcolonial- postmodern individual becoming ever more informed by experience, observation, reflection and self-examination, thus ever more self-aware and (self)conscious. I think, I feel, I imagine, I bear witness, in the tradition of Kristeva’s “speaking subject” or “subject in process” working toward an identity achievement that continually develops but is always necessarily incomplete (Rosenau, 1992, pp. 58-59). Only I can discover, make sense of, and tell my story; that process is vital to self-understanding and authentic comprehension of my world (Foner, 2002; Witkin, 2000; Garrett, 1996; Pratt, 1990; Jameson, 1981). I feel a deep resonance with the words of a contemporary Cherokee man:

I think who I am, is that I truly am two people, matter of fact, Doc Amoneeta Sequoyah used to call me “Gagoyoti” in other words, “two people.” In Cherokee, that’s a way of saying, well, you’re this and you’re that. For me, a lot of my conflicts in earlier years were because I wasn’t sure who I was. Was I Indian, was I white, you know, what was a mixture of a person, where did I belong? I knew deep down inside, I didn’t belong with that class of people who felt that they were better than others. And I knew that the people that I came from, the Cherokees, there was something very special. (Garrett, 1996, p. 18)

I considered writing my own story long before I happened upon Pratt’s and others’ similar
writings or consciously engaged postmodern thought. I began to write disparate notes about vivid childhood memories that I had carried around in my head for so many years—of my own experiences and of stories I’d heard about my father and his family. As I pieced them together, I became increasingly aware of their emblematic significance to my sense of self, one that felt painfully confused and helpless to articulate persistent, haunting questions about the facts of my Native origins shrouded in shame and enforced forgetting.

I embarked on my search for completion and self-affirmation long before I knew what feminism was, but my eventual reading of Sylvia Plath, Anne Sexton, Ntozake Shange, Ai, Tillie Olsen, Leslie Silko, Nikki Giovanni, Wendy Rose, Toni Morrison, Paula Gunn Allen, Adrienne Rich, Hum-ishu-ma, Audre Lourde, Beatrice Culleton, Gloria Anzaldua, and Beth Brant emboldened and enlivened my quest. From these and many other women writers and scholars, I drew strength and courage to persist.

In the main, First Nations women writers have expanded the lost identity theme to encompass the experience of mixedblood or halfbreed Native women. Paula Gunn Allen has written at length on the subject. In Spiderwoman's Granddaughters (1989), she points out four "fundamental facts of life" for Native people: First, that our communal existence with all living things is central to our lives and basic to our aesthetic stances; secondly, that conventional belief holds us to be extinct or nearly so; thirdly, that Native near invisibility to dominant American eyes is compounded for First Nations women to the point of virtual nonexistence; and, finally, that, as First Nations peoples, we can never forget our status as occupied or conquered peoples, which fact is the constant backdrop for "our tales of love, death, separation, and continuance" (p. 9).
The upstreaming format of my narrative—from present to past—follows the chronological direction of my quest to understand my world and ‘who I was.’ That is, my evolving experience of the world became an increasingly conscious and deliberate quest to understand myself relative to the facts of my mixed heritage. Pieces of that story are presented roughly in the order of occurrence of key remembered events as I experienced them, and stories and anecdotes as I heard them from the primary figures of my “growing-up” world.

My increasing consciousness of myself as something more than a “little White girl” who happened to be growing up on the Flathead Reservation constituted a progressive accretion of stories in my mind, heart, and very bones. As I moved forward in time from childhood, my self-awareness and self-understanding grew by moving further and further backward into history. Early memories of childhood experiences expanded to curiosities and subsequent gathering of impressions, ideas, information, longings, and grief from the memories of my elders—my father’s, grandparents’, then great grandparents’ stories of their lives.

Embarrassed or stubborn silences, implied omissions, discomfited hesitations were sometimes subtle, sometimes glaring, ingredients of those storytelling events, as I listened to my elders, commented, and asked many questions that they were often loathe to answer. Some of my recurrent questions were “What tribe are we from?”, “Where are our Indian relatives?”, “Why don’t we ever see them?” My father’s typical responses were composed of long silences, downcast eyes, his head shaking slowly side-to-side, sometimes a muffled “I don’t know…our mother wouldn’t tell us…” These spoke volumes to me of bottomless sadness, shame, and bewilderment, which I internalized.
I was treading on taboo territory, delving into a subject both my parents warned me repeatedly not to speak of outside our home. Clearly, they were extremely uncomfortable discussing it in our home. I received loud and clear the confusing and destructive message that only my whiteness—my mother's European heritage—was acceptable, real, and valid. How could I be whole if only half of me was real and valued, the other half associated only with shame, loss, poverty, conquest?

Gradually, in my teens, with painful effort and against their wishes, I began to separate myself from my parents' confusion, fears, and prohibitions, and more and more vigorously replace them with my own affirmation, my own “yes” to the whole of my self. I resolved to find my other family and history. At the time, I certainly did not understand the full significance of other. I sought out my father’s brother and sister for more information. I went to Eastern Montana to meet many of what I discovered to be hundreds of Chippewa, Cree, and Lakota relatives. I asked questions and listened to their stories.

Eventually, through long years of research and writing about the mixedblood experience, I discovered that my experience was not unique, but repeated in hundreds of thousands of lives throughout the Americas, in the racist aftermath of centuries of European conquest. I had engaged unknowingly in what Kristeva (1981), Cixous (1986), Irigaray (1991), Gunn Allen (1989), and a host of other women (and men) writers and scholars had already formulated and described—or were writing about, simultaneously—in narrative and theoretical depth: I had found my own history, my own voice. I had rediscovered and reconstructed my self.

Although this is a story of a Native woman in the aftermath of conquest, it might be any
woman’s, anywhere—or anyone’s—who has felt lost, invisible, irretrievably miscast in a world of
constricted roles, truncated possibilities, and alien or conflicting traditions. Perhaps you who read
this may be emboldened to search out the empty chapters of your own stories, to find the missing
pieces, make real and clear the dim, the uncertain, the forgotten. Most of you who read this will be
social workers and I hope you will be reinvigorated to watch and listen for those lost, hidden,
troubled interiors where so many women and men dwell silently—so as to make contact and keep
them company on their journeys to self-discovery and self-rediscovery, to be there as they learn to
give voice to the unspoken but essential substance of their lives.

Exercises

1. A decolonization strategy to raise awareness among non-Native students of the potential identity struggles of Mixedblood individuals:

   Imagine that you are a child of a mixed marriage: Your mother is White/Euroamerican and your father is a light-skinned Navajo and prominent in the Navajo community. You are a citizen of the United First Nations of North America (UFNNA), where 98% of the population are First Nations, Latino, African American, and Asian, while 2% are White/Euroamerican. The White minority were conquered and colonized by the First Nations five hundred years ago and have suffered from their racism ever since.

   Your parents seem to love and accept one another, but they avoid discussing the “White side” of the family and they forbid you to discuss it either at home or with others in the community. Thus, your White heritage is a taboo subject, a source of shame.

   Write an essay about this experience, in terms of thoughts and feelings you would have about your ethnic identity. What questions would you want to ask your parents about your White background? What conflicts or confusions might you experience? Describe your primary values, beliefs, and personality characteristics and try to discern which ones you learned from the influence of each parent.

2. A decolonization strategy for First Nations students to promote emotional and intellectual clarity about their ethnic identity as bicultural (First Nations/dominant culture) individuals:

   Describe your cultural heritage and identity in terms of your primary values, beliefs, and
personality characteristics. Attempt to classify them according to their Native or dominant (Euroamerican) cultural origin.

If you are a Mixedblood, try to connect these characteristics with the different First Nations of your heritage and/or with the Euroamerican aspects of your identity, as is appropriate.

In any case, describe how you think and feel about these aspects of yourself. Do your experience emotional conflict or confusion about them? Compare your feelings about the parts of your heritage. Do you feel more positive about your First Nations heritage or White heritage? Is your skin color an issue for you, as a darker-skinned person in a predominantly White society? If you are a light-skinned Mixedblood, how does your skin color affect your sense of self as a Native person? How does it affect you when you are functioning in a dominantly White milieu?
I continue to study the Psyche in the Human Organism and to create the new Fundamental Psychology.

I think, determination of Psyche in the Human Organism and creation of new real Psychology enables us to generalize and improve the World Psychology. As known, the different Countries of the World the Psychology has different a Definition. Naturally, it is the International crisis of the Psychology. That's why, I have given to Psychology the new single common International Definition. Generalization and Perfection of the World Psychology – one of the main aim and duty of new Psychology. I have generalized and improved Structure and the basic of Researches of Psychology (Below, these are described in the block - schemes).

As seen, the creation of new real, fundamental Psychology may help to eliminate crisis in the World Psychology. Besides, determination of Psyche and creation of new Psychology enables us to research the Human and Human Organism in detail.

We should study Psyche and to create new Fundamental Psychology. Because, the Psychology is a science about a Psyche ( Psychology = Psyche + logos ). Naturally, we do not have alternative roads. It is evolution of Psyche and evolution new fundamental and modern Psychology in the World Science System.

Scholarship for a Pipeline Challenge: Confronting The 21st Century Segregated Newsroom

By Mercedes Lynn de Uriarte, PhD

The power to define news determines who and what has value, preserves history and indicates culturally significance—key elements of social control. Silencing is a weapon of power. As a component of hegemony, power holders marginalize or censor diverse voice. In societies which assure freedom of expression, a most effective strategy takes the form of censorship by omission, including the elimination of information about whole populations. This pattern, carefully honed in the United States, led to alternative, ethnic and immigrant press. Minority voice remains marginalized. This was perhaps most comprehensively addressed by the National Advisory Commission on Civil Disorders (known as the Kerner Commission) in 1967, which called for major press and journalism education reform.

So more than a quarter century ago U.S. news organizations committed to desegregating their newsrooms. The American Society of Newspaper Editors set a goal for newsroom parity by the year 2000. At the time, fewer than 4% of all print journalists were minorities (most in the black press). Since then, integration has averaged ½ of 1% per year in print, slightly more in broadcast. Contributing to this slow change is journalism education, which still fails to seriously address this problem.

In 1989, a group of students and a professor sought to resist and reform from within by using institutional formats in alternative ways. Operating outside the norm, drawing on theory by Foucault, Garcia Canclini, Gramsci and Martin-Barbero as well as the professional cannons of journalism, a laboratory publication became part of course work for credit. This strategy succeeded in drawing individuals into journalism, producing genuine diverse voice in the form of published clips which allowed these individuals to compete for internships and jobs, the pathway to employment. Additionally, it became a model for other universities whose students included aspiring minority journalists. In 1996 the publication received the top national award for which students are eligible bestowed by leading members of the profession. Its students went on to newsrooms and law schools.

Meanwhile, the ASNE goal floundered and was cancelled in 1998. In 2003, on the 25th anniversary of the call for parity, the first assessment study—Diversity Disconnects: From Classroom to Newsroom—analyzing what went wrong, was released at the National Press Club in Washington DC. It was funded by the Ford Foundation. It set precedent by including related results of a representative, nation-wide interview survey of 615 reporters, editors and news directors exploring genetic and intellectual diversity.

This paper provides the student case study, an overview of counter hegemonic strategy, institutional resource use, obstacles and successes. It includes as well as findings related to the construction of newsroom genetic and intellectual diversity.
Title of the submission: WOMEN’S WRITING IS NOT 'JUST' ABOUT FACTS AND FIGURES, IT IS NOT JUST ANOTHER ACADEMIC DISCIPLINE-IT IS ABOUT CHANGE IN CONSCIOUSNESS.

Abstract & full length paper both are attached herewith.
ABSTRACT

The paper proposes to discuss that women’s studies are not ‘just’ about facts and figures, it is not ‘just’ another academic discipline—it involves a different way of viewing the world. It is about change: in consciousness material and psychological circumstances in control. The paper tries to focus on medieval women writing as outlet of women’s voice ,it also comparatively discusses the criteria. What Women's Studies grapples with is the premise that if women's oppression remains deniable and women's lives-work, art, culture invisible, then there must be something in the values, standards, reason and logic of society which needs to be change. As has been stated for psychology, for theology, for biology' education and for literature to name only a few of the critiques of the present state of the academic disciplines it is men—in particular, middle-class men—who continue to control the production, the assessment and the distribution of knowledge. Consequently, (females who have succeeded in getting access to education get a male-dominated, make-oriented and male-defined education: they are guests in Men's Studies. In this male-as-the-norm ideology there is more material about men and it is accorded more significance. It is knowledge-produced, distributed and owned by men and because if focuses on men and their 'achievements' such as wars and revolutions, when women want to be successful in a man's world what else can they do but copy men's styles and become 'social males'? '...to assert that "it need not be" presumes both the ability to take the oppression of women as an object of understanding as well as to feel the oppression in a deeply Personal way.' Refusal to tolerate the conditions that we discover proceeds from the historical consciousness that the world could be different. It assumes that alternatives are possible to the historically created male-dominated structures that oppose the freedom of women.
WOMEN'S WRITING IS NOT 'JUST' ABOUT FACTS AND FIGURES, IT IS NOT JUST ANOTHER ACADEMIC DISCIPLINE-IT IS ABOUT CHANGE IN CONSCIOUSNESS

There is a considerable section of society asserting that women are better off now than they have ever been. Understandably for people who hold such beliefs, the issue of women’s oppression is either solved or almost solved but in either case no longer relevant, and a field of study that concentrates on 'women only' is not only unnecessary but a luxury not to be afforded in these dire days of economic recession. We are told, more important issues to be dealt with than whatever is left of 'the women question'. Important for whom? is the question to be asked next. Who decides what a significant issue is? Who makes the rules and who profits? Who controls? Those who deny women's economic plight are also denying the systematic violence practiced by one sex against the other and they accuse women of 'over-reacting' and 'generalizing' when we point to men's roles in incest, child abuse, prostitution, battering, clitoridectomy, sexual harassment, pornography and rape. Who are they and on what do they base then judgments? What are the assumptions, values, standards, and ways of collating and interpreting evidence that enable them not only to oppress women but to remain oblivious to the very fact that they oppress us?

It might be argued that we all have our biases and assumptions and tend to think that we are 'right' and the others are 'wrong'. And there is no doubt that one of the unquestioned assumptions in our society is that the prevailing chauvinist ideology is not just a particular way of organizing the world but the only way, Looking at this issue in a detached manner one might come to the conclusion that 'truth' and 'objectivity' do not exist anyway and that it is all a matter of degree... However, 'detachment' leaves out the fact that it is live women of all ethnicities, ages and social groups who are beaten up and raped, that it is live women who lose their jobs and are humiliated and declared inferior, that it is live women who are portrayed as sex objects in the media. And it is these value judgments which lead me to think I am 'right' to want
change: change in the theories that bolster such despicable treatment and in the praxis that affects it.

The paper projects that women's studies are not 'just' about facts and figures, it is not 'just' another academic discipline—it involves a different way of viewing the world. It is about change: in consciousness material and psychological circumstances in control. What Women's Studies grapples with is the premise that if women's oppression remains deniable and women's lives—work, art, culture invisible, then there must be something in the values, standards, reason and logic of society which needs to be change.

Females who have succeeded in getting access to education today or in past get a male-dominated, make-oriented and male-defined education: they are guests in Men's Studies. In this male-as-the-norm ideology there is more material about men and it is accorded more significance. It is knowledge-produced, distributed and owned by men and because if focuses on men and their 'achievements' such as wars and revolutions, when women want to be successful in a man's world what else can they do but copy men's styles and become 'social males'? '...to assert that "it need not be" presumes both the ability to take the oppression of women as an object of understanding as well as to feel the oppression in a deeply Personal way. Refusal to tolerate the conditions that we discover proceeds from the historical consciousness that the world could be different. It assumes that alternatives are possible to the historically created male-dominated structures that oppose the freedom of women.

Books of visions and instructional texts were usually intended for more than their immediate audiences [1], and authors often became celebrities in their own right. Julian of Norwich is mentioned in other texts, such as The Book of Margery Kempe, which suggests that she was fairly well known, and a quick comparison between the Long and Short text versions of her Revelations shows that instances of self-doubt are fewer in the later, revised manuscript. Another example of the popularity of books on the religious way of life is that, whilst books were usually translated from Latin into English, Ancrene Wisse made the inverse transition, and was set into other languages besides [2]. Though not completely accepted, ‘women’s religious lives’ was a niche already in
embryo by the time of writers such as Margery Kempe. Thus, in a medium and subject already tentatively established by previous generations of women, it is no surprise that those who followed took this route for the outlet of their creative voices. Religious writing was a path to fame, and the greatest form of renown generally acknowledged; that in the hierarchy of heaven. Consciously or not, a woman writer (as any male) must have realized this, and any form of writing in this area represented to some degree a wish to achieve a voice in the idea of identification with the wounded, suffering Christ through (often self-inflicted) bodily hardships and the attempted visualization and empathizing with of his tortured death on the cross was a particularly prevalent one in the medieval period. Bodily identification with Christ was therefore a concept particularly close to women: “[The] biological parity between blood, sweat, tears, milk and urine meant that a woman’s contemplation of Christ’s blood was contemplation of her own blood, and further that her tears were equivalent to Christ’s blood. The suffering body of Christ thus allowed a woman not only to pity Christ but to identify in him her own perceived suffering”[3]

Wider community; religious texts merely presented the most accessible outlet for views, whether their authors realised this or not. Whilst the reason of writing as a model to be emulated appears obvious, the method of setting a spiritual example tended to differ much between male and female writers. Whilst male writers echoed the Grecian tenets of logic and rhetoric in spiritual matters, women, following a Gaelic tradition, identified with Christ more through sublimation of thought and by concentrating on bodily empathy. This process of empathy extended in its simplest form to providing solace in solidarity for others likewise persecuted for their faith but went much further in seeking to imagine the suffering of God in the Incarnation through equally weak mortal vessels. In her essay “Medieval Medical Views of Women and Female Spirituality in the Ancrene Wisse and Julian of Norwich’s Showings” Elizabeth Robertson asks: “[Did] women writers tend towards submission and accommodation or toward controlling and manipulating the prescription for themselves?”[10] The subject, as of many other essays on the literature of the period, is a discussion of how much women “internalize or challenge prescriptive medieval ideology”[11] Julian of Norwich’s statement “Just
because I am a woman, must I therefore believe that I must not tell you about the goodness of God ... ?"[12], whilst reiterating the apostolic dictate that women were prohibited from teaching, also reflects her knowledge that her work would be challenged especially because of her gender. This, then, may be read as an indication that as an author and a woman, Julian sought to resist the suppression of female voices. She repeatedly argues for an equality between male and female mystics, entreating her readers to “stop paying attention to the poor, worldly, sinful creature to whom this vision was shown”[13] This world-view of equality becomes more established in her mind by the writing of the Long Text, for in this she says that the visions are “made to whomever God may choose”[14], indicating not simply her own grown confidence, but also that her gender is irrelevant not only as a visionary, but perhaps also in her station within the Church as an anchoress. I now wish to turn to the topic of the nature of texts produced by medieval woman's writers, looking at the factors that influenced them in particular, and discuss further motivations for producing religious texts. The Aristotelian idea that in conception “The female always provides the material, the male that which fashions it”[15] is carried over into the creative genesis of authorship. Religious writing was effectively a means of preaching, when this was officially a profession disallowed women, based on the misogynistic writings of two apostles given great Biblical emphasis and importance: Paul & Jerome. Since women, unless possessed of wealthy and indulgent parents, were generally excluded from education, it comes as little surprise that a proportion of surviving texts show evidence of having been dictated to a male scribe. Therefore, a point which cannot be ignored or under-emphasised is that early female texts only existed within a framework of Church-connected scribes and editors, the overwhelming majority of which were undoubtedly male. This intermediary stage (coming even before editing), gives rise to the possibility of texts being interfered with at the most basic level; since the female author could likely not decipher the squiggles on the parchment before her scribe, she would have had no way of knowing if her words were being faithfully recorded, or some incriminating or censored version thereof. There are extremely real grounds for supposing that a scribe might take it upon himself to ‘assist’ an author in this way; since to be involved with a work that was subsequently attacked and condemned could lead to accusations of heresy on the part of all responsible
for its creation. The personal opinions of the scribe might find their way into the document; his view of women might have been that they were too feebleminded to come to terms with the theological consequences of their discourse, and have selectively added or deleted explanatory passages. A passage in the Life and Passion of Saint Margaret serves the church’s purpose to a greatly constructed extent: otherwise, it is impressively coherent for someone being brutally tortured: “Whoever writes a book on my life”[16] puts in a good word for the scribe; not at all uncommon. Whoever acquires it when written, or who ever has it most often in hand, or whoever reads it aloud or with good will listens to the reader, may all have their sins forgiven at once.”: this appeals to a population who were mostly illiterate. “Whoever builds a chapel or church in my name, or provides for it any light or lamp ... grant him, Lord, the light of heaven” appeals to the wealthy who gave to the church. (The dove swears that all of these powers are granted.)

This connects both with the theme of women’s texts being suffered to exist only so long as they helped support the church’s teachings, and also that women internalised those teachings to an amazing degree; it would not have seemed so instantly suspicious to its original audience that the martyr heroine made these requests. Even as a wholly male-scripted text, the Life and Passion of Saint Margaret is important because it confines the situation in which she, as a woman, holds respect more towards death than in life on earth — she and all women, by extension, have power only in sacrifice. This extract is used here to illustrate the innate power of saints’ lives; although most would argue that this text cannot be said to the work of a medieval woman’s life since its events are stretched into allegory, it may be possible to maintain that the Life and Passion of Saint Margaret has its roots in some sort of real-life event[17].

Teochinus obtains his tale from her, sets it down and “when it was faithfully committed to writing, sent it out widely”... the process of being ‘faithfully committed’ here may be said to apply not only to the process of recording the truth, but also the rigorous process of selection and vetting by the church; it is inconceivable that the text would have been suffered to be distributed (claiming amongst other things visitations and martyrdom) without the solicited approval of the church establishment. In the mould of (fictional) martyrs like Margaret, mystics and visionaries may have sought regard from
the very way that they were persecuted, aspiring to exalted status after death. Since texts were often considered heretical until they were passed by the church many years afterwards, some female writers must have realized that it was likely that only a surge of enthusiasm for their work generated by their death would see them accepted, and planned accordingly for this eventuality. Appending to Julian of Norwich’s conviction (in the introduction, before her ideas are elaborated) that all with be saved: “But I believe everything that Holy Church believes, preaches and teaches”[18] is a plea for the reader to withhold judgment until further explanation can be given. This is made in the certain knowledge that her views (disputing the damnatory nature of Original Sin) are unorthodox, even heretical. Separating out the initial conviction and the parable of the Lord and the servant has the effect of diluting the intensity of the argument; the fluid and archetypically female conversational style of language serves to ameliorate the content. The Augustine belief that “martyrs leave the world perfect and hence are prayed to but not for”[19] meant that this was a highly desirable way to die in the church hierarchy. It was even argued that martyrdom was “a form of baptism” in blood; this is especially relevant to women, aware of the Curse of Eve, who would especially aspire to a death in which Original Sin was absolved, and through the medium of the body, which was a concept heavily pushed to and accepted by women. A common theme in women’s writing, as in other medieval texts, is the concept that life under the Christian faith was ultimately a test. The phrase “no-one is crowned except for whoever fight truly in that fight”[20] in Hali Meidhad has its roots in the teaching of the apostle Paul:

“4:7 I have fought a good fight, I have finished my course, I have kept the faith: 4:8 Henceforth there is laid up for me a crown of righteousness, which the Lord, the righteous judge, shall give me at that day: and not to me only, but unto all them also that love his appearing.”[21]

The notion of trials of faith must have seemed especially valid to women, assailed by critics for myriad reasons, and one would expect the topic of virginity to have been a fertile ground for discussion in women’s writing. Virginity was, after all, so much a part of the medieval social consciousness that the word ‘maiden´ could mean both ‘girl´ and ‘virgin´ in Early Middle English[22]. However, despite its frequently being the obsessive
focus of instructional texts by male authors (“always the more precious something is, the harder it is to protect”[23] being an especially moderate example), it is largely absent from the texts that I have studied. This absence suggests one of two findings: either that women writers internalized and accepted the state of virginity as supreme, or conversely that some held strong feelings against it; in which case their silence may be read as a protest, an inacceptance or doubt marked by a refusal to acknowledge the topic in their writing. In fact, Julian of Norwich’s idea of universal redemption is more sympathetic to women who were not virgins, and other ‘sinners’, also challenging the legacy of Eve and making sin out to be ultimately irrelevant. There is strong evidence that the issue of virginity was a powerful force willfully used by the church to recruit and control impressionable young girls to their cause. Hali Meidhad makes a vivid argument that marriage is slavery; and goes on to state that “a maiden in virginity is like oil in a lamp that has not been lit”[24] This last passage is interesting: it suggests that a virgin exists in a state of neutralized suspended animation, her creative spark unlit; this could well have been the conclusion of women writers and a motivation to write on other religious topics that linked the female form to Christ and to salvation, a theme that will be returned to shortly. Certainly, if a woman remained virginal, she was expected not to marry, and therefore became reliant upon the church for succor; the other solution being to marry but remain chaste. Bearing in mind that a marriage could be annulled if not consummated (a common law arrangement still used as grounds for separation today), this left women in a precarious position. A community could not support greater than a handful of anchoresses; nuns required the backing of an even more wealthy family. It is almost as if competition for ‘places’ between women of a religious disposition was used to channel their energies away from the challenge they might come to pose to orthodoxy. Once in place within an anchor house, no effort is spared to control and limit this creativity: a goodly anchoress “must not send letters or receive letters or write anything without permission”[25]

Julian of Norwich is perhaps the best-known medieval woman writer who worked to emphasize the importance of the contribution of the female body and aspect in religion: “I understood three ways of seeing motherhood in God: the first is that he is the
ground of our natural creation, the second is the taking on of our nature (and there the motherhood of grace begins), the third is the motherhood of works’’[26] Her choice of words serves to starkly emphasize the feminine aspect of Christ and the closeness of its association with mortal women. Nor is just the stereotypical virginal female state raised by this, but the institution of motherhood and childbirth, paralleling the nurturing love of Christ: “The mother can lay the child tenderly to her breast, but our tender mother Jesus, he can familiarly lead us into his blessed breast through his sweet open side.”[27] Jesus gives us ‘spiritual birth’, therefore the birthing process in humans, arguably the closest we can ever come to mimicking God in his act of creation, deserves to be held in similarly high regard. Julian’s contribution as a writer and theologian is one that is still holds respect in this jaded modern era; of all medieval woman writers she has produced a text which endures to evoke sympathetic response. Her lasting impression is testament to the power of her skill in writing, her reasons for doing so none but the most positive: the sharing of an vision of equality with a cynical and hostile world.

Let me conclude the paper by saying that Women's Studies is not limited to specific 'women's issues' such as female biology, health care and reproduction, not to studies on the sexual division of labor or to women's participation in men's trade unions or men's wars. In fact every human issue is a women's issue and at the core of Women's Studies lies the demand to look critically at every facet of life from interpersonal relationships to politics from language to law, from the (ab)use of natural resources to the social construction of reality, and to look at it differently, from a woman-centered perspective.

Clearly such a definition shows that Women's Studies cannot remain within the compartmentalization of knowledge as it is established in the present academic disciplines. While some call Women's Studies 'interdisciplinary', we prefer the term 'transdisciplinary', arguing that 'inter-disciplinary' still accepts as a give the only recently institutionalized academic disciplines. Looking at the production of scholarship in Women's Studies—the body of knowledge classes in Women's Studies are based on various types of research can be differentiated: however, they can all be done simultaneously. What has been called 'compensatory' by Learner and 'collecting' by Register is research that meticulously examines with a women-centered perspective
where and how in what we currently call knowledge' women are 'omitted, distorted or trivialized'. Freud and Marx get re-visited; we ask 'where were all the women in history? 'And we find that they had a literature of their own'. Such work leads for example to a new periodization in history in which it emerges that the 'dark' middle-ages were much lighter for women that the allegedly 'enlightened renaissances. It also leads to a reconceptualization of the question of 'good' and 'bad' in literature, in art and in research itself.

In all we do we incorporate an historical perspective: patriarchy' was not invented yesterday and we had better learn about own sisters of the seventeenth, eighteenth and nineteenth centuries who had at least as radical -ideas as we have and try to find out why and how they were prevented from having a impact on society. As Dale Spender puts it so pointedly: 'Men either use or lose women's ideas' and indeed, we have little reassurance that our new knowledge will meet with a different fate.

Re-discovered through 'feminist research emerge all those women who, even in spite of their ongoing oppression, have chosen not to be victims. They were strong, imaginative and for centuries have been developing an independent woman-centered understanding of the world. They asserted their power of choice and survived by creating what Lynn Herring has described as the force in Adrienne Rich's poetry: 'the power of the ordinary-a universe of humble things'. Role models can be useful. The re-discovery of these women is reason for joy and it is in women's studies that we can legitimately pursue the discovery and perpetration of our heritage: a validation both of the extraordinary resilience of women struggling in isolation and obscurity- "gas lighted" for centuries' - and of 'the power of the ordinary'--of women's lives, past and present.

Men not only dominate women, they preside over the creation and distribution of knowledge. It is often accepted that women and men in effect inhabit two different cultures. It is argued that knowledge generated by the women's culture has been 'muted' while that produced by the men's culture is universalized and recognized. Interest in the possibility of 'two cultures' stems from empirical studies that produce differing 'his' and 'her' versions of 'reality' from anthropological observations of 'dominant' and 'muted' groups and the socially-determined 'inarticulateness' of the
latter, from extensions of the Marxist concept of 'hegemony' used to describe the ways in which ideas derived from the ruling class and serving their interests are accepted as commonsense knowledge by society in general; and finally from attempts by feminist sociologists to understand and conceptualize the gap between their own experiences and what they have learned about society through their studies.

The notion of separate cultures remains problematic, for several reasons. It is unclear whether women share a culture on the basis of common biology, common social experience, or both. If it is the former, arguments sail close to those historically used to condemn all women to inferior status and opportunities. To argue that, say, women are more co-operative or sensitive or peace-loving than men—whilst it may be empirically true—may be to give ammunition to those who will wish to restrict women to spheres where co-operation, sensitivity and peace are the only options. If the argument is based on sex differentiated social experiences, in a given case the divisions among women often appear to outweigh the similarities.

Even if we cannot resolve the difficulties of defending the concept of women's culture, we can turn to one outcome of such conceptualizations, the assault on what is seen as men's knowledge, in its masquerade as human knowledge. Much of the effort that has gone into 'Women's Studies' in recent years is an attempt to transcend what is argued to be arbitrary disciplinary boundaries and to create new forms of knowledge free from the distortions introduced by men's power to create knowledge in their own image.

The claim that women and men occupy cultures is easier to conceptualize within a specific setting such as an institution of higher education. As we have seen, women tend to be clustered in certain departments and relatively junior positions, which might well contribute to a sense of common consciousness among them, especially when this is seen as a consequence of common experiences of marginally within the institution. Those who are promoted to senior positions, or who study atypical subjects to doctoral level, are isolated from a 'women's culture' and instead exist on sufferance as individual anomalies in man's daily world.

Domestic Violence and the Level of Clergy Preparedness to Address the Problem

Mioara Diaconu, MSA, MSW

University of Texas at Arlington
Abstract

This paper is presenting a comprehensive analysis of the literature on domestic violence within the Christian community, and proposes a multi-method research approach to investigate the level of clergy preparedness to address the problem of domestic violence. At the same time, the proposed research study will seek to identify avenues that will help bridge the gap between mental health workers, social work professionals, and Christian clergy, thus providing the Christian community with the necessary tools and resources to deal effectively and sensitively with the issue of domestic violence.
Domestic Violence and the Level of Clergy Preparedness to Address the Problem

Introduction

Many studies show that violence against women, in the form of physical, sexual and emotional abuse, is nondiscriminatory in regard to age, socioeconomic, cultural and religious affiliation of its victims. As a result, it is considered the driving force causing physical pain and emotional distress, and affects the family unit at all levels. The Crime Data Brief from the U.S. Department of Justice, Bureau of Justice Statistics, shows that in United States, intimate partner violence primarily involves female victims. In 2001 approximately eighty-five percent of victims of intimate partner violence were women (U.S. Department of Justice, 2003).

Many studies have been conducted, and many articles have been written in regard to the need for different services to reduce the dangerous affects of domestic/partner violence (Miller & Krull, 1997). But we should remember that sometimes, when a victim identifies itself with a group that is more isolated, identifying and reaching the appropriate service many times becomes more problematic. The Christian community represents such a group. As a result, social work professionals must be attentive to creating fitting intervention responses that will appropriately respond to different groups. Several studies such as Nancy Nanson-Clark’s (1999), underlines the fact that in general Christians are reluctant to reveal their domestic issues, and that when victims need to address these problems, they will seek out clergy instead of professional practitioners who are trained to deal with issues related to domestic violence.

Based on these observations, this study will attempt to assess the level of clergy preparedness to address the problem of domestic violence. The goal is to determine if there is a need for social work professionals to reach out to the Christian community and if so, to educate them on how to deal with victims of domestic violence. Education would also include how to
provide resources that could help the victims survive, and develop coping mechanisms and/or ways to free themselves from abusive relationships.

Theoretical Framework

There are numerous theoretical approaches that try to analyze and explain domestic violence: feminist perspective, psychological perspective, social learning theory, status inconsistency theory, attachment theory and sociological perspective. Of the above enumerated perspectives, feminist theory and sociological perspective, seem to be related more closely to the general area of study: domestic violence within the Christian community.

The feminist theory maintains that gender inequality in society is the root of all forms of violence against women (Dobash & Dobash, 1979). The feminist perspective on spousal abuse is essentially a sociological structural perspective. It seeks to explain partner abuse on the basis of traditional gender-role expectations and the historical imbalance of power between women and men in a patriarchal society (Chornesky, 2000).

According to the sociological perspective, the social structures and prescribed socially acceptable roles influence human behavior (Chornesky, 2000). Some women, when having to stay home to raise children are placing themselves in an economically dependent and inferior position (Chornesky, 2000). The lack of employment, truncated education, and the paucity of employment skills may also prevent women from leaving abusive relationships (Chornesky, 2000). Other barriers are religious beliefs, adherence to the sanctity of marriage, and the belief by victims that they have a social responsibility to attempt to help their abusers (Chornesky, 2000).

Literature Review and Gaps

The research review was done through a thorough internet literature search. Some of the databases explored are as follow: Academic Search Premier, ArticleFirst, Contemporary Women’s Issues (CWI), ProQuest Digital Dissertations, ECO, ERIC, PsycInfo, Social Services Abstracts, Social Work Abstracts, Sociological Abstracts, WorldCat. The following search words were used when the searched was conduct in the above databases: domestic violence & religion; marital conflict & religion; battered women; battered wife; Christians & family violence; clergy liability & domestic violence; Christian & counseling and therapy, sex roles & religion; intimate partner violence; ministers & wife abuse, etc.

From the large number of articles found during the literature search for the research review, only the articles addressing the following issues were selected: (a) Is domestic violence a myth or reality within the Christian community? (b) Is there a higher rate of domestic violence in the Christian community in comparison with the secular society? (c) Is Religious denomination related to spousal abuse? (d) What is the Christian community’s response in general and clergy’s response in particular to the issue of domestic violence? (e) To whom are battered Christian man and women turning when facing spouse or partner violence? (f) Are the clergy prepared to address appropriately the issues faced by the victims of domestic violence?

The body of the literature chosen for this research review, focused mainly on women as the victims of domestic violence, and men as perpetrators. The literature review included articles published between early nineties to the present.

Only a few studies were found that focused on to what extent the needs of domestic violence victims, within the Christian community, are being met. At the same time, a gap in the expert literature was identified in regard to research studies in which social work professionals
and clergy are coming together to identify ways in which these two professions could work together in order to effectively respond to the needs of battered Christian individuals.

One of the common beliefs that can be found in almost all Christian denominations is that religion should play the main role in the Christian’s effort to cope with issues of all types, including domestic violence. This point of view is emphasized by Lori Beaman-Hall (1996), who states in her doctoral thesis that, as an ideology, conservative Protestantism contains a number of doctrines which might be seen to facilitate violence against women, including the sanctity of the family, the undesirability of divorce, and male headship of the family.

On a different note, in 2001, the results of Ellison and Anderson’s research study on the association of religion and perpetration of domestic violence showed that “religious involvement appears to diminish the risk of abuse” (p. 281). Cunradi, Gaetano and Schafer’s study published in 2002, presents similar findings in regard to the association of religion and domestic violence. These findings show that regular church attendance relates to lower rates of intimate partner violence among both men and women.

The findings of the above presented research studies are presenting two different trends that seem dichotomous: “conservative Protestantism contains a number of doctrines which might be seen to facilitate violence against women” & that “religious involvement appears to diminish the risk of abuse”. These differences in results may be attributed to some extent to different study limitations, one of which is the fact that Christians in general tend to keep their personal problems “under the rug”, due to the fear of peer judgment (lack of spirituality, etc.) This point of view is supported by Nancy Nason-Clark as well, when she states that, conservative Christians are frequently unwilling to reveal their familial troubles (1997).
Following up on Nancy Nanson-Clark’s study done in 1999, it can be observed that not only Christians are reluctant to reveal their domestic problems, but when the victims need to address family issues, they will seek out the clergy instead of the professional practitioners. Her observation is “based upon a five year program of research involving over 1000 clergy, church women, transition house workers, abused religious women, and members of faith communities. She highlights the relationship between religious belief and practice and violence in the family context.” (Nason-Clark, 1999).

Nancy Nason-Clark’s study also reveals that, although the clergy may be seen by their parishioners as the ultimate authority in counseling, the majority of clergy have limited or no training at all in counseling, and practically no background in understanding the longer-term implications of abusive behavior for victims, perpetrators or their children. As a result, women are encouraged to stay in the abusive relationship under the reason that they share Christ’s suffering, and that their suffering is part of the goal of reaching spiritual maturity (Nason-Clark, 1997). Less than 10% of the clergy involved in this research (from a pool of 343 clergy – 70% response rate), felt well equipped to cope with the demands of counseling (Nason-Clark, 1999).

The disappointment with which many battered Christian women are faced is mentioned in Lori Beaman-Hall’s research. She states that the most common criticism about clergy responses to violence against women is that they do not offer women practical support or advice, but rather tell women to “go home and pray about it” (1996).

Based on the findings of the research studies presented, we can conclude that although the majority of Christian victims of domestic violence are inclined to seek out the counsel of their spiritual leaders, rather than of a mental health professional, they do so with caution because of the lack of practical support and advices. At the same time, by “promoting the
sanctification of marital bounds and family life, clergy, make it more difficult for both victims and perpetrators to come forward and seek counseling. This fact may lead victims of abuse to remain in dangerous relationships” (Ellison & Anderson, 2001).

As a result, there is an increased need for collaboration between clergy and different mental health professionals such as marriage and family therapists and/or social work professionals. This collaboration is necessary to insure adequate screening of couples at risk for intimate partner violence and make appropriate referrals (Cunradi, Caetano & Schafer, 2002).

The following proposed research study will try to identify the level of preparedness of clergy to address the domestic violence issues facing their congregation. Ways of bridging the gap between professionals and clergy would be suggested if the study identifies a need for it
Proposed Research Strategy

Research Methodology

Since the issue of clergy’s preparedness to address domestic violence issues and its relation to battered individuals has not yet been clearly conceptualized or understood, the project will start as an exploratory qualitative study, with a pilot group of Christian clergy located in the state of Texas, during the summer of 2005. In order to enhance the reliability and validity of the study, methodological triangulation -- referring to the use of more than one method for gathering data (Denzin, 1970) -- will be used.

Based on this initial exploratory study, the research design will be improved and the literature review will be updated. With an improved research design, the main research study will be administered among the target population belonging to the main six religion/denomination located in the U.S., and the findings will be analyzed. The expected date of the publishing of the findings is the fall of 2006.

Interviews (formal, informal & in-depth) and focus groups will be used to measure the clergy’s knowledge of basic facts about domestic violence, appropriate counseling approaches, their awareness regarding the existence of the informal and formal social capital that could have helped to prevent further abuse, and can help victims build resilience at the present time. It will also measure their access to these social capital avenues. The following variables, such as age, education (high school, college, seminary, etc.), size of their parish, etc., will be assessed to identify their training and willingness to get involved in the process of prevention of domestic violence and building resilience of the victims.

The interviews will be conducted with small groups of 5-10 Christian clergy within each of the six main religions/denominations. The expected maximum time for the interview will be one hour. The participants will be asked to sign a formal consent agreement to audiotape the
The primary locations for interviews will be the offices of NGOs that are serving victims of domestic violence, theological institutes/seminaries, and/or clergy offices.

</tr>
</tbody>
</table>

As portrayed in the above table, the main data collection method would be represented by focus groups and interviews (formal, informal, and in-depth interviews). The following primary and secondary data sources will be used:

**Primary data sources:** (a) Focus groups; and (b) In-depth interviews - Interviews using unstructured, open-ended guides will be conducted with a small group of 5-10 Christian clergy within each of the six religions/denominations. The expected maximum time for the interview will be one hour. The participants will be asked to sign a formal consent agreement to audiotape the interview. During the process of data collection and sampling, sustained attempts to use Christian clergy from various ages, gender and social classes will be made.

The primary locations for interviews will be the offices of NGOs that are serving victims of domestic violence, or clergy offices.

**Secondary data collection:** (a) A study of the curriculums used by Christian theological institutes and seminaries; (b) A review of data collected from other sources than the study at hand will be done; (c) Other external data sources will be considered: demographics from the
Census data and basic statistical information about the targeted population from their main church WebPages, NGOs, etc.

During this study, confidentiality and privacy issues are very important in order to gain people’s trust and consent to participate. The following steps will be taken to assure confidentiality: (a) Participation in this study will be strictly voluntary; (b) Before starting the in-depth interviews and focus groups, the participants will be assured of the confidentiality regarding their names and personal information; (c) An informed consent form written in English and Spanish (if necessary) will be given to every participant of the interviews and focus groups.

**Threats to validity**

According to Maxwell, validity refers to the “correctness or credibility of a description, conclusion, explanation, interpretation, or other sort of account” (Maxwell, 2005, p.106). The following are some threats to the validity of the proposed research study:

1. **Misinterpreting the meaning of what participants say** – due to the fact that the participants are religious leaders, they are most likely to use specific theological terms or expressions in their statements; therefore there may be room for misinterpretation of specific religious responses in regards to the topic.

2. **Factor analysis** – when reviewing the various curriculums from different churches/denominations, a diversity of terminologies to be used for the same topic could be found. As a result, repetition of themes can take place.

3. **Reflexivity** – when trying to find ‘what role/ if any, can professional social workers play in helping Christian clergy address the issue of domestic violence among their parishioners’, my social work perspective may influence the outcome of the focus groups and interviews.
The following are several ways in which the researcher will use to control for the above threats to validity:

1. *Misinterpreting the meaning of what participants say* – can be minimized by using respondent validation (systematically soliciting feedback from the participants in the study)
2. *Factor analysis* – can be avoided by a clear identification of the items that can be coded together
3. *Reflexivity* – can be avoided by not including leading questions

**Ethical Considerations**

Since the project is centered on primary data collection (in-depth interview etc.), confidentiality is likely to be the main ethical concern. Because of that, the information that can link respondents to their responses will be stored in a safe place, and nobody but the researcher/s will have access to this information.

**Limitations of the proposed research study**

Some study limitations are related to the secondary data used. The data that will be gathered from studies conducted by other agencies and may be limited regarding the depth of variables studied in this research.

Other limitations of the studies identified for the research review are as follow: (a) Lack of generalizability, due to data collection methods, and to the exclusivity given to a specific religion by different studies; (b) Lack of comprehensive measures of domestic violence when using data from national surveys, limitation acknowledged by Ellison & Anderson (2001) as well: “further study should utilize more comprehensive measures of domestic violence then are available in the NSFH-1, which contains only a single-item indicator of physical violence; (c) Participants’ self bias, due to the fact that some of the research studies relied on self-reports of domestic violence - “domestic abuse evokes significant social stigma, and perpetrators can face
serious criminal and civil penalties, individuals may be tempted to deny or underestimate the frequency or severity of their abusive conduct.” (Ellison & Anderson, 2001); etc.

The Importance of the Study to Social Work Practice

Based on the findings of different research studies, some of which were presented above, we can conclude that due to the majority of victims’ inclination to seek out the counsel of their spiritual leaders, there is an increased need for collaboration between clergy and different mental health professionals such as marriage and family therapists and/or social work professionals. This collaboration is necessary to insure adequate screening of couples at risk for intimate partner violence and make appropriate referrals (Cunradi, Caetano & Schafer, 2002).

At the same time, the literature showed increase in the number of the domestic violence victims which are turning to their peers for help and support (single-sex ministries), or are trying to deal on their own with domestic violence related issues. This may happen because they lost their confidence in clergy, and at the same time, based on their beliefs, they do not feel comfortable to use the services offered by the secular professionals. As a result, a need for training of the single-sex ministries leaders, and the Christian community at large, in regard to domestic violence issues, arises.

Moreover, this research study will be a helpful resource for social work practice due to the fact that, based on its findings, the social work practitioners will be able to understand better the nature and the implications of domestic violence within the Christian community. As a result, they will be better prepared to use tailored interventions when dealing with conservative Christian clients.
**Definition of Key Terms**

*Christian Denominations* – for the purpose of this study, all religious denomination that profess to believe in Jesus Christ will go under this category

*Conservative Christians* – characterized as being more authoritarian and more traditional in regard to gender matters, and as having lower self-esteem (Brinkerhoff, Grandin, & Lupri, 1992)

*Resilience* – specific skills, behaviors, or competencies that can be used as coping mechanisms in the time of struggle with hardship

*Social Capital* – participants’ informal and formal social networks that enable collective action

*Spirituality* – the degree to which individuals endorse a relationship with God or a transcendent force that brings meaning and purpose to their existence (Berkel, Vandiver, & Bahne, 2004)

*Violence* – defined as any act carried out with the intention, or the perceived intention, to hurt another person physically (Brinkerhoff, Grandin, & Lupri, 1992)

PROJECT PROPOSAL

TEACHING CONTEMPORARY LITERATURE FOR STUDENTS AT THE UNIVERSITY LEVEL:
FROM READER-RESPONSE CRITICISM TO CROSS-CULTURALISM

by DINH THI MINH HIEN

RATIONALE

It goes without saying that the twentieth century has had many profound critics and theorists of literature who develop the legacy and heritage of the past and announce a change in the direction of literary study. These scholars might even suggest that literary study is being revised into cultural studies (Trimmer and Warnock, 1992). To some, this change might seem not more than an extension of conventional practice, since we have often believed that studying culture was actually synonymous with studying literature, and since ‘culture’, in Matthew Arnold’s terms, referred to literary works that contained “the best that has been known and thought” (Arnold, 1966-1977). Yet, for others, the shift toward cultural studies has stimulated a revolution in theory and practice since the term ‘culture’ has been “twisted through the words of art and work, and its current usage evokes both ‘material production’ and ‘signifying and symbolic systems’” (Raymond, 1983).

The shift toward cultural studies also makes teachers of literature rethink the basic assumptions of their teaching practice: How do words and worlds interact? How does this interaction create cultural contexts? How do texts produce traces of those contexts? What is a literary text? How does a literary text relate to other texts? What do we do when we study texts, and which one should we study? (Trimmer and Warnock, 1992). These issues were actually brought into discussions in the 1989 (Cultural Studies) and 1990 (Cross-Cultural Studies) Summer Institutes for Teachers of Literature that marked a new orientation for the teaching of literature (Trimmer and Warnock, 1992).
So far, as stated by Kirszner and Mandell (1991), the dominant critical views can be divided into three categories: (i) formal, (ii) social and (iii) personal. The first category is concerned with the structure or form of texts such as formalism, structuralism, deconstruction, modernism. The second one relates to texts in relation to social contexts such as new historicism, feminism, Marxism, poststructuralism and postmodernism; and the last category is concerned with the interaction between the individual who might be readers or learners and the texts. This approach might be seen through reader-response criticism and psychoanalytic criticism.

For years, literature itself has been taught by traditional approaches in the field of critical theory. Formalism, which started in England with I. A. Richards’s *Practical Criticism* in 1929, stresses the importance of literary form in determining the meaning of a work, and considers biographical, historical, and social questions to be irrelevant to the real meaning of a work. In opposition to this trend, sociological criticism was born; it asserts that a literary work cannot be separated from the social context in which it was created. Sociological criticism has emerged as the dominant theory in the twentieth century with two strong arms: Marxist criticism and feminist criticism.

Marxist criticism developed in the 1920s and 1930s in Germany and in the Soviet Union, and has received the greatest attention in Britain and America since 1960. Critics of this school base their readings of literature on the social and economic theories of Karl Marx (*Das Capital, 1867-94*) and his colleague Friedrich Engels (*The Communist Manifesto, 1884*). Marxist critics, including Raymond William, tend to analyze the literary works as products of the ideology, or network of concepts, which supports the interests of the cultural elite and suppresses those of the working class. Feminist criticism opposed the idea of seeing the feminine as passive and emotional in opposition to the masculine as dominating and rational. Feminist criticism was popular in the late 1960s and early 1970s. Simone de Beauvoir, an advocate, states that the female reader of literary work must identify with the male protagonist or accept a marginalized role.

Both Marxist and feminist criticism share some theories with new criticism, which focuses on literary texts in relation to historical and cultural contexts of the period in which it was created and evaluated. Rosenblatt, one of the advocates of this trend, prefers the term ‘cultural politics’ since it acknowledges the integral role literature and art play in culture and history of any country.

Another trend--psychoanalytic criticism, stresses that a work of literature is an expression in fictional form of the inner workings of the human mind. This trend was developed by Sigmund Freud whose ideas and literary applications were strongly disagreed with by his contemporaries. He believed that literature could often be interpreted as the reflection of our unconscious life, and Freud himself was among the first psychoanalytic critics, often using the techniques developed for interpreting dreams to interpret literature.

Critics of structuralism--a literary movement with roots in linguistics and anthropology, advocate that literature is a part of a larger literary system; therefore, in order to fully
appreciate a literary work, the reader must understand the system within which it operates. Deconstruction—developed from structuralism, argues that the structure that seems to hold the text together is unstable because it depends on the conclusions of a particular ideology. One of the representatives of this theory is Jacques Derrida, who believes that all writing is essentially literary and metaphorical since language, by its very nature, can only stand for what people call reality or truth (Kirszner and Mandell, 1997).

Also originated from structuralism, poststructuralism begins with the assertion that “consciousness” resides in language and that language is always a social phenomenon created by an interactive community of speakers. As Carey-Webb states, no one can have an isolated, complete, or “unified” consciousness separate from the language and culture in which we all live. Individuals are cultural beings, and language and social practices script the way people think and act. From this viewpoint human nature is particular and depends on culture, social codes, and the historical moment (Carey-Webb, 2002).

Another trend—“modernism” which emerged in Europe and America in the early years of the twentieth century, expresses a new vision and viewpoint toward modern life that is in sharp contrast with the Western civilization’s classical tradition Critics of this tendency suppose that the way the story is constructed became as important as the story itself (VanSpanckeren et al, 1994). And a school of “new criticism” arose in the United States to analyze the modernist novels and poetry. New critics, with a store of new critical vocabulary, hunt the ‘epiphany’, examine and clarify the work, hope to shed light upon it through their insights (VanSpanckeren et al, 1994).

As opposed to modernism, postmodernism means different things to different people. This trend has been increasingly recognized by intellectuals as the dominant cultural movement of the present time. Postmodern teaching invites different voices from different historical and cultural backgrounds; in other words, it “would find the historical in the contemporary, and the contemporary in the historical (Carey-Webb, 2002). Postmodernism has been considered the most playful of the poststructuralisms; however, it refuses to accept any simple separation between the individual and society. Postmodernist teaching can be understood as respect for difference, recognition of compositeness, mixture, blending, and examination of the restrictions that prevent people from creative participation in the making and hybridizing of culture (Carey-Webb, 2002).

When the communicative movement gained momentum in the late 1980s, literature came back into English language teaching (ELT) and has had a modest place in the ELT mainstream. Much of the current use of literature in ELT involves reader-response theory (Rosenblatt (1978), Culler (1982), and Hirvela (1996), which aims at using literary texts as a resource for stimulating language activities and creating opportunities for learners to generate personal language discourse. It sees the reader’s interaction with and contribution to the text as essential. This is seen in such popular literature-based teaching texts such as Bassnet and Grundy (1993), Marley and Duff (1989).

Indeed, reader-response criticism has been popular since the 1960s, with Norman Holland’s *The Dynamic of Literary Response* (1968) formulating the theory. An
American critic—Stanley Fish, in his book *Is There a Text in This Class*, also states that no two readers reading the same book have had similar responses to it (Fish, 1980). In *The Implied Reader* (1974), Wolfgang Iser, the author, goes even further by stating that in order to be an effective reader, one must be familiar with the conventions and codes of writing. Hans Robert Jauss proposes *Reception theory* (“Literary History as a Challenge to Literature Theory” in *New Literary History,* Vol.2.1970-71) from which he states that each new generation reads the same work of literature differently since each generation of readers has experienced different historical events, read different books, and been aware of different critical theories.

**AIMS:**

As suggested by the title, this study, on the whole, aims to develop a more thoughtful and principled theory to use literature in the classroom based on the foundation of reader-response criticism and cross-cultural approach. The primary aims of the study are (i) to improve students understanding of literary works of different cultures other than themselves; (ii) to bridge the gap between / among people from different cultural backgrounds via literature; (iii) to enhance students’ appreciation and enjoyment of literary works; (iv) to make students aware of cultural aspects in literary texts and know how to explore the content of literary texts written by writers of different cultural backgrounds; (v) to stimulate students for more advanced learning and (vi) to stimulate personal growth across cultures.

**OBJECTIVES:**

To achieve these final purposes in reality is difficult. However, reading library books for document studies might help the researcher to find out advantages and disadvantages of cultural—cross-cultural approach and reader-response theory that can answer the hypotheses of the question, “Why choose cross-cultural approach and reader-response theory as the starting point for the study rather than other approaches?” and “What reader-response approach needs to develop?” More specifically, with teachers, the study aims (a) to help them select texts and materials which are suitable for use with their students, (b) to provide them with teaching techniques and text-attack skills, (c) to make them aware of cultural aspects in literary texts and (d) to provide them with teaching strategies for solving cultural problems in their class.

As for students, the study aims (a) to improve their interpretation and their reaction to literary texts. In order to stimulate personal growth across cultures, the study aims (a) to enhance students’ interest in learning literature, and (b) to make students aware of the cultural aspects in literary texts. Moreover, the researcher’s overall aims are to carry out document studies and to co-operate with university teachers and/or teaching staff at the research site to organize workshops on teaching and learning literature.

**JUSTIFICATION:**

Culturally speaking, literature has been seen as one of the most obvious and valuable means of attaining cultural insights. It provides a model of a culture, which might
empower readers to overcome the limitations of sex or race. It also helps them overcome many barriers between cultures so that they become more responsive to them and improve their communication across cultures.

Linguistically speaking, students can benefit from literature in many ways. In general, literature models a wide range of communicative strategies. Through literature, students are exposed to various cultures. This certainly stimulates and improves students’ critical thinking, creative competence, and interpretation skill. In other words, literature extends students’ knowledge on the levels of usage and use.

Another major value of literature can be measured through its effects on learning. The questions here are that what the actual educational implications that reader-response and cross-cultural theories contribute to education. As we can see, literature provides much besides knowledge of basic skills. It presents a “new reality” in which the reader is not only expected to understand a passage within a conventional frame but also given an opportunity to experience a unique kind of discourse. By this way, literature contributes to both the process and product (Widdowson, 1983).

RESEARCH QUESTIONS:

Although reader-response approach has many advantages in supporting learning and teaching literature, it is believed that there still needs to consider the cultural aspects that students have to be aware of when exploring literary texts since literature reflects the culture of a nation. Originated from this viewpoint, the first question to be addressed in this study is “What do reader-response criticism and cross-culturalism need to be developed so as to improve students’ awareness of cultural aspects cross cultures in the university settings?”

And, the answers to the above research question might help the researcher see the significance of the study. This raises the idea for the second, “What contributions can cross-culturalism make to literature-based teaching?” And, the conclusions of the second research question would be of no effect if teachers and learners were not provided with appropriate techniques and methods to apply in real class. Therefore, the third question is “How should cross-cultural theories be made use of in literature-based classes at the university level?”

TERMINOLOGY:

*Imaginative literature:* begins with a writer’s need to convey a personal vision to readers. His primary purpose is to give a unique view of experience, one that has significance beyond the moment. Imaginative literature is more likely than other types of writing not only because they communicate the writer’s ideas, but also because they are memorable. A work of imaginative literature encourages readers to see the possibilities of language and to move beyond the factual details of an event. At another level, it also can lead readers out of their lives and times, enable them to see their lives and times more clearly. Imaginative literature can be divided into types called genres--fiction, poetry, and drama.
Reader-Response Approach: A theory concerns the effect of learning created from literature. Hirvela (1996) believes that literature can create a wide variety of learning opportunities for learners. This theory originates from the field of literary criticism. Its main focuses are on championing the reader’s role as an active participant in the creation of meaning and on providing both learners and teacher with a vital window into how the learner reads the original text and produces the evoked work. It emerges through the transaction that occurs when the reader engages the original text. And it is this evoked work that is accorded interpretative authority. In other words, the evoked work is a by-product of the reader’s experience of the original text together with the meaning embedded within the text. Reader-response theory works as an instructional tool in language teaching. It develops Rosenblatt’s idea (1978) that “The text itself...is incomplete; it needs a reader’s experience to make it understood”. In other words, the reader plays a critical role in the interpretative process. As Tomkins (1980) said, “We can no longer talk about the meaning of the text without considering the reader’s contribution to it.”

Personal-Response Approach: defines the use of literature within communicative language teaching (CLT). It aims at using literary texts as a resource for stimulating language activities and at assigning as many tasks as possible to create opportunities for learners to generate personal language discourse through engaging in the learning tasks. This approach is seen in such popular literature-based teaching texts as Bassnet and Grundy (1993), Marley and Duff (1989).

Top-down processing: a process of learning in which teachers take into account students’ intelligence and experience--the predictions they can make, based on the schemata they have acquired--to understand the text. This kind of processing is used when they try to interpret assumptions and draw inferences. Teachers make conscious use of it when they try to see the overall purpose of the text, or to get a rough idea of the pattern of the writer’s argument, in order to make a reasoned guess at the next step.

A reader adopts this approach when he considers it as a whole and relates it to his own knowledge and experience. This might help him predict the writer’s purpose, the likely trend of the argument and so on, and then use this framework to express himself. This approach gives a sense of perspective and makes use of all that the reader brings to the text: prior knowledge, common sense, etc, which have sometimes been undervalued.

Bottom-up processing: In bottom-up processing, the reader builds up a meaning from the black marks on the page: recognizing letters and words, working out sentence structure. Teachers can make conscious use of this approach when an initial reading leaves students confused. Bottom-up processing can be used as a corrective to ‘tunnel vision’, that is, seeing things only from our own limited point of view.

Cultural and Cross-Cultural Approach: promotes cultural communication and understanding across national boundaries, is inevitably bound up with the notions about culture that prevail in a given time and place (Cary-Webb, 2001)
Culture: is seen as “structures of meaning”, including memory, ideology, emotions, life styles, scholarly and artistic works, and other symbols (Carey-Webb, 2001).

International culture: cultural traditions that extend beyond national boundaries (Kottak and Kozaitis, 2003)

National culture: experiences, beliefs, customs, and values shared by people who have grown up in the same nation (Kottak and Kozaitis, 2003)

Subcultures: the diverse cultural patterns and traditions associated with subgroups in the same nation. Subcultures may originate in ethnicity, class, region, or religion (Kottak and Kozaitis, 2003)

Cultural criticism: Stuart Hall describes the emergence of this kind of criticism in the 1950s as a “significant break” in the history of criticism. In such a break, “old lines of thought are disturbed, older constellations displaced, and elements old and new, are regrouped around a different set of premises and themes (Hall, 1980).

Cultural Relativism: refers to a tendency from which is supposed that there is no superior, international, or universal morality—that the moral and ethical rules of all cultures deserve equal respect (Kottak and Kozaitis, 2003)

Cultural generalities: similarities that occur in many but not all cultures (Kottak and Kozaitis, 2003)

Internationalism: refers to an idea, a movement, or an institution that seeks to reformulate the nature of relations among nations through cross national co-operation and interchange (Iriye Akira, 1997).

Cultural internationalism: The fostering of international co-operation through cultural activities across national boundary (Iriye Akira, 1997)

Culture shock: refers to disturbed feelings that often arise when one has contact with an unfamiliar culture… It is a feeling of alienation, of being without some of the most ordinary and basic cues of one’s culture of origin. Usually culture shock passes if one stays in the new culture long enough (Kotak and Kozaitis, 2003)

Economic internationalism: envisaging a global network of economic changes (Iriye Akira, 1997)

Ethnocentrism: The tendency to use one’s own cultural standards and values to judge the behavior and beliefs of people with different cultures. Ethnocentrism is a cultural universal. That is, people everywhere think that familiar explanations, opinions, and customs are true, right, proper, and moral. They regard different behavior as strange or savage (Kottak and Kozaitis, 2003)

Globalization: linkages (through transportation, migration, the media, and various economic and political processes) that are developing at an accelerating pace among
people and nations throughout the world. Globalization links all contemporary people, directly or indirectly, in the modern world system (Kotak and Kozaitis, 2003)

*Socialist internationalism:* promoted by those who believed that world peace must be built upon the solidarity of workers everywhere (Iriye Akira, 1997)

*New Criticism:* Arising in the 1930s and 1940s, New Criticism emphasized the artistic or aesthetic aspect of literature, where “metaphor, irony, and poetic devices are interpreted so as to come together to create an ‘organic unity’ of form and meaning” (Carey-Webb, 2001).

*Multicultural Studies:* brings new and broader conceptions of literature to teaching. It reworks traditional philosophical approaches, recovers oral and popular traditions and stresses the importance of understanding literature in cultural and historical contexts (Carey-Webb, 2001).

*Multiculturalism:* seeks to multiply the number of socially defined groups that have access to the society’s dialogues about itself and to place those groups in dialogue with each other (Carey-Webb, 2001).

*New Historicism:* attempts to incorporate insights from many of the emerging schools of thought such as multicultural studies, gender studies, political criticism, media studies, popular culture, cultural studies, and so on (Carey-Webb, 2001).

*Text:* something that can be creatively “read”, interpreted, and assigned meaning by anyone (a “reader”) who receives it (Kotak and Kozaitis, 2003)

*Third World:* The recognized realities that come to “modernize” and look more into the stark contradictions between rich and poor, cultural contrasts, families and communities pulled apart by economic forces, religious revivalism and tenacious holds on fundamentalist truths in the face of rapid social change (Carey-Webb, 2001).

*Third World cultures:* are declared “fashionable and grantable” by major cultural institutions, to adapt Guillermo Gomez-Pena’s remarks about the sudden attention being showered on Latinos. This includes academic area, where more and more courses about Third World cultures are being tacked on to already existing curricula (Trimmer and Warnock, 1992)

*Postcolonial studies:* looks with a critical eye not only at European economic and military authority but also at the cultural traditions and Eurocentric legacy that identified colonized peoples as “savage”, “uncivilized”, “backward”, or “underdeveloped” (Carey-Webb, 2001).

*Poststructuralism:* begins with the assertion that “consciousness” as we experience it resides in language and that language is always a social phenomenon, created by an interactive communication of speakers. Thus, no one has an isolated, complete, or
“unified” consciousness separate from the language and culture in which we all live. Individuals are cultural beings, and language, texts, institutions, and social practices script the way we think and act. In this view, rather being than universal, human nature is particular depends on culture, social codes, and the historical moment (Carey-Webb, 2001).

**Deconstruction:** is a probing and intellectually intense version of both structuralism developed by the avant-garde French philosopher Jacques Derrida. Derrida attempts to demystify Western humanist thought not from the outside, but by examining its internal instabilities, its untenable dualisms, and the porousness of its definitions and boundaries. He considers everything we see, experience, and understand as always and already made for us, embedded in social and historical context. “Truths”, when examining closely, when “deconstructed”, turn out to be fictions created by language and particular systems of meaning situated in time and place. (Carey-Webb, 2001).

**Postmodernism:** alternately see the world as a cartoonesque Disneyland, an unremitting play of striking cultural difference, the overflow of an uneven and diverse globalism where African slum dwellers watch the Cosby show, where modern buildings are patterned like gift-wrapped Greek temples, where ancient Native American spiritual beliefs set the pattern for cosmopolitan Latin American novels. Postmodernism examines the kaleidoscopic variety of contemporary life. In its best versions, postmodernism teaching means respect for difference; recognition of compositeness, mixture, blending; an examination of the restrictions that prevent people from creative participation in the making and hybridizing of culture (Carey-Webb, 2001).

**METHODOLOGY:**

**Research design:** The study mainly takes the design of a qualitative educational research (Fraenkel and Wallen, 1996; Fetterman, 1986; Burns, 2000; and Nunan, 1992) in which the researcher will conduct an ethnographic study. The ethnographic study is in forms of document studies, participant observations in combination with in-depth interviews and field notes through which data collection will be reinforced by follow-up interviews. The study, on the whole, is in the field of cultural studies (ethnic studies / international studies), teacher education, content-based instruction (CBI), particularly in literature-based ELT in the university setting. It is a kind of action research (CR) in which some central issues of cultural—cross-cultural theory and reader-response approach such as view of text, role of discourse production, conceptualization of tasks, and view of reading literary texts will be under investigation.

**Sampling, instrumentation, and methods of data collection:** On the whole, since this study takes the design of qualitative research, sampling is not a matter of concern. However, integrating into the real life of teaching and learning literature at the research site is quite necessary. This is appropriate with the aims of an ethnographic study. To carry out document studies, reading library books will be of great importance so as to search for new theories in developing reader-response approach that can be served as foundation of the study. This will be done in combination with participant observations,
in-depth interviews and field note taking as triangulation to guarantee validity of the study.

In the ethnographic study, with participant observations, non-random sampling type in which cluster random sampling will be used. Standard format, which composed of three phases: before the lesson, during the lesson and after the lesson, will be applied. In the before- and after-the-lesson phases, the researcher will make contact with teachers, discuss and exchange ideas with them on the teaching points and the task types should be employed to create communicative classroom interaction during the lesson. In the during-the-lesson phase, the researcher will focus on observing how students are organized and how they interact with one another during the lesson.

The issues of culture will be categorized into three types: subculture, nationalculture and crosscultur (Kottak and Kozaitis, 2003). Issues to observe in real classes will be on (a) How much student talk occurs? (b) What are students required to do? (c) What difficulties do the students appear to have in exploring the cultural aspects in literary texts? (d) What activities are involved? (e) What helps learners express their viewpoint in literature-based classes? and (f) Can the material be a helpful source of strategies for making systematic connections between literature learning and cultural awareness? (Source: Fraenkel, 1996). And some issues to consult, discuss, and exchange ideas with teachers in participant observations will be (a) What difficulties might students have in learning literature? (b) What do students like and dislike when learning literature? (c) What are the cultural aspects in the lesson? (d) Are they understandable to the learners? (e) What makes them understandable, or motivating? (f) How could the teacher help learners grasp the teaching points? (Source: Fraenkel, 1996).

To measure explicit reactions in real classes, responses from students will be categorized into six types: Responses take place (a) individually, (b) between student-student, (c) between teacher-student, (d) among students, (e) between teacher-students, and (f) between student-material. These responses will be leveled according to the percentage of classroom participation.

Following is the format of the checklist used to measure explicit responses from classroom observations.

<table>
<thead>
<tr>
<th>Types of Response</th>
<th>Types of Interaction</th>
<th>Levels of Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(a) (b) (c) (d) (e) (f)</td>
<td>(1) (2) (3) (4) (5)</td>
</tr>
<tr>
<td>Subculture-Related Responses</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Nationalculture-Related Responses</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Crossculture-Related Responses</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Notes:
(a) Individual  (d) Between student-student
(b) Between teacher-student  (e) Among students
(c) Between teacher-students (f) Between student-material

(1) Always : 80-100% of the participation
(2) Frequently : 50-79% of the participation
(3) Occasionally: 30-49% of the participation
(4) Seldom : 1-29% of the participation
(5) Never : 0% of the participation

To measure implicit reactions in real classes, responses from students will be categorized into five types: (a) background-related response, (b) knowledge-related response, (c) experience-related response, (d) opinion-related response, and (e) feelings-related response (Source: Fraenkel, 1996).

And following is the format of the checklist used to measure implicit responses from classroom observations.

<table>
<thead>
<tr>
<th>Types of Response</th>
<th>Aspects of Response</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>B</td>
</tr>
<tr>
<td><strong>Subculture-Related Responses</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Nationalculture-Related Responses</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Crossculture-Related Responses</strong></td>
<td></td>
</tr>
</tbody>
</table>

Notes:  
B: Background-related  
K: Knowledge-related  
E: Experience-related  
O: Opinion-related  
F: Feelings-related

With in-depth interviews, non-random sampling in which informal conversations will be conducted with open-ended questions formatted on the basis of background questions, knowledge questions, experience questions, opinion questions and feelings questions (Source: Fraenkel, 1996). To achieve the final aims of the study, the question items in the in-depth interviews with teachers and academics will center around the following issues: (a) text selection and material development, (b) classroom tasks or text-attack skills to conduct, (c) cultural aspects in literary texts and (d) teaching strategies for solving cultural problems. Interviews with students will focus on (a) their learning style and learning strategies, (b) their concerns in learning literature, (c) classroom interaction, (d) students’ interest, and (e) their awareness of the cultural aspects in literary texts. Each subject will be interviewed for about 20 minutes each time and at three different stages. These interviews will be recorded and the participants will be required to listen to the
playback and answer questions for introspective data. With follow-up interviews, subjects will be varied according to the needs created by the environment.

In addition, **field notes** will be taken throughout the project when necessary. They include three types: **field jottings** used to take quick notes about something for later use; **field diary** used to reflect the researcher’s personal feelings, opinions, and perceptions; and **field log** to plan what will be done (Fraenkel, 1996). In short, triangulation will be used to ensure validity of the study. This can be seen through the use of a variety of instruments to collect data such as in-depth interviews, participant observations and field notes in the ethnographic study.

As far as the content of the project is concerned, the cross-cultural theory in this project will be conducted in a comparative setting. The researcher will speculate on different cultural formula within and across the border of Western culture which center around the following questions: (i) How do cultures represent themselves to outsiders? (ii) What roles do class, gender, race and ethnicity play in that presentation? (iii) How are these terms in conflict, and how are they subject to change over time and in different places? (iv) How do texts written in one’s culture address multicultural audiences? (v) How do outsiders interpret and evaluate texts written in other cultural contexts? How do texts written in other cultures contest and reconfigure the kind of literary works canonized by Arnold’s sense of culture? (Trimmer and Warnock, 1992). The cultural and cross-cultural aspects dealt with in the project based on the following backgrounds: multiculturalism, cultural nationalism, cultural internationalism, national boundary, globalism, new globalism, race, gender, ethnicity, pluralism, and cultural industries.

Also several aspects in the reader-response criticism might be taken advantage in this project: (i) recursive reading, (ii) explicit responses between the students and the text that could be seen through classroom interaction taking place between the students and the text, between teacher-student(s), between, within or among the students themselves; (iii) implicit responses that could be evaluated from students’ reaction and responses in their papers or assignments given by the subject teachers.

**VALIDITY:**

As mentioned earlier, the study mainly takes the design of a qualitative educational research (Fraenkel and Wallen, 1996; Fetterman, 1986; Burns, 2000; and Nunan, 1992) in which the researcher will conduct an ethnographic study. The ethnographic study is in forms of document studies, participant observations in combination with in-depth interviews and field notes through which data collection will be reinforced by follow-up interviews. This is intentionally done as triangulation to guarantee internal validity and stability of the study.

**DURATION:** The research project is intended to conduct in nine months, that is, in one academic year. In the first three months, the researcher will do literature review, familiarize with the new academic environment, take field notes and start participant observations in real classes. The project outline will be finishing by the end of this stage. In the next three months, she will conduct in-depth interviews with students, university
teachers, senior academics / administrators at the research site. Some follow-up interviews would be conducted if necessary. It is intended that the researcher will cooperate with colleagues at the research site to do some micro-teaching, or to organize workshops on learning and teaching literature. Data collected from document studies, classroom observations, in-depth interviews, and field notes will be analyzed and synthesized before the researcher start writing the first draft. In the last three months, the researcher will be reviewing and editing the final draft before having it printed.

ORGANIZATION OF THE STUDY

The study includes four parts. Part One entitled “Introduction” in which an overview, rationale, objectives, questions and scope of the study will be presented. Part Two which is entitled “Investigation” will include two chapters: Chapter Two under the heading “Literature Review” will clarify the meaning of some principal concepts related to the study such as Content-Based Instruction (CBI), Cross-Cultural Approach, Reader-Response Theory, Bottom-Up Approach, Top-Down Approach, Interactive Approach, Personal Approach, Modernism / Postmodernism; National / Internationalism, Cultural-internationalism, Colonialism / Postcolonialism, Globalism / New Globalism, national boundary, Race, Ethnicity, Pluralism, and so on. Chapter Three—“Methodology”—presents the research design, and how the structure of the study will be organized. In Part Three—“Results and Discussion”, all he results of the questionnaire and interviews will be presented in Chapter Four entitled ‘Results”. An elaborate analysis and discussion of the research questions based on the data collected from in-depth interviews, participant observations and field notes will be presented in Chapter Five—“Discussion”. In Part Four, a summary of all the findings will be done before coming to some conclusions that lead to the pedagogical implications of the study in Chapter Six “Conclusion”. This will be followed by Chapter Seven—“Suggestions” from which a number of teaching and learning strategies are provided and some suggestions for further research in the area are made. And finally are the references and the appendices included all documents relating to the study.

SIGNIFICANCE:

The project might offer benefits in many ways and for many objectives. As for the researcher herself, the project will certainly build up confidence and improve her teaching. Language teachers in colleges / universities of languages might also directly benefit from this project. ESP teachers, especially the ones in the literature-based section, might find this helpful for their teaching. The project might also be of great help for ESL students, language students at the university level in Colleges / Universities of Social Sciences and Humanities, Colleges of Education, and Colleges of Languages.

SCOPE:

Since reader-response criticism focuses on the interaction between the reader and the text, it “opens the door to a variety of approaches that further and more compellingly elaborate the connection between literature and lives” (Carey-Webb, 2001); however, it is
also due to this principle that reader-response approach tends not to be very beneficial and helpful in terms of facilitating how people define “culturally literacy” (Carey-Webb, 2001). The study, therefore, just limit to investigate the responses that might stimulate students’ cultural awareness taking place between and / or among themselves and the text rather than the ones that base on literary language elements such as plot, character, setting, and so on.

ABSTRACT

EFFECT OF COUNSELING ON NEEDS AND ACADEMIC ACHIEVEMENT Jr. INTERMEDIATE STUDENTS

No one can deny the crucial role of +2 education in the life of a student which is a turning point for their graduation. As they are in the period of adolescence, undergo lot of stress and strain. Unless their special needs and problems are identified and cared for they cannot cope up with academic pressure and achieve their best. Hence there is an urgent need to guide and counsel them for their proper adjustment in family, school and society at large.

A preliminary study has been conducted to find out the relationship between counseling needs and academic achievement of Junior Intermediate students.

A random sample of 200 students are administered Minnesota Counseling Inventory (Ralph F. Bardi and Wilour L. Layton (1957) to identify their needs for counseling. The scores of their academic achievement are also collected to find out the relationship if any.

Findings
1. Counseling needs of Junior Intermediate students are 39.06%.
2. The profile of the different areas of counseling needs follow the order of merit is - Mood - I (44.77%), Reality - II (44.45%), Leadership - III (41.58%), Emotional Status - IV (41.15%), Social Relations - V(38.6%), Conformity - VI(35.7%), and Family Relations - VII (29.5%).
3. There is a significant high negative correlation between counseling needs and academic achievement.
4. Female students have significantly more counseling needs than their counterparts.
5. Socio-economic status significantly influenced counseling needs.
6. Students of low socio-economic status had significantly more counseling needs than that of moderate and high SES.
7. Employment status of mother did not influence significantly the counseling needs of students.
CASE STUDIES

14 cases, whose scores of counseling needs are high are selected for study. The profiles of areas of counseling needs are prepared for each case to provide proper counseling.

Method

Exercises of behavior, hypno therapy and meditation are used. Along with these exercises, parents, family members and teachers are counseled.

The specific exercises given for each case are - (1) Jacobson's progressive relaxation; (2) Breathing exercise, tension, anger relaxations, thought stopping and worry chair. Hypnotic suggestions and meditation (omkar exercise) are also given.

One hour weekly session are conducted for one and half months. At the end of last (6th) session again counseling inventory is administered and also their scores of academic achievement in their final examination are collected.

Findings

13 out of 14 cases (92.3%) lowered their counseling needs and showed 10 to 20% improvement in their academic achievement.

The pretest mean of counseling needs is 42.23 and the post test mean is 29.41 (t=significant at 0.01).

After counseling their counseling needs are significantly reduced. The group showed significant improvement in their academic achievement (Pre test Mean = 42.6 Post test Mean = 57.23, t = significant at 0.01 level)
Abstract:

In recent years there has been a trend among companies, governments, and churches to offer public apologies and/or to ask for forgiveness for past wrongs. In fact, when pressured by public opinion, it is the first thing and perhaps the only thing that such an organization can do - or is it? A public expression of remorse and regret can actually serve to advance covert self-interests. A publicly contrite heart can win public sympathy, even public admiration. Wrongdoers then find or receive the grace of a new start. On the other hand, many groups of victims have expressed a clear and genuine invitation to their former oppressor to apologize for their actions—actions sometimes committed decades ago. In November 1993, President Clinton apologized to Native Hawaiians for the illegal overthrow of the Hawaiian Kingdom in 1893. Many Native Hawaiians were pleased with this confession, while others expected more from this acknowledgment. Such public confessions of collective wrongdoing raise several legitimate concerns. In this paper, I will focus on the sociological and ethical ramifications of the apologies that the US government
and the United Church of Christ offered to Native Hawaiians for the ways in which the military, political, and religious authorities oppressed and mistreated a people who were at that time living in a UN-recognized independent country.

The War on Oxy Contin and Heroin Use in New England Youth:
Applying Social Inoculation Theory to Prevent Community Disintegration

Introduction

Communities and particularly school districts have long sought effective strategies for preventing substance abuse and its extended effects (psychological distress, reduced academic success) among youth. In one area of Eastern Massachusetts, a multidisciplinary collaboration between the District Attorneys Office, university researchers, substance abuse prevention specialists and social workers, merged expertise to design an “inoculation-based” oxy contin and heroin abuse prevention intervention in the community. Rising rates of youth using oxy contin and heroin prompted this coalition to join forces.

Theoretical Base

Psychosocial inoculation theory derives from original research during post World War II at Yale and other universities hypothesizing that individuals would better “resist” enemy propaganda if they were systematically forewarned and provided practice against its persuasive appeals well ahead of exposure to it.

Formulated from the biomedical analog, where a future threat (e.g., flu virus) is weakened and then injected into the person ahead of exposure to enhance immunity, inoculation programs expose youth to the verbal and nonverbal communications (threats) they will likely encounter and gives them practice on how to successfully negotiate them. The scientific research on how youth come to be pressured into trying dangerous drugs concludes that young people receive less-than-adequate preparation on how to effectively manage this very clever “propaganda”. To the extent young people are “inoculated” about what they will hear or see in situations where drugs are being shared, they are more apt to be able to employ an array of resistance and extrication strategies. The more such strategies are utilized with success the more the problems of substance abuse are reduced. Such reductions inevitably translate into less neighborhood decay and better quality of life for those in the community. While inoculation interventions do not work effectively on all persons they have been shown to produce favorable results for a majority of participants.

Methods

In conjunction with the District Attorneys Office in ****…….. and their associates (social workers, substance abuse prevention specialists) an inoculation program was designed using multiple community and school interventions. Central among these is a curriculum of role play simulations where facilitators and participants simulate situations where young people report being pressured to experiment with oxy contin and heroin. The simulations psychologically and
behaviorally prepare participants to resist and/or extricate from both coercive verbal appeals as well as nonverbal signals they may eventually encounter in social settings in their community (concerts, movies, parties, athletic events, dances). Some simulations are scripted where participants are provided a variety of refutations to the appeals while others are unscripted and participants must generate their own rebuttals. Throughout these exercises participants and facilitators examine why and how a specific resistance or extrication strategy might work. For instance, while being pressured to try oxycontin at a party one participant is rehearsed to feign severe intestinal illness thus allowing for him/her to leave (extricate) the gathering without taking the drug. A wide variety of such strategies have been designed and tested in the program.

**Epidemiologic Trajectory**

We present the progression and epidemiology of the oxycontin and heroin epidemic in the community, how it drives the need for a *multidisciplinary effort* in creative substance abuse prevention, the entire theoretical formulation for this and comparable interventions in neighborhoods/communities and the sequence for how psychosocial inoculation programs are designed, implemented and evaluated.

**Projected Results/Analyses**

*Note:* Results and specific data analytic treatments are in process. Tentative outcomes indicate decrease oxycontin and heroin usage among the newest wave of susceptible participants relative to a comparable non-inoculation cohort (p < .05). We will report a set of dependent measures after data analyses are finalized.

**Confidentiality Assurance**

**** Due to the sensitive nature of this particular problem in the host community and affected neighborhoods, confidentiality –> at this time, prohibits identifiers or potential tracers to the identities of the participants or the community. We anticipate this will be favorably managed at a later date.

The Aged Population: The Emergence of Grandparenting

Introduction:

The twentieth century witnessed a number of dramatic changes. Advances in technology and medical care along with new weapons of mass destruction are all products of this past century. Social norms changed with shifts in perceptions of women, lowering fertility rates, and changes in sexual behavior. One of the more important changes that has received less notoriety than the others is the change in life expectancy.

In the year 1900 about one out of twenty-five Americans were 65 years of age or over. As of 2000, the proportion of elderly has risen to one out of eight or 12.4 percent of the entire population. There are almost 35 million persons in this age category. In fact there are currently almost 17 million persons 75 years and older, while there are 19 million persons under the age of five. Our oldest age cohort is almost the same as our youngest age cohort.

Another way to examine the changes in life expectancy is to look at the median age of the total population. In 1900, the median age of the population was 22.9 years. This means that 50 percent of the population was over 22.9 years and 50 percent of the population was under 22.9 years. In 2000, the median age of the population was 35.3 years. In fact since 1820 (with a median age of 16.7!), there has been a steady increase in the median age with the exception of 1960 to 1980 period where the baby boom period and its accompanying high fertility rates lowered the over age median age.

These data indicate that the United States is an aging society. This is not unique to the United States. Many of the more developed societies such as those in Europe are experiencing this same aging pattern. Life expectancy is now close to 80 years for

---

1 This paper is adapted, in part, from the author’s book Understanding Families: Critical Thinking and Analysis. Boston: Pearson, 2004; chapter 13: 126-34
females and almost 75 years for men in the United States, and some other more
developed countries have even higher life expectancies.

Perhaps even more significant is the fact that if one reaches the age of 65 years;
one has, on average, another 18 years of life. These demographic data are the
underpinnings of an interesting, but sometime overlooked phenomenon in our society,
and that is the emergence of grandparenting. One of the myths of family life is the belief
that in the past three generation households were common. This is a myth because in the
past there were not many grandparents. With relatively low life expectancy, very few
children ever saw their grandparents.

Today it is much more common for children to have grandparents. Evidence
indicates that grandparents are vital members of the extended kin network of children. A
recent survey by the American Association of Retired Persons (AARP) revealed that four
out of five grandparents had at least spoken to their grandchild in the previous month, and
about 70 percent had shared a meal with their grandchild.

There is no one type of grandparent. There is substantial variation in
grandparenting relationships. Different researchers have developed different grandparent
typologies. What follows is a summary of several different typologies. The grandparent
topology includes the following: family historian, mentor, entertainer, formal,
distant, and counselor.

The family historian is the grandparent who relishes in telling stories about the
family’s past. (S)he may be the repository of the family’s history and relishes passing on
this information to the younger generations. Younger grandchildren may not appreciate
this information, but as they get older the grandchildren are sometimes sorry they were
not as attentive as they should have been.

The mentor is the family elder others look up to and want to emulate. S(he is a
teacher who serves as a role model for others. Similar to the mentor is the counselor and
in many cases the grandparent combines both roles. The counselor is a good listener.
(S)he helps to soothe over conflicts between parents and child. This person has a good set
of ears and allows the child an alternative to the parent. Although this may be a very
difficult role to play, the grandparent may serve as a mediator between parent and child.

The **entertainer** is the fun loving grandparent. This person is typically a source of
great joy for the grandchild. This is the grandparent who tells jokes or wonderful stories.
This grandparent is the child’s “pal.” Somewhat opposite of the entertainer is the **formal grandparent**. As the term implies, this grandparent is very formal and “proper” in their
interaction with the child. They don’t seem to let loose. This type of grandparent was, in
all likelihood, a formal parent.

The **distant grandparent** is not defined by geographic distance. This is the
grandparent who has infrequent contact with the child. This may be due to individual
personality characteristics, issues related to their own son or their in-laws, or this
grandparent may be the parent of a divorced child who is the non-custodial parent.

How do these various types of grandparenting styles emerge? A key factor, of
course, is the relationship the grandparent had with his/her own children. This three-
generation relationship constitutes a **triad**, with each generation influencing the
relationship with all other generations. If a grandparent has a difficult relationship with
his or her own child, this may help to sour the relationship with the grandchild.
Grandchildren, on the other hand, develop strategies as to how to interact with their
grandparents by observing how their own parents interact with the grandparents.

In addition to these internal dynamics, the larger culture will also influence the
interaction patterns. Variables such as social class, race, religion and ethnic background
may all impact on the triadic relationship. Cultural perceptions of the elderly will also
play a role. It seems to be the case that in the United States there has been a sea change in
the perceptions of the elderly. In the past the elderly were seen as **old**. This may seem
odd so allow me to explain. Years ago the elderly were older in how they behaved.
Perhaps because of closer ties to traditional notions of the elderly, they were to be
revered. You would not see the entertainer type of grandparent as much as you would see
the formal or distant type.
Today many grandparents are what one researcher terms the “young-old.” Persons 65 years and over are in many ways more youthful than their counterparts in the past. They are certainly healthier and are often better educated as well. The culture’s entire perception of old age is changing. This may be due to the large numbers of baby-boomers who are beginning to enter this stage of life. To put it in a historical context, this emerging grandparent generation was there when Rock and Roll began in the 1950s. They were fans of Elvis Presley, and later on the Beatles and The Rolling Stones. They listened to Bob Dylan, and participated in the Civil Rights Movement, the Women’s Movement, and debates about society’s involvement in the Vietnam War.

They are also a generation that is the wealthiest the society has ever produced. In large measure because of the high level of educational attainment, and the expanding economy this generation is better prepared to retire than any generation before. It understands the importance of 401Ks and IRAs and other retirement products. Perhaps because they understood that unlike previous generations there was a much greater likelihood that they would have a large number of retirement years, they took greater care to plan for that retirement. The reader, however, should not misinterpret this information. There are still elderly members of the society who are not well off economically. A number of elderly are poor, although the proportion of elderly who are poor is not as great as was the case in the past. What of course all this means is that the emerging generation of grandparents has both the physical and economic resources to be more active grandparents.

Because the potential to grandparent is greater today than in the past the question then arises as to how to integrate oneself into the life of the grandchild. One important issue that may be contentious is parenting styles. Grandparents and parents may differ as to the strategies being utilized by the parents. The reverse may also hold true. For example, the grandparents may wish to give things—money, toys, etc.—to the grandchildren. The parents may interpret this as spoiling the child. What constitutes giving and spoiling is not clearly delineated. It seems to be a matter of one’s point of view. However, real disputes may arise over this very issue.
What is interesting is the underlying dynamics. The grandparent is still the parent of the parent. Your own children may be different parents than you were; their children are certainly different children than were your own children. There are not only different personalities at play here, but also different generations. Each generation is a product of a different cultural milieu with different values, beliefs, and certainly with different experiences. This three-generation triad then has the potential for much friction. What is surprising is that there is little evidence that much friction occurs. Most grandparents, when surveyed, appear to be quite happy in their grandparenting role.

The most intensive form of grandparenting is when the grandparents take on the parenting role full time. We will refer to this as the grandparent as parent (GAP). This is often seen as an oddity or at the very least somewhat unusual. It is often the result of a tragic set of circumstances whereby the biological parent has died; there is a young unwed mother who is incapable of raising the child; the parent is incapacitated by physical or emotional illness; there is the presence of substance abuse; or, one or both parents are incarcerated. In some cases, GAP may not be the result of a tragedy of such dimensions, but may be due to situations where both parents work, and work long hours. It may be due to divorce, and the custodial parent must work to support the family. In any case, GAP appears to be somewhat of a social anomaly and there is relatively little social support and unclear legal status for grandparents.

There have been a number of recent legal cases involving the legal rights of grandparents. Courts have not sent any clear message as to these legal rights. In some cases the grandparent(s) may be granted physical custody of a child where the child lives with the grandparents. There is also the issue of legal custody—who has the right to make legal decisions for the child. Grandparents may also seek or be assigned guardianship that typically involves temporary physical and legal custody. In some cases grandparents may adopt their own grandchildren which would result in permanent physical and legal custody. All of these cases involve a difficult and perhaps costly legal process. In most states the court cases indicate that courts favor parents over grandparents even in cases involving visitation rights. If custody is at issue this will be even more difficult for the
grandparent to attain. Because this is largely an emerging form of family, the legal process will evolve over time.

There are several positive and negative attributes to GAP. **Positive attributes** include helping the child to grow and mature and the emotional benefits derived from this experience. Raising a child may also help the grandparents stay or at least feel young. Being around young people may stimulate one’s own feeling of well being. In some cases, raising the grandchild also benefits one’s own child - if he or she needs to work, or if he or she is going through some difficult period in their own life.

**Negative attributes** may include the economic hardships one may incur in trying to raise a child. Bringing the child in may alter the grandparent’s own retirement plans. As the grandparent ages, health issues may arise, and their capability of raising the child may be brought into question. For many grandparents put in this position, this may be viewed as a mixed blessing.

Next, this paper will examine some of the relevant data on grandparenting.

**Data Analysis:**

**Table 1 Total Number of Persons and Persons 65 or Older (in millions): 1950 to 2000**

<table>
<thead>
<tr>
<th>Year</th>
<th>Total Population</th>
<th>65 or Older</th>
<th>Percent Aged</th>
</tr>
</thead>

<tr>
<td>2000</td>
<td>281.4</td>
<td>35.0</td>
<td>12.4</td>
</tr>
</tbody>
</table>

Table 1 presents data on the overall change in the aging population. Since 1950 the proportion of the aged population has risen by 50 percent, from 8.1 percent of the total population in 1950 to 12.4 percent in the year 2000. The total population has increased by 85 percent, while the aged population has risen by 185 percent.

The data in Table 2 help to explain the growth of the aged population. Life expectancy, both at birth and at age 65, has increased substantially since 1900. For men, at birth, life expectancy has increased by 26 years, and for women the figure is close to 29 years. At age 65, life expectancy for men is now almost five years more than it was in 1900, and for women it is 7 years more.

Table 2: Life Expectancy at Birth and At Age 65: 1900 to 2000

</table>

These data clearly indicate that there is a larger number and percent of people living longer lives. How then does this impact on grandparenting patterns. Table 3 presents data on grandchildren living in the homes of their grandparents.

Source: U.S. Census Bureau, Grandchildren Living in the Home of their Grandchildren: 1970 to Present, release date: June 29, 2001 www.census.gov/population/socdemo/hh-fam/tabCH-7.txt

There has been a consistent and steady increase in both the number and percent of children living with their grandparents. While the total percent increase in children under 18 years of age between 1970 and 2000 was a mere 3.9 percent; the increase of children living with their grandparents rose by 74 percent.

What are these households like that have grandparents and grandchildren? Are the biological parents (and children) there as well; or, are the biological parents absent? Table 4 presents data that will help to answer these questions.

Source: U.S. Census Bureau, Grandchildren Living in the Home of their Grandchildren: 1970 to Present, release date: June 29, 2001 www.census.gov/population/socdemo/hh-fam/tabCH-7.txt
The household configuration of grandchildren living with grandparents has undergone changes over the past thirty years (see Table 4). In 1970 and 1980 the modal category was no parents present. In 1990 this changed to the mother only present category. This, in part, may be accounted for by the increase in out-of-wedlock births and the rising divorce rate. A number of single mothers, regardless of cause, may return to their parental home for both financial and emotional support. A little over one-third of the children living with their grandparents have no parents present in the household.

The 2000 Census allows for further analysis of the grandparent-grandchild relationship. Question 19a. on the census long form asked: “Does this person have any of his/her own grandchildren under the age of 18 living in this house or apartment?” If the response was “yes” then there were two follow-up questions:

19b. Is this grandparent currently responsible for most of the basic needs of any grandchild(ren) under the age of 18 who live(s) in this house or apartment?
19c. How long has this grandparent been responsible for the(se) grandchild(ren)?

The census took as their population all persons 30 years old and over. Table 5 presents some of the data derived from these questions. It examines both the percent of grandparents who were responsible, and the duration of that responsibility. The analysis includes the variable of race and Hispanic origin for those listing one race only.

If one looks at the entire population 30 years old and over there are some significant differences based on race and Hispanic Origin in the percent of grandparents who reside with their grandchildren. For the white subgroup, it is 2.5 percent. For Black or African Americans, the figure is 8.2 percent. For Asian Americans it is 6.4 percent, and for Hispanic Americans it is 8.4 percent. The data in the table allows for a more in depth analysis.

Over one-half of all African American grandparents were responsible for their grandchildren, while for Asian American grandparents, it was only 20 percent. Therefore, not only is there a larger percentage of African Americans living with their grandchildren, a larger percentage is also responsible for their grandchildren. For all groups, the modal duration time for this responsibility is 5 years or more; however, there is a larger percentage of African Americans who fall into this category as compared to the other groups. For African Americans close to one-half of all grandparents are responsible for 5 years or more while for the other
groups the data indicate about one-third of the respondents fall into this same category. What is somewhat surprising (at least to this author) is that for all groups the responsibility lasts over an extended time with only one-fifth to one-quarter of the grandparents responding that their responsibility is for one year or less.

Conclusions:
This paper has examined what is often an overlooked emerging pattern in family life in the United States—the emerging importance of grandparenting. As the data indicate, there is a growing trend in children being raised by their grandparents. In 1970 one out of thirty-three children, under the age of 18 years were living with their grandparents. In 2000 this had increased to one out of twenty. In 2000, 42 percent of those children had grandparents who
were responsible for them as reported by the grandparents themselves. In addition, as noted above, this responsibility lasts for an extended period of time (5 years or more).

This raises many questions for the society as a whole. There appears to be relatively little public discussion of this family pattern. Are there support networks, financial, legal and other, in place to assist families with this household structure? At the very least, it appears that there is a need for further research on this emerging phenomenon. This paper may be viewed as a very preliminary effort in that direction.

Convergence phenomena in a European context: the role of Europeanization?

By

Sophie Enos-Attali, Alexandra Jönsson
and Elizabeth Sheppard

Understanding the relationship between convergence and Europeanization is at the heart of European integration studies. The quest has in general essentially been to determine if Europeanization leads to the convergence of national policies, the convergence of public policies at the domestic level being considered as the obvious impact of the European integration on policy-making in Europe. Our analysis is rooted in an analysis of the effects of European integration upon the administration of public policy in Europe as well. Nonetheless, such an inquiry is different from traditional analyses, in that we propose to pursue our investigation by using convergence, and not Europeanization as the starting point. Rather than focusing on the amplitude or the limits of convergence engendered by Europeanization, our analysis asks whether the existence of convergence between EU member states in given policy fields can be explained as the result of Europeanization?

The observation of the convergence of national policies in Europe in the sectors of family policy, foreign policy, as well as security and defense policy leads us to question the notion of Europeanization. While the examination of the possible factors of convergence does not highlight the EU as the principal explanation, the analysis of processes of convergence highlights the role, not necessarily central, but ever-present of Europe. Relying on the perspectives introduced by different works on policy transfer, our analysis allows for the detection of several mechanisms by which shared norms, perceptions and logics of action can be diffused between different political systems. From our reflection we find that Europeanization plays an important role in the societal and political transformations in European countries. This role notably surfaces as Europeanization intervening indirectly in the interactive processes that link the different levels of governance and by which the diffusion of cognitive and normative conceptions pass. Thus, Europeanization appears as a useful resource to understand the convergence of public policy.
Be On the Look Out: Exploring the Neighborhood Correlates of On-Campus Crime

This study is a secondary analysis exploring the relationship between neighborhood conditions in areas adjacent to a major university in a large southeastern city, and rates of on-campus crime and victimization. The goal of this study is to increase knowledge of the impact local neighborhoods have on institutions of higher education in urban settings. An important benefit from this study will be developing more innovative campus-community partnerships to enhance quality of life for both local residents and students.

The geographic location of many metropolitan universities places them within a broader community context shared with surrounding neighborhoods. As a result, the impact of social and economic conditions within these adjacent communities may influence rates of on-campus crime committed by “non-affiliates” (i.e. non-students). This study uses existing data available through the campus police department, the U.S. census bureau, local law enforcement agencies, and city/county government to address two research questions: 1) What are the rates and types of on-campus crime perpetrated by non-affiliates; 2) Do increased rates of crime, poverty, and residential instability in neighborhoods adjacent to the university result in higher rates of crime committed on-campus by non-affiliates. In addition, Geographic Information System (GIS) software will be used to geo-code and map data from this study. The purpose is to determine which neighborhoods have the highest concentration of arrested offenders, and to more closely examine the social and economic conditions within those locations.

Findings from this study will be used to further develop university-community partnerships that promote neighborhood revitalization efforts as an anti-crime strategy both on and off campus. A re-examination of the role of campus resources to support crime prevention efforts aimed at ensuring the safety of students is necessary. Consideration will be given to a partnership approach that embraces re-development
initiatives which may raise the quality of life for all residents in a community, including students housed on and off campus. Potential partners in this endeavor include local community residents, neighborhood associations, faith-based organizations, business leaders, law enforcement agencies, student organizations, and the university community.
Linking Kinship Families to Community Supports:  
The Role of Geographic Information Systems (GIS) to Inform Service Delivery

This paper reports on a study that used Geographic Information System (GIS) technology to examine the need for service delivery among families providing kinship care in five counties of West Central Florida. The goal of the research was to increase awareness of the spatial disparities between kinship families requesting linkage to community-based resources and the availability of those services within their immediate geographic area. One important benefit from this study is to inform policy decision-makers about the gaps in service delivery for families providing kinship care and the need to more effectively utilize resources to match the requests for support within the geographic locations most in need. A second benefit is the continued development and dissemination of cross-disciplinary knowledge to inform social work practice and positively impact social welfare policy.

Background
Kinship care is defined as “the full time nurturing and protection of children who must be separated from their parents by relatives, members of their tribes or clans, godparents, step-parents, or other adults who have a kinship bond with the child” (Child Welfare League of America, 2002). A variety of social factors contribute to children requiring substitute caregivers, including neglect, abuse, abandonment, substance abuse, non-marital childbearing, mental illness, HIV/AIDS, emotional difficulties, teen pregnancy, incarceration, parental death, divorce, unemployment, and general familial dysfunction (Caputo, 2001; Flint and Perez-Porter, 1997; Landry-Meyer, 1999; Minkler and Roe, 1996; C. J. Smith and Beltran, 2000).
The rates of children being raised in kinship family homes have risen markedly in recent years. In 1997, it was estimated that 1.8 million children lived with relatives, with neither of their parents present in the home, according to analyses of the 1997 National Survey of America’s Families (NSAF) (Ehrle & Geen, 2002). The 2000 U.S. Census presented higher national figures, including reports of 4.5 million children under the age of 18 living in grandparent-maintained households, and another 1.5 million children under 18 living in other relative-maintained households (Generations United, 2001).

**Research Objectives**

The overarching goal of this research is to increase awareness of the spatial disparities between kinship families requesting linkage to community-based resources and the availability of those services within their immediate geographic area. Several objectives are identified: 1) to increase our understanding of the need for information and referral services among families providing kinship care in five counties of West Central Florida; 2) to increase awareness of the spatial disparities between kinship families requesting linkage to community-based resources and the availability of those services within the immediate geographic area, and; 3) to maximize the effective utilization of community resources by identifying existing gaps in service delivery and enhance planning for the distribution of additional supports.

**Methodology**

Administrative data were collected from telephone calls to a help line for kinship care providers seeking assistance in locating community resources and supports. The data covered a five county area of West Central Florida and included 160 kinship families (n = 160). Addresses provided to the help line were geo-coded and mapped at the census tract level using ArcView GIS software. Community resource data were also mapped indicating the location of available services within each county at the tract level. Finally, a set of indicators from the 2000 U.S. Census were mapped to display the social and economic characteristics of each census tract. The spatial data were examined to determine the distribution of kinship families requesting assistance and the availability of community-based resources to meet the needs expressed.

**Discussion**

One important benefit from this study is to inform policy decision-makers about the gaps in service delivery for families providing kinship care and the need to more effectively utilize resources to match the requests for support within the geographic locations most in need. Child welfare practice, policy and research have championed efforts designed to meet the unique needs of kinship care families. However, most kinship care is informal and unaccounted for by any agency, making it difficult to accurately assess the number of families affected and services needed. Many of the families involved in kinship care are not involved in the child welfare system and do not receive the amount or quality of support available to those families with differential child welfare oversight. Results from this research can assist in raising awareness of the spatial disparities that exist with regard to the distribution of community-based resources available to families providing kinship care. This is particularly true for families residing in rural communities. This information can aid agencies in the decision making process.
to maximize limited resources by ensuring that services are accessible to the greatest number of families expressing need.

A second benefit from this research is the continued development and dissemination of cross-disciplinary knowledge to inform social work practice and positively impact social welfare policy. This study was designed in partnership with a regional community agency on aging to apply current technology for thinking innovatively about service delivery issues. The study provides an interesting way to use administrative data for informing policy decisions to help families engaged as kinship caregivers.
Title: The Risk and Reward to Pension Investments in Employer Stock

Abstract:
This study examines the consequences of a pension fund investing in the stock of the sponsoring firm. Using a merger of data on pension asset holdings from IRS Form 5500 filings and financial data on the company’s stock from CRSP, two broad questions are addressed: First, what factors influence the extent of a pension funds’ investments in the employer’s stock? Second, when a pension invests in the employer’s stock, how much is lost as a result of poor diversification? The empirical results suggest that investments in employer stock are responsive to non-diversification costs, tax consequences, and employee risk preferences. Also, a 10 percentage point increase in the holdings of the typical employer stock is estimated to result in an expected return that is 0.9 to 1.2 percentage points below what could be earned by an efficiently managed portfolio.
Smiling and Agreeableness

Smiling and Agreeableness

Abstract

Studies indicate that women tend to smile significantly more than men (Dodd & Russell, 1999; LaFrance, Paluck, Hecht, 2003). In addition, some researchers suggest that smiling is a sign of agreeableness; thus the reason for the findings that women smile more. Others see smiling as a sign of submissiveness or a way to ease tension rather than a sign of agreeableness (Eagly, 1995). Based on these studies, the present study was designed to investigate the relationship of smiling and gender in the attribution of perceptions of the personality characteristic of agreeableness.

A total of 24 black and white pictures were used as the stimuli for this project and included two pictures each for six females and six males of similar age. Each of the twelve individuals was pictured smiling in one picture and not smiling in another picture. Each of the 24 pictures had a rating scale based on Norman’s twenty markers for the “Big Five” personality traits of surgency, agreeableness, conscientiousness, emotional stability and culture attached to the bottom of the picture.

Four forms of participant questionnaire packages were developed each containing six pictures consisting of three males and three females; three smiling and three not smiling. The same individual did not have both a smiling and not smiling picture in the same packet.

Participants were read a Consent Agreement when requesting their participation in the study. A packet was then given to each participant that included the pictures with the attached rating scale. The participants were asked to 1) look at each picture and decide what type of person you think is in the picture and 2) for each trait, circle the number that best represents the personality
characteristics of the person in the picture. Participants were asked to provide limited
demographic information regarding gender and age on the instruction sheet. Participants were
given a debriefing form as soon as they completed the packets.

Preliminary analyses focused on differences in the assignment of the personality trait of
agreeableness to the pictures based on the gender and smile of the individuals pictured.
Agreeableness was measured by adding together Norman’s four markers of agreeableness on the
rating scales. Values ranged from a total maximum of 20 (least agreeable) to minimum of 4 (most
agreeable). The 137 participants include sixty-four males and seventy-three females. Seventy-
seven percent of the participants were 18 to 25 years of age, twelve percent were 26 to 35 and
eleven percent were over 35 years of age.

Multivariate Analysis of Variance (Wilk’s Lambda) indicated a significant main effect of gender
(F = 4.101; p = .045) and a significant main effect of smiling (F = 66.233; p < .001). The
interaction of gender and smiling was not significant. Pictures of males (mean = 10.949) were
rated significantly more agreeable than pictures of females (mean = 11.480). Pictures of
individuals smiling (mean = 10.076) were rated as significantly more agreeable than individuals
not smiling (mean = 12.354).

“The White Man’s Burden”: Female Sexuality, Tourist Postcards, and the Place of the Fat Woman in Early 20th Century U.S. Culture

6. The cultural and ideological meanings of the stigmatized fat body have been largely unexamined and undertheorized within historical scholarship, with the exception of recent works such as Braziel and LeBesco’s Bodies Out of Bounds: Fatness and Transgression and older works such as Hillel Schwartz’ Never Satisfied: A Cultural History of Diets, Fantasies, and Fat. This paper explores the symbolic place or rather no-place of the fat woman’s body within early 20th century U.S. culture through a discussion of a collection of “fat women” tourist postcards from the 1910s-1940s, which I located at the Alice Marshall Women’s History Collection at Penn State-Harrisburg, while researching my book, Fat Shame: Stigma, Dieting, and the Fat Acceptance Movement.

By the beginning of the twentieth century, fatness for women became associated less with matronliness, healthful fertility, or attractive sensuality, than with a body out of control, exuding an overabundant sexuality that threatened to suffocate men. Illuminating this particularly well are these popular postcards sent in the first half of the twentieth century, often from beach destinations or national parks and arriving with clever sayings from the sender. The butt of many of the postcards’ jokes—literally and figuratively—were women’s voluminous buttocks, portrayed as so comically huge that they literally overcame the elements, blocking out the sun, providing shade for sunburnt children, stemming the tide, or causing tidal waves of their own.

Literally, then, these fat women took up too much geographic space; in addition, the cards clearly suggested they took up too much sexual space. In postcard after postcard we see women bending down—to look for a shell, to do the laundry, to reach over the railing of a ship. We see the round cheeks of her bottom, clad in some absurdly decorated, lacy undergarments. While all these postcard women are white, their poses are reminiscent of the early 19th century representations of the African “Hottentot Venus.” The only men in these postcards who look happy with these fat women are poor (hobos), working class (such as plumbers) or exceedingly silly (the absurdly small or thin). In contrast, most of the men in the “comic fat women”
postcards are more like the white middle class white man who sits in a drawing room with a heavy woman on his lap, with the telling caption “The White Man’s Burden.”

This paper places these representations within the context of medical and popular literature from the time that increasingly valorized the superiority of the thin body as one showing “correct” attitudes of control, both in terms of sexuality and appetites for food. According to this literature, the “thin ideal” needed to be taught to the “primitive”, meaning immigrants, the working class, and, certainly, people of color. Ironically, then, these tourist postcards illuminate both the increased mobility of the middle class within the United States, and the decreased symbolic and literal space available to any woman who did not toe the line of bodily control.

6. Abstract
   Please see next page
In this workshop, a new approach is outlined in which “affective” techniques are systematically combined with cognitive and behavioral techniques for alleviating emotional disturbance. This is referred to as “Cognitive Behavioral Affective Therapy” or CBAT. This approach is placed in historical perspective by taking a glancing look at the dawn of behaviorism, the advent of cognitive science, and the present resurgence of interest in the topic of emotions. It is pointed out that affective approaches to therapy may take advantage of current developments in the psychology of emotion. It is explained that the cognitive and behavioral are indeed vantage points for tackling human psychological problems but that they are greatly complemented by another direct point of entry: the emotional or the affective. When these three avenues converge, a holistic approach to therapy is produced.

The second phase of the workshop is devoted to an exposition of the affective techniques. Here, the primary consideration is to ensure that the techniques chosen are compatible with techniques from the cognitive or behavioral domains. A distinction is made between theoretical compatibility and pragmatic compatibility. A second issue is the need to engage in some selection process so that techniques are tailored to the particular client and the particular problem at hand. Among the techniques described are time-honored emotionally evocative or emotionally cathartic techniques. These include adaptations of Gestalt therapy, psychodrama, play therapy, expressive writing, but they also extend to components of modern-day emotion-focused therapy. Applications of these techniques to certain types of emotional disorders (e.g., the anxiety disorders, depressive symptoms, and maladaptive anger) are illustrated with reference to case studies. The author also draws upon his recently published research and ongoing projects where CBAT has been employed.

The third and final phase of the workshop is highly discursive and interactive. Ethical considerations in the use of CBAT are explored in comparison to the ethical challenges that typify other types of therapy. Methodological issues for outcome research on CBAT are broached. Prospects for greater multicultural relevance of psychotherapy are raised. Finally, ideas for further innovation and selective integration of therapeutic techniques are invited as part of the need to keep pace with the changing discipline of psychology and the ever changing world of human problems.

6. Abstract

   Please see next page
Anxiety, depression, and anger are not only the modal affective problems experienced by medical populations (as documented in a recent book by the author) but they are also the most common affective disturbances in the general community. Recent research supports the view that these are highly prevalent as well as closely co-morbid with one another. They are therefore termed the “Core of Negative Affect”.

With reference to the psychology of emotions, it is explained that anxiety, depression, and anger disorders are extensions of the primary emotions of fear, sadness, and anger. With reference to evolutionary psychology, these emotions are interpreted as the prime motivators of our defenses against aversive stimuli.

Evidence for the prevalence and co-occurrence of anxiety, depressiveness, and dysfunctional anger (or their emotional rudiments) is drawn from research on community samples. It is further evident that at the root of these types of affect are specific cognitive appraisals and at the motivational end of these types of affect are action tendencies: in the case of fear or anxiety, the perception of threat motivates escape or avoidance; for anger, perceived wrongdoing generates the urge to retaliate or resist; for sadness or depressiveness, perceived loss or misfortune generates a tendency to withdraw or submit or yield. The author proposes another facet of these affective types -- the action fantasy or what the individual would like to be able to do.

The author incorporates these three facets (cognitive appraisal, action tendency, action fantasy) in a new rationally constructed assessment tool for anger, fear/anxiety, and sadness/depression. Called the CONA (Core of Negative Affect), this instrument yields scores on each of the 3 affective types that correlate highly with scores from existing clinical scales of anxiety, depression, and anger. By implication, the CONA can serve as a prescreening tool for these core affective conditions. Assessing the three core negative affect qualities in one instrument provides the added advantage of a common metric for scoring and interpretation of results. Further research is proposed to test the long-term predictive validity of the CONA and the generalizability of its results.

6. Abstract

Please see next page
As they grow and expand on global economic endeavors, cities in the U.S. attract immigrants from many developing countries who seek greener pastures and better employment opportunities. Relying on mutual social support systems and on various economic prospects within the systems, these immigrants often form ethno-specific neighborhoods that are distinctive in their social character. As a result, urban ethnic enclaves are an increasingly common phenomenon in the multicultural American metropolis today. Literature examining cultural enclaves in cities often focus only on their economic aspects and/or inter-group politics within cultural communities. While the foundation is undoubtedly an economic need, there are many other socio-cultural forces at play in ethnic enclaves in cities. Ethnic neighborhoods also contribute significantly to contemporary American urban landscapes by creating a plethora of cultural expressions through the physical built environment. However, how the phenomenon of culture interacts with the urban built environment to create a distinctive enclave character is a rarely addressed topic in scholarly discussions. This paper examines the specific nature of the inter-relationships between cultural behavior and the urban built landscape of Chinatown in New York City. Based on empirical research and naturalistic data collection, the study analyzes various mechanisms with which the culture of the Chinese immigrant community is expressed through the medium of the urban built environment of Chinatown. The key concepts discussed are the group behavior shaped by culture and represented through various activities that involve space use, the nature of architectural elements and built spaces that aid in such behavior, and the resultant community and place identities and meanings. Findings of the study show that interactions between culture and the urban environment in Chinatown are complex and heterogeneous in type. Urban streets are widely used not only for economic activities but also as social, religious and community spaces; they are spaces with culture-specific meanings. The built environment also renders itself beyond the instrumental uses; building facades, street level stores and services and sidewalk spaces are all spaces that carry cultural meanings, generating a sense of community and place identity for the Chinese American inhabitants. The results of the study add knowledge to the current quest in understanding the role of the built environment in accommodating socio-cultural differences of the users. It also complements the research efforts towards developing the concept of inclusive urban design and planning practices in multicultural cities in the U.S.

Basic Planning Ideas

**Ebenezer Howard**

Howard is the innovator of the Garden City. He was an advocate for small self-sufficient cities. He supported the human scale, which he delineated as 10 sq. miles. The city was based on public ownership with a small intimate feel. He did not advocate the through traffic associated with mixed use cities. He believe amenities such as laundry, restaurants and small industry should be kept on the outer limits of the city.

**LeCorbusier**

LeCorbusier was of child of the Bauhous Movement. This was the ideological movement of simplicity and functionality. He was one of the forefathers of the prototype of the housing complex. This is exemplified in his large towers with small footprints. He also saw the need to bridge the gap with man and nature. In housing complex that use his knowledge as precedent this is seen with the use of courtyards. He took a kit of parts approach to architecture and planning. He had a one size fits all attitude, ignoring the aspects of infrastructure, class and context.

**Mumford**

Mumford is pretty much the opposite of LeCorbusier. He supports a non-mass productionist approach. Through the individualistic approach like Howard, he advocated the more intimate scale. However, he believes zoning fell under the sins of separation and embraced the idea of mixed use. This mixed use would be implemented through more cellular communities. This included low-rise multi-family units that developed through organic growth.

**Wright**

Wright did not support the tract housing approach to planning. In his Broad Acre City, he supported the idea that every American had the right to the American dream by being allocated no less the one acre of land. He advocated the individualistic approach to the point of isolation. He despised the idea of multi-family unit. The apartment build depicted a jail cell. He believed in as little interference from federal government as possible, a strong supporter of local power. Americans have the right to be left alone with their families. This meant a high depends on the automobile. Today he would be a chief advocate of sprawl. He too was blind to the diverse situations of the populous, ignoring class or social constraints.

**Jacobs**

Jacobs is a New Yorker who loved the city. She is a strong advocate of inner city life and out rightly condemns suburban life. She believes planners should utilize a small block format to encourage mixed primary uses. Within these small blocks should be buildings
that speak to the character of the place. This includes occupying old buildings as well as new ones with mixed-use occupancy. She supports more intimate parks opposed to large parks. She suggests the problem with cities losing population is white flight. A way to alleviate this situation is there should be more of balances economic accommodations. She never deals with the fact that people are territorial, value ownership, the automobile or infrastructure.

**Neotraditionlist View**

The Neotraditionlist view supports walkable suburbs, mass transit, mixed-use development, pedestrian friendly design and private-public partnerships. The mix-use can be linked back to Jacobs. The pedestrian friendly more intimate scale can be connect the Howard and Mumford. Perry supported private-public partnerships. He also used the technique of curvilinear streets to deter through traffic like Howard.

Using Public Policy to Promote Community Economic Development: Focusing on Transportation and Workforce Development Policy

By Zenobia L. Fields

Abstract

This study is being conducted in the interest of discovering changes that can be made in transportation and workforce policy to promote economic development. These changes will revolve around the amalgamation of place-based and people-based strategies with an emphasis on investment in people. The people-based strategies will relate to transportation policy, while place-based strategies will pertain to workforce policy.

The following research questions will be answered: What people-based policy changes need to occur through collaborative efforts to foster environments in urban areas that synthesize upward mobility through workforce development? What are the advantages of place-based and people-based strategies? How can transportation policy like Job Access and Reverse Commute grant programs, a people-based strategy, be changed to produce greater outcomes? What lessons can be learned from products of workforce development policy such as one-stop centers, a place-based strategy, in terms of performance? To answer these questions, the investigation uses case studies of Job Access and Reverse Commute grant and one-stop center programs, with the intent of deriving a framework for interagency coordination strategies.

The case studies include the Northern Jersey Transportation, the Baltimore Metropolitan Regional Transportation and the Portland, Oregon Tri-Met Plans. In addition, one-stop centers within the same three regions were examined for potential connections. A comparative analysis of all the case studies will be performed focusing on six major components in order to propose a policy framework that includes federal influence, governance structure, mechanism to connecting with the marker, feedback mechanisms, incremental career step provisions, and accountability systems.

CHAPTER 1: INTRODUCTION

This investigation employs the use of literature reviews, case studies, and comparative analyses to illustrate the changes in policy needed to foster the synthesis of people and place-based strategies, which allows greater upward mobility for low-income citizens through workforce development. Recommendations for change are developed through the discussion and evaluation of two different types of case studies, which illustrate people-based and place-based strategies. The first set of case studies will focus on transportation policy, particularly Job Access and Reverse Commute grant programs, to illustrate a people-based strategy. The second set of case studies will be a product of labor policy, in particular one-stop centers, a representation of a place-based strategy. The investigation will lean in the direction of people-based strategies. Even though one-stop centers are in the realm of place-based strategies, one of the centers main functions is skill development of the workforce, which is a people-based strategy. The combination of the two economic development strategies is thought to have the greatest potential for increasing the standard of living among low-income citizens.

This paper begins with a literature review, which includes a discussion of potential implications resulting from this study. The three major points of interest are economics, access, and one-stop centers. The various strategies and initiatives covered under these topics contribute to the progression of workforce development, which will inevitably contribute to economic development. Next, case studies relating to transportation and employment initiatives will be presented. Finally, a comparative analysis of all the case studies will be performed focusing on six major components in order to propose a policy framework that includes federal influence, governance
structure, mechanism to connecting with the marker, feedback mechanisms, incremental
career step provisions, and accountability systems.

Research Question
What people-based policy changes need to occur through collaborative efforts to foster
environments in urban areas that synthesize upward mobility through workforce
development?
Specifically:

- What are the advantages of place-based and people-based strategies?
- How can transportation policy like Job Access and Reverse Commute grant programs, a people-based strategy, be changed to produce greater outcomes?
- What lessons can be learned from products of workforce development policy such as one-stop centers, a place-based strategy, in terms of performance?

Hypotheses
1. Coordination across disciplines (i.e. transportation and labor) is not seen as an
efficient method of economic development by decision-makers.
2. Collaborative initiatives though envisioned in a comprehensive manner are
implemented in a piece-meal fashion.
3. Place-based strategies inevitably cause inequalities.
4. Sustainability provisions for initiatives affecting workforce development specifically,
accountability systems are lacking.
**Objectives and Methods**

*Objective 1:* To understand current transportation policies in place that could be changed to promote economic development.

*Method 1:* Perform comparative analysis of three case studies that have implemented Job Access and Reverse Commute grant and three case studies of One-Stop center program initiatives in the same metropolitan area as the grant programs in terms of economic development potential.

*Objective 2:* To suggest changes in policy and implementation tactics based on analysis conducted in objective/method one.

*Method 2:* Interview organizers with standard inquiries and get feedback on possible changes. The organizers were asked the following: Who are the necessary stakeholders and what fields should be targeted for recruitment? What are the coordination issues? What continuation factors are built into the programs? What are the criteria for the targeted populations participating in the program? What are the criteria for evaluating progress? What non-work travel services are offered with the program, if any? How are issues of accountability handled?

Note: Response can be reviewed in Appendix A.

*Objective 3:* To suggest ways to improve the standards of living for low-income and welfare populations, based on the research conducted in objective/method one and two.

*Method 3:* Develop a model that includes missing or underrepresented issues necessary for consideration in order to promote career ladder progression.
CHAPTER 2: LITERATURE REVIEW

Community Economic Development Strategies

The issue of poverty in this country has a serious effect on economic development potential, particularly in urban areas, and has to be examined at a community level, more specifically at the people-based level in order to encourage viable projects of change. The poverty rate in the U.S. has fluctuated from 12.6% in 1970 to 19% in 1990 to a declining 16% in 2000 (Dalaker, 2001: US Census Bureau, 2000). The growing concentration of poor in large cities has made it almost impossible for governments to raise funds to provide basic services. This means the closing of crucial public facilities such as schools, hospitals, health care center, police stations and fire stations (Dreier, 2003). Welfare reform was originally seen as way of dealing with fundraising issues.

According to Jared Bernstein with the Center for Social Development, “The goal of welfare reform was not to transform the welfare poor into the working poor, but to significantly lift the living standards of former recipients. That hasn’t happened” (Bernstein, 2003). The underlining assumption of welfare reform is that work for the poor is the cure for poverty. Recipients responded by working more than ever with the employment rate of low-income single working mothers reaching an all time record high (Bernstein, 2003). This did increase their income in comparison to their situations on welfare rolls but not by much. Studies have shown the former welfare recipients in low-wage careers make an average of $7 per hour with little flexibility in mobility.

The key to increasing the living standards of low-income working families is substantive-wage employment with potential for upward mobility. This investigation
hopes to prove that in order to actually focus on increasing the living standards for low-income communities, the focus of the investments has to be on the community.

The focus of the investments decides the project emphasis for community economic development. If the focus is on the economy, the emphasis is on the growth in numbers referring to jobs, revenue, and other cash flow producers. If the focus is on the development, the emphasis is on structural change with long-term effects- stability, sustainability, and advancement. If the focus is on community, the emphasis is partnerships- mutual place-based commitment (Boothroyd, 1993). For the purpose of this investigation, the interest is community economic development that focuses on community or social-economic change with an emphasis on long-term effects. Similar to this is the Boothroyd’s community focused economic development approach, which is comparable to the people-based strategies, aspired to in this investigation. The chart below shows the comparison of community economic development strategies.

Source: Community Economic Development: Three Approaches, (Boothroyd, 1993)
The community-focused approach has to have a larger goal than gainful employment. This investigation will reveal it is no longer enough to be satisfied with obtaining of entry-level jobs for low-income citizens. Entry-level jobs in the food and retail sectors such as checkout clerks are being reduced, deskilled or abolished as a result of automation (Blakely & Bradshaw, 2002). Research shows that the problem is not a shortage in jobs. It is a shortage in well-developed human capital that can survive in the current workforce. A Hudson Institute study revealed 90% of U.S. workers need to improve their computer skills, and 60% of workers need to improve their analytical skills to keep doing their current jobs (Blakely & Bradshaw, 2002). This means there is a need for incumbent worker development.

Worker development includes skills training, mentoring, placement and post-employment services (Fitzgerald & Leigh, 2002). In this investigator’s opinion, the most important of these activities are the post-employment service because they continue the development process for incumbent workers. The process has to go beyond job placement. There has to be continued support for members of the population transitioning from unemployment to work in order to solidify the foundations of self-sufficient workers with increased standards of living. A people-based development goal has to be the creation of economically self-sufficient populations with the skill set necessary to increase standards of living. This study seeks to prove that doing this requires an ongoing connection with the changing workforce development issues.

The Seattle Jobs Initiative (SJI) is considered one of the most successful workforce development programs in the country because it considered the ongoing connection with the changing workforce development issues. SJI undertook their charge
of linking low-income residents using living-wage jobs with four main goals of the initiatives:

1. To help residents obtain jobs that pay living wages of at least $8 per hour plus benefits
2. To ensure long-term job retention
3. To secure employer involvement to ensure that people receive relevant training, that jobs exist at the conclusion of training, and that employers get skilled workers
4. To integrate human services with employment and training services

Source: Fitzgerald & Leigh, 2002

The key components of the strategies were employment linkages and targeted sectors. The employment linkages strategies focused on immediate placement of citizens who were job ready. The targeted sector strategies focus on the structure of job training, the support services, and the case management necessary to place residents in growing sector with opportunity for advancement.

The implementation process required for the targeted sector strategies uses tactics which set the initiative apart from its peer programs. The support services are truly targeted towards the low-income populations’ needs. Some residents who either have never been in or have little experience in the labor market, there is a need to start with the “soft skills” or work ethic (Holzer, 1996; Moss & Tilly, 1996; Turner Meiklejohn, 1999, Wilson, 1998). The support service range needs to encompass drug treatment, psychological counseling, child care, and transportation (Fitzgerald & Rasheed, 1998; Osterman, 1993; Pavetti & Acs, 1996; Stawn & Martinison, 1998). There may also be services needed in resume writing, interview techniques, English as a Second Language (ESL), or even basic hygiene or other life-skills (Pitcoff, 1998). These provisions are
essential to long-term employment success.

Another key provision in long-term employment success is case management before and after employment. Case managers maintain contact with all employers and service providers. This is what maintains the approach as comprehensive instead of piecemeal, which is a primary interest of this study. SJI took on the responsibility of facilitating partnerships through one-stop centers. This network of information and actual programs housed in one location is crucial to sustain workforce development initiatives. SJI made sure all partners were upholding their ends of the bargain and subscribing to the overall mission. The systematic networking of one-stop centers made this possible. One-stop center are essential to the creation of systemic reform because it acts as the core delivery mechanism for job placement and federal employment training programs (Fitzgerald & Leigh, 2002).

SJI efforts have resulted in a decline in welfare rolls, and an increase in education and training programs (Fitzgerald & Leigh, 2002). The training programs include the creation of a budget for wage progression and advancement strategies. As a result, the state community college system has received funds to develop wage progression and career ladder programs. This was $17 million moved from the Department of Social and Health Services to the State Board for Community and Technical Colleges. In support of the ideology that workforce development for low-income populations is not a “social work” issue; it is an economic development issue (Fitzgerald & Leigh, 2002). The reason for detailing the provisions made SJI program is to provide an example of a program that
Using Public Policy to Promote Economic Development

considers soft skills, support services, and incumbent participant development services as needed elements to ensure the success of workforce development efforts.

**Workforce Development**

As defined by the Center for Community Change, workforce development is the act of implementing a system of programs that provide citizens with competitive advancement skills needed in the labor market to attain a higher standard of living (Okagasi, 1997). Population, ethnicity, employment, employment type, poverty, education, and services available are the variables that influence workforce and consequently economic development. In this investigation, employment, specifically workforce development, is the primary focus. There is a need for jobs that will benefit low-income populations now and in the long-term.

“Policies that are designed to help low-income individuals find better, more stable, higher-paying jobs are increasingly important in this time of economic and political change. Employment and income are at the root of many of the most pressing problems our communities face—poverty, blighted housing, alienated youth, single-parent families, crime . . .”

—Report of the Neighborhood Funders Group (Okagaki, 1997)

In 1996, Congress confronted these issues by passing the Welfare Reform Act, which emphasizes work for welfare recipients (Federal Welfare Reform Act, 1996). The Act created an urgent need to develop local and state-level policies and to derive strategies for moving people off welfare into jobs. Obstacles to moving people off welfare are poorly educated and trained populations, widespread poverty, institutional racism, and urban decline. The way to overcome these obstacles is workforce development aimed at preparing low-income citizens for jobs with potential for career progression.
The linkage between education and work is the key element in career progression. In 1998, President Clinton signed the Workforce Investment Act (WIA) supporting these ideals. As of now TANF funding far exceeds funding for WIA, which makes it a prime target for advocacy (Giloth, 2000). This act resulted in a reduction in poverty from 15.1% to 13.3% between 1993 and 1997, as more people went back to work and, in some cases, experienced wage gains (U.S. Bureau of the Census, 1999; Giloth, 2000); a decline in welfare roles by 50% to 40%, as populations became more self-sufficient; and a decrease in unemployment from 43.1% to 31.1% for single-parent mothers and from 48.1% to 36.1% for black men between 1992 and 1998 (Freeman & Rodgers, 1999; Giloth, 2000). These results were achieved with the specific goals of the Workforce Investment Act of 1998:

1. Providing comprehensive education and training programs, especially professional and technical programs, for students and workers that equal the highest international standards of achievement.

2. Promoting continuous public and private investment in improved management practices, competitive production processes and worker training.

3. Developing the capacity of and providing significant opportunity for business and labor to direct the development and delivery of state education and training policy, programs and standards.

4. Coordinating the delivery of all education, training, employment, apprenticeship and related programs to eliminate needless duplication and assure the efficient and effective provision of these services.

5. Ensuring the equitable distribution of quality education, training and employment services statewide, especially to distressed and rural areas, and areas servicing the economically disadvantaged citizens.

6. Achieving the benchmarks established by the municipal Board that relate to education and training (Okagasi, 1997).
To achieve these goals, government and employment policy needed to be developed comprehensively towards a system of reform. According to Alan Okagasi, a planner with the Center for Community change, policies can be categorized into “Tiers.” (Okagasi, 1997) Tier one policies are those, which can be operational (administered by a funding agency). These policies either help or hinder job programs that are quite specific and single-faceted. Examples of these policies are transportation or employment agencies that operate exclusively from agencies of different disciplines. Tier two polices are broader policies which promote targeted strategies for using the powers of government to address issues with several dimensions. These policies often times involve cross-discipline collaboration, joint transportation and workforce initiatives for example. Finally, Tier three policies are the most multi-dimensional and comprehensive systems reform. These policies support block grants or vouchers over categorical programs. In the case of these policies, the focus is a variety of programs and their interconnection.

This investigation is concerned with Tier 2 and Tier 3 policies. For example, JARC initiatives, supported by Tier 2 policy, will be examined. Job Access and Reverse Commute (JARC) grant programs sponsor transportation service and the multi-faceted human resource development activities that include provisions for job training, healthcare and childcare. JARC funds are also used to support one-stop centers as the appropriate venue to house and conceive these human resource activities. The a major focus of this study is to suggest the changes necessary in Tier 2 policies to be evolved to and maintained as true Tier 3 policies. Not all Tier 3 policies remain true Tier 3 polices. Take Community Development Block Grants (CDBG) for example. This grant is
considered a Tier 3 policy because it is very comprehensive and requires interagency efforts including the agencies of housing, health, human services, transportation, and labor.

Unfortunately, even with broad based policies such as this example, the scope of the grant’s intent gets narrowed and individual agendas are still forged under a collective umbrella. For example, in some municipalities the grant can be renamed according to practice as an exclusive physical housing grant. To be fair, this is often times due to prioritization and resource availability. Still, this possibility needs to be considered by program initiators. Even though, planners of government and social service initiatives implement programs with good intentions, they often times fall short of true interconnected process. The visioning process is usually completely interconnected. However, the implementation stage is the stage in which awareness of long-term objectives are compressed by short-term products because of the desire for immediate results. Applied interconnection becomes lost in the selective consciousness of the grants original intent because of the desire of immediate results.

In the case of this investigation, the tangible products are a prepared workforce, transportation access, and support services. Increasing the quantity of these products does not ensure the future effectiveness on economic development initiatives among low-income communities. The quality of these products that will emerge as a result of interconnection between initiatives will have the greatest proportional impact on economic development in low-income communities. According to Okagasi, since the welfare reform, there has been an interest among community organizations, government officials, and service providers to collaborate on workforce development initiatives
Okagasi suggests that since most of the resources for workforce and economic development come from the federal level, federal policy is the proper context for local policy reform. He suggests the following policy changes are the most important:

- Welfare reform.
- Possible consolidation of categorical federal workforce development and vocational education programs into block grants or vouchers.
- Budget reductions and other changes in the federal Departments of Commerce and Housing and Urban Development (HUD). (Okagasi, 1997)

Welfare reform has a major impact on retail, homeownership, and the labor market in low-income communities. The basic elements of welfare reform are Temporary Aid for Needy Families (TANF) and a Child Care and Development Block Grant. TANF is funding stream not a program, so states do not have to distribute funds directly to recipients. Funds can be redistributed into job creation, training, transportation access, childcare, education, and other activities besides income assistance. Federal funds can only be used for welfare recipients for up to 60 months.

Cost-minimization is one of the main factors driving welfare reform. For this reason, quick job placement activities are favored over support-based placement that included education and skill development approaches. Time limits also encourage quick job placement since welfare recipients are restricted to five years of assistance. Restrictions create especially strenuous circumstances for young males because the provisions for fund distribution are not targeted towards them. The target population
consists of single-mothers, which can be seen in grants such as TANF and the Child Care and Development Block Grant.

The Welfare Reform Act is a policy, which sets-up a framework that alienates the untargeted, in this case young males age 18 to 35. It also encourages the use of workforce development funds for job obtainment in the public and private sector over education and skill development. This is in support of the “work first” philosophy over the education and training approaches (Giloth, 2000). The premise of this investigation is that in the long run this framework will prove to be counter-productive. The result will be increased homelessness and joblessness as well as a contribution to even greater social and economic instability (Okagasi, 1997).

This policy framework also risks the danger of “creaming”, which is the choosing of the most employable person to meet workforce development performance goals (Okagasi, 1997). Consequently, welfare mothers are targeted the most. Besides the fact that this leaves a considerable number of recipients out, the bigger picture of sustainable economic growth is compressed. The goal in this case has become the increased quantity of jobs not the quality of skills necessary for career advancement that leads to sustained economic growth.

Workforce development policy consists of a variety of uncoordinated federally funded programs. Okagasi describes these major programs as follows:

- The federal Job Training Partnership Act (JTPA) system, including Private Industry Councils (PICs) and local employment and training agencies funded by the PICs.
- The state Jobs Service (funded through the federal Wagner-Peyser Act).
- The community colleges, vo-techs and other adult educational institutions, many of which receive funding under the Perkins Vocational Education Act.
• Social service systems, including childcare, substance abuse and mental health. (Okagasi, 1997)

Source: Center for Community Change, (Okagasi, 1997)

From workforce development policy reform, a need arose for program creation that targeted specific population needs that were culturally and geographically sensitive. The proposed legislation that answered this need was one-stop centers. One-stop centers provide workforce development services in a central location that is specific to the geographic context of the targeted populations. The functions of these centers are a concern for some non-profit service providers. The providers’ funding could be lost due to competition from one-stop centers.

Another concern is the fact that many states limit the services of the one-stop centers to information. In some cases, these services do not include actual programs. These centers can do a disservice to welfare or low-income residents that are facing long-term unemployment without programs for skill development. It does not alleviate some of the fundamental problems of employability (Okagasi, 1997).

Welfare and workforce development reform policy has a large effect on economic policy in general because of the influences on the employability of citizens. Welfare
reform creates a competition for jobs. Workforce development reform focuses on strategies of training for jobs with living wages. Entry-level positions that offer livable wages are limited. The problem is there are still gaps between preparation and the type of jobs actually available. There are not enough jobs with a living wages in comparison to jobseekers. According to Okagasi, an average of 31 new job seekers competed for a livable wage job that required one-year or less training.

Thus far, research implies that the most prominent answer to this problem of job gaps is Tier 2 policies. These policies encourage the cross-discipline cooperation including job access, job training, support services, and employment providers. The framework includes hiring centers, linking neighborhoods and business development organizations, improving public transportation, and making child care provisions.

Even with all of these provisions, the issue of improving earning wages still needs to be a chief concern. This is covered partially through policy by having hiring agreements that states that employer can receive subsidies only with living wages for their employees. This restriction on subsidies can assist in helping target welfare and low-income citizens as the beneficiary population. These requirements are necessary in improving entry-level living wages.

However, entry-level living wages do not always accommodate entire families. To create an entry-level living wage that accommodates families, career ladders have to be explicitly defined by the employers. Employers must support workplace learning and skill-upgrading opportunities. In particular, employers must be clear on how workers can acquire the incremental skills necessary to increase productivity, which can translate into wage and benefit increases and promotions (Giloth, 2000). A step that can be taken by
public agencies towards achieving this goal is to train for skills sets that have been defined by the current labor market. Public agencies and employers together need to create both the external and internal maps to career advancement within and among firms, sectors, and clusters.

This tactic can fall under the title of cluster-based economic development strategies, which deal with the type of labor market that is in a specific geographic area. Mary Jo Waits, a director of a public policy center, defines cluster-based economic development as shared needs for common talent, technology and infrastructure (Waits, 2000). For the purpose of this investigation, the concern is limited to talent. Public agencies work at equipping low-income populations with the talent necessary to be competitive in the current labor market. Harvard Business School Professor Michael Porter claims the public sector’s role is to improve the circumstances that impinge on competitiveness” (Porter, 1990). This competitiveness will lead to advancement on the career ladder.

The research suggests that all training should include an incremental step-process or phased process. All workers do not start at same level nor do they wish to stay at the same level in their career permanently. Incremental career step provisions have to be made to ensure evolutionary competitiveness.

Made apparent by sample programs, a key element to this competitiveness is education, which has led employers and entire industries to invest in education. A 1998 report exhibits this by showing nearly 50% of manufacturers increased fourfold their investment in the training of production-level workers (National Association of Manufacturers, 1998). This report supports the fact that community colleges are
important players in the training arena. Employer and industry investment has been essential to the transformation from theory-based to application-based curriculum. Interdependency is developed with the constant exchange of talent and sponsorship. Here human resources are developed as well as the local market; both are contributing to economic growth.

Employers may fear this investment in training because of the “free rider” problem in which other, similar employers poach trained employees by offering pay bonuses without paying training costs (Giloth, 2000). However, this still can be a win-win situation. A well-developed workforce with trained employees that have upward mobility within the same firms can open up opportunities for new entry-level employees who cost less. Employers need to recognize that investing in increasing skill development over investing in decreasing worker turnover rates will lead to a dynamic cycle of well-developed employees.

The research previously stated suggests employers and service providers alike should be careful of exclusive industry investment. However, it may prove not to be as win-win as these researchers think. Take the investment in the biotech industry for example. It creates jobs, invests in the local market, and sponsors the education of citizen that could start them on career ladders. However, that career ladder only exists within the biotech industry. What happens when there is a change in technology? The worker’s developed skill set is only applicable to the biotech industry. This initiative does result in long-term affects but not as long as it could be. In order to have development initiatives with long-term effects there needs to be more encouragement for educational partners to invest in theoretical techniques as well as applied techniques. This
investigation is interested in educational techniques that will lead to the development of workers with skills that are malleable to changing labor market and technological situations.

There are situations in which job-readiness is not enough to overcome certain barriers such as discrimination. Many employers claim that just having workers with strong “soft skill” or work ethic, in other words showing up is enough (Giloth, 2000). Employers claim this is the main problem of workforce development in minority communities, particularly among young urban black males, although there is mixed empirical evidence to support this claim (Holzer, 1996; Moss & Tilly, 1996; Turner Meiklejohn, 1999, Wilson, 1998). This has to be considered since the new workforce paradigm seeks to challenge roles of race, culture, and gender in the labor market. Many employers lack the ability and willingness to find, accept, and support workers who come from wholly different backgrounds. This causes skills and aptitudes to be frequently misread and ignored during the hiring process (Miller & Rosenbaum, 1996). Intentional or not discrimination is still an issue of employment. A 1994 study revealed that employment discrimination, whether related to hiring, wages, or labor market information from employers, occurred in 20% to 25% of testing cases (Bendick, Jackson, & Reinso, 1994). This implies there is a need for understanding discrimination in the arena of workforce development.

These goals are to be implemented and monitored by quality control council and committees on the state and local levels. The Workforce Investment Act is a Tier 3 policy. A major component of Tier 3 policy is devolution of power from federal to local and state levels. Oregon is an example of a state that has embraced this Tier 3 reform
policy with success. First, Oregon composed Workforce Quality Control Council that consisted of representatives from the following:

- Oregon Department of Employment
- Office of Community College
- State System of Higher Education
- Oregon Department of Education
- Oregon Bureau of Labor and Industries
- Oregon Department of Economic Development
- Oregon Department of Human Resources

Source: Center for Community Change, (Okagasi, 1997)

Oregon moved forward with workforce development reform with the following system of elements based on the workforce act:

- An overarching goal with broad scope. “The best trained workforce in the United States by the year 2000” does not speak to any single program or agency, but rather to the overall effectiveness of the workforce development system in its totality.

- A new institutional structure—the state Workforce Quality Council and the regional Workforce Quality Committees—for leading this effort.

- A conscious attempt to bring together previously disparate programs so they are managed as part of a coordinated system, as suggested by Goal #4.

- An effort to make the system more market-driven, as evidenced by Goal #3 above, rather than being fundamentally driven by the program operators themselves.

- An accountability system (Oregon Progress Board) for measuring success and progress toward the goals.

Source: Center for Community Change, (Okagasi, 1997)

With this system in place Oregon still faced some obstacles. One, existing workforce development agencies have their own historic agendas. They may not be willing to compromise. It was difficult to make the vision and action of these agencies align with the council. Two, strong leadership was lacking. “States [must] assume a stronger leadership role.” This is crucial to maintain consistency in vision and the relationship of all program activities (Okagasi, 1997). Three, maintaining committees that were not driven by biased agendas was difficult. Several of the committee heads had
been prominent figures in local service agencies, for example, a director of the Private Industry Council. As a result, the discussion of the committee becomes governed by self-interest. The most disturbing problem revealed in this case is that low-income communities are inconsistently represented on regional workforce quality committees. A 1999 HUD report explains that some central cities and neighborhoods have not experienced the benefits of recent economic growth (Marcelli & Joassart, 1998; U.S. Department of Housing and Urban Development, 1999). The reason for this is poverty is a difficult issue to address and as a result change among the chronically disadvantaged is the most difficult to enact.

This study operates on the premise that change in workforce development in should also include disadvantage communities. Therefore, there needs to be a true paradigm shift in strategies from the demand-side, which emphasizes employer or market driven strategies, to the supply-side, which places emphasis on those low-income jobseekers that need work and a pathway out of poverty (Giloth, 2000).

The Oregon example demonstrates there is a need for policy that is responsive to workforce development barriers in the context of poverty stricken communities. These communities have an effect on their economy, the regional economy, the state economy, and the national economy. The Oregon initiative implies policy makers have to recognize that policies, which value expedient changes over all else will contribute to the degradation of already negative situations. Using federal funds to subsidize already successful initiatives will lead to more reactive rather than proactive behavior. If government agencies are encouraged to be innovative through incentives, programs will remain status quo and there will not be any real progress made in the workforce
development arena. For long-term change, it is in this investigator’s opinion that the difficult problems have to be addressed by taking the lessons learned from pilot programs such as the Oregon initiatives.

Through the examination of the initiatives of Oregon and others, a lesson can be surmised that workforce development simultaneously includes recruitment, training, retention, and advancement as well as unique, contextualized constraints and opportunities related to jobseeker characteristics, occupations, and regional economies (Giloth, 2000). The research reveals the problem is that none of the unique characteristics have received adequate attention, leading to a lack of quality benchmarks and standards. Recruitment, training, and retention are the predominant indicators of success, reducing the process in one, which is not effective in the context of low-income communities.

This investigation will offer suggestion for policy reform as defined by Okagasi, “Policy reform is the vehicle for applying the lessons from effective pilot programs to increase the effectiveness of the system as a whole” (Okagasi, 1997). It will suggest the changes necessary to evolve current Tier 2 policies to Tier 3 policies. The model presented by the Center for Community Change will be a control reference for measures taken by agencies in studies to be described later in the investigation. Although the primary components will be derived from the Center for Community Change model, the control reference will be a version modified according to the context of the study and additional suggestions from other literature. The initial phase of the model process begins by mapping the system for change. The phase begins by identifying key service agencies involved in workforce development as shown in Chart 2.3 below.
The next phase in the process is assessing the system. First, this involves the identification of the population being served and to what capacity they are being served. For the sake of this investigation, only the services that impact welfare and low-income citizens in specified regions of the country will be examined. Second, the investigation will identify strong service providers. Third, the study will identify agencies that are willing to collaborate. The final component of this step is the identification of policies that encourage strong performance. The policies studied in this investigation are transportation policies, specifically JARC grant programs, and workforce development policies involving the use of one-stop centers.

The third phase is to articulate the principles of the systems change. The principles will be empowering of participants, networking well, integrating across disciplines, being community-based, and being evolutionary. These principles were derived from the existing federal requirements of the two types of policies being examined.
The final phase in the process is the recommendation of system reforms, the adjustment that should be made in the policies. In this investigation the focus is on the adjustments that should be made in transportation policy, specifically JARC (a people-based strategy) and workforce development policy, specifically one-stop centers (a place-based strategy). The list of recommendations below reflects the primary components of a policy framework to be suggested based on the evaluation of the JARC and one-stop center case studies. The intent is to best account for strengths of the two types of strategies used in the policies. The components of the policy framework are as follows.

1. Federal Influence
2. Governance structure: This describes the executive body that will ensure accountability and commitment to overall vision.
3. Mechanism for connecting markets
4. Feedback mechanisms: agencies in the system to receive feedback from all participants
6. Accountability systems: Monitoring and evaluation process, identify clear benchmarks and standards

People-Based & Place-Based Strategies in Workforce Development

Both place-based and people-based economic development strategies seek to address the process of obtaining and maintaining employment. The differences between the two can be seen in the investments. On the one hand, transit investment is seen through the mobilization of people, which links workers to jobs without changing the location of the job or residential area, a people-based strategy. On the other hand, investment in skill development that brings new resources and opportunities to areas central to people in need, a place-based strategy (Ihlanfeldt, 1999). The outcomes of both of these strategies can be measured in economic effects. Greater access to employment whether it be through place-based or people-based mobility means an
increase in earning potential. The income increase in turn contributes to the boosting of the overall economy.

This paper will look at how the merger of the two strategies can produce the greatest outcome. Transportation policy is seen as an integral factor in the “geography of opportunity,” which means the places where individuals live or to which they have access affects their opportunities (Rosenbaum, 1995). Transportation policy can facilitate the linkages to opportunities outside neighborhoods or reaches of the disadvantaged. However, job accessibility is not the only factor affecting employability for the disadvantaged. Lack of information and lack of discrimination prevention measures are also factors, which prevent employment for disadvantaged residents (Ihlanfeldt, 1999). Potential workers are often not job-ready because they lack information including skill development. This skill development needs to be provided in a context that is molded to the specific social and cultural circumstances of an area.

Lack of knowledge of circumstance perpetuates the barrier of discrimination and also contributes to the lack of employment opportunities for the disadvantaged. As addressed in spatial mismatch theory, it is a false assumption to believe job access and centralization of services are the only governing factors in the process of obtaining and maintaining employment for the disadvantaged (Ihlanfeldt, 1999). Discrimination factors are also determinants of the potential employability of a population. Steps have to be taken to alleviate the cultural barriers that greatly influence career progression. Noted economists have stated many employers lack the ability and willingness to find, accept, and support workers who come from wholly different backgrounds (Miller & Rosenbaum, 1996).
The lack of impetus to dissolve cultural barrier has a significant impact on potential networking opportunities, which is a large factor in career development. It is true that sometimes it is “who-you-know.” Low-income citizens have more difficulty experiencing these networking opportunities. Dora L. Costa, a research at the National Bureau of Economic Research, notes that a lower income worker has an average workday of eleven-hours, while the well-to-do have an average workday of nine-hours (Costa, 1999). Considerations for networking opportunities that address these cultural barriers need to be infused in both place-based strategies and people-based.

This commentary suggests that policies which acknowledge the potential for career ladder progression and the cyclical economic benefits of networking for the beneficiary population are just as essential as job access and centralized skill development activity access. Having the lives of lower income populations transcend economic classes in more diverse ways will prove to produce greater proportional outcomes to the investments.

The case studies, to be described and analyzed later, put the diverse development investments into context focusing on people-based and place-based strategies. The first invests in geographic mobility. The focus of this strategy is getting people to the jobs in various non-centralized locations, hence, the interest in transportation policy. The second strategy focuses on skill development in a location that is central to people in need of training for employment. One-stop centers serve as an example since they are interaction nodes for various services in a specific area.

One-stop centers deliver services for skill development that are specifically targeted towards the geographical and cultural situations of the localities in which they
are located. This is in the hopes of prescribing strategies better suited for contributing to job growth in the local market. This is a place-based strategy involving people-based tactics. The reason this strategy uses people-based tactics is because it links of a population to jobs through the elimination of barriers. In this case, the barrier is lack of knowledge. With job-readiness training a population can develop the skills necessary for personal mobility. The job procured can be inside or outside their residence. Skill development for personal mobility is important for the progression on a career ladder.

The importance of investigating these strategies is to form a list of changes to be taken under advisement by policymakers, in order to forge more self-sufficient populations that contribute to their individual increase in living standards as well as the entire network of economies. As result even though this paper seeks to suggest ways to merge the two strategies, the support information to follow explains the impacts of investments in these strategies.
CHAPTER 3: ACCESS

Economic Effects

Transit initiatives have more single-faceted sets of evaluation measures as compared to workforce development but have significant potential impact on economic growth. A national analysis proved the year following the transit capital investment 314 jobs were created for each $10 million invested in transit capital funding (Vary & Weisbrod, 1999). This is the reason for transportation investment by local, regional, and state officials as an economic strategy nationwide.

Increased public travel service can have a number of impacts. First, it improves mobility and access to personal, neighborhood, and community level tasks. It can reduce travel time by eliminating the congestion caused individual travel. Research in travel efficiency lead can also lead to reduced congestion. The results of this research may be seen in rerouting or the addition of travel routes. The decrease in travel time leads to increased business productivity. A business is only as productive as its personnel. People can be more efficient when given access to transportation that saves time. With an increase in business and personal income there is more revenue for government, which is produced by sales, property and income tax (Vary & Weisbrod, 1999).

There are other economic benefits to transit investment that is more difficult to quantify. Examples of these benefits are environmental impacts; medical, particularly stress associated issues; and personal impediment reduction such as environments, noise, constructions sites, and spatially opened spaces. Results of these benefits can be associated with matters of property value, health care, environmental degradation, and personal well-being.
The magnitudes of these impacts are dependent on the context. In metropolitan areas, public transportation systems can add capacity to the regional area at rush hour. In smaller urban and rural areas, transit may play a role in preserving highway capacity. In the setting of smaller urban and rural areas, the economic benefits are not as tangible because with different qualities of life comes a different set of value measures.

In metropolitan areas, there is more value placed on economic and social well being, opposed to placing high value in environmental and historic preservation that is often the case in rural areas, for example. An area with a preference such this is more likely to be supported by non-transit investment such as workforce development (Vary & Weisbrod, 1999). This causes interdependency among agencies and government levels, local and regional, because of the shared interest of promoting economic and social well being of population (Vary & Weisbrod, 1999). This interdependency is the interest of this investigation. The interest is the coordination of government funds and policy towards a common use that impacts a population with the diverse characteristics that can be found in metropolitan areas.

According to economist Vary and Weisbord, investment in transit can be profitable for all members of society. The results are changes in operation costs, travel time, out of pocket expense, and emissions. Individual savings acquired from reductions in transportation cost, which increases disposable income causes the profitability. This happens because laborers are better equipped and more efficient. Businesses are affected by cost savings in wage, price, and profit, which affect the overall cost of doing business because of efficient labor and gain in sells. There are overall market benefits with the combined change in business cost and individual income. This increases regional
competitiveness and business market shares, which benefit the entire population (Vary & Weisbrod, 1999).

There are also the benefits represented jobs developed through construction, maintenance, and operation of transit systems. A rail system for example produces numerous new full-time jobs and other jobs are derived as new income is spent and re-spent in the economy (Wornum, 2001). All new employment is associated with the new system because there is a need for a person to build, operate, and service the facilities. The money invested in transit could be invested by the government in other ways. For example, investment in the construction of a sewer plant or welfare payment could be made. However, these investments do not have the same redistribution properties as transit investment with the job production.

**Job Access and Reverse Commute Grant Programs Description**

A large portion of this investigation will be centered on the evaluation of Job Access and Reverse Commute (JARC) grant projects. The program was born under the TEA-21, a federal Transportation Equity Act of the 21st century. The grant programs purpose is to help local governments and non-profit organizations with funding to develop transportation services to connect welfare recipients and low-income persons to employment and support services (FTA Website, Accessed 2003). Transportation access is one of the main hindering or helping agents in obtaining employment.

The main activities that are sponsored by the grant are transportation access and human resource development. The funding is provided by the FTA under the U.S. Department of Transportation. Therefore, Job Access projects are focused on developing transportation services such as shuttle vanpools, new bus routes, connector services to
mass transit, and guaranteed door-to-door programs for welfare recipients and low income persons. The Reverse Commute portion of the grant is defined by TEA-21 as projects designed to transport residents of any area to suburban employment opportunities (FTA Website, Accessed 2003). The Reverse Commute projects focus on making employment services available to all populations by providing necessary support services.

States and localities applying for funds from this grant program must make provisions for coordination, services, and a financial distribution schedule. For municipalities to be eligible for funding, human services, the transportation planning processes that administer the Temporary Aid to Needy Families (TANF) and Welfare-to-Work (WtW), and other stakeholders must be coordinated. The municipality must provide an outline that explains how services will meet a community’s need. Finally, each applicant must supply a project financing schedule that includes sustainability of funding, financial commitments from human services providers, and commitments from existing transportation providers.

All of these provisions are intended to establish a coordinated regional approach to job access projects. All projects funded by the grant program must be the result of a collaborative planning process. Agencies that may be included in this process are states, metropolitan planning organizations (MPOs), transportation providers, agencies administering TANF and WtW funds, human services, public housing, child care organizations, employers, impacted communities, and other stakeholders.

Applicants are selected by different government agencies according to level of urbanization, population size, and government authority. The MPOs select the applicants
in urbanized areas with populations of 200,000 or more. The states select the applicants of small-urbanized areas with population less than 200,000 and in non-urbanized, rural areas. For instance, tribal governments can submit to the state or directly to the FTA requests for selection. The FTA has been authorized to fund $150 million annually in Job Access and Reverse Commute grants since 1999. There is a 50/50 Federal/Local match required. The local match can be supplied by other federal funds. It is also important to note, applicants are not guaranteed a renewal of grant funds (FTA Website, Accessed 2003).

**JARC CASE STUDIES**

The purpose of investigating Job Access and Reverse Commute grant programs is to understand its possible applications of federal fund use as a method of economic development. This method is seen as a more comprehensive approach that includes a diversity of decision-makers and stakeholders, opposed to an incremental approach or tactics that are performed by isolated sectors with divergent interests in economic development initiatives. For the purpose of this paper, the investigation will be limited to case studies on Portland, Oregon; Northern New Jersey; and Baltimore, Maryland metropolitan area. Portland represents initiatives administered by a local agency (a more bottom-up approach), while both Northern New Jersey and Baltimore represent initiatives administered by state agencies (a more top-down approach).

**Portland, OR Initiatives**

Portland is a large urbanized area of 1.3 million residents with almost 220,000 living below the poverty level. In 2000, approximately 15,000 of the residents were on
welfare. Three of the biggest challenges identified for this area were moving out of poverty by acquiring job skills, finding affordable childcare and accessing transportation. Convenient and affordable transportation services have been the main challenge to obtaining and retaining employment (Portland, Oregon Area-Wide Job Access Plan, 2000).

There are still significant access issues, even though 85 percent of poverty-stricken individuals live within a quarter-mile of transit. A hire analysis showed that the majority of people accept jobs within walking distance their homes or easily accessible by public transportation. Suggested reasons for this occurrence are circumstances not considered when attempting to develop an efficient transit service for the welfare and low-income populations. Circumstances include childcare, shift work, multiple transfers, and excessive travel.

Portland developed a Regional Job Access Plan that focused on the use of collaborative efforts to address the needs of the welfare and low-income populations. Their goals were to maximize the existing transportation and social services. Doing this provided the needy population with improved job access and job related services. The plan was modeled after Oregon’s welfare reform program, which achieved a 47 percent reduction in welfare caseloads in less than four years. The model places significant value on partnerships between social services agencies; employers; and local, regional, and state agencies.

By using effective partnerships, Portland developed a three-tier plan that addressed the transportation needs for the welfare and low-income populations. The tiered approach included making provisions for an extensive regional information
program, the designation of multi-modal transportation centers and focusing on employers that retain as well as recruit from welfare and low-income populations. This was done in order to maximize resources for existing alternative transportation networks, the regional transportation systems, land use strategies and successful alternative transportation outreach programs.

Programs were implemented using the guiding principles of regional coordination, serving regional markets, committing to implementation, focusing on job retention, time of day matters, and employer-provided benefits. Participating partners employed some form of the guiding principles in the development of all the strategies.

First, Portland partners recognized that a plan designed entirely from a transit perspective would not meet the true needs of the welfare population. At the same time, partners acknowledged the fact that social service agencies do not have the expertise to design or operate an efficient transportation service. In order for the plan to be successful there needed to be coordination involving the regional transit agency; social service agencies; alternative transportation groups; and local, regional, and state jurisdictions. To develop an effective transportation solution coordinated efforts had to be made. Specifically, the coordination strategies include the use of private industry partnerships, employer partnerships, private transportation providers, and one-stop centers.

The Job Access Plan needed to meet the needs of a broad population. Therefore, the regional market had to be considered. This was necessary in the process to improve access to the targeted needs of the welfare population. This principle was intended to provide universal access to regional services.
The Portland partners worked on several service levels of human and transportation service industries that varied in complexity. This meant that implementation would be performed in phases. Partners focused on implementing the simple things right away that made a big a difference without a lot of investment. The remaining factors were done based on the predicted availability of resources.

Noting the location of job resources was also important. The Job Access Plan identified areas with projected growth in entry-level positions. It also noted the location of employers that hired people off of welfare and have a record of retaining those employees. This was done in order to designate a route of sustained use and the most promising areas for employees.

The developers of the Plan accepted the fact that if a transportation solution was going to be developed that was inclusive of the diverse needs of low-income employees, time schedule was an important factor. There needs to be transportation options that address off-peak work hours. The transportation options needed to address off-peak needs and designs flexibility into the network. Also, general life’s needs had to be balanced in the time schedule. For example, the time for drop-off and pick-up at childcare, especially on public transit, can drastically reduce an employees earning potential. Alternatives needed to be considered for transportation solutions.

According to these principles, the Job Access Plan needed a transportation solution that required an approach from many different levels. The Plan focused on three-levels of emphasis: regional, area-specific, and employer-specific. The levels focused on different elements of improvement.
The regional approach focused on improving coordination, training and information. Tasks associated with this approach were many, orchestrated by social service providers, who focused on developing new marketing materials and training methods to meet the special needs of the welfare and low-income populations.

The area-specific approach focused on designating areas most suitable for Job Access transportation hubs, which would service the targeted population. These areas were deemed suitable by being a centralized point where people could connect to the regional transportation system. These hubs would also house information on a variety of transportation and other support services. The hubs included information on car sharing, vanpooling, bicycling, transit and other information.

The employer-specific approach focused on targeting information about employment areas. The employment areas were selected on the basis of employment growth patterns and existing levels of transit service. Participants involved in this approach focused on employers that were likely to hire and retain welfare and low-income employees. The concepts for targeting these areas were built off of the Portland, Tri-Met employer outreach programs.

Tri-Met is a municipal corporation that provides public transportation for the tri-county Portland metropolitan area. Tri-Met operates a 33-mile light rail line, bus routes, and services for seniors and people with disabilities. The corporation also provides alternative transit choices including ridesharing options, bicycling, employer-based programs and innovative pilot programs that test new ways of providing an alternative to the automobile. All of these services are highly coordinated regionally, reaching from the downtown core to the outskirts of town and suburban employment centers.
Tri-Met also works with other transportation service providers on integrated services. These providers include C-TRAN, South Metropolitan Area Rapid Transit (SMART), South Clackamas Transportation District (SCTD), and number of private service providers. The corporation also keeps track of employers that make their own arrangement for employee transportation. Some of these employers are Intel, Nike, St. Vincent’s Hospital, transportation management associations and social services that make their own provisions.

Provisions for transportation remain a key objective when planning for new or expanded Welfare to Work services. Portland’s analysis has proven there is more to meeting the needs of the targeted population then proximity to transit services. This accounts for the diversity among partners involved in the use of the Job Access and Reverse Commute Grant for Portland. A comprehensive criterion towards developing a transportation solution that meets the diverse needs of the targeted populations has been employed. The criterion includes access to the transit system, connection to community and other transportation services, high population concentration, and easy access for the community.

**Northern New Jersey Regional Initiatives**

The Northern New Jersey region is a large urbanized area that encompasses the 13 northernmost counties in the region and is a part of the New York metropolitan area. It houses five of New Jersey’s six major urban centers, with several of the centers surrounded by old suburbs exhibiting patterns of poverty. In 1990, the total population for the region was 5.5 million, of which 417,460 (7.6 percent) people were below the
Using Public Policy to Promote Economic Development

poverty level. The region had an unemployment rate of 5.2 percent (U.S. Census Bureau, 1990). The profile to follow illustrates a more vivid picture of the region.

**Table 3.1: NJTPA Regional Household, Employment and Client Travel Profile**

<table>
<thead>
<tr>
<th><strong>Households</strong></th>
</tr>

Source: Regional Job Access Reverse Commute Transportation Plan, NJTPA, 1999

By 1997, the need to develop programs that address these realities became even more urgent with the federal welfare-to-work initiative of 1996 (Welfare Reform Act, 1996). In the words of the state’s Secretary of Transportation Rodney Slater,

"Transportation is the to in welfare-to-work" (NJTPA, 1999). The comment recognizes that transportation is one of the challenges to obtaining and maintaining employment.

There are other unique challenges that at times compound the issue of transportation such as education, work skills, and training. The immediate concern of the state transportation
department is the fact that most welfare recipients lack access to vehicles or housing serviced by the public transportation necessary to reach entry-level jobs. Another concern is for the ability of welfare recipients to meet the challenge of balancing work and family responsibilities, access to support services such as child care and shopping must also be available. Original transportation services did not respond to the needs of unique groups such as welfare recipients.

The Job Access and Reverse Commute grant was designed to fund programs that responded specifically to the unique needs of welfare recipients and low-income citizens. The program required the state to collaborate with MPOs, local and regional transportation agencies, and social service providers. Their joint efforts orchestrated by the North Jersey Transportation Planning Authority (NJTPA), were essential to successful job access initiatives. Additionally, the New Jersey Department of Human Services (NJDHS) derived a plan coordinating county-based and regional services to implement projects integrating the reverse commute part of the grant program that focused on the support services such as child care and skills training. Both of these state agencies utilized funds and developed projects relating to job access and reverse commute, but implementing and reporting was done separately.

Both NJTPA and NJDHS recognized the importance of reliable transportation to the development of economic independence among welfare participants. For the New Jersey Department of Human Service specifically, GIS was used to identify transit routes that would be responsive to housing patterns, support services, and jobs for the target population. The spatial analysis provided the percentage of client residences, training centers, childcare and family day care facilities, and potential employers within walking
distance of the transit routes. The study also considered that the average transit rider would not walk more than one-half a mile to a transit stop or destination. The study revealed the need for feeder transit connections that fill missing links to existing transit stations, park and rides, and circulator services to area stores and restaurants.

The Northern Jersey Transportation Planning Authority also used the grant to conduct the same GIS analysis and examine the same current data. This information complemented the Regional Job Access and Reverse Commute Transportation Plan, which included identifying the current location of TANF recipients, mapping concentrations of poverty and employment, illustrating prospective client travel, screening projects for established or showing the potential the establish regional links, and prioritizing programs.

The NJTPA analyzed and documented the patterns using data collected from NJDHS and the Census in GIS applications. This helped in the connection of transit-dependent populations to job opportunities. The authority developed the following guiding principles for transportation strategies:

Table 3.2: NJTPA’s Recommended Transportation Strategies

- Modify existing bus routes and schedules to increase the frequency of service, add destinations, or provide connections to other services.
- New services, operating on fixed or flexible routes and schedules, to link county residents with regional transit services or employers and other major destinations.
- Increase coordination of para-transit services, including establishing transportation brokers.
- Expand para-transit systems to offer service to new user groups or add hours of service.
- Initiate programs to assist low-income individuals with the purchase and operation of their own cars.
- Initiate employer shuttles.
- Increase distribution of public transportation information to users, including trip-planning services.
- Implement NJ Transit’s WorkPass program and other incentives for using transit passes.
- Encourage car pooling and van pooling.

Source: Regional Job Access Reverse Commute Transportation Plan, NJTPA, 1999
This transportation plan was made possible through several cooperative federal, state, and local partnerships. Collaboration between agencies is essential to leveraging the resources necessary to begin to solve the multi-layered problems low-income populations have in obtaining and maintaining employment. However, the lack of collaboration between the NJTPA and NJDHS reveals redundancy in efforts in efficient use of federal resources. Tapping diverse resources and expertise is the key to filling the gaps of transit service to these communities. The federal government communicated the vision of helping welfare and low-income populations in the area of employment by eliminating transit barriers through policy and funds. The state made the vision applicable through specific program objectives and goals that required partnership to derive a comprehensive solution to satisfy the needs of the target population. The partners of this effort include:

- U.S. Department of Transportation (U.S. DOT)
- Federal Highway Administration (FHWA)
- Federal Transit Administration (FTA)
- New Jersey Department of Transportation (NJDOT)
- New Jersey Department of Human Services (NJDHS)
- North Jersey Transportation Planning Authority (NJTPA)
- 13 NJTPA counties, with participation from members of their economic development corporations, planning departments, divisions of social services, transportation divisions, and others
- The Bloustein School of Planning and Public Policy at Rutgers, the State University of New Jersey

In this investigator’s opinion, these projects demonstrate that there is no single method to address transportation planning in low-income communities. The challenge to future planning initiatives includes inclusive data, effective partnerships, continued responsiveness to need, and sustainable programs. There has to be a continued effort to recover data from primary qualitative sources such as one-on-one interview, focus
groups, and surveys that reveal the public need. Quantitative tools, like GIS, require qualitative understanding. This should be complemented by partnerships that bring a diversity of expertise to the project. True success of the projects will be measured by the amount of low-income citizen can be afforded the opportunity of survival in the workforce because of the job access initiatives. This is accomplished through the combined strength of the previous elements and continued investment the policies and funds that make these initiatives possible.

**Baltimore, Maryland Metropolitan Initiatives**

The Baltimore, Maryland Metropolitan region is considered a large urbanized area. The region consists of six counties and is in proximity to the Washington, DC metropolitan area but is considered a separate metropolitan area. According to the Maryland Department of Human Services as of January 2000, there were a total of 20,151 TANF recipient households in the region. In 2000, the total population for the region was 2.5 million, in which 241,255 (9.6 percent) people are below the poverty level. The region had an unemployment rate of 2.6 percent (U.S. Census Bureau, 2000).

The region was faced with the similar demand as other states to develop job access and reverse commute transportation services. This was in response to two conditions. The first condition refers to the relocation of employment centers from the central cities to the suburbs. Even though public transit continues to serve urban areas well, it is difficult and often impossible to reach new suburban job opportunities with conventional transit service. The second condition refers to the welfare reform criteria of 1996, which mandated recipients to join the workforce. The state of Maryland has reported 7,738 families have exited welfare between October 1996 and March 2000.
(Baltimore Regional JARC Transportation Plan, 2001) These issues had to be considered when devising a transportation plan that addressed the needs of low-income residents in an appropriate time period.

To address these diverse needs there needed to be a diversity of stakeholders involved in the planning process. The Baltimore Metropolitan Council has provided a forum for these diverse stakeholders and has convened since 1997. Participants of the council include transportation service providers, human service providers, economic development organizations, and employers from across the region. The intention is to develop a comprehensive approach to transit service for the special needs low-income populations.

The Baltimore Regional Transportation Board, the MPO for the region, orchestrates the development of comprehensive transit services in the region. The Board reviews JARC grant proposals and makes recommendations to the Maryland Transit Authority for statewide application. These proposals contribute to funding recommendations and long-term service planning for the region. The Regional Job Access and Reverse Commute Transportation Plan for the region is meant to build on existing welfare-to-work transportation activities, not supersede them. This allows stakeholders of the initiative to have an understanding of issues involving welfare recipients, employment centers, employment related services, and transportation gaps without reinventing the wheel (Baltimore Regional JARC Transportation Plan, 2001).

The Baltimore Regional Transportation Board examined population trends versus job growth trends as economic indicators to gather a better image of the progress being made in the areas of employment, employment centers, and employment related services.
The region performed studies on the Regional Planning District (RPD) level to note trends. The region concentrates on urban-suburban transition, in which the understanding of the transition heavily impacts the region’s capacity to assist low-income citizens in retaining employment. The trends were determined for the period 1990-2000. The trend study revealed a substantial population growth in all the districts.

As a result of the population growth in these RPDs, new business establishments have been attracted to serve new residents. There was a significant growth in the service industry in these areas. This led to the creation of service-oriented jobs in construction, office, retail, hotel or motel, hospitals, nursing homes, and institutions. These are the jobs that could be conducive to properly trained low-income citizens. However, due to lack of skills or experience, jobs in these industries are not easy to obtain by all welfare recipients. Welfare recipients often only qualify for low-wage or entry-level positions. According to the Occupational Outlook Handbook 1998-1999 Edition, U.S. Department of Labor, Bureau of Labor Statistics, the some leading low-wage occupations are cashiers, food and beverage preparation works, stock labors, home health aides, child care workers, and deliver route workers.

The Baltimore Regional Transportation Planning Board was charged with supporting projects that directly impacted transit service for low-income residents of the region keeping the previously mentioned contextual issues in mind. Using JARC funds, the Board’s objectives were to implement transportation service; to improve customer service and to operate efficiency; to promote the use of transit, transit vouchers and pass programs; and to develop employer-provided transportation. The guiding principles for the coordination of these job access projects are as follows.
Table 3.3: Baltimore Metropolitan JARC Transportation Plan Strategies

- Build upon existing partnerships among transit providers, social service providers, and workforce development agencies that formed as a result of the JARC grant program, both in planning for services and combining funding.

- Create new Transportation Management Associations (TMAs) with coordinated efforts to assist low-income commuters, including:
  - Provide a one-stop information clearinghouse for transportation services, including a toll free phone line;
  - Work with employers to promote and initiate employer-based transportation programs such as employee shuttles, carpooling, Guaranteed Ride Home (GRH), telecommuting, and flexible work hours;
  - Adapt traditional rideshare and carpool activities to include people who do not own cars; and
  - Implement the Maryland Commuter Choice program and the federal employee workforce transportation initiative.

- Improve safety at transit stops through design and land use enhancements, including:
  - Locate transit stops in mixed-use, higher-trafficked areas;
  - Install bus shelters with lighting, security cameras, and phones;
  - Increase police patrol of transit stops.

- Improve access to transit stops by providing sidewalks and other pedestrian infrastructure.

- Extend fixed-guide-way transit service to employment centers not already served.

Source: Baltimore Regional JARC Transportation Plan, 2001
All of these strategies are essential to a comprehensive approach to improve job access for low-income populations in the region that will lead to more sustainable employment, which in turn will lead to increased standards of living. The Board intends to enhance the plan with GIS analysis that includes more specific information of employers; new job growth data; and time related data such as frequency and bus hours, child care operational hours, and work shift time schedules.

Summary

The purpose of investigating these three Job Access and Reverse Commute grant programs was to understand its various applications as a method of economic development. The various techniques employed by the different metropolitan areas reveal the possible coordination options. Coordination across disciplines is essential to developing a wide-ranging approach to economic development, opposed to single-faceted sector approach that is most prevalent.

Included in the approaches of all three cases were partnerships with various sectors comprised of transportation planners, social service providers, municipal officials, private employers, and other stakeholders. By bringing these decision-makers together, there is more of an opportunity for sustainable economic development initiatives. The reason for this is that various disciplines of expertise that collaborate towards one common goal. The goal is to increase the economic situation of welfare and low-income populated communities. Recommendable is the acknowledgement that there is no-one-size-fits-all solution to economic development. Coordination across disciplines is essential to the viability of the various phases of economic development.
The main interest in this method is continuous viability and sustainability as expressed in career paths and the general improvement of life situations. It is one thing to provide entry-level jobs that remove a certain percentage of the population from welfare. However, it is much more valuable to start a population on a continuous upward spiral. One time intervention with an isolated focus will not do it.

The programs developed under this grant do consider external circumstances. For example, childcare is a large factor when considering travel time from work to home. However, the long-term advantages for the target populations are not clear. For instance, is it in the person’s better interest to take an entry-level position that causes them to sacrifice finances and the amount of time they can spend with their children? Unfortunately, the answer is sometimes ‘no’. It is apparent that these programs provide greater access to jobs but not the training to continue climbing. It can be difficult to see the incentives for self-sufficiency.

In the Portland study, there were provisions made for employment training but occupation levels for the trainees still were not clear. The most abundant jobs were available in the food service, transportation, security, and home care industries. It is not apparent that the skills necessary to develop a career are provided by these jobs. There were also employment opportunities made accessible in high-tech corporations such as Nike and Intel. However, the Portland Plan was not clear about the positions that the targeted population would qualify for, if any. The Northern Jersey case left similar concerns. Both plans did not include services for incumbent workers, which is necessary to career ladder progression.
The Baltimore regional model however, specifically mentions service for incumbent workers and partnering with employers concerned with providing opportunities for upward mobility. If Portland and Northern Jersey have programs in place that do set people on career paths in corporations such as these, which would change the lifestyle situations of welfare and low-income populations, these would be great models for economic development. However, it is not certain that this is the case after investigating the cases. The Baltimore regional model is the closet to aligning with one of the main overarching objective of this investigation, which is to develop a model that includes missing or underrepresented issues necessary for consideration in order to promote career ladder progression.

The Baltimore regional model addresses the often underrepresented issues which low-income citizens are confronted by including childcare, healthcare, basic skill training, housing, and job access. The state government has a substantial enough role in administration to more easily ensure consistency. Special considerations were made to recruit employers, which provided entry-level positions with potential for upward mobility. The study also considered program impacts in more affluent neighborhoods. The focus was not limited to acquiring the support of lower-income citizens but also the broader economic impacts. To compare the impacts of federal funds on economic development an addition strategy will be examined besides JARC. JARC programs are federally funded transportation initiatives. The case studies covered in the next chapter will examine federally funded workforce development initiatives, one-stop centers.
CHAPTER 4: ONE-STOP CENTERS

In 1998, the Workforce Investment Act (WIA) required states and localities to coordinate most federal funds supporting employment and training services into a single system, the one-stop center system. Possible federal support for these centers can be obtained for the Department of Labor, the Department of Education, Health and Human Services, and the Department of Housing and Urban Development (GAO Report, 2003). The one-stop center system involves a central location, in which jobseekers can access information and/or programs pertaining to employment, training, and other related support services. The overall objective of the system is to unify the “patchwork” of categorical programs into one workforce development system (Kogan, 1997). The one-stop center system is a network node for employers, employees, and service providers.

The specific objectives of one-stop initiatives are as follows:

- **Universal access:** Core workforce development services universally accessible to all individual and employer customers, regardless of their eligibility for specific categorical programs.

- **Customer choice:** The transformation of the bureaucratic maze of categorical workforce development programs into a customer-driven system that allows jobseeker and employer customers to select services appropriate to their individual needs and interests.

- **Service integration:** The integration of the planning, design, and delivery of services across multiple funding streams and agencies to create a system of services that is seamless from the customer perspective and minimizes duplication of effort.

- **Outcome accountability:** The development of new system-level accountability mechanisms to ensure that the system is driven by efforts to improve outcomes for worker and employer customers.

Implementation Strategies

The one-stop centers, considered exemplary in a report prepared by the U.S. General Accounting Office (GAO), implemented a range of streamline services for jobseekers, engaged employers in the community, and built solid one-stop infrastructure (GAO 03-725, 2003). Educational training of one-stop staff and the consolidation of case management and intake procedures streamlined the service needs of jobseekers. The successful centers also all had at least three methods of engaging employers that were tailored to the service needs of the employers. This meant that there was specialized staff for specific employment industries and assistance from intermediaries such as Chamber of Commerce and economic development agencies. Strong infrastructures of the centers were built by strong program partnerships and consistent fundraising to supplement the funds supplied by WIA. The program partnerships were strengthened through the encouragement of teamwork and joint projects. Additional funds were raised through fee-based services, grants, and contributions from partners and local or state governments. Below is a flow chart of the exchange fostered in one-stop centers.

Figure 4.1: One-Stop Center Flow Chart

Source: The U.S. General Accounting Office
The Department of Labor does currently track outcomes such as job placement, jobseeker satisfaction, and employer satisfaction to evaluate workforce development programs. However, there is very little known about the impact of various one-stop service delivery approaches on these and other outcomes (GAO 03-725, 2003). This investigation will examine those outcomes along with approaches. The approaches of the one-stop centers are lacking in evaluation of integrated services such as sharing customer intake forms across programs, employer partnerships, and the dedication of staff to focus on engaging and serving employers. Also, missing is the collaborative evaluation across federal agencies on the interdependent affects that does not just favor labor but includes issues of education, health, housing, and urban development. This study operates on the premise that an acknowledgement of the interdependency of these issues is needed for a comprehensive solution to increasing the standards of living for low-income populations.

**Coordination of Federal Funds**

As a result of welfare reform, there are increasingly more TANF dollars being used in the one-stop centers across the country. This allows increasing TANF-related services to be available on-site, and more importantly the joint efforts in serving clients. Examples of these joint efforts are electronic linkages and client referrals. There are many states, in which to some extent provider TANF services through one-stop center. As of 2001, only four states in the nation did not provide any TANF services through a one-stop center (GAO-02-696, 2002). This is important to states workforce investment programs with centers because once fully operational one-stop centers should serve 80% of the nations civilian labor force according to a 1997 projection (Kogan, 1997). TANF dollars are the main funding stream of welfare recipients. Various issues are associated
with the task of distributing these funds to increase the situation of the low-income population there comes a variety of issues.

A variety of issues including historic relationships, geography, adequate facilities, and different perspectives influence how one-stop centers are used to relay services to TANF clients. Historic relationships pertain to the staff of local agencies that do not have experience working with one-stop center staff, which leads to a lack of trust limiting coordination options. Geography can be a barrier because of uncertainty of service district. Some local agencies may be reluctant to work with one-stop center because of physical location and being unsure of the one-stop center’s service reach encompassing their area. In the case of adequate facilities there may not be enough space to house a joint staff. With different perspectives, there is a debate over whether or not TANF clients are better serviced in separate social service facilities. There is a concern that because of multiple employment barriers TANF clients may not receive priority of service in a one-stop environment (GAO-02-696, 2002).

These issues influence coordination provisions. For example, workforce staff might be outsourced in various welfare agencies to service TANF clients. Without a centralized locale, this hinders coordination. There are also program differences that hinder coordination efforts. For example, there are different measures of program success that include variations in definitions and report requirements. For example, defining what income level constitutes self-sufficiency (GAO-02-696, 2002). Currently, there is no evaluation of how coordinated service delivery forged by one-stop centers affects the outcomes of TANF clients. This investigation will seek information on those outcomes and efforts made to alleviate coordination issues through sample case studies.
Efforts that can be made to alleviate coordination issues include welfare and workforce information systems, which are not equipped to exchange data. A one-stop staff has to enter data on the same client into two different systems. A 2002 GAO report recommended that coordination issues should be dealt with jointly be the Department of Labor and Health and Human Services (GAO-02-696, 2002).

This research seeks to analyze policy coordination on the federal level that trickles down to states and localities, which is necessary to the promotion of positive development. Efforts need to start at the federal level, which is the proper platform to ignite consistency and momentum for real change. The previous conclusion is surmised based on preliminary literature support. Preliminary literature explains performance measures must be clearly outlined by the federal government before the devolution of funding control occurs (GAO 03-725, 2003; GAO-02-696, 2002; Kogan, 1997; and Okagasi, 1997). The standard of living for low-income populations will not be improved with the efforts of a few anomalies. Meaning the measures of success for one-stop centers need to be standardized and judged based on a set of criteria that are easily transferable. Knowledge from model programs as well as failed ones using one-stop centers need to be documented to promote the proper policy adjustments. One-stop centers are viable venues to promote economic growth for low-income and all citizens of society.

**ONE-STOP CENTER CASE STUDIES**

**Portland, Oregon Initiatives**

The Portland one-stop center case study will serve as example of initiatives involving the participation of community colleges. Today a portion of the curriculum of
community colleges around the country are being devoted to applied skill development directly relating to industry to better prepare potential participants of the labor market. This can be recalled from a discussion in Chapter 2 about workforce developers attempting to meet the specific needs of particular industries and the issue of industry cluster development. The particular interest in this tactic is the possibility of better preparing low-income population to join the workforce in a position directed towards upward mobility.

Metro One-Stop is the center being studied in this case. The center is one of three centers in the Portland Community College (PCC) workforce network. The PCC workforce network is an organization that seeks to optimize workforce performance. It serves the north and northeast regions of Portland. The network specializes in helping businesses fulfill their human resource needs and helping jobseekers in their career development.

Overall services provided by the network include workshops, Adult Basic Education (ABE) & General Educational Development (GED) services, computer classes, teen opportunities, short-term training programs, workplace English, career centers, and transportation assistance. Topics covered in the workshops are resume building, career exploration, interviewing skills, and mastering the application process. GED preparation courses are also offered. Computer classes are available at every center in the network with a mix of self led and instructor led classes. Teen opportunities range from life skills to career development. There is also a broader connection to transportation assistance in the region including access to a Tri-Met trip planner.
Network partnerships consist of self-sufficiency offices, departments of human services, regional one-stop centers, workforce developers, educational partners, employers, and teen services links. These partnerships equip the network with the tools need to serve employers and jobseekers. Services offered by the network are as follows.

**Northern New Jersey Regional Initiatives**

The Northern New Jersey region one-stop center case study will serve as example of initiatives involving state administration. The one-stop centers in New Jersey like the JARC initiatives are more from the top down in terms of governance structure. The program control is still maintained at the state level. The one-stop centers are part of a state network in New Jersey. The particular interest in this tactic is the possibility of system that exhibits standards for consistency and a capacity to easily transition into a process involving interdependent agencies with common missions. The importance of these standards and processes, as covered in Chapter 2, are crucial to the development Tier 3 reform policy that is multi-dimensional and is a comprehensive system of reform.

The Jersey City of Hudson County one-stop center will be examined in this case. The center is part of the Workforce New Jersey Public Information Network. The centers
in this network are divided by counties with one managing center. The Jersey City center is the managing center of Hudson County. The center and network is operated under the State Employment and Training Commission.

Overall services and programs provided by the network include the NJ Employer Council, services for employers, government contracting, professional service group, apprenticeships, intern programs, unemployment and disability information, labor market information, and transportation for employees. The NJ Employer Council is a statewide organization that partners with the state department of labor to work on ways of improving the state workforce through development programs and services. The network provides a variety of services for employers includes maintaining a 24-hour a day, seven days a week talent bank. New Jersey has professional service groups, which are self-help organizations of professionals helping professionals to find new jobs. There are a number of transportation options for employees in the region, a number of which tie into the JARC initiatives.

Participating partners of network initiatives are state departments of labor, personnel, education, human services, commerce and economics, community affairs, and veteran affairs, as well as private sector employers. The partners contribute to the service of jobseekers, employers, and career explorers. Services specifically provided by the Jersey City One-Stop of Hudson County are as follows.
Table 4.3: Jersey City One-Stop Services

**Services:**

- Public access to One-Stop computers for posting resumes and searching for jobs
- Assist applicant in registering for services
- Review the applicant’s job qualifications, experience, readiness, abilities, etc.
- Vocational counseling to veterans and other applicants
- Refer the applicant to employers with appropriate job openings
- Refer to other agencies for job training
- Refer to other agencies for supportive services (health, housing, legal, etc)
- Classes in job seeking methods (searching for job openings, writing resumes and cover letters, interviewing for a job, networking, etc.)
- Assist job applicants in writing and entering their resumes into America’s Talent Bank
- Public access to computers featuring the Workforce New Jersey’s One-Stop website (Job Bank, Resume Bank, directories of training and services, etc.)
- Assistance, when needed, to registered applicants using the computers
- Vocational rehabilitation services
- Fax, copier, phones available to applicants for use only in their job search
- Certification of unemployed job seekers for tuition-free training at any community college or state college (on a space-available basis)
- Orientation and referral to the Self-Employment Assistance program

**Services to employers include, among others:**

- Screening and referral of appropriate job candidates from the largest pool of workers
- On-site (at employer’s location) recruitment and screening for the employer
- Positive recruitment—employer can conduct recruitment using the office and facilities of Workforce New Jersey
- Employers can set up on-the-job training for workers through Workforce New Jersey

**Baltimore, Maryland Initiatives**

The Baltimore, Maryland region one-stop center case study will serve as example of information technology driven initiatives. The one-stop centers in Baltimore are similar to New Jersey in terms of being administered by a more top-down approach. The program control is still maintained at the state level. The one-stop centers are a part of a state network in Maryland. The particular interest in this tactic is the outcomes produced by a center that works as a node of information, instead of a node of information and
program activity. The center works as a collector of information but, out-sources actual programs. The center exhibits the possible tactics of one-stop centers that should be implemented with care since it can do a disservice to the region by not providing extensive development services, particularly in the case of low-income citizens.

The Baltimore City CareerNet one-stop center will be examined in this case. The center is a part of the Maryland Job Services CareerNet. This network is operated under the State Department of Labor, Licensing, and Regulation. The centers in this network are divided by counties. The technology is used by jobseekers and employers to find career matches by connecting people to jobs.

Partners of the network include Professional Outplacement Assistance Center, employment agencies, the state departments of human resources and health, licensing boards, bankers, educational institutions, and employers. The Professional Outplacement Assistance Center is for workers that already have professional, technical, or managerial skills. A host of other organizations collaborate by providing a comprehensive resource bank of websites and contact information for programs and information relating to employment.

Services specifically provided by the Baltimore City CareerNet One-Stop are as follows.
Table 4.4: Baltimore City CareerNet Services

- Full service WIA One-Stop Worker Services
- Locate job opportunities
- Receive free computer training in the Digital Learning Labs
- Discover winning job search techniques
- Access training opportunities
- Identify and assess current skill levels
- Explore career options
- Learn about financial aid
- Obtain information on local employers and labor market trends
- Participate in GED or adult basic education classes
- Create a winning resume Business Services
- Outreach & Recruitment Prescreening
- Assessment & Testing
- Occupational skills
- Cooperative programs (workplace & instruction)
- Upgrade skills training
- Job readiness

Source: Maryland Job Service CareerNet One-Stop Centers website (http://www.dllr.state.md.us/county/), Accessed 2004

Summary

The purpose of investigating one-stop centers in these particular regions is to examine potential connections to JARC initiatives, as well as evaluate impacts of the three different typologies. The typologies have different dimensions which contribute to the deriving of a comprehensive system. A comprehensive system, which involves standards of consistency, provisions for sustainability, and frameworks for interdependent government agency efforts, is one of the main interests of this investigation. A system of policy reform consisting of these measures will transition Tier 2 policy such as JARC to Tier 3 policy, which provides the necessary federal support for merging people-based and placed-based strategies leaning with preference towards the arena of people-based strategies that are believed by this investigator to produce the greatest outcomes.

Strategies such as these open up the dialogue between decision-makers with the intent of developing plans for economic growth that cause a large enough ripple effect, in
which there is no need to compete over place standings. Without the competition of place standings, the beneficiary population no longer needs to be single-faceted in order to produce meaningful outcomes. The benefits can be reaped across several income brackets. The focus does not need to be either exclusively on job opportunities for low-income citizens or network opportunities for well-educated professionals. The research implies that networking opportunities provide cyclical benefits, which are essential to economic growth. Meaning social networks can create career opportunities, which in turn contributes to monetary benefits. This is the reason for interest in merging the place-based strategy of one-stop centers with people-based strategy of people mobility.

Pertinent information that can only be acquired at the grassroots-level utilizing place-based strategies adds an advantage to the overarching people-based agenda, which is more likely to receive the federally support, a top-down approach, because of the protection of the public interest.

The advantage provided by all the one-stop centers is access to a node of employment information and activity. Diverse resources are apparent in every case. However, alleviation of bias barriers is not apparent in every case. In each of the case, a specific group of residents is targeted or shown preference. In the Oregon center, the younger generation has a higher likelihood of success in a community college based program. This assumption is made because most of the services and programs are directed at teens and young adults. In the New Jersey and Maryland centers, there is an assumption of populations with the above basic skills needed to take advantage of the services offered in the information-technology based systems. Systems with multiple phases to serve a diverse population with different skill levels are needed.
None of these models are exemplary collective one-stop center systems, which use these tactics successfully. However, each model has successful individual tactics, which should be integrated into a multi-phase system. The Oregon center works closely with local industries and community colleges on creating an applied curriculum that is reflective of the current labor market. The downfall is this ties a jobseeker to a place. In the New Jersey model, a participant is not as tied to a place and has more transient freedom within the state when looking for a job. Because of the state administered system, jobseekers can find fair consistent one-stop practices across the state. The Maryland model is also state administered system and in addition has in-house WIA staff to assist the particular needs welfare and low-income citizens. In order to comprise a successful collective model of one-stop center systems, the model needs the include all of the successful aspects of the individual models described above and a stronger connection to transportation initiatives such as JARC. To make suggestions of the specific dimensions of an ideal model, a comparative analysis of all the model samples will be performed in the chapter to follow.
CHAPTER 5: ANALYSIS

This chapter is designed to comprise a framework for policy changes through analysis of the sample models of JARC initiatives and one-stop center systems. The chapter begins by further detailing dimensions of the model strategies to support the summaries at the end of chapters three and four. Then, the paper ends with consolidated analysis, which includes a framework of suggested policy changes to synthesize people and place based strategies to promote economic upward mobility.

JARC Comparison

The purpose of this segment is to perform a comparative analysis of Job Access and Reverse Commute (JARC) grant program applications in terms of process and resulting projects. The projects compared are located in Oregon, New Jersey, and Maryland. This sample was chosen for its ability to exhibit a diversity of situations across the country and initial information available on JARC programs based on Federal Transit Administration (FTA) resources. The information discussed in this section will cover both the state and regional level. In certain cases the focus stressed in implementation strategies differ between states and between regions within a state have agendas that go beyond the overall state agenda.

This serves as a preliminary study to identify guidelines needed to utilize transportation policy as an effective vehicle of community economic development. Using this strategy is seen as a comprehensive approach that includes a diversity of decision-makers and stakeholders. This approach is preferred over incremental approaches or tactics that are performed by isolated sectors with divergent interests in development initiatives. The study will first describe the JARC grant program. Then, the
study will compare and contrast coordination structures, guiding principles, and services provided by each state. This will be followed by an overall evaluation.

**Coordination Structure and Hierarchy**

The major criterion for the use of grant funds is coordination. All states are required to make provisions for coordinated services, employment and related services, and a financial distribution schedule. The difference discovered among the New Jersey, Maryland, and Oregon cases is the governance structure. For the most part, all of the states used partnerships to implement these requirements. The dissimilarity was the states’ organization of the partnerships.

In the case of Portland, Oregon, partnerships were heavily dependent on local participation encouraging individualized implementation tactics. Participants included members of public and private transportation providers as well as human service providers. The bulk of the effort was spearheaded by Tri-Met, an independent transportation provider. In Oregon, there is no apparent state committee or agency to oversee the day-to-day tasks after initial administration by the MPOs. Authority for day-to-day management is mainly deferred to the local level with necessary provisions for regional services (Portland, Oregon Area-Wide Job Access Plan, 2000).

This is not the case for both New Jersey and Maryland power of administration is maintained from inception to completion mainly at the state level. In both cases, there is a State Coordination Committee for Human and Transportation Services. Funds are still primarily distributed to local transportation providers for programming but final approval is up to the discretion of the state committees. In these states, programs are also generally examined on the county level.
In New Jersey, each county develops a Community Transportation Plan and there is a steering committee for each county that implements the action strategies. The steering committee consists of representatives from the State Departments of Transportation, Human Services and Labor, the NJ State Employment and Training Commission, and NJ TRANSIT. The county-based steering committees are responsible for updating transportation gaps and identifying possible strategies with specific types of services offered (NJDOT website, Accessed 2003).

**Guiding Principles**

Each state has its own set of guiding principles that governed the services to be researched and developed that is as follows.

<table>
<thead>
<tr>

</tbody>
</table>

Note: Each region derive their own more elaborate set guiding principles or strategies from the overarching principles of their states
Services

Each state provides a broad range of services. All the states supplied public and private transportation, employment resources, training, services for the aging and disabled, and information networks. Other services were reliant on the state’s partnerships.

In the case of Portland, other services included childcare, health benefits, and a large array of non-traditional transportation alternatives. These alternatives were CarSharing, in which recipients were loaned a vehicle to use for carpooling; the Bicycle Transportation Alliance, the recipients were loaned a bike for work; and the recruitment of companies that supplied transportation as a part of its benefits package (Portland, Oregon Area-Wide Job Access Plan, 2000).

At the state level, Maryland did not appear to look at alternatives to a straightforward package of transportation services. The projects found in this case do not seem to prioritize additional support services over additional access routes. Descriptions of social services beyond employment related services are limited. This makes the state stick out in comparison to Oregon and New Jersey since several of the programs in these states are hinged around childcare provisions. This does not seem to be Maryland’s focus.

Although on the regional level in the case of the Baltimore Metropolitan region, there were provisions made for both childcare and health care. These programs were necessary to respond to the needs of citizens in that environment. These considerations consequently affected transportation planning. For example, steps were taken to reduce
multiple trips by providing more convenient childcare and health care in low-income
neighborhoods, along major public transportation routes, and at work sites.

More detail on this case in covered in Chapter 3, along with the exemplary
strategies to the Baltimore region employed, using JARC funds, to utilize employer
partnerships to assist in starting low-income citizens on a career ladder. Baltimore JARC
planners went beyond recruitment and retention of employment for low-income citizen.
They established a criterion for working with employers that would allow even
incumbent workers to maintain continuous viability in the changing labor market. For
example, employers were encouraged to provide opportunities for upward mobility, and
pay for career advancement courses. A list of similar criteria can be found in Chapter 3.
These criteria or any similar criteria with this focus were not mentioned in process
performed by any of the other states or regions.

New Jersey does focus on childcare in their programs as well as reduce fares for
children and after-school programs. Studies have ranged from traditional route access
plans for employment and shopping centers to trip analysis of daycare and schools of
Welfare to Work participants. The state also includes programming that impacts more
diversified populations (NJDOT Website, Accessed 2003).

After reviewing a case study of the Northern Jersey region, the actual
administration that makes these impacts possible is interesting. The transportation
planning authority and the department of human services, these two municipal bodies
administering grant funds for the region, derive separate plans and implementation
strategies. Both agencies share and use data from but do not derive a joint plan even
though they are using the same federal funds and serving the same target population. The
reason for this is a difference in perspectives, transportation and human resources. This is an example of program differences the hinder coordination efforts. For example, there are different measures of program success that include variations in definitions and report requirements. For instance, defining what income level constitutes self-sufficiency. (GAO-02-696, 2002) This issue will be revisited because it has to be addressed for so-called comprehensive initiatives to progress.

**Evaluation**

The purpose of this comparative study is to compile the pros and cons that manifest as result of different implementation strategies for the Job Access and Reverse Commute Grant program. This will serve as a preliminary study to identify guidelines needed to utilize transportation policy as an effective vehicle of economic development. This method is seen as a comprehensive approach that included a diversity of decision-makers and stakeholders. This option is opposed to incremental approaches or tactics that are performed by isolated sectors with divergent interests in economic development initiatives.

The foundation of this method is built on partnerships of various sectors including transportation planners, social service providers, municipalities, private employers, and other stakeholders. By bringing these decision-makers to a common ground, there is more of an opportunity for sustainable development initiatives because various disciplines of expertise collaborate towards one common goal. This is feasible as pointed out in GAO reports in Chapter 4, but there needs to be more policy coordination among department on the federal level to support the efforts. Without this support universal indicators and measures of success will not result. Thus, there will be continued
redundancy and piecemeal efforts that do not have sustainable effects. The goal is to increase the economic situation of welfare and low-income populated communities inevitably leading to a more self-sufficient population with a higher quality of life. The best thing about these tactics is the acknowledgement that there are no one-size-fits all solutions to improving a person’s individual situation. Coordination across disciplines is essential for diversified solutions and for allowing continuous viability.

Continuous viability is the main reason for interest in a strategy that requires coordination across disciplines. Particularly, the interest is the creation of sustainable career paths and general improvement of living standards for impoverished communities. It is one thing to provide entry-level jobs that remove a percent of the population from welfare. However, it is much more to start a population on a continuous upward spiral. One time intervention with an isolated focus will not do it.

The programs developed under this grant do consider external circumstances. As advised by several economic developers, the range of support service need to encompasses drug treatment, psychological counseling, child care, and transportation. (Fitzgerald & Rasheed, 1998; Osterman, 1993; Pavetti & Acs, 1996; Stawn & Martinison, 1998) For example, childcare is large factor when considering the travel time from work to home. However, the long-term advantages for the target populations are not clear. For instance, is it in the person’s better interest to take an entry-level position that causes them to sacrifice finances and the amount of time they can spend with their children? Unfortunately, the answer to this question is sometimes ‘no’. It is apparent that these programs provide greater access to jobs but not the training to continue climbing. It can be difficult to see the incentives for self-sufficiency.
In the Portland project, there were provisions made for employment training but provisions for occupation levels are not clear. The most abundant jobs were available in the food service, transportation, security, and home care industries that did not allude to the potential for elevation. There were also employment opportunities made accessible in high-tech corporations such as Nike and Intel. However, the study was not clear about the positions that the targeted population would qualify for, if any. If Portland has programs in place that do set people on career paths in corporations such as these, which would change the lifestyle situations of welfare and low-income population, this would be a great model for economic development for its completeness. However, it is not certain that this is the case after investigating this study. The reason for this belief is the predominant jobs resulting from the project did not provide the option of upward progression on a career ladder.

In the case of Portland, one of better non-traditional transportation service plans was implemented. Workers had the option of a bike or a carpool, catered to the schedule of the individual more than the non-traditional services of the other states. These provisions were made recognizing the need for extended hours and expanded routes in public transportation is still sometimes not enough.

The presence of a State Coordinating Committee is a definite plus for both Maryland and New Jersey. Also, the organizational power at the county level with steering committees makes regional coordination and consistency easier to maintain. This level of hierarchy in coordination is necessary for efficiency.

New Jersey built in another level of efficiency for the state while still maintaining enough flexibility in program to cater to the needs of individual localities. Even with the
more top down approach, the diverse needs of the localities are recognized. This approach even extended to include populations outside the targeted low-income and welfare populations in which the grant is designed. The extension of servicing population will prove to be essential in the viability of projects that genuinely improve the quality of life. Individuals are afforded the opportunity to transcend and truly improve their life situation.

A negative for the Portland case was the diffused power involved in organizations implementing the plans. Oregon deferred most of the power to localities. This is good for responding to the needs of local populations but it makes it difficult to respond or be on board with the agenda of the state macrocosm. The lack of a State Coordinating Committee could cause a decrease in productivity and sustainability, particularly in overlapping geographic regions. After review these case studies it is clear that the rings of administration need to be orbiting on the same axis from the innermost ring being localities to the outermost ring being federal government. (See Figures 4.1 and 4.2 below) As noted in the GAO reports in Chapter 4, joint efforts need to be made starting on the federal level to ignite consistency and the momentum for change.
One-Stop Center Comparison

The purpose of this section is to perform a comparative analysis of One-Stop center services and programs in terms of typology. The three different type of typologies
covered will be a community college partnership center, a state administered center, and an information-technology based center. This sample was chosen for its ability to exhibit a diversity of situations across the country and potential connection with JARC programs in the same region.

This will serve as a preliminary study to identify guidelines needed to utilize one-stop centers as an affective venues for services and programs resultant of policies that promote community economic development. The one-stop center system involves a central location in which jobseekers can access information and/or programs pertaining to employment, training, and other related support services. The overall objective of the system is to unify the “patchwork” of categorical programs into one workforce development system (Kogan, 1997).

The interest in one-stop center is the fact that it is a network node for employers, employees, and service providers. Using this system is seen as providing the proper forum to forge a comprehensive approach that includes a diversity of decision-makers and stakeholders. The study will include a summary table center types, administering body, and services provided by each region. This will be followed by an overall evaluation.

## Using Public Policy to Promote Economic Development

### Computer Access
- ✓ Computers with Internet Access
- ✓ Self-paced computer classes
- ✓ Instructor led computer classes
- ✓ Public access to computers featuring the Workforce New Jersey’s One-Stop website (Job Bank, Resume Bank, directories of training and services, etc.)
- ✓ Receive free computer training in the Digital Learning Labs
- ✓ Discover winning job search techniques
- ✓ Create a winning resume
- ✓ Business Services

### Labor Market Resources
- ✓ Full-service Career Center with current job listings
- ✓ Resource library with over 250 job search books and videos
- ✓ Job search workshops on resume writing, interviewing and other topics
- ✓ Classes in job seeking methods (searching for job openings, writing resumes and cover letters, interviewing for a job, networking, etc.)
- ✓ Assist job applicants in writing and entering their resumes into America’s Talent Bank
- ✓ Obtain information on local employers and labor market trends
- ✓ Outreach & Recruitment Prescreening

### Employer Related
- ✓ Employer presentations
- ✓ Full time Employment Department Representative
- ✓ Screening and referral of appropriate job candidates from the largest pool of workers
- ✓ On-site (at employer’s location) recruitment and screening for the employer
- ✓ Positive recruitment—employer can conduct recruitment using the office and facilities of Workforce New Jersey
- ✓ Employers can set up on-the-job training for workers through Workforce New Jersey
- ✓ Use of talent bank database as recruitment source.

### Incremental Career Step-Provisions
- ✓ Career assessment
- ✓ Review the applicant’s job qualifications, experience, readiness, abilities, etc.
- ✓ Refer the applicant to employers with appropriate job openings
- ✓ Certification of unemployed job seekers for tuition-free training at any community college or state college (on a space-available basis)
- ✓ Access training opportunities
- ✓ Identify and assess current skill levels
- ✓ Occupational skills
- ✓ Explore career options
- ✓ Upgrade skills training
Special Needs

✓ Individualized services to help you find or keep employment
✓ Refer to other agencies for supportive services (health, housing, legal, etc)
✓ Orientation and referral to the Self-Employment Assistance program
✓ Full service WIA One-Stop Worker Services

Evaluation

This study is used to identify guidelines needed to utilize one-stop centers as an affective forum for services and programs resultant of policies that promote community economic development. Knowledge from these model-programs using one-stop centers can lead to more effective adjustments in policy. One-stop centers are viable venues to promote economic growth for low-income and all citizens of society.

All of these centers have different sets of pros and cons. The community college network center seems like a perfect model for escalation on a career ladder. The environment obviously supports education and training. The question becomes, is this environment more conducive to a certain age bracket, specifically the teens to the twenty something generation? The services offered by the center imply that its target population is the younger generation. The center operators try to appeal to student as they graduate from high school. This is not to say other generations are purposely excluded or that there are no programs directed towards their age group, but that services and resources available at this center are better suited for younger generations.
Using Public Policy to Promote Economic Development

The services and resources available at the state administered center in Jersey City can be suited for just about everyone. There is a plethora of services available through the state mandated collaboration of various departments. The problem is in the smorgasbord of programs available in the network, a client could become lost in the overwhelming knowledge not knowing how to process the information. Not everyone is a ‘self-starter.’ Some people need the extra guidance. The local center does offer basic programs. This still might not be basic enough for people coming off of welfare with little or no experience working.

As mentioned early by Giloth, many employers claim that just having workers with strong “soft skill” or work ethic, showing up is enough (Giloth, 2000). It seems like this center would consider this skill to be too remedial since, this particular center does not employ a WIA worker. A WIA work has a better understanding of the needs of welfare and low-income clientele.

The information technology based center in Baltimore City does employ WIA staff in the actual center. There is a separate list of services specifically designed for TANF and low-income population too extensive to include in the table above. However, the concern is whether low-income citizen can obtain labor marker information via the one-stop center. Or, are they still resorting to individual human service agencies? The abundance of information offered by the center requires a certain level knowledge. This requirement of knowledge can serve as a barrier to low-income citizen Maryland. Limiting centers to information can do a disservice to welfare or low-income centers that are facing long-term unemployment without programs for skill development.
As recalled by Okagasi, it does not alleviate some of the fundamental problems of employability (Okagasi, 1997). Information technology based center like this one also distract agencies for true joint efforts. From the perspective of this investigator being hyperlinked on a website does not replace joint policies, joint missions, joint goals, and joint initiatives. It avoids the necessary logistics of them.

Maryland has the programs, the initiatives, the networks, and the knowledge to use one-stop centers to their capacity but, it does not. Everything is in place except the true interdependent collaboration among agencies. The state is even orchestrating the effort but it is not a strong enough leader.

Okagasi mentioned, “States [must] assume a stronger leadership role.” This is necessary to make the vision and actions of these agencies align (Okagasi, 1997). The information collected throughout this investigation has implied this is crucial to the maintaining consistency in vision and the relationship of all program activities. The one-stop centers alleviate some of the communication barriers with physical proximity. However, they are not being utilized to their full potential.

This capacity usage includes interagency performance within states, especially when they are operating under the same federal policies and funds. Departments of labor, human services, health, housing and urban development, and transportation all should be working jointly on the issues of job access and employment support service for low-income citizens. The issues impact all of these departments. The piecemeal approaches sanctified in the past are not making a big enough dent.

The recommendations in a 2002 GAO report have to be taken under advisement, coordination issues should be dealt with jointly be the Department of Labor and Health
and Human Services (GAO-02-696, 2002). It is the opinion of this investigator that policy coordination on the federal level that trickles down to states and localities is necessary for the promotion of positive development. This would be a start to overdue comprehensive approaches. The standard of living for low-income populations will not be improved with the efforts of a few anomalies. There has to be an agenda of policy reform that encourages interdependent agency initiatives and the use of one-stop centers as nodes of activity not just information that responds to the needs of a diversity of populations including low-income citizens.

**Consolidated Analysis**

The purpose of proposing the merger of people-based strategies such as JARC initiatives with place-based strategies such as one-stop centers is to suggest a framework of policy changes which better suit the synthesis of the two strategies to promote economic upward mobility for all citizens. Currently, the policies discussed in the case studies are Tier 2 policies with the potential of becoming Tier 3 policies. JARC is a multi-faceted transportation policy that mandates regional coordination including funding the one-stop centers, which are the result of multi-faceted workforce development policy. In order for transportation and workforce policies to become Tier 3 policies, there needs to be a comprehensive system of reform, which requires federal influence in terms of administration to maintain universal performance standards.

The purpose of engaging in a discussion, which emphasized people-based strategies and their impacts on employment, was to illustrate the common need among diverse decision-makers for universal performance measures of collaborative efforts as common interest of diverse decision-makers. The discussion has led to the conception of
a policy framework which encourages interdependent agency initiatives based on lessons learned from the sample case studies and relevant literature. Described on the next page, in Table 5.1 and in Figure 5.2 are the current structures in position and the additional links to be made in order to create a system which produces a large enough ripple effect in economic development to be experienced by all.

IMPLICATIONS FOR PLANNING

The lessons learned from examining the policy framework components in Table 5.1, which identifies the missing links in policy have been used to form the suggested policy cycle in Figure 5.2. This cycle will be explained through a discussion of administrative changes, component changes in framework, and potential impact changes. Then, the paper ends with a suggestion for future initiatives to be undertaken by both planners and economic developers.

Both planners and economic developers need to create integrated workforce development and social welfare strategies because the strategies affect the overall public
interest and the greater economy. The integrated strategies should include interagency action with universal performance standards, an unbiased governing body, and provisions for workforce development that go beyond job access. As defined in spatial mismatch theory, the process of obtaining and maintaining employment is also impacted by lack of information and lack of discrimination prevention (Ihlanfeldt, 1999). The U.S. General Accounts Office also notes that joint efforts need to be made starting on the federal level to increase consistency and the momentum for change.

These recommendations need be taken into account starting with increased numbers of departments participating in coordinated efforts to address the issue of employment. These departments should not only include the departments of transportation and labor, but also departments of housing, health, and education. Extensions of joint efforts are necessary to address the underrepresented or missing issues of employment. Not addressing these issues is often times to the detriment of low-income populations. Addressing these missing issues will ignite true change because the needs of the weakest links in the economy, low-income populations, will be recognized.

The changed administration has to be governed be a non-biased body. Specifically, the governing body should be spearheaded by a municipality to avoid conflicts of interests or dominating voices. As previously exemplified in the Oregon Workforce Investment Board example, having initiatives led by private industry participants can lead to the forging of alternative agendas compressing the original comprehensive purpose of the Board.

To maintain the comprehensive purpose behind workforce development initiatives there has to be a comprehensive means of evaluating them, which means that new
performance standards have to be derived that measure new coordinated systems not old single-faceted systems. Transportation providers and social services providers cannot keep performing with different measures of success and claim to be coordinating their efforts. For example, as explained in the New Jersey JARC case study, having two agencies use the same federal funds to develop completely different plans and implementation tactics is an inefficient use of resources. An evaluation system that relates to the measure of coordinated outcomes, not the predictable historic outcomes of the separate agencies, has to be put in place in order to overcome perspective barriers to coordinated efforts. Historically, different government agencies use different methods to solve problems. There has to be a paradigm shift centered around collaboration in order to derive universal performance measures.

The shift needs to start at the federal level through incentives and directives, which orchestrate the mentality change. The federal government has the power and funding, which should only undergo devolution to the local levels with guidelines to support collaboration from inception to completion. This major step needs to be to taken to ensure a policy cycle of success.

Conclusion

Standardized evaluations of federally funded programs such as JARC and one-stop center systems can lead to the creation of better integrated workforce development, and therefore social welfare strategies. Development of these integrated strategies can begin with the synthesis of people and place-based strategies, which allow for greater upward mobility for low-income citizens. By focusing on low-income citizens, the underrepresented or missing links of policy structure can be added. By adding the
missing links to policy structure currently in position, a system can be created which produces a large enough ripple effect in economic development to be experienced by all.
REFERENCES

APPENDIX A

Portland, Oregon Response

Who are the necessary stakeholders and what fields should targeted for recruitment?
Stakeholders include regional transportation providers, social service providers, community colleges, vocational schools, regional employers, TANF clients, and people living at or below 150% of the federal poverty level.

What were the coordination issues?
Aside from arranging meeting times that work for many parties, the largest coordination issue has been making certain that no services duplicate fixed route transit service already offered by TriMet.

What continuation factors are built into the programs?
Ideally programs will sustain themselves beyond the duration of the grant, however there is no process in place to assure this.

What are the criteria for the targeted populations participating in the program?
What are the evaluation criteria for progress?
The criteria for the target audience is TANF clients and people living at or below 150% of the federal poverty level. The evaluation criteria is ridership on services funded by the grant. We may also review regional TANF data (enrollment) in the near future.

What non-work travel services are offered with the program, if any?
How were issues of accountability handled?
Non-Commute vouchers are funded by the Job Access grant. The grant also funds travel training. Accountability is not a problem. All vouchers have carbon copies. Travel trainings are tracked by instructors. This is especially important because students receive an all-day TriMet pass for completing the training.

New Jersey Responses

1. Who are the necessary stakeholders and what fields should targeted for recruitment?
   a. We have no specific employment fields we are targeting. The stakeholders have become the transportation provider, the human service agency, and the Metropolitan Planning Organization.

2. What were the coordination issues?
a. Some of the issues surrounding coordination have been establishing the benefits received. From my own observation many of the employers, human/social service providers, and transportation providers had to be shown what they would be receiving from any type of collaboration. For example, a transportation operator must feel confident that a certain level of ridership can be guaranteed in order to operate a given route.

3. What continuation factors are built into the programs?
   a. There are no guarantees on the receipt of future federal funds for a project that received an award. The guidance given is that grantees should incorporate into their programs methods of sustainability, barring a possible additional award, once all federal funds have been used.

4. What are the criteria for the targeted populations participating in the program?
   a. Are you referring to poverty level of an area?

5. What are the evaluation criteria for progress?
   a. JARC grantees are required to submit two reports, which assist the FTA in evaluating the program. First, they are required to submit a quarterly report to TEAM. TEAM is the electronic grant making system for the FTA. This system allows us to track a measure of the qualitative and the more quantitative data. These measures include the money drawn down, and the milestones met for different phases of the project. Second, the FTA has a more qualitative reporting database that grantees must utilize. This enables us to track data such as number of employer sites reached, number of new transit stops added, etc.

6. What non-work travel services are offered with the program, if any?
   a. The program does call for routes to employment sites, as well as, employment related services such as childcare centers, senior facilities, etc.

7. How were issues of accountability handled?
   a. Please explain

This is an abstract proposal for a paper or poster session on a completed research paper to be given at the Hawaii International Conference on Social Sciences. The topic areas are: International Studies, Women Studies, Social Work, Psychology, and Sociology.
Abstract

Assessing the Needs of Refugee and Asylee Families

In 1996, Congress asserted that marriage is the foundation of a successful society and is an essential institution for promoting the interests of children. While recognizing that a healthy marriage would not in and of itself prevent poverty, research indicated “stable marriages are associated with more stable employment, higher wages and better physical and emotional health” (Administration for Children and Families [ACF], 2004). In an effort to encourage states to strengthen marriages, Temporary Assistance to Needy Families (TANF) policies included a directive to increase two-parent families and decrease out-of-wedlock childbearing (ACF, 2004; Rector & Pardue, 2004).

In 2003, President George W. Bush proposed the Healthy Marriage Initiative as part of the TANF reauthorization. The initiative included funding, to be administered by the U.S. Department of Health and Human Services Administration for Children and Families, to promote healthy marriages and strengthen families. Overall goals for such programs include: increase the number of children raised in healthy, two-parent marriages; increase the number of married couples in healthy marriages; provide premarital couples with the skills and knowledge to form and sustain healthy marriages; and, support research on healthy marriages and healthy marriage education (ACF, 2004). The ACF Office of Refugee Resettlement (ORR) was included in this initiative as related to refugees.

The Immigration and Nationality Act describes refugees as persons who have fled their native countries and who are unable or unwilling to return to their homelands because of persecution or a well-founded fear of persecution based on race, religion, nationality, membership in a particular social group, or political opinion (ACF, 2003). The U.S. has been a leader among developed nations with regard to the number of
refugees resettled each year. Between October 1998 and September 2003, the U.S. resettled 465,967 refugees, 1,800 of which were resettled in Travis (Austin) and Bexar (San Antonio) counties in Texas. Refugees settled in these areas represented people from 23 countries with the largest groups immigrating from Afghanistan, Bosnia, Cuba, Iran, Sudan, and Vietnam.

While Austin and San Antonio agencies have a long history of resettling refugees, little research has been conducted with regard to the strengths and challenges that refugee families face during the resettlement period. The Office of Family Services Refugee Program of the Texas Health and Human Services Commission contracted with The University of Texas School of Social Work’s Center for Social Work Research (CSWR) to identity these issues, with particular emphasis on the goals of the Healthy Marriage Initiative. While the findings are limited to Texas, the discussion will also include comparative research studies done in Asian and Southeast Asian communities, such as China and Vietnam and other refugee dominant states like California, New York, and Florida.

This project’s purposes were to determine the marital and family challenges experienced by refugees, and outline services available to refugees, in Austin and San Antonio, Texas. Thirty-one families and 21 providers of refugee services participated. Refugees from 12 countries were included: Afghanistan, Bosnia, Colombia, Cuba, Ethiopia, Iran, Liberia, Republic of Congo, Serbia, Somalia, Sudan, and Vietnam. The Texas Health and Human Services Commission funded this project, which was completed in September 2004.

Researchers gathered data using a semi-structured questionnaire. Queries about refugee family composition, stressors and strengths of marriages and families, challenges to parenting and mental health, and available and unmet social services needs were included. Interviews were conducted in participant’s homes or in social.
Interviews were audio-recorded and transcribed. Data were analyzed using a modification of the grounded theory method, an iterative process that identifies and codes broad themes in interview transcripts in order to reveal thematic relationships.

Eight major themes were identified by refugee participants. These included: 1) family and marital dynamics, 2) parenting and discipline challenges, 3) family and marital strengths, 4) mental health challenges, 5) barriers to self-sufficiency, 6) resettlement and other services, 7) unmet needs, and 8) solutions. Service providers provided feedback on ten broad themes. These included: 1) services provided by agencies, 2) agency strengths, 3) agency limitations, 4) strengths of refugee marriages and families, 5) tensions in refugee marriages and families, 6) tensions refugees experience with U.S. culture, 7) consequences of resettlement, 8) barriers to success, 9) needs of refugee communities, and 10) solutions.

These findings both support the research literature on Southeast Asian, African, European refugees and provide data specific to the Austin and San Antonio refugee and asylee populations and service systems. They also reinforce what refugees, service providers and policymakers already know about the challenges faced by refugee families during the resettlement period. That is, that refugee families were committed to self-sufficiency but face barriers with regard to transportation, employment, language, and time limits of the resettlement process and although refugee families place high priority on family unity and cohesion, resettlement brings new challenges, such as the loss of and separation from extended family and shifting roles and responsibilities in families.

This empirical research project documents these findings, discusses implications for practice for educators, policymakers, or professionals who work with or provide services to refugee children and families, and makes recommendations for improved service delivery for working with children and families with international backgrounds. Additional recommendations will be made to educators and professionals
who work with or do research on refugee women who have experienced episodes of PTSD and/or human trafficking victimization trauma.
1. Problem and Significance

In today’s world it is hard to find a part of society and the creations that society has wrought that are not somehow touched by oil. The impact of oil on the lives of so many is on a grand scale, such that without oil society would be plummeted back roughly 100 years; until at least alternative sources of energy were harnessed.\(^1\)

*Oil and its Significance*

The term *oil* refers to a broader spectrum of products that aid in the services from heating a house on a cold day to creating the right kind of plastic used in a pace maker to regulate a heart. It is of little wonder why oil companies are so important to the daily flow of modern civilization.

It is also theorized by the U.S. Department of Energy that the first two decades of the 21\(^{st}\) Century will be the most oil dependant that the world has seen. The reasons for this are two-fold. First, nations that are developing will be growing towards parity with industrialized nations. This in itself wills nearly double the global consumption of oil.\(^2\) The second reason is that while alternatives to oil are being explored and made market ready, they are still a long way off from being readily accessible to the world. Hybrid

---

cars are now entering the market at an accelerated rate, at least relative to an originally set date of 2010.\footnote{2002 International Energy Outlook is published by the US Department of Energy.} This is all a reaction to the instability that oil is routinely around.

Most of the world’s oil supply is tapped from areas of the world that are politically unstable and environmentally inhospitable. This adds to the cost of doing business. Specifically, at some point between the harvesting of oil to the delivery of the product to the market there is a risk of interruption. This risk often destabilizes the pricing of a barrel of oil. The interruption can be virtually anything from weather, to pinhole leaks in a pipeline, to terrorism.

\textit{Oil and Terrorism}

When thinking of terrorism one must not think of it in the traditional way of evaluating the damages only through the lens of the loss of life. Often the loss of infrastructure is underplayed, as are the long-term affects of the loss of infrastructure. The event of September 2001 not only was a loss of lives, but it was also an actual loss of financial and institutional infrastructure that sent the US economy into a decline. Similarly the war in Iraq has necessitated a drastic slow-down and even a halt to infrastructure activities in that country. Such a halt only exacerbates the already instable political, economic and social fabric of the country.

Although there is an increasing debate as to what a terrorist is and what constitutes an act of terrorism, the main goal of terrorism is to disrupt the normal flow of life, commerce and society. This goal has been satisfied as the result of many attacks throughout the years. Often, after the smoke and initial shock have cleared from a terror
attack, what remains is the lingering fear of other attacks and the lack of confidence in established systems.

The act of terror itself need not be a bombing or a hijacking. The recent threat of bio-terrorism has yielded an even more sinister an effective mode of operation for a terrorist. In October of 2001 a British Petroleum office in Ho Chi Minh City received a letter laced with anthrax. It is still unknown who the perpetrators of this attack were. What is known is that many of the employees of that office became ill and some were hospitalized as a result. This attack served to undermine the confidence that ordinary office employees.

Recently, oil employees have been targeted in the Kingdom of Saudi Arabia. Hostages were taken, and later set free through the actions of counter terrorist forces. The impact though has been such that many of these foreign workers are now leaving for home. This will create a technical expertise drain upon the operations that these employees have been engaged with.

As a result, corporations have often felt the aftershocks of terrorism more so than other social organs within society. The oil industry itself is a risky industry where normally, 9 out of 10 explorations fail. Yet, in the face of a terror attack the oil industry has seemed to fair rather better than expected. If a casual observer were to look at the oil industry prima facie they would see that the industry is much more related to agriculture than other industries. Both are based in land, technology and resource, and thus are very dependent on location and permanently invested structures.

---

5 The relation between agriculture and oil is more along the lines of landlord tenant and the ability to harvest a resource that is often at the whim of nature. One of the key tenets of being able to access oil
Yet, the reality of the oil industry survival in times of uncertainty including times of terror attacks is that oil companies appear to hedge their portfolios so that they are not adversely affected by terrorism. This is a trait that is evident when one looks at where most of the oil comes from in the world. Often oil companies are forced to install operations in some of the most inhospitable regions of the world.

Dealing with everything from genocide to typhoons has tempered the oil industry to be able to create fiscal systems that are able to account for such dramatic uncertainties. The recent kidnapping of an American contractor in the Middle East sent oil prices soaring. With his later beheading, the job of the terror act is complete. There is now a lingering fear amongst American workers and other expatriates in the Middle East that a similar situation could happen to them.

The Importance of this Study

With the above factors I am led to ask whether the events of 9/11 positively or negatively affect the oil industry? This is still hard to say in light of current market fluctuations and political trends. The majority of the nations where oil is extracted is now more unstable due to 9/11 (indirectly, or directly) and the cost of doing business seems to have risen in these regions.

This issue is of importance since oil companies are at the heart of foreign economic and diplomatic policy in several parts of the world, and in the formulation of national, regional and inter-regional policy to prepare corporate assets against the threat

---

reserves is also being able to strike an agreement and gain concessions with the host nation. This is often akin to striking an agreement with a landlord.

6 Even though a great deal of oil comes from the ocean floor, the refineries and the majority of transportation is land based. In this regard, oil is viewed in the terms of dealing with terrestrial terms rather than maritime terms. An example would be how international boundaries are defined. For the most part an international boundary is defined in terms of where a certain submerged land mass ends.
of terrorist attack. Without an uninterrupted power source, civilization at least as is currently enjoyed and expected, will not function.

One academic justification for researching this topic is that academically, financial risk event studies have been pursued for over 40 years. The path-breaking work of Fama, Fisher, Jensen and Roll (1969) showed that successive price changes in individual common stocks are very nearly independent since in well-established financial markets, prices adjust rapidly to new information. They proposed a new "event study" methodology for measuring the effects of actions and events on security prices. This study would attempt to assess the role of a globally intervening event, such as terrorism, on the market’s view of a company’s stock returns.

The policy relevance in examining the connection between oil and terrorism is that there may be a connection between the UN Global Compact and a *triple bottom line* of corporate responsibility, quality, and size of corporate returns. Another relevant policy discussion is around the structure, provision and pricing of government-sponsored terrorism insurance. Recently, the US Government Accounting Office (GAO) issued written testimony regarding the effectiveness of the Terrorism Risk Insurance Act of 2002 (GAO (2004)). The significance of this report from the GAO shows current methodology of how insurance is being crafted to counter the losses of a terror attack on corporate entities.

The rest of this paper is organized as follows:

- Literature Review
- Variables and their Significance

---

7 The Triple Bottom Line refers to a practice principle that is used in industry to accommodate the corporate governance.
2. Literature Review

There are many factors which affect oil stock prices. Some of these influencing indicators range in a spectrum from changes in corporate structure to erratic weather patterns to external catastrophic events. The rise in political violence in recent years has only proven that drilling for oil is a risky business.\(^8\)

Within the range of influencing factors that affect oil production and therefore oil prices, are certain factors that outweigh other all the others. These factors can be broken down into the two categories of governmental controls, and extraordinary catastrophic events. Catastrophic events include any of a variety of market, credit or operational circumstances. The effect of these categories would impact shareholder returns through revenue and cost, as well as taxation of profits.

Fama, Fisher, Jensen and Roll (1969) demonstrate that stock prices react quickly to new information and adjust the value of shares relative to the impact of that information on corporate earnings and balance sheet value. Since that time, several event studies have been formulated to examine the effects of external events on corporate shareholder returns. Relevant for a review of the effect of terrorist events on shareholder returns are two recent studies.

---

\(^8\) Political violence encompasses a broad array of nefarious activities that are intended to bring about political change with the use of violence. Terrorism would fit under this overall moniker.
Cummins and Lewis (2002) develop a model of terrorist impact on insurance company value and the resulting change in insurance contract pricing. Their conclusion is that such an event simultaneously and severely depresses insurance industry shareholder returns and increases shareholder return volatility. Subsequently, and consonant with a long term persistence in negative impacts, there is a flight to quality underwriting and an increase in the price of insurance.

Abadie and Gardeazabal (2001) study the impact of terrorist conflict in the Basque Country on shareholder value. They find that per capita GDP in the Basque Country declined by 10 per cent and widened relative to more stable areas during times of terrorist attacks. Stocks of firms were positively impacted by times of credible truce with terrorist groups and were negatively impacted when cease-fires deteriorated. They conclude with the sobering thought that their study may aid terrorists by documenting the negative economic impact of terrorist action, an outcome that ostensibly is one goal of terrorism. Neither of these event studies examines the impact of 9/11 on the one set of companies that has a significant influence on the economy: energy and oil companies.

Both of these studies underscore the need to assess drivers of the impact terrorism has on shareholder value. Both develop an approach that measures both the systematic and specific risks of terrorism on the changes in shareholder value. Systematic risk is shared by many, if not all, market participants and represents a market-wide response to the terrorist event. This risk will be evident in economy-wide increases in insurance deductibles and premiums, the cost of funding any project, especially a project in a politically unstable region, as well as a higher hurdle for measuring the performance of management in any activity. Specific (also called idiosyncratic and unsystematic) risks
include the impact of a terrorist event on the operations of a company, having controlled for the market’s response to the terrorist event.

Examples of specific risk include the impact a terrorist event has on the negotiation of a production sharing agreement between a company and a foreign government, the maintenance of a pipeline that transport crude oil to a company’s dock bunkers and onto a company’s ship in a politically unstable country, and the detention or kidnapping of company personnel critical to the success of a company’s operations. Elements of the measurement of systematic and specific risk are elucidated in sections below.

2. Variables and Their Measurements

The null hypothesis is whether corporate returns are resilient to terrorist actions. The dependent variable is defined as publicly traded stock returns of several large oil companies traded in the U.S. The independent variables are expressed as a combination of broad-based market return and a terrorist event(s) indicator variable. Stock returns are the provisional indicator of a company’s ultimate market value. In this study, the percentage change of daily stock returns for over 252 days before the event window and 252 days after the event window will give light to the status of an oil company after a terror attack of massive proportions. These returns are computed as percentage changes of daily closing prices adjusted for stock splits and stock dividends. Market returns are the percentage change of the Standard & Poors 500 Composite Index. The event indicator variable will be coded a 0 if outside the event window and a 1 if

---

9 The combination of market returns and a terrorist event become the independent variable. It is important to recognize that these two components in essence form one variable.
inside the event window. The event window will be initially defined as the 30 days following the reported terrorist event.

3. Research Design and Data Collection

The market index and stock price data are publicly available and downloaded from finance.yahoo.com into a spreadsheet. The event window indicator variable is manually coded against the reported 30 days following the terrorist event. After the 30 day period an analysis will be conducted to review how much damage was done to the stock prices after the attack. This survey of data will go on for over 252 days (as there are approximately 252 trading days per year for stock shares). The same endeavor will be taken for 252 days prior to the attack.

Research Design

The research design relies on the event study approach espoused by Fama et al. cited above. The event study approach makes use of statistical regression analysis to separate systematic from specific risks. Regression is a statistical technique used to determine the straight-line equation that relates a dependent variable with independent variables with the least margin of statistical error. The procedure to examine the effect of an event on shareholder value is summarized below.

1. Choose events and record dates based on publicly available information about events.

2. Select sample of publicly traded companies that may be affected by events. Select market index against which company stock prices may be compared.

3. For each company procure daily stock prices adjusted for stock splits and stock dividends for at least 252 days before and 252 days after the event.
4. Compute daily percentage changes in stock prices and market index.

5. Compute intercept, slope and standard error of regression of each stock return against the market index percentage change on a rolling 100 day sample across the event date.

6. Graph the intercepts, slopes and standard errors of the regression against time (in days) across the event date.

7. Set level of confidence for comparison tests. Against this level of confidence, compare the average intercept, slope and standard error of regressions: null hypothesis is that there is no difference between the regression parameters before or after the event; alternative hypothesis is that the parameters before are greater (or less than) the parameters after the event.

8. Interpret the results in the light of the wider research study.

**Regression Model of Share Returns and Market Returns**

If we were to plot a scatter plot of dependent variable on the vertical axis and the independent variable on the horizontal axis, the regression equation would be the line that passes through the scatter plot as closely as possible through all of the data points. In this study the dependent variable is the Stock Return and the independent variable is the Market Return. An equation that relates these variables is the following:

\[
\text{Stock Return} = a + b \times \text{Market Return} + \text{Event Indicator} + \text{Error Term}
\]

Where \( a \) = intercept, \( b \) = slope term, and \( e \) = error term. The intercept measures the average stock return accounting for sensitivity to market movements. The slope measures the average sensitivity of the stock to changes in the market index. For example, if \( a = 0.001 \), then the average stock return, adjusted for market movements, is
0.1%. Also, if \( b = 1.5 \), then a positive 10% movement in the market index will be associated with a \( 1.5 \times 10\% = 15\% \) positive move in stock return on average. This regression model is the approach recommended by Fama, Fisher, Jensen and Roll (1969) and adopted by Abadie and Gardeazabal (2001) and Cummins and Lewis (2002).

The plot of Halliburton stock price percentage changes (vertical axis, dependent variable) versus the Standard & Poor’s 500 index percentage changes (horizontal axis, independent variable) is depicted below for the full sample.

The slope of the line measures the degree of systematic risk of HAL versus the SPX. The degree of specific risk is the amount by which the scatter of returns deviates from the line. The sensitivity of HAL to SPX is 0.35, which means that if the SPX return rises by
10% then HAL’s return will rise by only 3.5%. The intercept of 0.00027 or 0.027% is the average amount of HAL return per day.

In the next panels we split the sample into two parts: pre-9/11 and post 9/11 to illustrate the effect of this event on HAL returns. For the pre-9/11 sample:

Before 9/11 HAL shows little sensitivity to movements in the market and is slightly negative, -0.066. Its risk is also entirely specific to HAL, or to other indicators not modeled in this study such as oil price shocks. These other indicators may be embedded in an intercept of -0.003% per day.

After 9/11 the scatter plot changes as depicted below.
The sensitivity of HAL to SPX is about 0.98 with a near zero average stock return after 9/11. There is a marked change in market risk before and after 9/11. This sort of risk would affect HAL’s ability to raise capital, approve new projects, and grow. The statistical measure of specific risk is the standard deviation of the regression. Before 9/11 the standard deviation of the error terms is 3.2% per day. After 9/11 this measure rises to 3.6% per day. HAL’s risk is consistent with the following statements:

- HAL’s systematic risk has changed and risen after 9/11
- HAL’s specific risk has changed and risk after 9/11

Given these two statistical consistencies, it appears that HAL’s total risk-return profile has changed coincident with the 9/11 terrorist event.
4. Methodology and Methods for Analysis

The methodology to be employed in this study is as follows:

- Posit a relationship between external event of terrorism and corporate shareholder returns for oil industry participants. Financial and economic theory would indicate that an event such as terrorism would raise the risk and reduce the available returns to shareholders.
- Choose oil industry companies, statistically measure the relationship between risk and return for these companies before and after the event, here, 9/11.
- Based on the statistical measurement, as well as background information about oil industry practices, comment on the results of statistical hypothesis inferences.
- Conclude the study with policy implications.

Shareholder Impact

Reviewing the shareholder impact of how terror events affect the stock price of an oil company is quite important. To say that one is not interdependent upon the other is an exercise in chop logic. Shareholder impact is linked with the conceptualizing of what the stock of a company is worth. The ripple affects of events in the market and ultimately in the world affects how a company perceives itself, and is perceived by the shareholder. If the perception changes the stock itself could be worthless.

To recap for the benefit of the reader, this study builds on two studies of the impact of terrorist events on shareholder value. Cummins and Lewis (2002) develop a model of terrorist impact on insurance company value and the resulting change in insurance contract pricing. Their conclusion is that such an event simultaneously and severely depresses insurance industry shareholder returns and increases shareholder
return volatility. Subsequently, and consonant with a long term persistence in negative impacts, there is a flight to quality underwriting and an increase in the price of insurance.

Abadie and Gardeazabal (2001) study the impact of terrorist conflict in the Basque Country on shareholder value. They find that per capita GDP in the Basque Country declined by 10 per cent and widened relative to more stable areas during times of terrorist attacks. Stocks of firms were positively impacted by times of credible truce with terrorist groups. They conclude with the sobering thought that their study may aid terrorists by documenting the negative economic impact of terrorist action, an outcome that ostensibly is one goal of terrorism.

It is important to keep in mind that both studies rely on the efficiency of financial markets to impound new information into stock prices through supply and demand of shares. Stock prices should react only to new information. Therefore, in the case of insurance companies, their stock prices should have been negatively impacted due to the increase in potential claims caused by a reassessment of potential loss from terrorist attacks. As security increases, businesses prepare for such losses in their plans and operations; insurance company returns should become less negatively impacted and improve over time, at least relative to the new information about terrorist attack preparation. In the case of Basque companies, as a truce is negotiated, company shares should react positively to this new information, and negatively when a cease-fire is about to be violated.

In this study, the new information is an unprecedented terrorist attack of magnitude on US soil. Stock prices should be depressed given the impact of such an impact on US GNP, consumer, investor and saver’s perceptions, confidence in the future,
and business ability to coordinate operations. All of these drivers of shareholder value were affected, and in turn, negatively impacted market prices. Thus oil company prices should also be immediately and negatively impacted. With a rise in economic volatility, oil company prices should also experience at least a temporary increase in volatility, an indicator of market perception of potential risks ahead. However, given oil company assets, strategies and operations that deploy globally, innovate with each new find and event, and impound pervasive loss controls contractually and operationally, oil company stocks should not experience lasting and persistently negative impacts.

Oil companies tend to possess global and local knowledge and skills that can compensate for events such as terrorism through preparation. Also, since oil company assets are located in several non-US locations, the impact of non-US terrorist events on shareholder value has already been impounded in oil company stock prices. Similarly, the impact of terrorist events, that occur on US soil, are ameliorated through oil company strategy.

5. Sample Data and Regression Results

Data to illustrate the hypotheses and analysis in this study are selected from oil service, integrated out and refiner and marketing companies in the oil industry. Oil service companies provide project management, oil field support, engineering, and manufactured products. Integrated oil companies span the value chain from exploration and production upstream, through storage and transportation midstream, onto refining and marketing downstream. Refining and marketing companies take crude oil and manufacture, market and distribution refined products such as gasoline for industrial,
commercial and consumer use. The following table lists the companies selected for this indicative study.

<table>

</tr>
</tbody>
</table>

In addition to the companies a broad-based market index is selected to approximate the market return. The Standard & Poors 500 index is often used as a leading indicator of major economic changes, including GNP, GDP, employment, interest rate and commodity price risks.

Data is downloaded from finance.yahoo.com, a provider of daily stock market information publicly available. 1,322 observations were gathered from January 26, 1999 to May 7, 2004. This allows us to split the sample into roughly two equal groups for events before and after 9/11 in 2001.

Employing the procedures outlined above, regressions of company stock returns versus the Standard & Poors 500 returns yielded three statistics. The first is the regression slope term. This measures the degree of market related systematic risk. The second is the standard deviation of the error terms. This measures the amount of risk
specific to the company. The third is the accumulated error term after 9/11. This measures the amount of shareholder return gained or lost immediately following the event. The results of the performing the above tasks may be summarized in the following table.

<table>

</tbody>
</table>

Notes on the Table values:

1. Ticker is stock exchange symbol for sample company.
2. Beta is the regression slope term; SEE is the standard error of regression error in percentage/day.
3. AR is the sum of abnormal returns immediately following 9/11 until there are no statistically significant residuals; for Duration in number of days.
4. Pre-9/11 sample days extend from 26 October 1998 through 10 September 2001; Post-9/11 sample days extend from 17 September 2001 through 7 May 2004. Stock prices and market index are adjusted for stock splits, dividends and other adjustments as of the close of each day.

The sample clearly discriminates between HAL and AHC on the one hand and the other companies on the other. A severe drop in shareholder value occurred immediately following 9/11 for both HAL and AHC. The other companies actually experienced a rise in shareholder value during this event window. Most notably for all companies, the
degree of systematic risk rose. This can be interpreted as an increase in the required average return for investors to buy or hold shares of these stocks. If the equity cost of capital rises systematically, then any project that these firms would care to initiate would require a return that would have to be even higher to clear the higher equity cost hurdle. It is also important to note, that the specific risk of XOM, SLB, SC and AHC drops across this event. As these companies experience a higher systematic risk, they appear also to experience a lower specific risk. Regression results are reported in the Appendix with additional commentary.

6. Summary Comments and Key Findings

The above results are highly preliminary and exploratory in nature. That is to say that in the course of researching this study it became evident rather quickly that large gaps in motive and data are missing due to the nature of the oil industry. Simply put the trade secrets of the oil industry have only made this paper exploratory by its nature. It appears that the following holds for these oil industry participants:

- **Finding 1: Market related risk increases after 9/11.** This would mean that the cost of capital for these companies would be higher after 9/11 than before on average. Some firms had little or no market sensitivity pre-9/11. After 9/11 these firms report significant relationships to market movements. Higher cost of capital can also imply that investment would be curtailed, since investors require more compensation for the risk they perceive for each dollar they contribute to the capital of a firm.
Finding 2: Company risk drops or remains the same after 9/11. Except for HAL, risks not due to systematic or market influences seem stable or are even lower after 9/11. This might mean that investors view these firms as able to manage post-9/11 risks after the fact even better than before this event.

Finding 3: Some companies gain in “abnormal” returns after 9/11. Both HAL and AHC loose significant amounts of market capital in the first few weeks after 9/11. Other companies actually recover and gain during this period. Hopefully a non-recurring event, 9/11 does appear to have significantly affected the volatility of some oil industry companies. Not only is the volatility attributable to company specific actions (the standard deviation of “abnormal” or non-market related returns) lower, but the systematic risk of owning these stocks is higher. Overall, expected returns are higher than average because of 9/11 for these companies. A higher expected return means that companies face higher hurdles to their performance and investment activities. However, due to the disposition of company assets, strategies and tactics, some companies are experiencing lower company-specific volatility. All companies are affected immediately after the event itself. Future research will expand the sample, and attempt to infer drivers of systematic and specific risk.

PKZ is an example of a stock return that has little or no sensitivity (and not statistically significant) to market returns. Betas and the regression fail to reject the null hypothesis that beta = 0 or that the market does not explain returns. R-squares are also very low. Intercepts are positive and statistically significant. Other systematic independent variables would have to be specified to explain (statistically) these stock returns. However, an assessment of residuals around the 9/11 event reveals significant shocks in
PKZ’s stock returns prior to 9/11. These shocks cannot be attributed to systematic market movements since those movements are statistically insignificant.

It appears from this graph that there is a dampening of PKZ specific risk pos-9/11, while at the same time higher stock return volatility prior to 9/11.
X Variable is beta, the average response of stock return to market return movements. For SC, the post-9/11 market response is higher on two counts: higher beta and greater degree of market influence on stock returns evidenced by higher Post-9/11 R-squared (percentage of stock return movements explained by movements in market index returns). Betas and the regressions are not significant at high levels of confidence (less than 1% probability that the regression significance is false) for pre-9/11 stock returns. However, they are for post-9/11 stock returns. SC post-9/11 has become sensitive to the market.
X Variable is beta, the average response of stock return to market return movements. For AHC, the post-9/11 market response is higher on two counts: higher beta and greater degree of market influence on stock returns evidenced by higher Post-9/11 R-squared (percentage of stock return movements explained by movements in market index returns).

Betas and the regressions are not significant at high levels of confidence (less than 1%
probability that the regression significance is false) for pre-9/11 stock returns. However, they are for post-9/11 stock returns. AHC post-9/11 has become sensitive to the market.

Background: The McKinney-Vento Homeless Assistance Act, which was reauthorized in 2001, prescribed mandates to ensure the education of homeless school-aged children. Such mandates include immediate school enrollment, placement in meal and any other programs for which the child qualifies; appropriate transportation; liaisons between schools and homeless children and their families; as well as a monitoring system for school district compliance.

Prior research indicates that school districts fail to comply with the federal mandates included in the act (James & Lopez, 2003; O’Leary, 2001; Rafferty, 1998). There is a lack of study investigating parental knowledge about the Act or the perception of parents in enrollment experience.

Method: The purpose of this study is to investigate how Atlanta area public schools implement the provisions of the McKinney-Vento Homeless Assistance Act by listening to homeless parents’ voices. The researchers are conducting one on one interviews, using a structured questionnaire, with parents of school aged homeless children in five participating Atlanta area emergency shelters and transitional housing establishments.

Findings: Preliminary results based on 22 interviews, from four shelters, clearly indicate a lack of knowledge of the McKinney-Vento Homeless Assistance Act, as well as its provisions, among the homeless parents interviewed. Interestingly, 96% of parents reported that no one from any school has ever talked to them about their children’s rights as a homeless child to go to school. Approximately 36% of parents reported that they had to bring missing documents back to school in order to enroll their children in school instead of being enrolled immediately. Types of services to which homeless school aged children are entitled that parents are aware of were limited to transportation, free lunch, and uniforms. The educational needs of their children that parents addressed include day care, after school programs, access to computers for assignments, and change of attitudes and behaviors of school personnel toward homeless children.

Implications: Implications of this study include (1) to increase education of the parents of homeless children of the provisions of the McKinney-Vento Homeless Assistance Act, (2) to increase education of emergency shelter and transitional housing staff members, (3) to increase interaction or communication of mandated liaisons between schools and homeless children and their families, as well as (4) to increase funding for the implementation of the Act.

6) Workshop Abstract

Our growing aging population coupled with medical advances is demanding another look at how social work education prepares students for practice. This workshop outlines one approach that helps students learn about end of life care.

Essay

Many people are growing older, but are not necessarily living well. The one-two punch of advancing medical technologies that makes living longer possible is also creating conditions that are resulting in increasing demands for a stronger social work presence. Beyond the traditionally defined practice areas such as hospice, palliative care medical practices, skilled nursing facilities, and home-health services, it is likely that social workers will be exposed to this area of concern across diverse practice lines, including mental health, school-based, and other service arenas. The potential emotional, physical, and financial fallout of life-threatening and terminal illnesses on individuals and familial caregivers are requiring heightened levels of knowledge and skill in the area of end-of-life care for bachelors and masters prepared social workers.

Quig (1989) and Parry (2001) argue that social workers are best prepared to respond to the psychosocial concerns and needs of people facing the end of life. Based on the profession’s core components as defined in the Working Definition of Social Work (Bartlett, 1957), social workers are ideally suited to assess and advocate for individual and familial wishes through direct care, responsible systems changes, and to facilitate collaborative relationships in order to maintain a holistic system of care.

Three recent studies exemplify the critical need for social work knowledge and methods in end of life care. The 1995 Study to Understand Prognoses and Preferences
for Outcomes and Risks of Treatments (SUPPORT) is considered the landmark study of care of the dying in America. This study reveals alarming deficiencies in the way people are cared for as they are dying. In 1997, the Institute of Medicine (IOM) released their report, Approaching Death: Improving Care at the End of Life, further revealing the deficiencies of care in this country among medicine, nursing, and social work disciplines (Gelband, 2001). In 2002, the Robert Wood Johnson Foundation sponsored a state-by-state survey of end of life care provision. Using eight areas of care as the benchmark, each state was graded on its performance in each of these areas. The results provided further evidence of the disturbing trends in caring for people who are facing end of life matters. From this report card’s findings, most states’ scores were mediocre at best and downright harmful in certain cases, further revealing the critical need for responsive educational strategies (www.rwjf.org).

Other studies looking specifically at social work practitioners and at social work educational efforts in end of life care serve to support the above-mentioned studies. These discipline-specific studies reveal alarming perceptions of low levels of competence and of educational opportunities (Christ & Sormanti, 1999). Social work education is in a critical position of exploring academic options that can better prepare future practitioners with a strong baseline of knowledge and skills in caring for those facing the end of their lives.

This workshop will describe a case study dissertation focusing on one educational approach that infuses academic course work with community-based experiences to provide social work students opportunities to learn about practice in end of life care. Specifically, the course connects students with agencies that serve people dealing with
end of life matters and with volunteer mentors – people facing the end of their lives. 

Using Social Constructionism as the theoretical perspective, this approach provides a ‘greenhouse’ effect in heightening learning opportunities for gaining knowledge, skills, and professional development specific to practice in end of life care. Evaluation results of the course’s effectiveness will be provided along with recommendations for educational replication.

ABSTRACT

AUTHENTICITY: A CRITICAL REVIEW

Authenticity—the idea of being one’s true self has been explored within a variety of disciplinary traditions. Philosophers, psychologists, and sociologists each offer different perspectives on what it means to be authentic. This paper provides a critical review of the literature across these three disciplines. Historically, philosophy was the first discipline to explore authenticity. Attention to authenticity within philosophy has focused on its moral underpinnings, social character, and contextual dependence on culture. Psychological approaches to authenticity traverse a number of branches within psychology from humanistic psychology to self-regulation. In tandem, psychological approaches to authenticity focus mainly on meeting the needs of the self, but suggest both the costs and gains to the self of authentic behavior. Sociological approaches to authenticity, especially the symbolic interactionist tradition, focus on the reflexivity of the self, the construction of identity, and the negotiation of social interactions. The sociological literature highlights the motivational basis of the self and self-enhancement functions of authenticity, and processes of impression management (including emotion management) and self-presentation. This paper integrates the literature from these three disciplines into a single conceptual framework that can be the basis for future research on authenticity. Drawing from these three intersecting literatures, authenticity is defined as the enactment of the true self. Authentic behavior is the subjective perception that one is behaving in a way that is in accordance with his or her core being. This paper concludes with discussion of trajectories for future research on authenticity.

6) Abstract and full paper follows
This study focused on mother-adolescent children communication, from the perspective of the mother and within the context of low-income female-headed households. Two primary objectives guided this work. First, it was the intent to understand everyday communication between mothers and their adolescent children in female-headed households, free from the "at risk" concerns and a priori labeling usually associated with such family-type. Second, there was a desire to provide a platform for these mothers to describe their family world and explore the success and struggles experienced within that world from their own point of view, which is distinguished from the male, two-parent, middle-class perspectives that dominate research. Phenomenology was selected as the methodology because it strives to understand everyday mundane occurrences and because of its suitability for studying women's communication. In-depth interviews were used to obtain phenomenological descriptions from 12 low-income mothers with adolescent children in female-headed households residing in Appalachia. 25 themes were brought to the fore and through a process of phenomenological reductions were further clustered to six essential themes. Arising out of the six themes, through hyper reflection, was a revelatory note from which major interpretations of themes were made and through which meanings not immediately apparent were discovered. The findings were brought to the field for member validation in a focus group discussion. The members agreed with the findings and provided additional insight to the interpretation. The findings of this study support existing research on some obvious strengths in female-headed households, and in particular, the closeness between mothers and adolescent children in this family-type.
The strengths of female-headed households have, as a rule, not been of great interest to researchers. Instead, studies of female-headed households have tended to focus on and emphasize the problems faced by this type of family (Richards & Schmiege, 1993). Additionally, existing research tends to hint at the culture of communication created within female-headed households while focusing primarily on other aspects of family dynamics. This study strives to break with that reality by contributing to the comparatively small body of work that focuses on communication within low-income, female-headed households. More specifically, our interest was in the mothers’ perception of their communication with their adolescent children.

While this research is primarily about mothers in female-headed households, a distinction is made when needed between single parent and sole parent mothers. In brief, the term “single parent is applied to situations in which, at some point in time, the mother experienced the presence of her child’s father within the household and whose child has (or children have) a relationship with their biological father. The term “sole parent” is, by comparison, applied to situations in which the mother has never experienced the presence of her child’s father in her household and whose child has (or children have) never had contact with their biological father. Additionally, as the research was conducted within an Appalachian region of the United States, the culture of Appalachia is discussed in the literature review. However, it must be stated that the research is not limited to the perceptions of women who identify themselves as “Appalachian.”
Background

There is a dearth of in-depth studies that focus on communication in low-income female-headed households. Existing studies tend to touch on a range of topics but fail to delve deeply into the culture of communication within these families. The significance of the problem created by this absence is, perhaps, best argued by Mohanty (2003) who observed that:

In knowing differences and particularities, we can better see the connections and commonalities because no border or boundary is ever complete or rigidly determining. The challenge is to see how differences allow us to explain the connections and border crossings better and more accurately, how specifying difference allows us to theorize universal concerns more fully. (p. 505)

While Mohanty’s statement can be read as applying to the “border crossings” involved in examinations of “Western” versus “Third World” countries, Mohanty goes on to argue for the use of the language of “One-Third World” versus “Two-Thirds World” as those labels move us away from geographic representations, invoking instead the specter of the “haves” and the “have-nots” within national boundaries. The argument that we advance is that absence of research concerning communication within female-headed households not only fails to address the challenge of helping us to appreciate the “differences and particularities” that characterize the communication culture of these families but also opens the door to uninformed claims and stereotypes concerning the life worlds of these families.

In studying mother-child dyads of Appalachian background, there is a tendency among researchers to consider this segment to be economically and socially at risk. The economic risk is illustrated in the greater tendency of children from female-headed households (Appalachian or non-Appalachian) to drop out of school (see, for example, McLanahan, 1985; also see Zelkowitz, 1982). The social risk is a product, in part, of the presumption that Appalachian parents’ interactions with
their children are thought to be less varied, thereby placing the children at risk developmentally (Farran & Ramey, 1980; Walters, Conner, & Zunich, 1964). Reaching back in research relevant to this issue, Dempster (1969), in an investigation of child-rearing attitudes and interests of low income mothers residing in Southeastern Ohio found that, while the mothers acknowledged the importance of their children’s opinions, children’s participation in decision-making was limited. The mothers in Dempster’s study stated that they avoided communicating with their children to discourage the children from “pestering” them. Kuipers, Southworth, and Reed (1979) found that adolescents and pre-adolescents reported that the person they spoke with most often about educational goals was their mother. At the same time, however, Kuipers et al. found a “high level of anomia” indicated by the mothers, and concluded that “the high extent of anomia” was an important influence on mothers’ and children’s decreased aspirations and expectations” (p. 4).

More recent work moves away from a limited view of communication to at least hint at a wider variety of interactions as present within the Appalachian family. Lovdal (1989) described Appalachian mothers’ communication with their children as being characterized by giving orders, disciplining through the use of punishment and rewards, and engaging in consoling, understanding, and offering encouragement when the children had concerns. Roszmann-Millican (1995) studied the interaction styles of 25 low-income urban Appalachian mothers and their children finding a range of interaction behaviors as characterizing the dyads studied.

Moving from studies that are specific to the Appalachian culture/region to research that has more broadly examined communication within single-parent families, Petronio and Endres (1986) found that the mothers in female-headed households involved in their research generally faced difficulties disciplining their children and often sought the help of male dates in reinforcing discipline. Focusing their attention on adolescents in female-headed households, Dornbusch, Carlsmith, Bushwall, Ritter, Leiderman, Hastorf, and Gross (1985) found that the adolescents in
their research reported being more inclined to make decisions without parental input and were more likely to exhibit deviant behavior. In addition, McLanahan (1985) notes that children in female-headed households tend to drop out of school due to economic difficulties while Zelkowitz (1982) posits that children from this family-type are considered “at risk” because they are usually economically disadvantaged. Further, Longfellow (1979) and McLanahan (1985) note that the absence of a male-role model in female-headed households invariably presents this family-type as a social deviant.

This study attempts to give voice to low-income mothers in female-headed households as history reveals that, in general, women's perspectives and voices have been muted for a long time (Anderson and Jack, 1991), resulting in gendered communication among women (Minister, 1991). In addition, this study gives voice to mothers in female-headed households to counteract dominant thinking that women's ways of knowing are considered subordinate to men's ways of knowing (Gilligan, 1982).

The mutedness of women's voices and perspectives is underscored by The Muted Group Theory which, was first proposed by Edwin Ardener and expanded by Shirley Ardener (1978). The theory posits that modes of expression in a given society are generated by the dominant groups that head the social hierarchy of that society. Ardener (1978) posits that in the case of gender polarity, it is women who are the muted group because their perspective is excluded from the dominant modes of expression.

As low-income mothers in female-headed households are the focus of this study, their perspective, which is muted in several aspects, that is, from the dominant, male, two-parent, middle-class perspectives is given voice through this study.
Research Questions

Two research questions guide this study:

RQ1: What is the role of communication (talk) in female-headed households?

RQ2: What is the perceived difference in family communication (i.e. how mothers and their adolescent children relate to one another) since father exit?

Methodology

This study uses phenomenology as a methodology. Phenomenology is the study of “whatness” (Van Manen, 1990) because it asks what an experience is like. Merleau-Ponty (1962) posits that all phenomenological studies amount to “finding definition of essence” (p.vii). Because phenomenology scrutinizes the lifeworld as it is experienced pre-reflectively, responses in a phenomenological study are descriptions of a certain experience, and are not based on conceptualizations, abstractions, or hypothetical constructs of what might be happening to a person(s) in that experience. In fact, Morgan and Smircich (1980) emphasize that phenomenological insight is at the extreme opposite of positivist knowledge, which operates from an objective reality. However, Polkinghorne (1983) posits that lived experience is not a “buzzing flux but a constituted, meaningful and ordered understanding…[T]he spectrum of experience is organized into units and recognizable wholes…” (p.204). The structures of consciousness which comprises spatiality, temporality, corporeality, relationality – are formed both by experience of the body and the history of one’s lived experience (Merleau-Ponty, 1968).

At the heart of phenomenology is intersubjectivity because as noted by Schutz (1967), a mundane world exist and others share our understanding of this mundane world. Lindlof and Taylor (2002) reiterate this notion of intersubjectivity as “stocks [of knowledge which] include all the facts, beliefs, and desires, prejudices, and rules we have learned from personal experiences, as
well as the ready-made knowledge available to us in the culture into which we are born” (pp. 34-35).

As this study attempted to scrutinize low-income single mothers’ perception of communication with their adolescent children, phenomenology became an appropriate methodology for this research because this particular methodology strives to understand and describe everyday mundane occurrences (Merleau-Ponty, 1964) free from a priori labeling.

Phenomenology also became an excellent methodology for the present study as it serves as an excellent inquiry for the study of women’s communication. In phenomenological research, the body plays a central role, as it is “the body that elicits precise descriptions” (Nelson, 1989, p. 225). According to Nelson, when a woman speaks, her bodily experiences are made sensible as phenomenology facilitates this process. Hence, in phenomenological research, women have the potential to speak for themselves as “speaking subjects” rather than spoken for.

Steps in A Phenomenological Methodology

Phenomenology involves three steps: description, reduction and interpretation (Lanigan, 1979; Nelson, 1989). Each step, be it phenomenological description, phenomenological reduction, or phenomenological interpretation, is a part in a whole, and yet, the whole is larger than the sum of its parts (Lanigan, 1979).

Method for Gathering Phenomenological Descriptions

In-depth Interviews

For the purpose of this study, phenomenological descriptions were obtained from in-depth interviews. In-depth interviews allow for the collection of vast descriptions and as practiced in phenomenology, are conversational or dialogic (Van Manen, 1990); encouraging spontaneous exchanges and fostering freedom of description. An interview protocol was employed comprising both topical and hypothetical questions. Topical questions served as a general guide to elicit
When I had Her 9

descriptions regarding the phenomenon investigated while hypothetical questions served as a back up for participants who required some specificity or needed some help in responding to questions.

Interview Protocol

Topical Protocol:

Communication with children as mothers of female-headed households
>>daily communication topics
>>important, difficult, fun topics
>>setting (what places and at what times communication occurred)
>>closeness

Communication with children while father’s children was present in the households (directed to single parent mothers)
>>topics discussed
>>children’s father’s communication with family
>>communication during father presence and at present
>>closeness

Children’s views about communication in the family
>> then and at present from the perspective of the mother

Examples of Topical Questions:
- Tell me about your child (children). What is his/her age and what is he/she like?
- Describe how you and your child (children) relate to each other.
- In what circumstances/times/and places do talk take place in your family?
- What are some regular topics of communication that you and your child (children) talk about?
- Describe a particular instance of talk with your child (children) that was significant for you.
- If there is one word that would best describe your relationship with your (child) children, what would that word be?
- Describe what the relationship (talk) was like between you and your child (children) while you were married or living with the child’s (children’s) father.
- What are your child (children’s) feelings about the kind of relationship that exists in your family at present as compared to when you were married or when their father lived in your household?
- Based on your experience, how would you sum up the mother-child relationship? What is it like?

Examples of Hypothetical Questions:
- What if your child (children) were no longer with you? What do you think life might be like for you?
- What if you were no longer around for your (child) children? What do you think life might be like for him/her (them)?
When I had Her

- If your husband or partner were around, what would the relationship (or talk) be like between you and your child (children)?
- What if your child (children) disclosed something really personal to you? How would you respond?

All phenomenological descriptions were audio-taped and transcribed verbatim. The transcripts were then “read, reviewed, bracketed, re-read and re-bracketed” until a chain of initial themes emerged (Orbe, 1994, p. 290). As emphasized by Idhe (1977), all descriptions obtained during interviews were given equal emphasis or “horizontalized”, free from a hierarchical order. Relevant statements from participants were highlighted and clustered according to themes.

Phenomenological Reduction

The goal of phenomenological reduction was to determine which descriptions were relevant and which were not in order to identity the invariant features of the phenomenon (Nelson, 1989). Imaginative free variation was used to accomplish this purpose. Imaginative free variation consist of reflecting on the phenomenological descriptions which are conscious, affective, and cognitive; and systematically imagining each aspect as present or absent within the lived experience (Lanigan, 1988). In other words, “imaginative free variation” helps in determining if “a theme belongs to a phenomenon essentially (rather than accidentally)” (Van Manen, 1990, p. 107). When a theme did not belong to a phenomenon, it was discarded. Further, themes that reveal redundancy and overlap were clustered together until the number of themes was reduced. The clustering and eventual reduction of themes is called thematization.

Phenomenological Interpretation

The phase of phenomenological interpretation begins simultaneously while the researcher is in the reduction phase. Orbe (1994) posits that “an interpretation of themes involves a constant reflection of essential themes and how they relate to one another; it also entails discovering meta-meanings which are not immediately apparent in earlier steps” (p. 295). Merleau-Ponty (1968)
calls this effort radical reflection or hyper-reflection, which is actually reflecting upon reflection. The objective of hyper reflection is to identify one central idea or revelatory note from which interpretations of the major themes can be made. According to Nelson (1989), in hyper-reflection, the researcher must not only return to the speech of the respondents but also go beyond the “speaking significations…The goal of interpretation is to discover meanings which are not immediately apparent in the description and the reduction” (p. 237).

Participants

The participants for this study were mothers in female-headed households with adolescent children, with adolescence defined as involving children 12 to 19 years of age. Participants came primarily from the Ohio Appalachian counties of Athens, Glouster and Coolville. The initial pool of respondents was contacts of the researchers, or was located through the assistance of a local medical facility, or through the support of the Rural Action Program in Trimble. In addition, a letter was published in a local newspaper requesting for the participation of mothers with adolescent children from low-income female-headed households.

The 1996 Federal Poverty Index Guidelines were used to determine if a participant’s income fell below the poverty line. If a potential participant’s income fell below the poverty line, she was asked if she would be willing to serve as a participant. As each interview ended, participants were asked to identify other mothers who might wish to be included in this study. This method of obtaining participants through a people’s network is known as the network sampling technique or snowballing (Granovetter, 1976).

The profile of mothers participating in this study was as follows: nine regarded themselves as Appalachians while three considered themselves as non-Appalachians. Nine mothers were single parents (that is, those mothers whose children had experienced father presence in the household at some point in time and whose children had a relationship with their biological father at
some point in time) while three were sole parents (that is, those mothers whose children had neither experienced father presence within the household nor had a relationship with their biological father). While all mothers regarded themselves as belonging to the lower-income category, 10 of these households existed below the poverty level as indicated by the 1996 Federal Poverty Index Guidelines (see Appendix A). Two of the households (headed by participants 1 and 9) involved incomes of approximately $5,000 above the poverty level. Six of these mothers were receiving some form of aid such as Temporary Assistance for Needy Families (TANF, formerly known as Aid to Families with Dependent Children or AFDC) while six others held minimum wage jobs and/or held two or more jobs to provide for their families.

Findings

The process of phenomenological reduction brought to the fore 25 potential themes. The themes are 1) The presence of the absent father, 2) disagreements about each other’s choices and behaviors, 3) the centrality of children in the mother’s existence, 4) learning from the children, 5) equipping the children for life, 6) talking about anything the children want to talk about and treating these topics as important, 7) always being there for the children, 8) mother in the know, 9) being the parent, 10) enforcing the rules, 11) admiration and appreciation for one another, 12) closeness between mother and child, 13) a love-hate relationship, 14) guarding against negative influence, 15) dealing with sibling squabbles, 16) teaching children about financial realities, 17) support network, 18) breaking the cycle of poor communication, 19) sharing aspirations, dreams, and future plans, 20) looking out for one another, 21) having fun with each other, 22) being both the parent and the friend, 23) talk is best when one on one, 24) happier in a female-headed household, and 25) in need of a male role-model.

Additional thematization became necessary to reveal the interconnectedness and interrelatedness between themes. This process of further clustering the themes involved a
When I had Her

The technique known as “imaginative free variation”, which is an attempt to reduce the description of themes to those that are essential to the participants' lived experience. As a result, six essential themes emerged which were organized into meaningful units of discourse. They are: 1) the centrality of children in the mother’s existence, 2) being the parent, 3) still in need of a father, 4) equipping the children for life, 5) encouraging open communication, and 6) having a close relationship.

Centrality of Children in the Mothers’ Existence

The centrality of children in the mothers’ existence meant that mothers would always be there for their children because of the intertwined existence between mother and child. Comments such as “My world totally revolves around my kid” (1), “[My children are] all I ever had…it's something like a partnership (7), and "my main concern ...is making sure that they have their needs [met]” (10) exemplified this intertwined existence between mother and child. The notion of being there implies two things: i) constant togetherness between these mothers and their children in terms of the time spent together, and ii) a figurative notion of mothers serving as a constant and dependable source that the children can rely on at any time. Noted Debbie, a single parent of two children, “Do [my children] know that their Mom is like a rock in their lives who will always, always, always, be there regardless anything they do. Regardless of how awful it could be, I will always love them? Will I always support them? Yes, I will” (8).

Invariably, constant togetherness between mothers and children caused some mothers to feel distressed and depressed when they were separated from their children albeit for short periods of time. Hence, it appears that there were overtones of dependency in some mothers’ relationship with their children.

Constant togetherness also placed mothers in situations where they learned from their children. Unlike the mothers who intentionally educated their children, it was not always the
children's intention to educate their mothers. Nonetheless, such interactions helped these mothers to become better parents, and at times, assisted them to make important changes in their lives. As an example, Debbie's decision to leave her alcoholic husband came after a conversation with her six year old son:

I had [my son] in the bathroom and he said, "Mommy, if something ever happened to you, who would take care of us?" And I said, "Well your Dad would." And he started crying and he said, "Mommy, he can't. He couldn't take care of us, Mommy, don't you see that...?" And...it was a month later that I left his Dad. Then I thought, whom am I kidding here when my child who is six years old can see what the situation is. (8)

Other lessons comprised corrections of mothers' behaviors by their children indicating that parental behavioral changes were in order.

**Being the Parent**

Being the parent meant that the participants i) set household rules and enforced them, ii) provided guidance and direction in matters such as choice of boyfriend/girlfriend, children's dressing, their habits and other behaviors, iii) dealt with sibling squabbles, and iv) were watchful of negative societal elements that could potentially influence their children.

Remarks such as, "you're not allowed to criticize each other" (5), and "My son is basically grounded most of the time because he has to definitely tell me where he's going" (11) reflect rules set to guide children. Children were disciplined when household rules were violated. A big part of being the parent involved dealing with sibling squabbles. During these occasions, the mothers served as mediators and educators with the hope of setting guidelines for proper conduct between their children. At other times, parental authority was asserted and mothers disciplined their children during the squabbles.

The mothers in this study also felt the need to become the eyes and ears that scanned the environment of their children to keep negative influences at bay. According to Lorie, "[T]here's a
couple of [my daughter's friends] that I don't particularly care for... [My daughter] doesn't do drugs...she doesn't get drunk, doesn't sleep around...a lot of people treat her like, “Gee...you're so boring” (5). The urgency of being the eyes and the ears that scanned their children's environment was probably all the more felt in these female-headed households as there was only one parent present to safeguard the children.

The task of setting rules and enforcing them as well as providing guidance and direction to their children often resulted in a love-hate relationship with children. There were times when the children appreciated their mothers for caring enough to correct them and at other times, children disliked their mothers for their direction. With frustration, these mothers noted that their guidance or direction was often challenged by their children. Without a doubt, the task of being the parent often served as a site for conflict between the mothers and their children.

Still in Need of a Father

The mothers in this study recognized the futility in trying to fill the void in their children's life resulting from father exit. This was especially true for those households that had experienced father-presence at some point in time. It pained some mothers to see their children missing their fathers. With vividness, Carolyn described one such situation involving her 12-year old son.

The other day, a song came on...It's about a man who watches his kids grow up in pictures. He has nothing to do with them. Well, [my children's] father has been in and out of prisons and he hasn't had really anything to do with them. Well...I noticed [my son] in here and he was listening to the song and he was walking around and moping. And I was reading a book and he comes in there and flops down in the chair, slams himself down just looking at me all hateful and stuff. He said, “You ever heard that song, Mom?” And I said, “Yes. Sad isn't it?” He just gave me this hateful look. So I tried to act like I wasn't really looking at the look and I was reading a book and asking questions, “Does that make you think of your Dad?” [He replied] “No”. He said, “I hate it here, I want to leave, I don't like this place” and things like these, which he wasn't allowed to say...but he was venting and I was letting him cause it's been going on for months. And then he finally cried and opened up to me about what was going on.
He just kept saying, "Mom, that song makes me feel sad." [I said], "That makes me think of your dad and you kids." (7)

The mothers acknowledged that children desired to have a closer relationship with their fathers despite obvious flaws in these fathers such as being drunk on the weekend of the children's visit.

The mothers also struggled with educating their male adolescent children about questions on sex as they felt they could not present to their sons, the male perspective regarding sex. Nonetheless, since fathers were not available to guide their male children on such topics, the mothers inevitably had to fill this role.

**Equipping Children For Life**

Perhaps the most important form of communication occurring in the homes of the participants was the need to equip their adolescent children for life. From the mothers' description, it appeared that much time was spent preparing children for what lies ahead as mothers were aware that their children's survival was greatly dependent upon their guidance. Efforts to equip children for life included i) teaching children values such as self-respect, being respectful of others, earning respect, doing the right thing even when it is most difficult to do etc. ii) lessons in personal safety iii) being prepared for sexual relations, iv) understanding choices and the consequences that come with making a certain choice, v) providing strategies, solutions and coping skills for everyday problems including relationship problems, and vi) teaching living skills such as cooking, doing the laundry, and understanding finances particularly about income and expenditure.

The mothers felt an urgent need to educate their adolescent daughters about personal safety. Sally emphasized to her 16-year old daughter that her body is her own, "... no one touches you. Not even me. And if I touch you in a wrong way, you tell someone" (12). However, despite all the advice, some mothers felt that they could never do enough to caution their children about possible dangers in the world as in the case of Sally's daughter who was sexually molested.
In teaching children about choices, the mothers were of the opinion that when children are given choices and the consequences of their actions clearly spelled out, children often make an informed decision which would likely meet with parental approval. For some mothers, giving children choices served as a strategy in discouraging children from going through with decisions that parents disapprove.

The effort to educate children about finances, presented a dialectical tension in some mothers' lived experience. Some mothers were of the opinion that they should not burden their children with financial concerns as they had heard that such talk produces stress in children. For these mothers, being a child meant children should not have to understand how much money a household needs to make in order to survive in a month. Yet, the same mothers were frustrated that their children did not understand how many hours of work it would take for them to be able to buy the children the items they requested. Penny who was receiving food stamps noted the ingenuity that mothers on welfare exhibit when they have to survive on a tight budget due to limited income. Yet, with frustration, Penny noted that her children were oblivious to her efforts to provide for her family:

My children don't realize...that it's going to be a lot of energy for me to have to go to the store and go grocery shopping. But when you get food stamps and when you get that once a month, you have to have a plan. And... that takes a lot of hard work to plan meals and go shopping and budget the money and...you can't just go to one store...like people that are making a lot money can go to one store and buy whatever they want...I have to go from store to store to budget my money to get the cheapest prices. (5)

Encouraging Open Communication

1 While it is generally accepted that open communication between two parties is not necessarily indicative of a close relationship (Stafford & Canary, 1991), the mothers in this study viewed their open communication as indicative of a good relationship primarily because such communication was in stark contrast to the limited communication that existed between these mothers and their own parents. However, this theme of open communication is not subsumed under the sixth essential theme of "having a close relationship" because the former specifically focuses on the openness between mothers and their children and the ease with which both parties discuss topics that are generally
The mothers in this study were willing to “talk about anything from food to sex” (7) with their children. These mothers seemed to have a hidden agenda in desiring open communication with their children. According to Debbie, “There’s just a lot of things out [in the world] that we have to counteract that it’s so important to have children feel secure that they can discuss the things they see” (8). In other words, open communication between these mothers and their children helped the mothers know exactly what might be occurring in their children’s lives at any given time.

Carolyn aptly summed up the need for open communication with her children this way:

I remember when I was growing up, I would say, “Mom, so and so was thinking about smoking dope, pot or something.” And my parents would go, “Well, I don’t want to hear you doing that…” And I kept thinking, well, if my kids approached me like that, then I would say, ‘Well, now I know what’s on their mind.’” (7)

The mothers valued open communication with their children for two main reasons: i) as children, some mothers desired open communication with their parents but were unable to have that type of relationship and ii) as children, other mothers had experienced open communication with their parents and were motivated to have the same kind of communication with their own children. Whatever their motivation for engaging in open communication, these mothers acknowledged that such communication “happened out of a lot of hard work” (9).

In addition, some mothers noted that disclosure of intimate and important matters usually occurred in these households when children were assured of their mothers’ exclusive attention. This often meant that the children knew they had their mothers all to themselves and there were no

regarded as taboo and difficult in nature. Further, this theme focuses on the settings in which open communication takes place and the importance that mothers’ place on their children’s communication because they view all communication from their offspring as an opportunity for knowing what might be occurring in their lives. In contrast, the latter theme (having a close relationship) focuses on non-taboo/ non-difficult topics, and other behaviors and nuances that are indicative of a close relationship between the mothers and their children.
other siblings in sight. When such conditions existed, communication tended to be very open. Said one mother, “Some of the things my children have told me have floored me!” (1)

However, the mothers also disclosed that there were times when children opted to withhold information from them. However, these mothers claim to be well informed about the hidden agenda in their children’s lives because of the “smoke signals they give of” (7). As Molly noted, “I did exactly what he did and worse [when I was his age]. I am one step ahead of him” (11). At other times, the mothers were well informed about their children’s misbehavior and secret activities because they had “spies” who would report these matters to the mothers on a regular basis. With confidence, Carolyn disclosed, “It’s not worth hiding [things] from me…I’ve got] birdies all over the place” (7).

Having a Close Relationship

In this study, closeness between mother and child were exemplified in the following ways: i) enactment of loving acts between each other, ii) an instinctive knowing about what might be occurring in the life of the other, iii) mutual admiration and appreciation for one another, iv) sharing aspirations, dreams and future plans with one another, (v) a friendship relationship between mothers and children, vi) teasing and having fun with one another, and vii) a sense of protectiveness towards each other.

Among other things, loving acts included the mothers singing to their children and spontaneous hugs from children for no apparent reason. One mother said, “[I]f I see one of them depressed, I stick a little note under the pillow saying, ‘I’m not the tooth fairy, but I love you anyway’” (7). The instinctive knowing described by the mothers alludes of the bond between mothers and children where without even communicating, one knows that the other is hurting or troubled by something. Based on the mothers’ description, admiration and appreciation between the mothers and their children were mutual. Often, as might be expected, it was the mothers who
When I had Her

exemplified greater admiration and appreciation for their children. However, it was Ruth’s admiration and appreciation for her daughter that was the most poignant. Ruth’s daughter had become addicted to sniffing glue. Recalling the incident, Ruth said, “[My daughter came] to me and said, ‘Mom, I have a problem. Will you sign me in [to a chemical dependency rehabilitation center]?’….Ain’t that something!” (4).

For the children in these households, the sharing of aspirations, dreams and future plans often involved their plans for higher education and possible means of funding. For the mothers, it was about owning their own home and to be able to work one job instead of two or three.

With regard to a friendship relationship, the mothers noted that such a relationship tended to exists between them and their adolescent daughters. The mothers commented: “[My 15 year old daughter] is one of my best friends (11), and “me and my 16 year old [daughter], we’re not close in age but she’s enough of an adult now that she’s kind of my best friend” (12). Bette observed, “[My daughter] and I do behave like girlfriends at this point in our lives…we’ve done all the mother-daughter stuff and she’s aged… [W]e’re kind of more friends and partners” (9). But on the rare occasion, it does seem like some mothers get too close to their children discarding what might be regarded by some experts as generational boundaries. Lorie confessed that, at times, it was difficult to distinguish who the child and who the parent were in her household. However, from the descriptions, it became apparent to the researchers that many mothers were quite aware that they were the parent in the household and that their closeness with their children did not compromise that role. When the parent-child relationship is redefined as a friendship, it allows for a closeness in which mothers are able to share their feelings instead of being the ones who constantly listen to their children’s feelings, hence, meeting an important need in the mothers.

Closeness between mothers and children was also marked by a sense of protectiveness between the mothers and their children. Tanya disclosed, “My son…keeps things from me to try
When I had Her

and keep from hurting me” (1). Melissa is of the opinion that her son disapproves of her romantic relationships because he doesn't want her to get hurt. Lillie recalled, “[If anyone hurts Mom], [my son] is about to kill them…[Y]ou don’t talk about Mommy or I’ll knock your face out…” (3). The mothers had the same protective sense towards their children.

Interpretation of Experiences Through Hyper-Reflection

The goal of hyper-reflection is to advance toward an essential definition of the experiences of the phenomenon of communication between mothers and children in female-headed households from the perspective of the mothers. The process of hyper-reflection in this study continued until one revelatory note emerged that united the six afore-mentioned essential themes of: 1) centrality of children in the mothers’ existence, 2) being the parent, 3) still in need of a father, 4) equipping the children for life, 5) encouraging open communication, and 6) having a close relationship.

The Revelatory Note: “When I Had Her, My Life Turned to Hers”

Merleau-Ponty (1964) noted that everyday mundane occurrences or “true little incidences are not life’s debris but signs, emblems and appeals” (p.313). The biggest sign, appeal or emblem of the mothers’ lived experience was presented to the researchers during an interview with Sandy, the sole parent of her 17-year old daughter. Sandy was asked to describe what life would be like for her, if for some reason, her child were no longer with her. Sandy’s response was profound and illuminating. She said,

I would probably go nuts...I just can't see life without [my daughter]...I don't even want to think about it....[I]t would be too hard...cause when I had her, my life turned to hers....When I had her...she'd come first is how I should say it....

Upon hyper-reflection, the statement, “when I had her, my life turned to hers” became the revelatory note for the phenomenon being investigated. Three essential meanings are conveyed through this revelatory note:
i) The first meaning is, the mothers were living a particular sort of existence but made a change to the mode of existence when they became mothers. The symbol *turn* constitutes within it not just a sense of change but a permanent alteration. In addition, the experiences of a mother will be quite different from a woman who is not a mother. The mother now has a dependent -- her child. And this change in the mother’s existence is a permanent one because the lives of the mother and her child are forever intertwined.

ii) The second meaning conveyed is the image of the mother *turning* towards her child and now, being in full view of her child, observes his or her behaviors while scanning the environment. Thus, the revelatory note conveys the image of the ever-watchful eyes of the mother upon her child observing his/her behaviors and scanning the environment. Such watchfulness is imperative in order to identify any inappropriate behaviors in her child and to ward off any unwanted influence upon her child.

iii) The third meaning is the sense of distance conveyed between the mother and her child. The turning of the mother’s life towards her child is indicative of the image of a child who is positioned “ahead” of the mother. The notion of the placement of the child ahead of the mother makes sense in view of the statements made by these mothers that their children always came first in the lives. In placing their children ahead of themselves, these mothers acknowledged that they were placing their children’s wants and needs ahead of their own.

It is clear that constituted within the revelatory note are the notions of the ever-watchful eyes of the mother upon the child and the mother putting the child’s wants and needs ahead of her own because of the intertwined existence between mother and child. The notions of the ever-
watchful eyes of the mother and the mother placing the needs of her child ahead of her own are
exemplified in all six themes.

Discovering Meanings Not Immediately Apparent

The revelatory note, “When I had her, my life turned to hers” was further illuminated when
two hidden meanings emerged: i) The first hidden meaning is, when Sandy, a sole parent (i.e., a
mother whose child had neither experienced father presence in the household nor had a
relationship with the biological father) said, “when I had [my child], my life turned to hers”, she
described an immediate act of turning her life towards her child. In the context of this study, turning
is interpreted as attending to the needs of others. Because Sandy had never experienced partner
presence (that is the presence of her child’s father), such turning by this sole parent towards her
child was quick, swift, and complete. However, for mothers with partners in the household, such
turning might not be as quick, swift, or complete. The turning of the mother to her child is delayed
because she is turned towards her partner (the child’s father), first and foremost. Before this
mother had her child, she had turned towards her partner and hence, complete turning towards her
child is not possible. Such turning to one’s partner is probably a factor of socialization for married
mothers or women who have their partners (the child’s father) present in the household. In such a
situation, the woman might feel it her duty to turn towards her husband/partner first and foremost
and/or her husband/partner might have an expectation that the woman turn towards him first and
foremost before attending to the needs of the child.

Admittedly, there were mothers in the study who relayed that there was no difference in
their relationship with their children while they were married or when their partners lived with them.
This absence of difference appeared to be the product of mothers having always accorded their
children the primary position in their lives.
ii) A second hidden meaning that emerged was that, just as a mother *turns* towards her child, so does her child *re-turn* towards his/her mother. When one (mother) is *turned* towards the other (the child), and is poised and committed to *turning* towards the other, it becomes difficult for the other not to reciprocate. One cannot, not *re-turn*, the *turning* that the other is committed to doing. Because there will always be a response be it desirable or undesirable to every *turning*, it is assumed that there would be a *re-turn* to every *turn*. Hence, when the ever-watchful eyes of the mother are upon the child, the child *re-turns* the mother's gaze acknowledging the mother's watchfulness. When the mothers strive to put their children's needs before their own, however these needs might be defined, the children are bound to observe such commitment and *re-turn* by providing some feedback indicating gratitude, or other kinds of actions and reactions.

The mothers provided numerous descriptions of children *re-turning* to them. Just as mothers taught their children, they learned from the children. Just as the mothers appreciated and admired their children so did the children show their appreciation and admiration to their mothers. However, the mothers claimed that such *re-turns* by children were usually lacking in frequency and intensity. Just as the mothers worked at being friends with their children, so did the children *re-turn* the friendship by providing the mothers with the sort of companionship that is lacking in female-headed households.

**Returning to the Field: Focus Group Discussion**

Upon completion of the interpretation of the mother's lived experiences, the researchers returned to the field to present the interpretation to the participants and to ascertain if they had been able to accurately capture the mothers' lived experience and to incorporate any changes or suggestions that the mothers might wish to add to the interpretation. The interpretation was presented to three mothers, all of whom were selected because they were available to participate in a focus group discussion.
Focus groups enable participants to reflect on their lived experiences even as others share their lived experiences. Apart from being known as “hermeneutic conversations” (Van Manen, 1990, p. 101), Orbe (1993) states that, unlike individual interviews, focus group interviews “create a context that encourages synergistic insights unattainable during individual interviews” (p. 77). Bate (1988) notes that focus group discussions are an ideal way for women to search for identification and oneness with other women and demonstrate the connectedness between them.

The focus group discussion in this study served as member validation or member checks (Lincoln & Guba, 1985) of the findings obtained in the field. Also known as member tests of validity and host verification, the construct implies “taking findings back to the field and determining whether the participants recognize them as true or accurate” (Lindlof & Taylor, 2002, p. 242). According to Lindlof & Taylor, the process of member validation involves “the researcher sitting down with one of more participants to ask what they think of a description, an interpretation” (p.243) that has been put together by the researcher based on descriptions gathered from the members. According to Borland (1991), returning to the field to engage participants in post fieldwork interpretation is ethical and must be done more regularly by researchers especially when these researchers claim to speak concerning others’ lived experience.

In the main, the interpretation presented to the mothers in this study was fully accepted by them with some interesting insights provided. The mothers agreed that the revelatory note conveyed the meaning of a forever-intertwined existence between the mothers and their children; and when they turned towards their children with their gaze upon their children, it was with the hope of watching over the children’s behaviors, to scan the children’s environment, as well as to equip their children for life’ needs and challenges. They also agreed with the interpretation of the revelatory note that their children’s wants and needs were always placed ahead of their own. In addition, the mothers provided three insightful contributions. First, the mothers posited that, in
general, children were “ahead” of mothers not only because mothers were committed to placing their children's needs ahead of their own but also because “life was going a lot faster” for their children and they were being exposed to all kinds of challenges and “maturing a lot faster than when we were in school” and thus, were “ahead” of their parents in this sense. In view of these challenges, the mothers emphasized the need to engage in proactive or counteracting communication.

Second, the mothers agreed that sole parent mothers were probably able to turn quickly, swiftly and completely to their children upon childbirth unlike mothers with husband/partners in the household. Two mothers in the focus group discussion, now divorced, noted that if their ex husbands had sought to meet their needs and those of their children and stopped competing with their offspring for attention, the mothers would not be faced with the conflict of which party to turn to (i.e. choosing between their partner and their children). According to the mothers, it is the norm for women to do more than is necessary in providing for their partner's and children's needs because men are not bearing their share of the responsibility for their families. As if underscoring the emancipation that is needed for women in general and mothers in particular, Penny offered that it was usually the women, not the men, who were left holding the children after the divorce. All three mothers agreed that women are socialized to meet others' needs ahead of their own needs more than is necessary.

Third, the mothers agreed that when they turn to their children, their children re-turned to them. However, Penny asserted that re-turns do not always have to be obvious or direct. She then recalled a story that was shared by Sandy minutes earlier in which Sandy's daughter had chided one of her friends for wanting to take drugs. Penny affirmed that any time their children engaged in good deeds and exemplified lessons taught by the mothers to help others, they had re-
turned to their mothers. Penny anticipates that the older children get, the better the re-turns for mothers in female-headed household.

Answering The Research Questions

Research Question 1: The role of communication in female-headed households

This study sought to answer two questions. The first is, what is the role of communication in female-headed households from the perspective of the participants in this study? It appears that communication played several roles in the female-headed households involved in this study:

1) Communication with their children helped the mothers to look out for their children and to scan the environment with the purpose of counteracting the influence of negative societal elements in a timely manner.

2) Communication with their children enabled the mothers to identify the various needs experienced by their children and to equip them for life as they enter the world of adulthood. The mothers in this study taught, trained, and prepared their children for life’s realities.

3) Communication between mothers and their children was intended for the reinforcement of positive behaviors and experiences and the isolation of negative and undesired behaviors in their children.

4) Communication with their children assisted the mothers to learn and grow and become better parents even as they obtained feedback from their children.

5) Communication served to keep the relationship between the mothers and their children fluid and dynamic bringing both mothers and their children closer.

The first two roles are thematic and are constituted within the revelatory note. The mothers understood that they must watch their children and scan their environment in order to protect them. They also realized the importance of knowing their children’s needs and meeting them to the best
of their abilities. The mothers in this study declared that they have open communication with their children where they talk about anything and everything and suggest that communication within their family is democratic in nature. Although open communication is not necessarily indicative of a close relationship (Stafford & Canary, 1991), in the present study, mothers noted that open communication between themselves and their children have led to closer relationships in these households.

**Research Question 2: Perceived difference in family communication since father exit**

Specifically, the second research objective attempted to determine if there were perceived differences in family communication since father exit. Of the nine mothers who had experienced the presence of the children's father before becoming female-headed households, some expressed no perceived difference in their relationship with their children since father exit. According to these mothers, this is partly because when the fathers were present in the households, the children totally relied upon the mothers to meet their every need. The mothers acknowledged that their children always came first. Hence, the mothers asserted that they were not torn between choosing to attend to their partner’s needs and those of their children and said they did not allow the problems presented by the children’s father to affect their relationship with their children.

However, for other mothers, their relationship with the children was difficult during father presence. Mothers described situations where: their partners made demands on the mothers that kept them away from their children; mothers had to protect their children from their partner's abusive nature; constant conflict occurred with fathers with regard to child discipline; fathers were jealous of the mothers' relationship with their children; and mothers’ had no control over how they spent their time with their children because that decision was made by the children’s father.
According to these mothers, they were relieved to see the children's father leave their household and perceived that their children were happier since father exit, noting at the same time that their children loved their fathers.

**Discussion**

With regard to the companionate/best friend relationship existent between mothers and their children in this study, several studies by Steinberg, Southern & Atchinson (1983); Weiss (1979); and Youniss & Smollar (1985) support the observation regarding such a relationship in female-headed households. Arditti (1999) found that adolescent daughters in her study described their mothers as their best friend as these relationships were generally close and often involved a high level of disclosure. In providing a reason for the closeness, Arditti posits that the role shifts experienced by divorced mothers provides greater independence to mothers and facilitates democratized relations with their children. The adolescent children’s growing need for autonomy, and the mother’s need for emotional support coupled with democratized relations within the household all contribute to provide a sense of equality within adolescents leading to a friendship relationship with mothers. In fact, notes Arditti, the growing maturity among adolescents often gave way to greater understanding, empathy and appreciation for their mothers. Arditti posits that the best friend relationship tended most often to occur between divorced mothers and their adolescent daughters. The phenomenon of the “best friend” relationship is exemplified in the present study between mothers and their older female adolescent children.

While a best friend relationship between mothers and their adolescent daughters in female-headed households is not unexpected, the present study indicates that closeness existed between mothers and their male adolescent children as well. Weiss (1979) relegates this occurrence to the disappearance of the authority structure within female-headed households. With the disappearance of the authority structure defined by Arditti (1999) “as the implicit coalition of two
adults who are in a hierarchically more powerful position than the children", children in female-headed households tend to be “promoted” to a new position (p.116). Arditti posits that the promotion occurs when mothers relinquish their control and relate to children as if they were “junior partners”. Scholar such as Wolff (1950) in citing George Simmel underscores the hypothesis that the decomposition of the authority structure and group size increases communication and disclosure.

According to Arditti, divorce presents a context for change within the family structure that invariably leads to a closer relationship between mothers and children. The mothers in the present study noted that closeness with their children allowed them to share their feelings and emotions with their children, an outlet that is sorely lacking in many female-headed households. According to Arditti (1999), “the mothers’ need for emotional support and the sharing of confidences with children gave children a sense of equality” (p.115), and unlike popular thinking, was not burdensome to children but rather, served to bring both parties closer. Further, Arditti notes that there is no evidence in her study that “mothers’ reliance on children for emotional support or advice precludes mothers from engaging in more traditional parenting behavior such as providing guidance” (p.118). The mothers in the present study made the same claim. In fact, Arditti (1999) posits, that the “closeness and intimacy described by young adults in relation to their mothers is an important example of the viability of single-mother households” (p.116).

Mothers in present study cited closeness between them and their children, which included a sense of protectiveness for each other in addition to mutual appreciation for one another. At least two other studies have confirmed this observation (Arditti, 1999, Wallerstein and Blakeslee, 1989). In fact, Wallerstein and Blakeslee posit that children’s relations with custodial mothers’ exemplified closeness, appreciation for the mother’s efforts and concern for the mother’s well being.
With regard to open communication within the households, mothers in the present study posited that their children discussed “anything” and “everything” with them, all of which the mothers regarded as important. Arditti’s (1999) study supports this observation as the adolescents in her study claimed to have discussed “anything” and “everything” with their mothers. Some experts are of the opinion that the sharing of confidences and open disclosures between mothers and children are indicative of the violation of generational/intimacy boundaries common in female-headed households. Such violations, the experts argue, place adolescents in a vulnerable position with regard to emotional well-being and behavioral adjustment (Bowen, 1978; Minuchin, 1974, Weltner, 1982). However, Arditti’s (1999) study indicates that adolescents viewed the offering of emotional support to mothers and the sharing of intimate disclosures positively.

With reference to the first research question on the role of communication in female-headed households, it appears that the first three roles of communication as identified in this study, which is: i) looking out for the children and their behaviors and scanning the environment with the purpose of counteracting the influence of negative elements; ii) identifying the various needs experienced by their children and equipping them for life as they enter the world of adulthood; and iii) reinforcing positive behaviors and experiences and isolating negative behaviors and experiences, are supported by Ruddick’s (1982) thesis. According to Ruddick, motherhood is characterized by three needs: preservation, growth, and acceptability of a child. Ruddick posits that a mother sees herself and is seen by others as the one primarily responsible for the preservation of her child’s life. This act of preservation is underscored by the first role of communication in this study. Next, Ruddick argues that a mother is concerned with the emotional, physical, and intellectual growth of her child and works towards meeting these needs. This assertion is underscored by the second role of communication as determined in this study. Then, Ruddick notes that a mother is guided by a third motivation, that is, her child grows to be accepted
by her and her community. Ruddick notes that for a woman, the acceptability of her child by the community validates her existence as a mother and marks her as a success. This assertion is effectively underscored in the third role of communication in the study. Hence, it appears that the behaviors of the mothers in the present study are characteristic of the practices in motherhood.

Pertaining to the second research question of perceived difference in family communication since father exit, some mothers in this study said they were relieved to see their children's father leave the household because they knew their relationship with the children would improve from that point. The mothers also claimed that their children felt the same way even though they loved their fathers very much. The observation that the mothers' relationship with their children would improve with father exit is supported by Weiss (1979) who notes that divorce and father exit often tend to decrease the social distance between mothers and their children leading to boundaries between mothers and children that are characterized by a level of openness uncommon in two-parent families. Further, Arditti's (1999) posits that the hidden strength of divorced households is the maintenance of close ties between mothers and children. Hence, it seems that father exit does impact family communication in a positive way in some families.

Future Directions for Research

The present study provided some insight into communication in low-income female-headed households from the perspective of the mothers. Because of the encouraging findings in this study that have been supported by existing research, it would be interesting to find out about communication two-parent families between mothers and their adolescent children from the perspective of the mothers. Such a study would provide insight on how the authority structure within the two-parent families affects closeness and disclosures between mothers and their adolescent children. A second area of study, a follow up to the present one, could be about how mothers in female-headed households use strategies and behaviors to bring about successful
When I had Her

communication with their children in light of the roles of communication in female-headed households, which the present study has identified. A third area of study could scrutinize the perception of communication in female-headed households from the perspective of adolescents. Several studies have indicated that mothers and adolescents perceive the occurrence of communication between one another very differently (Hanson, 1986; Koerner, Jacobs & Raymond, 2000; Vogl-Bauer, Kalbfleisch, Beatty; 1999). More crucially, a study that seeks children’s perceptions of communication between themselves and their mothers might be able to determine what these children define as the roles of communication in their households.

Although this study is about low-income female-headed households, the notion of “low income” as a defining concept was not obvious in the mothers’ descriptions. The extent of the mothers’ descriptions regarding their disadvantaged economic state was limited to the theme of educating children about financial realities. The mothers felt that their economic state had been such a part of the identity that unless asked, there was no need to delve into it. It is also true that the notion of “Appalachia” as a defining concept was not obvious in this study even though nine out of the 12 mothers who participated in this study identified themselves as Appalachia. Hence, the researchers felt that the study did not warrant a discussion regarding differences in communication in the Appalachian and non-Appalachian female-headed households participating in this study. This stance is further underscored by the findings of this study, which did not indicate cultural differences with or obvious departures from existing research regarding female-headed households in mainstream America but rather, supported it.

The significance of the study is that its findings were particularly positive and were in line with existing research (Arditti, 1999, Hanson, 1986; Weiss, 1979, 1980; Youniss & Smollar, 1985) regarding female-headed households. One reason for the overwhelmingly positive findings in this
study is that the mothers who participated in the study were pleased with the communication occurring in their households and were eager to share their experiences.

A limitation of this research is that it reveals the perception of 12 mothers in female-headed households. Hence, it cannot claim to speak for the lived experiences of all mothers in female-headed households. However, as the present study has clearly indicated, its benefits are clearly obvious when interpretive conclusions are added to already existing empirical research findings.

This study, like other existing research, indicates that hidden strengths exist within female-headed households and ought to be given due recognition especially in view that these households often suffer from “at risk” concerns and a prior labeling. The closeness found within this family-type is a strength not often mentioned in research regarding two-parent households. And yet, two-parent households are the norm in most societies. A household must never be left with the choice of experiencing closeness due to father exit or lack of it due to the authority structure existent in two-parent families. Closeness ought to be the desired goal of all family-types. The structures that impede closeness in two-parent households must be examined and necessary changes introduced in order to inculcate closeness for the sake of all family members especially children. Therein lies the value of specifying difference regarding communication in female-headed households as compared to communication in two-parent households, which, as posited by Mohanty (2002), “allow[s] us theorize universal concerns more fully” (505).

Further, this study calls for scholars seeking to study female-headed households to examine their expectations and be willing to experience a paradigm shift in order to understand the dynamism present in this family-type.

ABSTRACT

Title: Appalachian Studies: Do They Still Have a Role in Preparing Health Science Students for Practice in Rural Appalachian Kentucky?

Gerry Gairola, Ph.D.
University of Kentucky

This paper will examine the history of Appalachian Studies as they apply to the education of health science students in a large medical center. Chronic health problems, such as diabetes and cardiovascular disease, have led to increased focus on community-based efforts to address these and other health-related issues. Although the emphasis on Appalachian Studies has been variable during the history of the University of Kentucky Medical Center, the question addressed in this paper is whether Appalachian Studies is needed if health problems are to be adequately addressed within the Appalachian region of the state. The paper describes the Training for Appalachian Practice Project (TAPP) carried out in the Physician Assistant Studies Program which might serve as a focus for considering the potential benefits and costs of implementing Appalachian Studies for health science students today.
Persons with co-occurring mental illness, substance use and chronic medical disorders (P-COD) present complex and challenging treatment needs and the interactions of these disorders are rarely addressed in treatment practices or research. La Frontera Center, Inc. conducted a survey to assess the prevalence of physical health problems across a stratified sample of consumers. The results indicated that 74% reported at least one health problem, 79% reported pain, 66% smoke, 66% have BMI 25 or higher, and 62% are inactive. Importantly, 47% indicated interest in increasing exercise, 44% in learning stress management skills, 36% in improving their diet, and 49% wanted to quit smoking.

Following these results, we conducted a pilot study of a cognitive behavioral (CB) skills intervention applied to health behavior change in P-COD. Groups were held weekly for 10 weeks and CB skills practice centered on healthful behavior changes including increasing exercise, improving diet, and relaxation skills. Ten P-COD enrolled. Complete pre, post, and follow-up data were available for six participants. Overall, the intervention was well received by those who participated and, in general, the pre to post-intervention results appear encouraging. There was significant improvement in overall BASIS-32 scores (t = 3.1, p< .04), SF-12 physical functioning (t = 3.3, p< .03) and social functioning (t = 4.0, p< .02), less emotion-focused coping (t = 3.5, p< .03), and improved working alliance (t = 2.7, p< .05).

Introduction

Universities can play a vital role in helping to address our housing crisis. This crisis impacts seniors, disabled, and working poor. Yet only a handful out of the 3,650 higher education institutions are putting resources of faculty, staff and students to meet this urgent task. This is the story of one University who made a major effort to rebuild, revitalize and restore one of the nation’s most historic black neighborhoods that fell into neglect and despair. West Louisville was once proud middle class neighborhood that was the childhood home of Muhammad Ali.

Since 1994, University of Louisville SUN (Sustainable Urban Neighborhoods) program has worked to great acclaim helping to facilitate the necessary resources that support the aspirations of resident families in West Louisville. The predominant focus of the SUN activities there included the historic, predominantly African-American neighborhood of Russell which had 10,000 residents. Russell is one of the most economically disadvantaged areas in the City of Louisville and is characterized by excessive poverty, unemployment, crime, and homelessness, along with relatively low levels of education and training.

Louisville’s ‘West End’ (the Russell neighborhood, in particular) was a familiar portrait of inner-city American poverty, unemployment, crime and despair. Surveys of Louisville citizens have shown that housing affordability as among the most important issues confronting the city (Gilderbloom and Mullins, 2005). In several Louisville neighborhoods, one out of every four housing units is substandard, compared to the national average of one out of every 20 (Gilderbloom and Mullins, 2005) A majority of low-income renters in West Louisville paid more than 50 percent of their income for
housing (Gilderbloom and Mullins, 2005). This was a neighborhood of gangs, drugs and prostitution. These vices paved the way for the heavy concentration of funeral homes, liquor stores, and pawnshops. Engineers turned the neighborhood into four lane one way freeway so downtown office workers could race back and forth to their suburban homes. One-way streets helped kill the neighborhood spirit—reducing housing appreciation, creating greater opportunities for criminal activity, and turning streets into no play zones for kids.

Digital Photos: Examples of what Russell looked like in 1992

Pictures1-15: Figure 5

Beforeshotgun

4.jpg

While these were considered neighborhood liabilities, I also discovered neighborhood assets. I discovered a high concentration of churches, an eight story historic YMCA, a public tech college, the first library open to blacks, a large collection of historic buildings dating back over a hundred years (federal style, shotgun, Queen Annie, arts and crafts) several parks and cemeteries that give the neighborhood residents green spaces to use, and within walking distance of good paying downtown jobs. In many ways, this neighborhood had the potential to be developed as a new urbanist neighborhood. Lot sizes were significantly smaller (about one third size) compared to suburban counterparts allowing homes to be built cheaper. Small lot sizes also caused new houses occupy a large portion of the lot with front porches extending out to touch the sidewalks. I saw Russell in West Louisville as having the potential to become the first moderate income or for that matter nearly all black new urbanist development.
I do not believe that all poor neighborhoods can be revitalized (especially suburban ones built in the sixties) but Russell seemed like a good candidate especially with the leadership of the non-profits and city officials. I was also inspired by what had happened in my own hometown of San Francisco along with Chicago, Seaside in Florida, Washington D.C. and New York.

Numerous meetings were held with organizations and individuals to examine how SUN could help make more affordable housing. Many recognized leaders and organizations were consulted in the development of SUN. As a result of this process, our collective proposal was circulated to over 50 individuals and organizations. The reaction was positive. The SUN proposal received letters of support from the Mayor, non-profits, four institutions of higher education, various government agencies, numerous businesses, realtors, banks, builders, and charities. The participation of these organizations molded SUN into an innovative and pragmatic partnership. SUN was developed as a realistic approach to create self-sufficiency among the economically challenged. This program can change hopelessness into hope for a poor neighborhood and help weave together the fabric of the community.

All plans to “do good” stir opposition. Despite the efforts to do grass roots planning, the program also had some major opposition. This is not surprising but what was disappointing was where this opposition came from. It was not from black leaders, city hall, and real estate interests but from top white housing leaders that claimed it was
wasteful, untested, and a failure from the start. A letter signed by the major players who provided affordable housing called for the proposal to be withdrawn. The nay Sayers demanded a free market economist from the University of Louisville who calls for less government (zoning, historic preservation, environmental regulations) to draw up a downtown enterprise plan and abandoned black West Louisville. The letter was delivered to my boss a top University official who quietly said no to their demands.

But this was not the end. Once the grant was awarded, they demanded that “one of their own” help manage the project. Two “old time” neighborhood leaders were hired to appease and make a compromise. But these “old time” neighborhood leaders were unable to relate to the idealism, spirit and energy of the students, faculty and black community leaders. I learned to regret hiring the Nay sayers. The nay Sayers continued their campaign after the grant was awarded by feeding the newspaper false information and demanding an investigation into the program. They demanded that I be fired. They were correct in noting that previous liberal efforts to help revitalized black neighborhoods had been a failure. But we had learned from these mistakes. The real reason for their opposition was fear of competition over scarce housing dollars and their self appointed role as housing gatekeepers being put into jeopardy (Gilderbloom and Appelbaum, 1988, Pahl, 1976).

The local newspaper came out with a highly negative front-page story claiming we were way short of our goals with too much money wasted on administration. What the newspaper failed to note was that the goals were for the life of the grant which turned out to be ten years not just 16 months they were reporting on. It takes years not months to successfully renovate or build affordable housing. Moreover, many of the claims
made by the newspaper were false and the grants evaluator, Reg Bruce, found that most of the goals of the grant were accomplished (Gilderbloom and Mullins, 2005). Mid course corrections did eliminate some goals because of cost, lack of staff or opportunities to invest resources elsewhere.

**SUSTAINABLE URBAN NEIGHBORHOODS**

Learning from lessons of the past, a fresh, innovative, bold and pragmatic partnership of business, government, a local university, junior college, and community-based groups was organized. The Russell partnership represented a multifaceted effort committed helping a low-income African-American neighborhood lift itself from dependency to self-sufficiency.

This partnership was built on the belief that the problems of low-income neighborhoods can only be remedied by a combination of programs involving: job development, planning, home repair, homeownership programs, community planning, entrepreneur training, and loan programs. Federal money from the U.S. Department of Education and the U.S. Department of Housing and Urban Development helped stimulated the development of this partnership. These funds are partially matched by local churches, non-profit organizations, industries, businesses, local foundations, and community groups. SUN’s goal is to make operational the concept of public-private partnerships in order to succeed in urban renovation and rehabilitation where many others have failed. As Marilyn Melkonian, President of Telesis Corp., has observed, its vision goes “beyond just the physical improvements of the bricks and mortar.” SUN carries out its vision through outreach-orientated partnerships with community development organizations, business firms, government agencies, community groups and universities.
SUN promotes human and economic development in the impoverished neighborhoods of West Louisville, with a resulting impact on the entire city.

**The SUN Directive**

The mission of SUN is to explore all strategies that foster a sense of community while empowering individuals in the community and promoting neighborhood revitalization, individual self-sufficiency, and self-reliance. These goals are achieved through community partnerships. Former University of Louisville President John Shumaker remarked in 1996 that “SUN, through its sheer tenacity helped turn an eyesore of blocks and blocks of boarded-up buildings into a development that the entire city can be proud of.” To help end this decline and create the dynamics for revitalization, the partnership’s goals and strategies focus on four functional categories: housing, economic development, community organizing and neighborhood revitalization.

As part of its comprehensive approach, SUN provided oversight, monitoring, technical assistance, and advocacy for low-income West Louisville residents. SUN works closely with local officials on budgetary and policy issues affecting the neighborhood community. Revitalization of old urban neighborhoods is crucial to preserving Louisville’s cultural heritage. Strengthening existing neighborhoods helps reduce sprawl, safeguard green spaces, and create healthier environments. SUN also works to identify, evaluate, preserve, and protect significant historic sites, structures, cultural landscapes, cultural artifacts and tangible community traditions of West Louisville.

SUN offers assistance to housing developers and small business owners in locally designated revitalization areas, stimulates community revitalization activities that protect and enhance historic resources, and improve existing residential and commercial
structures. SUN and its partners support initiatives to revitalize neighborhoods through programs such as redevelopment assistance, business training for individuals, education, and community crime prevention.

COMMUNITY OUTREACH PARTNERSHIP CENTER

The University of Louisville’s SUN goal is to develop partnerships that succeed in urban renovation and rehabilitation. SUN’s successful programs illustrate the impact that university and community, public and private partnerships can have on target areas. Documented results have been produced. The processes that have developed and that are being utilized are tools to successful urban rehabilitation. Sun celebrates its successes and learns from its mistakes.

The Community Design and Planning Program focuses on cooperation with neighborhood leaders and generating a shared community and neighborhood vision through ‘bottom-up’ participation by residents. A master plan and detailed site development plans for housing, commercial, recreational, and light industrial uses are guide for development efforts. The quality of the plan rests in the feasibility of its implementation.

SUN provides direct assistance to the neighborhoods and institutions through community design work such as architectural services, and helping developers adhere to the Urban Renewal Commission’s rules and regulations. SUN also provides technical assistance ranging from resurveying lots, redesigning houses, creating design plans and providing site visits to oversee construction to non-profit developers, with the objective of improving the availability, affordability and quality of housing in the Russell
Neighborhood and surrounding enterprise communities. The actual number of units that have been completed within the target neighborhood illustrates results.

**H. Temple Spears Elderly Housing**

In partnership with the Neighborhood Development Corporation (NDC), SUN identifies two housing priorities: 1) increased home-ownership opportunities for low-income households, and 2) the preservation of the current housing stock through renovation of older housing. This involves the acquiring of vacant decayed buildings, rehabilitating them, and reselling them. In-fill housing can be created, resulting in new housing units on vacant, city-owned land.

One of the best examples of this partnership is H. Temple Spears elderly housing, which was started as a project of SUN in 1994. A graduate student came up with a 300-page plan to create 65 units of affordable senior housing in West Louisville. The need for senior housing was great since West Louisville had very little senior housing for blacks. The initial effort was to build a brand new housing development in the neighborhood but this was abandoned when NDC saw the economics and sentimentality of rehabing an historic 100-year-old school. This architectural landmark, which was located on one city block with plenty of surrounding green space, won the hearts and minds of residents and city officials.

**Photos of H. Temple Spears Senior Housing about here**

MVC001f.jpg found in the folder  
P1010193.jpg  
P1010196.jpg

The student who came up with the proposal was Bill Friedlander an active APA member who left SUN with a Ph.D. to resurrect a defunct Neighborhood Development
Corporation and revived it. H. Temple Spears has become one of their most important successes. Ten years later Neighborhood Development Corporation believes it has helped revive, build and save over 150 housing units and manages roughly 300 units in West Louisville. Many of these housing units are historic and present the fabric of the neighborhood.

**Louisville Central Community Center**

SUN worked hand in hand with the non-profit Louisville Central Community Center (LCCC) to help provide drawings, designs, planning and helping with getting approvals. Ten years later LCCC has helped develop 76 apartment units of which 46 houses and 17 apartment buildings have been built in Russell. Nearly all of the apartment units are 3 bedrooms and two bathrooms ranging from about 1,120 to 1,800 square feet. All the units sold for between $49,500 and $115,000. For the earliest units, a monthly mortgage estimated around $395 a month was $100 less than nearby apartments. These housing units look attractive and fit within the historic character of the neighborhood of 100-year-old shotgun homes. Many of the shotguns were renovated to maintain the historical character of the city.

Word file pictures1-15 Figure 11

**File:**

30.jpg

23.jpg—new housing complimenting older renovated housing

p1010202.jpg
A team of student architects, planners, lawyers and engineers (most notably Rob Mullins, Mark Wright, Michael Brazley and Scot Ramsey) helped to created architectural renderings, house plans, interacted with city leaders to understand the approval process of various private and public agencies and the economics of preservation and new housing construction. The students were edgy, energetic and inventive. I gave them a long leash to “make it happen.” Of special note was that much of the houses were prebuilt before they even got to the lot—roofs, walls, kitchens and bathrooms. The parts were fitted together similar to modular housing on site. The lots were provided to LCDC for $1 (that is not a typo!) with sewers, electrical and paved roads and some sidewalks. The leader of LCDC (the largest black social service agency in Russell) was Sam Watkins Junior who opened the gate for us to come into the neighborhood. He was critical to our success; he was honest, charismatic and smart. While embracing our grit and idealism, Mr. Watkins had the political clout to keep the Nay sayers at bay.

Digital Photos

File: Word, Figure 14 before and after shots of crack building turned into family housing

Telesis Corporation

SUN worked with Telesis development corporation and neighborhood leaders such as Deborah Todd and Sam Watkins to help save Village West from demolition. The demolition of Village West would have resulted in the loss of 653 family housing units and exacerbated the housing crisis for African Americans. Many of these housing units were abandoned and board up. SUN helped introduce the idea of crime prevention through environmental design (see Newman, 1980, Jacobs, 1961). This resulted in new
504 units remaining out of the 653 original units so that every unit had good views—eyes on the streets. The brick units had a total make over with front doors going out to the streets, public/private space demarcation, attractive and varied roof lines. Village West was gone and renamed city View Park acceleration of the downtown. The flat root barrack like project was gone. These units are a mix of market rate and section 8 units. Despite the history of these units as a place of rampant crime and vice, rents are nearly as high as white middle class neighborhoods--$707 for a four bedroom; $594 for a three bedroom; $496 for a two bedroom and $373 for a one bedroom. In 2009, plans are in the making to sell the units off as affordable condos in a range of around $30,000 per unit, which would make these units, have a monthly principal and interest at around $250.

Photos of Before and After Shots of Louisville Homes Renovated by Telesis

Digital Photos: Pictures1-15 Figure 15
SUN was retained as a consultative and mediator partner in the proposed development of a H.U.D. Section 232 backed project to construct a 156-unit retirement residential center for the underserved, which will be replicated in other parts of Louisville. A for-profit Limited Liability Company made up of three cooperative partners anchors the project: the landowner, the builder, and a local labor organization, which is providing pre-development financing. The project will demonstrate how unions can realize superior investment returns by investing in housing. The project is expected to yield units which rent profitably at approximately 30 (thirty) percent below current market rents for similar housing as a result of LLC partnership and H.U.D. financing. Financing, land and construction cost savings are pooled to create a long-term investment opportunity for the company and needed housing for the elderly. Unfortunately this development has been stalled because of infighting among partners over how much of big a slice of pie each
park was going to get. Hopefully, this model will be replicated by other labor organizations, non-profits, and faith based organizations in the future. A similar project was developed for the University that was estimated to cost around $7 million dollars with the land being leased from the University for $1.00 a year. The three-story development would have 65 rooms with a peak capacity of 130 nursing home patients. After 15 years, the nursing home would be given back to the University for $1.00 and the University would have a dorm facility for 130 students at an appreciated value of $12 to $15 million dollars. The University said no to this proposal.

CONCLUSION

As a result of the SUN project, Sustainable Urban Neighborhoods was recognized by Harvard University. The John F. Kennedy School of Government chose SUN as a semi-finalist in its “2001 Innovations in American Government Awards Programs.” The University of Louisville’s outreach community partnership initiative through the Sustainable Urban Neighborhoods program and Dr. John I. Gilderbloom, its principal investigator, received the Sierra Club National Best Practices Award. SUN has been selected by Industrial Economics, an EPA funded group, as one of the most outstanding examples of Smart Growth Practices in the United States. Our program were given positive coverage in Planning Magazine, New York Times, Atlanta Journal and Constitution. Even the local newspaper that had run a highly critical story in the beginning ran several more positive stories on the accomplishments of SUN.

SUN’s successful programs illustrate the positive impact that a university can have on a distressed neighborhood. SUN’s program involves local housing, economic development, community organizing, and neighborhood revitalization.
The SUN project was designed to serve as a change agent in promoting revitalization in the federally designated West Louisville Enterprise Community. The overall mission of SUN is to improve the quality of life for residents of the Enterprise Community; SUN’s East Russell, an inner city Louisville neighborhood, has seized the nation’s attention by creating a renaissance in the central city, bringing new life and vitality.

SUN’s approach is holistic rather than piecemeal. SUN enhances problem-solving capacities by linking residents with systems that provide resources designed to increase productive self-sufficiency. Community education coordinated through partnerships with educational institutions, nonprofit organizations, and faith-based groups increase the depth and breadth of information available to the residents. These partnerships promote a positive outlook to overcome initial skeptical neighborhood attitudes. New business and investment in the neighborhood, vital to its redevelopment and growth, came about through the coordination of enterprises outside the neighborhood and those struggling within the neighborhoods.

Today the gangs, prostitutes and drugs are invisible to the eye. Crime has fallen on a per person basis. The place looks like a safe and comfortable neighborhood. Western Louisville has always been a distinct black neighborhood that was several blocks from the center city business district. It was a Western bookend to the center of the city. With the revitalization of Russell has also come a sudden revitalization of the Center of the City with new loft housing and entertainment district recently opening up. Universities do not need to be in the ivory tower but can be an active agent of positive
change. Imagine what a difference Universities could make if similar programs like SUN were embraced by the other 3,650 higher education institutions?

Gilderbloom, John, 2004, Invisible City: Power, Place and Poverty, unpublished manuscript, University of Louisville

Dear Suzanne:

I want to make a presentations at your upcoming conferences in Charleston (Spring of 2005). Here is my revised abstract for the Charleston Conference for Summer of 2005:

How Universities Can Make Cities More Livable

by John I. Gilderbloom, Professor School of Urban and Public Affairs, University of Louisville

The SUN program has won various honors and awards from Harvard University, Sierra Club, and United States Congress. The key is creating a sustainable partnership that can grow with the neighborhood. Urban universities with planning and architecture programs can bring tremendous creative and technical resources to community leaders and should take activist roles in helping their communities by supplying the knowledge and assistance. As part of this presentation of DVD on successful university-community partnerships will be presented.
Title: Activating 'money talk' among classroom learners of EFL: A textbook study.

Name of author: Andrew Gladman.

Affiliation of author: Miyazaki International College

Address of author: 1405 Kano, Kiyotake-cho, Miyazaki 889-1605, Japan

Email of author: agladman@miyazaki-mic.ac.jp

Abstract of paper:
The author takes a critical pedagogy approach in making a exploratory content analysis of an EFL textbook written for Japanese college students. The targeted textbook is tested to determine if its rubric activates learner talk on money-related issues using WH-questions at a notably higher level than comparable textbooks, with positive results. The author suggests that this is misaligned with the needs of the target users and argues that such textbooks are counter-productive to teachers seeking to encourage their students to develop counter-discourses to the dominant economic paradigm through English.

ABSTRACT

This is an initial cross-sectional study to determine if students motivation for language learning shifts during the course of their college career.

By undertaking a study of students at Japanese universities, it should be possible to develop a model of how motivation affects L2 learning with Japanese students. As the Japanese government focuses more of its attention on the communicative competence of its young people in English, it is important to discover what motivates students to learn the language and how that changes over time. Motivation has been found to have important consequences for both willingness to communicate and communicative competence in a second language in other parts of the world (e.g. Noels, 2001).

We hypothesize that students’ motivation for learning English will change from a more intrinsic and integrative motivation to a more extrinsic and instrumental motivation as their college career progresses due to the pressure to perform well on the TOEIC in order to get a job. At the same time, their willingness to communicate will decrease and their L2 anxiety will increase, leading to an overall decrease in L2 competence even as their test scores increase.
The Effect of Multiple Categorization on Explicit Stereotyping

The Effect of Multiple Categorization on Explicit Stereotyping

Crystal M. Glover  
Howard University

Lloyd R. Sloan  
Howard University

Ethnicity and gender were studied to assess their effects on explicit stereotyping and evaluation. Measured dependant variables assessed explicit stereotypes and evaluations held of multiple categorizeable target groups (target groups composed of individuals that represented an ethnic and gender target group). Participants’ ethnic identities were assessed as moderators. Participants were 199 African American undergraduate students. Results indicated target ethnicity main effects for male and female participants. Results, also, indicated a target gender main effect for female participants. Participants’ ethnic identities moderated the relationship between multiple categorization and stereotyping and evaluation. All significant evaluative findings were consistent with Social Identity Theory (SIT; Tajfel & Turner, 1979).

Keywords: multiple categorization, stereotypes, ethnic identity

Stereotyping is one of the most complex, intriguing, and oldest phenomena in social psychology. Stereotypes are simply stated as, “category-based images” (Gilbert, Fiske, & Lindzey, 1998). Stereotyping occurs when individuals place other individuals or groups into categories based on their memberships in certain groups and associate certain traits and characteristics with the individual or group. Two of the most salient categories by which individuals are stereotyped and evaluated are ethnicity and gender. The union of single categories ethnicity and gender creates multiple categorizeable target groups (e.g. African American women). This research investigated general evaluations of target groups. The potential moderating role of participants’ ethnic identities was investigated, as well.

MULTIPLE CATEGORIZEABLE TARGET GROUPS AND EXPLICIT STEREOTYPING

Target groups composed of individuals that represented an ethnic and gender target group were multiple categorizeable target groups. Multiple categorizeable target groups were created by the union of single categories ethnicity and gender. In this research, African and White Americans composed the ethnic target group portion of multiple categorizeable target groups, while men and women created the gender target group portion of multiple categorizeable target groups. Ethnicity and gender were terms regarded as appropriate by psychological research guidelines (APA Publication Manual-IV, 1998). Definitions of ethnic target groups used in this research were set forth by the United States Governmental Guidelines. An African American (Black) was stated as, “a person having origins in any of the black racial groups of Africa,” while a White American (White) was stated as, “a person having origins in any of the original peoples
of Europe, North Africa, and the Middle East’ (Randall, 1999). Definitions of gender target groups used in this research were set forth by the APA Publication Manual (IV, 1998). Gender was defined as a cultural term that referred to men and women as social groups (APA Publication Manual-IV, 1998).

Both ethnic and gender categories have been shown to influence explicit stereotyping (Kashima, 2000; Madon, Jussim, Keiper, Eccles, Smith, & Palumbo, 1998). Multiple categorization has been investigated in explicit stereotype research to understand which category takes precedence in particular contexts (Smith & Zarate, 1992; van Rijswijk & Ellemers, 2002). The review by Smith and Zarate (1992) stated that an individual’s self-schema, individual differences, past experiences, and other factors influenced the attention that an individual directed toward one category of a multiple categorizable target person. van Rijswijk and Ellemers (2002) investigated stereotyping of students who belonged to different universities with differing majors. The salience of a category (i.e. university affiliation) was manipulated. It was shown when a target person was multiple categorizable, salience of context or category influenced into which category the target person was stereotyped. However, investigation of effects of multiple categorization on explicit stereotyping and evaluation had not been researched to understand specific stereotypes and evaluations of certain multiple categorizable target groups and how they differ from one another.

Investigating the effects of multiple categorization on explicit stereotypes and evaluations was the primary goal of this research. It was crucial to investigate stereotypes and evaluations of multiple categorizable target groups since every individual represents an ethnic and gender target group simultaneously. Individuals simply do not represent only the single categorization of ethnicity or gender, which has been the focus of most explicit stereotype research. African Americans at a predominately African American university served as participants in this research. Investigation of explicit stereotyping and evaluation within a sample of African Americans was fairly novel and rare since most explicit stereotype research has used White American samples.

PREVIOUS LITERATURE

**Ethnic Stereotypes**

The investigation of the effect that ethnicity has on explicit stereotyping has often been a focus of stereotype research. Stereotype research began with Katz’s and Braly’s (1933) seminal work on ethnic stereotypes. The top five traits for the American ethnic group were industrious, intelligent, materialistic, ambitious, and progressive. The top five traits for the Black ethnic group were superstitious, lazy, happy-go-lucky, ignorant, and musical. Results suggested the American target group was stereotyped with positive traits while the Black target group was stereotyped with negative traits. Hence, American and Black target groups were stereotyped differently.

Replications of Katz and Braly (1933; Gilbert, 1951; Karlins, Coffman, and Walters, 1969) were conducted. Results suggested the stereotype of the American target group remained positive and the stereotype of the Black target group remained negative. American and Black target groups were stereotyped differently.
Judd, Park, Ryan, Brauer, and Kraus (1995) investigated the stereotypes that Blacks held of Whites. This research was descriptive and paralleled the research conducted by Katz and Braly (1933). Overall, results suggested Black participants view their ingroup as heterogeneous and their outgroup as homogenous. These results indicated Black participants perceive their ingroup and outgroup similar to how White participants perceive their ingroup and outgroup.

Krueger (1996) continued to investigate the stereotypes that Black participants possessed. Many Black participants shared the same personal beliefs and cultural stereotypes and underestimated how favorably their ethnic group was rated. Results suggested Black participants perceive that their outgroup perceives them unfavorably.

Previous literature indicated different stereotypes existed for African and White Americans within African and White American samples. Predominantly positive stereotypes of the American target group existed while predominantly negative stereotypes of the Black target group existed. These stereotypes have persisted from the beginning of stereotype research until present stereotype research.

**Gender Stereotypes**

Kunda and Sherman-Williams (1993) investigated the use of stereotyping when individuating information was available and how stereotypes influenced the construal of information. In Experiment 1, participants were given ambiguous or unambiguous individuating information associated with aggressive behavior in regards to a construction worker or housewife. In the ambiguous condition, the construction worker was seen as being more aggressive than the housewife. When presented with ambiguous behavior, participants used gender stereotypes to construe the information. Summarily, results suggested a different stereotype existed for males (aggressive) and females (non-aggressive).

Swan and Wyer (1997) investigated the effects of being a gender minority in a group. The Social Identity Theory (SIT; Tajfel & Turner, 1979) perspective was used to make predictions and explain results. Participants participated in groups that positioned them as the majority, the minority, or were equally distributed. Results suggested being a minority in a group led male participants to behave stereotypically (masculine) and led female participants to behave counterstereotypically (masculine). Also, results suggested female participants, when in the minority in a group, aimed to distinguish themselves from other ingroup members (females) by behaving counterstereotypically.

Dade and Sloan (2000) investigated sex role stereotypes utilizing a Black sample. Black female participants equally distributed the typical African American man and woman across the four sex role stereotypes. Black female participants mostly distributed themselves to the feminine sex role stereotype. Black male participants equally distributed the typical African American women across the four sex role stereotypes and mostly sex role stereotyped the typical African American man as androgynous. Black male participants distributed themselves equally across the four sex role stereotypes. Results suggested that Black male and female participants stereotype themselves and each other differently. Gender of African American participants may influence stereotyping of themselves and each other.
Previous literature indicated different stereotypes existed for men and women, as stereotyped by men and women. These different stereotypes have persisted from earlier stereotype research until more recent stereotype research. Gender stereotypes were more likely to be used in the absence of individuating information in regards to a target person. Also, individual differences have been shown to influence the likelihood of stereotyping gender target groups.

HYPOTHESES

Social Identity Theory (SIT; Tajfel & Turner, 1979; Tajfel & Turner, 1986; Turner, 1999) states, generally, that individuals more favorably stereotype and evaluate individuals who are part of their ingroups in comparison to individuals who are part of their outgroups. Group differentiation and social comparison are key factors in ingroup/outgroup relations. Based on these key factors, Social Identity Theory suggests when group membership influences favorable or less favorable group stereotypes and evaluations. An individual seeks to positively stereotype and evaluate ingroup members by accepting, valuing, and assigning positive attributes to ingroup members because an individual’s personal identity is linked to social identity. Secondly, an individual values less and assigns less positive attributes to outgroup members. As a result of the review of previous literature pertaining to Social Identity Theory and ethnic and gender stereotypes, the following hypotheses were proposed.

Hypothesis One

Social Identity Theory (SIT) suggests that members of an ingroup seek to evaluate their ingroup and its members favorably because ingroup identification is related to personal identity. Hence, a participant should evaluate target groups more favorably that share traits and characteristics that she or he possesses in order to think of his- or herself in a favorable manner. It is predicted that the more traits and characteristics that a participant and target group share, the participant should more favorably evaluate the target group. More specifically, it is predicted that participants should evaluate their “double ingroup” most favorably (shared ethnicity and gender), evaluate their “partial ingroups” (either shared ethnicity or gender, but not both) more favorably, and evaluate their outgroup (neither ethnicity nor gender shared) least favorably. This hypothesis is tested with Single Item Ratings of target groups.

Hypothesis Two

Participants’ ethnic identities are individual differences that are predicted to moderate evaluations of multiple categorizeable target groups. If ethnic identities are positively important to a participant, then the participant should more favorably evaluate his or her ethnic and gender target groups. This hypothesis is tested with Single Item Ratings of target groups.
METHOD

Participants

One hundred and ninety-nine African American undergraduate students enrolled in an introductory psychology course (143 women and 56 men, mean age=19 years) volunteered to participate in this research for course credit.

Measures

Single Item Ratings

In an effort to assess positivity or negativity of each target group, Single Item Ratings were developed. Participants rated the favorability of four groups: African American men and women and White American men and women. The favorability or unfavorability of each target group was assessed using a 9-point Likert-type scale with endpoints 1 (very unfavorably) and 9 (very favorably). Favorability ratings served as the Single Item Ratings of each target group that provided an overall assessment for each target group.

Participant Ethnic Identity

Ethnic ingroup identification was measured by a modified version of the Integrated Threat Theory (ITT) Scale (Stephan & Stephan, 2000). The ingroup identification portion assessed a participant’s belongingness to and importance related to his or her ethnic and gender groups. Items were assessed on a 10-point scale with endpoints 1 (strongly disagree) and 10 (strongly agree). “Strongly disagree” indicated a strong gender/ethnic identity while “strongly agree” indicated a weak gender/ethnic identity.

Design and Procedure

A 2 (target ethnicity: African and White American) X 2 (target gender: men and women) X 2 (participant gender: men and women) design was employed for the dependant variables.

RESULTS

Hypothesis One

Hypothesis one predicted that the more traits and characteristics that a participant and target group shared, the more favorably the participant would evaluate the target group. Participants were predicted to evaluate their double ingroups most favorably (shared ethnicity and gender), evaluate their partial ingroups more favorably (either shared ethnicity or gender, but not both), and evaluate their outgroups least favorably (neither shared ethnicity nor gender). Hypothesis one was tested with Single Item Ratings
of target groups. Dependant variables were analyzed using a 2 (participant gender) X 2 (target ethnicity) X 2 (target gender) ANOVA.

Results for Single Item Ratings did not indicate significant two-way (target ethnicity X target gender) interactions or significant three-way (target ethnicity X target gender X participant gender) interactions. Single Item Ratings indicated target ethnicity main effects for all participants and a target gender main effect for female participants. These main effects will be discussed throughout the Results section.

Target Ethnicity Main Effects

Results for Single Item Ratings indicated all participants evaluated African American target groups (7.46) more favorably than they did White American target groups (5.14; F(1/197) = 224.02, p<.001). Results for Single Item Ratings indicated male participants evaluated African American target groups more favorably than they did White American target groups, as did female participants. Hypothesis one was supported among male and female participants.

</tbody>
</table>

Target Gender Main Effect

Results for Single Item Ratings indicated a target gender main effect in that all participants evaluated female target groups (6.49) more favorably than they did men target groups (6.12; F (1/197) = 20.77, p<.001). When male and female participants were analyzed separately, only female participants indicated a significant target gender main effect. Hypothesis one was supported among female participants and not supported among male participants.

### Hypothesis Three

Hypothesis three predicted that participants’ ethnic identities would moderate evaluations of multiple categorizeable target groups. Hypothesis three was tested with Single Item Ratings of target groups. Single Item Ratings were analyzed using a 2 (participant gender) X 2 (target ethnicity) X 2 (target gender) ANCOVA with participants’ ethnic identity as covariates.

**Main Effects Moderated by Ethnic Identity**

Results for all participants, before covariance of ethnic identity, indicated main effects for target ethnicity. When ethnic identity was covaried, target ethnicity main effects were reduced for all participants.

Results for female participants, before covariance of ethnic identity, indicated a target gender main effect. The gender main effect was reduced when participants’ ethnic identities were covaried.

DISCUSSION

Social Identity Theory effects are consistent with all significant evaluative findings, especially for female participants. This research has shown that participants favor their ethnic ingroup more in comparison to their ethnic outgroup and female participants favor their gender ingroup more in comparison to their gender outgroup. These findings contribute to a more complete view of Social Identity Theory effects and evaluation of target groups.

This research suggests that ethnic and gender categories may interact. A pattern throughout the results of this research suggests ethnic and gender categories influence one another.

Not surprisingly, this research suggests participants’ ethnic identities moderate the target ethnicity and target gender main effects. This research contributes to a more complete view of the operation of individual differences within the relationship between categorization and evaluation.

A major theme that surfaces throughout this research is that female participants’ results indicate a pattern different than male participants. This finding may suggest a different social psychological mechanism is operating within male participants. Perhaps the progressive images of women or single family homes influence male participants’ responses. However, a limitation of this research is the small number of male participants. Future research should employ more balanced numbers of male participants.

Abstract

Nine psychiatric inpatients diagnosed with borderline personality disorder participated in a psychoanalytically-oriented, exploratory spirituality group led by a clinical psychologist and a hospital chaplain. Through the use of drawings and group process the participants 1) uncovered their representations of God and 2) worked through distortions in these representations. Two distinct patterns of God representations were identified among participants: 1) representations of a punitive, judgmental, rigid God and 2) representations of a depersonified, inanimate, nebulous God. The second set of patterns was found to be associated with the presence of comorbid narcissistic features. Participants who initially presented punitive God representations were able to begin the process of re-creating these representations during the course of the group and in so doing begin the process of re-creating their self-representations, while participants who initially presented depersonified God representations did not seem able to begin the process of re-creating any mental representations during the course of the group. Contrary to expectations, none of the participants' parental representations appeared to change. It is recommended that a spirituality group be considered as a vehicle for facilitating the re-creation of representations of both God and self among spiritually curious borderline patients.
INTRODUCTION

The world is facing a freshwater crisis. Over 1.5 billion people lack access to drinking water and if current projections continue, at least 3.5 billion people will live in water stressed basins in just 20 years. Furthermore, 3.3 billion people have access to water, but much of it is contaminated and 2.5 billion people have no water sanitation services. In developing countries, an estimated 90% of waste is discharged without treatment into rivers and streams. Consequently, there are about 250 million cases of water related diseases which result in 5-10 million deaths each year (World Wildlife Fund, 2003).

The problem is not just a developing nation phenomenon. Freshwater conflict has been documented in Europe and North America. In the United States, 400 million cubic meters of groundwater is removed annually from aquifers annually in Arizona double the amount of recharge. In Spain nearly half of the 100 aquifers are over exploited (Mayell, 2003).

Population increase, industrial pollution, and drought all contribute to freshwater scarcity, which is further exacerbated by myopic and often inefficient governmental responses. While there is no exact formula for solving water scarcity, one plausible way to mitigate the problem can be through the continued development of interstate water accords. Of the 152 water conflicts documented in the twentieth century, only seven have resulted in skirmishes (Wolf, 1998). This suggests that states can work together collectively to solve future water

---

1 One cubic meter equals 1000 liters.
conflict and possibly adhere to a recent UN goal of providing 95% of human beings with safe drinking water and sanitation by 2025 (Asian Development Bank, 2004).

While empirical data from interstate water accords offers hope, comprehensive research has not been conducted on the underlying motivations for creating interstate water accords nor has there been a thorough assessment in understanding the level of cooperation within water accords. Therefore, two central questions are addressed in this study: How are nation states able to overcome collective action problems and achieve measurable accords? What factors make accords so resilient?

Freshwater scarcity is viewed in terms of conflict and cooperation. Levy (1990), Homer-Dixon (1993), Postel (1993), Gleick (1993, 1998, and 2000) view it in terms of conflict. Further, Nakayama (1997), Homer-Dixon and Percival (1995), Ward (2002), and Bennet (1995) provide detailed cases studies depicting freshwater scarcity and its impact on various societies. However, aggregate analysis of 1,831 international water related events over the last 50 years reveals that two thirds of these encounters were cooperative. Nations agreed to implement joint scientific or technological work and signed 157 water treaties (Postel and Wolf, 2000).

Wolf (2000, 02) provides initial insight towards understanding and evaluating interstate how water accords reduce freshwater scarcity. His central finding is that nation states have been able to negotiate successfully over water quantity, quality, and non-water linkages such as pollution reduction. While these
are important findings, it is uncertain why this occurs or how it applies collectively to interstate water accords. The reality is that few authors have conducted systematic analysis on international water treaties as a whole (Wolf, 1997). However, there is a growing need for global environmental scholars and international security experts to evaluate the early signs and likely locations of water related disputes, as well as understand what governments and international agents can do to prevent the eruption of violence and political instability (Wolf, 2000).

While water disputes generally end amicably, it is not the rule. One fourth of water-related interactions during the last half of the twentieth century were hostile. While much of the hostility was simply verbal antagonism, there were 37 occasions where rival countries either fired shots, engaged in dam destruction or undertook some other form of military action (Postel and Wolf, 2000).

While acute instances of water conflict may be dismissed as outliers, the reality is the much of the world is experiencing freshwater shortages. The amount available water today is the same as it was during the times of ancient Mesopotamia (approximately 4000 years ago). Since 1950, the renewable supply per person has fallen 58 percent as world population swelled from 2.5 billion to 6 billion (Postel, 2000). But unlike oil and other strategic resources, freshwater has no substitute. Clearly, forward thinking policies must be developed to manage this global crisis.

This chapter provides an in-depth overview of the current global freshwater crisis and a theoretical and empirical assessment of interstate water
accords. A brief summary of the entire study is presented at the end of the chapter.

RECOGNIZING A GLOBAL ENVIRONMENTAL PROBLEM

Freshwater scarcity is a complex geo-political phenomenon with multiple dimensions. Therefore, it needs to be addressed in an incremental manner. This entails issue overview, causal factor evaluation, alternative policy solutions, and interstate water accord evaluation.

Background

Water is endemic to any society; “From water we have created every living thing (The Koran) to American literature “if you touch water, you touch everything” (Cassuto quoting Gunther, 2002). Water has significant symbolic value because it is viewed as a cleansing and healing agent and in many cultures is associated with rebirth (Driscoll, 1998). It also is the only limited natural resource that absolutely is essential to human life. Unlike energy, where technological advancements offer solar panels, wind turbines, and fuel cells to replace coal, oil, and gasoline, there is no alternative to water (Graffy, 1998).

Population increase, pollution, drought, and myopic governmental solutions have increased freshwater competition. While a Malthusian

---

2 Water scarcity is understood as a lack of secure, uninterrupted, and long-term availability of adequate amounts of freshwater, of required quality, on a regular basis, and for multiple needs (Elhance, 1999)

3 Even though the world is 97% water, only 3 percent is freshwater and of that only 1 percent is available. Freshwater is inaccessible because it is trapped in glaciers and water distribution is not allocated evenly. Some places, like Canada, Austria, and Ireland, have more water than they can possibly use; others, like Australia, northern China, and the Middle East have too little. In many parts of the world, such as India and Bangladesh, rainfall is highly seasonal: almost all the year’s supply may arrive within a few months. (UNDP 2000)

4 A 1% deficiency of water in the human body makes one thirsty, a 5% decrease causes a slight fever, and a 10% decrease creates immobility. At a 12% loss of water causes death (Swanson, 2001)

5 Thomas Robert Malthus in his Essay on the Principle of Population in 1798 asserted that population growth naturally outstrips the growth in food production, so that a decrease in the per capita availability of food is inevitable, until eventually a point is reached at
perspective has never been proven, water management needs to improve greatly in order to meet current and future population needs. If current practices remain unchecked, Benjamin Franklin’s statement, “when the well’s dry, we know the price of water” (Postal, 1993) may soon be felt in massive proportions.

A starting point to evaluate freshwater scarcity is the seminal study, Water Scarcity in the Twenty-First Century (International Water Management Institute, 1999). It projects water supply and demand for 118 countries from 1990-2025 based on water consumption patterns in agriculture, industry, households, and the environment. The study indicates that the Middle East, Southern Africa, and portions of China and India will face absolute water scarcity issues by 2025. This means that these countries will not be able to meet their basic water consumption demands by 2025. Population growth is the central factor for explaining water scarcity in each of the four previously mentioned categories.

Countries that are labeled category one and two are of immediate concern. Countries in the first category face absolute water scarcity where daily water requirements are threatened. One billion people (projected to reach 1.8 billion by 2025) predominantly located in the Middle East, South Africa, and portions of China and India are affected. More ominously, these people will not have enough water to maintain 1990 per capita levels by 2025 (IWMI, 1999).

The second category are countries that have sufficient water resources to meet projected 2025 requirements, but will require greater efforts to extract water. Currently, 350 million people live under these conditions but 900 million

which starvation, or some other disaster, drastically reduces the human population to a level which can be sustained by the available food supply (Caroline Thomas in Baylis and Smith, 2000)
people could be affected by 2025 (IWMI, 1999). The problem is further pronounced because many of these countries lack financial resources to offset impending water shortages (i.e., dam construction and irrigation development).

Freshwater scarcity will remain a serious issue even if better irrigation methods are implemented. According to the IWMI, improved irrigation will require 60% more water in order to meet basic food supplies by 2025. This means 2.7 billion people will still remain without adequate freshwater supplies.

It is perplexing that while major diseases have been eradicated, humankind has not effectively managed natural resources. Nature’s conflict with neoliberal ideology is part of the problem. Natural resources have been viewed simply as a means for creating greater economic growth without concern for current or future generations.

This is a serious problem for developing countries who are under pressure to meet the basic needs of the people; food and clothing, shelter, and economic growth. But in some cases, developing countries believed that environmental destruction was an inherent by-product of the development process and thus environmental measures meant less economic growth. For example, Indian Prime Minister Indira Ghandi asked at the 1972 Stockholm Conference on the Human Environment, “How can we speak to those who live in the villages and in the slums about keeping the oceans, the rivers, and the air clean, when their own lives are contaminated? Are not poverty and need the greatest polluters?” (Andreen, 2000).

---

6 Though some may argue that the highest form of neo-liberal thought encompasses post-industrial values, where protecting the environment is of highest priority.
Whether it is from socioeconomic or other factors, nation states are reluctant to recognize water scarcity’s full impact. Water should be valued as a natural resource independent of socio-economic considerations. However, vague international law and pressing economic demands have enabled it to remain ill-governed and severely under-priced. (Economist, 2003) Consequently, there has been limited domestic and international support in solving freshwater scarcity issues.

This in turn has led to substantial, unnecessary, and preventable human suffering. An estimated 14 to 30 thousand people, mostly young children and the elderly, die every day from water-related diseases. At any given moment, approximately one-half of the people in the developing world suffer from diseases caused by drinking contaminated water or eating contaminated food (United Nations 1997).

Other studies corroborate IWMI findings. According to a recent UN World Water Development Report, freshwater demand has tripled in the past 50 years. More than 2.3 billion people (17% of global population) lack access to safe drinking water. Two million die each year from water related diseases and half the developing world population suffers from water related maladies (Wertheim, 2004). The United Nations and the National Intelligence Council project at least 40 per cent of the world’s population, or about three billion people, will live in water scarce countries by 2015 (Jehl, 2002). Additionally, as many as 7 billion people in 60 countries will face water scarcity within the next half century (UNDR, 2003).
By 2015, nearly three billion people – 40 percent of the projected world population are expected to live in countries that find it difficult or impossible to mobilize enough water to satisfy the food, industrial, and domestic needs of its citizens. This scarcity will translate into heightened competition for water between neighboring states and provinces.

Two continents exhibiting serious acute water shortages are Africa and the Middle East. By 2010, freshwater scarcity will affect 450 million people, approximately 37% of the Africa’s projected population (Farley, 2001). The Middle East is another desperate region. Nine of the 14 Middle East countries face water scarce conditions. Several country populations are expected to double over the next 25 years, exacerbating pressure on already scarce water supplies (Postel, 1992). The Middle East is also where war has been waged directly over water.7

Other problem areas include China, Mexico, India, and United States’ southwestern region. The Chinese government is redirecting rivers (1000 miles to the north) from the Yangtze basin to water parched cities of Beijing and Tianjin. This could have serious environmental implications because much of the water is untreated and nearly 300,000 people will be uprooted. (Eckhol, 2002). In the western part of the United States water scarcity has impacted negatively local U.S. and Mexican border economies and strained interstate relations over access to the Colorado River. Water riots have occurred in New Delhi, India.

---

(2002) and Monterey, Mexico (1995). While water conflict varies in size and location, it is evident in both hemispheres, including central Asia\(^8\), Europe, and South America.

**Causal Factors**

Freshwater scarcity is caused by population growth, industrial pollution, drought, and ineffective governing policies. In 1830 one billion people inhabited the earth. Despite wars, famine, and disease, human population increased 500% over the last 150 years. Today, six billion people inhabit the earth today with a population equivalent of New York City added each month (ninety million people a year). Even if terrorism or war claims a million lives, those numbers are replaced within four days (Ward, 2002).

Unprecedented population growth has increased water use six-fold (Jehl, 2002). Half the world’s available freshwater is depleted each year. This figure could reach as high as 74% by 2025. Water tables have fallen on every continent and the situation is expected to worsen. Greater food production is required to meet expanding population needs. However, this entails increased agricultural output. Over-pumping, and agricultural run-off have reduced water quantity and quality in many regions. Groundwater mismanagement is now wide-spread in parts of China, India, Mexico, Thailand, the western United States, North Africa, and the Middle East. (Postel, 1993).

---

\(^8\) Environmental problems of the Aral Sea basin are amongst the worst in the world. Water diversions, agricultural practices, and industrial wastes have resulted in disappearing sea, salination, and organic and inorganic pollution (Beach et. al, Transboundary Freshwater Dispute Resolution, UN Press: New York, 2000, p. 121.)
The largest and most combustible imbalance between population and available water supplies is Asia, where crop production depends heavily in irrigation. Asia today has roughly 60 percent of the world’s people but only 36 percent of the world’s renewable freshwater (Postel and Wolf, 2000). China, India, Iran, and Pakistan are among the countries where a significant share of the irrigated land is now jeopardized by groundwater depletion, scarce river water, a fertility-sapping build up of salts in the soil, or some combination of these factors. Groundwater depletion alone places 10 to 20 percent of grain production in both China and India at risk. Water tables are falling steadily in the North China Plain, as well as in India’s northwest Punjab region.

Water scarcity has forced many farmers to move to overcrowded cities. This is the case in Pakistan, where falling agricultural output has prompted a massive rural migration to large urban centers, contributing to renewed outbreaks of ethnic violence.

Internal water stresses also shifts international political alliances, which in turn adds to the humanitarian crises. Many countries commonly adapt to water stress by importing their food (provided they have the foreign exchange to do so). It takes about 1,000 cubic meters of water to grow one ton of grain. By importing wheat and other staples, water stressed countries can allocate more of their scarce freshwater to cities and industries, which generate far more economic value per liter than agriculture does. Currently water stressed countries in Asia, Africa and the Middle East account for 26 percent of global grain imports (Postel and Wolf, 2000). This trend is projected to increase over the next 15 years,
which includes China, India, and Pakistan. These countries are grain self-sufficient, but are unlikely to remain so considering that 80% of the available freshwater in Asia is used for irrigation, and 90% of irrigation water is used for rice.  

**POLLUTION**

Man’s callous treatment of natural resources has led to global warming as well as river and stream pollution. Water ways are contaminated with human, industrial, and agricultural wastes. Fertilizers, pesticides, and overgrazing have reduced water quantity and quality. Now, more than half the world’s major rivers are either polluted or have reduced water levels. Additionally, half the planet’s wetlands have been lost in the twentieth century, and freshwater systems all over the world are losing their ability to support human, animal, and plant life (Ward, 2002). The problem is compounded further because natural freshwater is distributed unevenly, with too much water in some areas and far too little in others (Jehl, 2000).

In many developing countries water-quality indicators have deteriorated or are not even measured. For example, ambient water quality for Chinese rivers shows substantial degradation since 1990 (Gleick, 2003). Even in developed countries, water quality improvements have been modest (Gleick 2000).  

Since 1980, water per capita use in the United States declined substantially due to

---

9 Rice is a heavy consumer of water. It takes an average of 650 gallons (2,500 liters) of water to produce one pound of rice. Over the last hundred years, Asia has been facing a dramatically increasing demand to feed a rapidly growing population. Future rice production must focus on far more efficient irrigation systems and reduced water consumption by the rice plant. (Swanson, 2001)

10 Gleick found that organic pollutants and global emissions increased in study conducted from 1980-1998. The United States recorded modest water quality improvements by reducing pollutant emissions from 2.74 million to 2.58 million per day (Gleick, 2000)
greater efficiency by farmers and industrial users. However, these gains could be lost by increasing water demand of American cities and suburbs, especially in the arid west.

There are many serious socio-political issues that permeate the world. Civil war, famine, AIDS, and malaria are prominent social issues that impact life quality and longevity. Still, these issues pale in comparison to global freshwater scarcity problems. No society can survive without adequate freshwater supplies. Modern society must refocus and sustain existing water supplies.\footnote{Water sustainability means the ability of human society to endure and flourish into the indefinite future without undermining the integrity of the hydrological cycle or the ecological systems that depend on it (Gleick, 2000).} However, achieving sustainability is a difficult process. Goodland and Daly (1996) believe sustainability must incorporate both human and ecological needs. They divide the legacy left to future generations into natural, manufactured, and human or social capital. Natural capital is defined as our natural environment. Manufactured capital is the human created infrastructure. Finally human or social capital reflects the people, its institutions, information, knowledge, and culture. These categories are not interchangeable and sustainability must be applied to each category (Cousins, 2003). This means that people need to develop a comprehensive (economic, political, social, and scientific) understanding of water sources. Only then will society be able to adapt effective water management policies to resolve future disputes. Even then policies must be pragmatic for effective implementation to occur (Cosens, 2003). This strategy could entail a combination of philosophical approaches. According to western thought, God made an imperfect world for man to make perfect. For the eastern mind, God...
made a perfect world for man to learn how to live in harmony with it. In their own ways, both philosophies are correct in addressing regional water scarcity and in developing effective measures for mitigating the crisis.

**International Recognition**

Freshwater scarcity has been recognized as a major problem at the international level. The Dublin Principles (1992) declared that freshwater is an input to which every human has the right to “sustain life and meet basic sanitation needs” and elucidated that each person is entitled to 50 liters of water per day.\(^\text{12}\) (Asian Development Bank, 2003). The 1992 Rio Earth Summit reaffirmed this point by expanding human rights to include environmental water needs. In 1997, the United Nations declared that water planning must address both human needs and ecosystem preservation. (Asian Development Bank, 2003). The Johannesburg Earth Summit (2002) agreed to reduce the number of people without safe access to clean water and basic sanitation by half by 2015. The United Nations declared 2003 to be the year of freshwater (Economist 2003).

However, there is a significant discrepancy between declaring goals and achieving them. First, the Dublin Principles delineate that each person is entitled access to safe drinking water, but more than a decade later, nearly 20% of the global population remains at risk. Second, the United Nations’ 2015 goal to reduce freshwater scarcity by 50% is formidable. This means the United Nations

---

\(^{12}\) There are four Dublin Principles 1) Freshwater is a finite and vulnerable resource, essential to sustain life, development, and the environment 2) Water development and management should be based on a participatory approach, involving users, planners, and policy-makers at all levels. 3) Women play a central part in the provision, management, and safeguarding of water 4) Water has an economic value in all its competing uses and should be recognized as an economic good
or other institutions will have to provide viable freshwater resources for 630 million people in ten years. The sanitation challenge is even more daunting: Over the next decade, 1.4 billion people will require this service. The year 2025 is the target date for 100% global access to equitable water supplies. (Wertheim, 2004).

CHALLENGES FOR MITIGATING WATER SCARCITY

Freshwater scarcity is complex because it affects societies in various ways. Its impact is felt locally, nationally, and internationally. Regional water shortages have raised the specter of armed conflict, forced relatively affluent societies to finance huge water projects and left some of the world’s most impoverished nations in deepening crisis (Jehl, 2002). While each case requires different methods to alleviate freshwater scarcity, it is illusory to believe that freshwater scarcity can be reduced without a global commitment. Actions must take into account a wide range of social, ecological, and economic factors and needs. Governments need to enhance ongoing dialogues, in order to achieve a global consensus (Dowedswell, 1998).

However, current water policies are developed in a fragmented fashion. Distrust between competing institutions prevents effective collective action. Interagency cooperation fails because each power is too decentralized. In some countries, irrigation is considered by ministries of irrigation, water supply by municipalities, hydroelectric power by ministries of energy, navigation by ministries of transport, environment by ministries of environment, and health by ministries of health. Lack of coordination exhibited by intense rivalries has
resulted in suboptimal water policies.\textsuperscript{13} Without institutional rationalization and strengthening, water management simply will not become effective. (Dowedswell 1998). Equitable water management is also complicated because each river basin has its own peculiar ecosystem. Attention must be given to each river basin’s hydrology in the terms of inflows and outflows.

Regardless of perspective, governments, international aid agencies, water agencies, non-governmental organizations, and local communities must work together to provide all humans with a basic water requirement and to guarantee water as a human right (Gleick 2000).

**Alternative Policy Solutions**

Privatization has been suggested as a method to reduce freshwater scarcity. This perspective is based on the Washington Consensus, which is an economic model that links effective resource allocation to liberal market economics. However, this is a deceptive practice. First, it means that a few transnational corporations, backed by the World Bank and International Monetary Fund (institutions that are supposed to provide economic well-being) have taken over public water services. The results are uneven because many third world societies do not have sufficient resources to pay for water price increases. (Barlow and Clark, 2002). In turn, this weakens local economies, further destabilizing water scarce regions.

\textsuperscript{13} Two emerging cases are with China and Argentina. The Chinese are developing the world’s biggest dam to divert water from the Yangtze River in the south to water scarce cities in the north. Soil erosion and water contamination could create serious environmental and health problems. In Argentina, private companies sought to overhaul and manage some of its water systems, only to encounter cost and technical problems. (Jehl, 2002)
Recent events in Cochabamba, Bolivia underscore these risks. Following the privatization of Cochabamba’s water system, water rates skyrocketed. This resulted in water bills that equaled to a more than a quarter resident’s income. While Cochabamba is extreme, it is not an isolated case. Activists in Colombia and South Africa likewise have opposed the privatization of water and other municipal services. Meanwhile, IMF loan agreements with at least half a dozen countries last year called for some degree of water system privatization. The number of urban dwellers is projected to double to 5 billion by 2025. Unless governments and lenders strengthen municipal water agencies towards equity as well as efficiency more violence like that in Cuchabamba may be forthcoming.\footnote{In April 2000, the La Paz government sent soldiers into Cochabamba, where approximately 30,000 protesters amassed in the central plaza. Several days of violence ensued, leaving one person dead and more than a hundred injured. The conflict abated only when the water system returned to public control.}

One cannot predict how water scarcity will impact future societies, but the IWMI and UN agency reports must be taken seriously. Water is a vital resource for sustaining human life, growing crops, and serving industrial needs. However, freshwater demand is rising faster than the supply and clearly delineated conservation practices are needed to reduce the current one billion people who daily lack sufficient water supplies.

One area where this has occurred is within the framework of interstate water accords. The international environmental agreements (IEA’s) have proven remarkably successful in the twentieth century. Of the 152 water disputes documented in the twentieth century, 145 or 95.3\% were resolved (Wolf, 2002). However, it is perplexing that even with such success, freshwater scarcity remains a growing global concern.
Therefore, this study provides a comprehensive assessment of interstate water accords as a means to mitigate regional freshwater scarcity. This study contributes to the development of a new intergenerational water ethic\(^\text{15}\) where the needs of the present are met “without compromising the ability of future generations to meet their needs” (Graffy, 1998). Specifically, this means a fair share of water for both developing and developed riparian nations. It also includes a fair share of water for the poor most notably women and children. They spend long hours collecting water and suffer the most from water quality and water related diseases. Finally, there must be a fair share of water among competing users which includes aquatic species, habitats, and ecosystems.

Heraclitus, the ancient Greek philosopher stated one never steps in the same river twice. Heraclitus’ observation indicates the ever changing flow of water and life. The world’s freshwater systems are in a constant state of natural flux. Undoubtedly, these changes have influenced the direction of civilization. However, human activities and population growth have accelerated and altered natural hydrological processes. Today, freshwater quantity and quality are serious global issues. Arid and semi-arid regions face increasing stress from water scarcity and much of the world faces growing pollution problems resulting from environmental change and inefficient management.

The potential for freshwater conflict is enormous, given its importance for basic survival, industry, energy production, and other fundamental societal components. Many freshwater basins (approximately 300) lie on or across

\(^{15}\) Intergenerational equity is the view that members of the present generation hold the earth in trust for future generations. Intergenerational rights were recognized in both the Stockholm and Rio Declarations and are integral to the concept of sustainable development (Graffy, 1998)
international borders. Several conflicts linked to freshwater scarcity are apparent already at both the local and international levels. In many cases, little preventive action has been taken and even less definitive planning has been implemented systematically to analyze and propose integrated management solutions (Green Cross, 1997). Therefore, it is imperative to evaluate measures that have been successful and analyze them in greater detail. This starts with evaluating interstate freshwater accords.

**WATER BASINS**

River basins\(^\text{16}\) have existed throughout humanity. They have influenced human settlement and interaction long before the establishment of interstate accords. River location and flow determined how societies developed. They provided transportation and communication which contributed to the formation of political units (Driscol, 1998). River basins should not be viewed as a mere function of society. In some instances, the physical unity of the basin has often proved stronger than the various political divisions. (Driscol, 1998). Yet the river basin has unified communities and stimulated trade by creating large political and economic units. Agriculture, navigation, and human settlement location are all directly influenced by river basins.

Commercial unity and non-navigational has enabled the water basin to evolve into a complex and multi-purposed entity. By the 20\(^\text{th}\) century, water appropriators emphasized a systems wide integration approach of river water.

\(^{16}\) A river basin is an area which contributes hydrologically (including both surface and groundwater) to a first order stream, which in turn, is defined by its outlet to the ocean or to a terminal (closed) lake or inland sea. River basin is synonymous with watershed (U.S.) and catchment (UK). A basin is international if any perennial tributary crosses the political boundaries of two or more nations (Wolf and Natharius et al, 1999)
Nations, in turn, valued water basins even more which created greater dependency on them in terms of social organization and administration (Driscol, 1998).

**Interstate Water Accords**

Currently, there are 263 rivers that either cross or demarcate international political boundaries. Geographically, Europe has the largest number of international basins (69), followed by Africa (59), Asia (57), North America (40), and South America (38) (Wolf, Giordano, 2004). The absolute number of international basins, as well as the nations through which they traverse, change over time due to political changes. For example, in the 1990’s, the break up of the Soviet Union and Yugoslavia led to the internationalization of several basins as well as to changes in the political composition of existing international basins (i.e., Danube and Aral Sea Basins). In contrast, the unification of Germany and Yemen in 1990 resulted in the “nationalization” of the Weser and Tiban water basins (Wolf, Giordano, 2003).

The geographical structure of the world’s international waterways is also significant. The world’s 263 international river basins accounts for nearly one-half of the earth’s land surface, generate 60% of global freshwater flow, and are home to approximately 40% of the world’s population. It is the political composition of these shared water systems that highlights their vulnerabilities. A total of 145 countries contribute territory to international basins. Thirty-Three nations, including sizable countries such as Bolivia, Chad, the Democratic Republic of the Congo, Niger, and Zambia have more than 95% of their territory
within the hydrologic boundaries of one or more of the international basins. Even more significant is the number of countries that share individual basins. The Danube has seventeen riparian states. The Congo, Niger, Nile, Rhine, and Zambezi are shared by more than nine countries while the Amazon, Aral Sea, Gagnes-Brahmaputra-Meghna, Jordan, Kura-Araks, La Plata, Lake Chad, Mekong, Neman, Tarim, Tigris-Euphrates, Shatt al Arab, Vistula, and Volga basin each contain territory of at least five sovereign nations (Wolf et al., 1999).

The complex physical, political, and human interactions within international river basins makes the management of these shared water systems especially difficult. Issues of increasing water scarcity, quantity, rapid population growth, unilateral water development, and uneven levels of economic development are potentially disruptive factors in co-riparian water relations (Wolf, 2004).

Yet, despite these formidable obstacles, co-riparians have demonstrated a remarkable ability to cooperate over their shared water supplies. In the largest quantitative study of water conflict and cooperation, Oregon State University researchers found that cooperative interactions between riparian states over the past fifty years have outnumbered conflictive interactions by more than two to one. Since 1948, the historical record documents only 37 incidents of acute conflict (i.e. those involving violence) over water (30 of these events were between Israel and of its neighbors, the last of which occurred in 1970. At the same time, approximately 295 water agreements were negotiated and signed. (Wolf, 2004).
At the sub-acute level, which defines most water interactions, cooperative relations dominate the history of international water relations. This does not imply that water cannot act as a source of discord. Water was the last and most contentious issue resolved in negotiations over the 1994 Treaty of Peace between Israel and Jordan and in the Israeli-Palestinian context discussions concerning the resource were relegated to the “final status” negotiations along with other controversial issues such as the status of Jerusalem, and the right of return for Palestinian refugees (Wolf, Giordano, 2003).

However, water cooperation is far more prevalent especially where strong institutions are present. The establishment of the Indus Water Commission in 1960 between India and Pakistan fostered remarkably resilient bilateral cooperation over water, notwithstanding two wars and continued political turmoil between the two states. The Mekong River Committee, established in 1957 among the four lower riparian states of Thailand, Cambodia, Vietnam, and Laos also weathered extreme political conditions and viable water cooperation even during the Vietnam War (Wolf, 2004).

Thus, the creation and maintenance of effective international water institutions offer hope that current freshwater scarcity problems can be managed. In fact, the presence or absence of institutions has proven to be one of the most important factors influencing co-riparian water relations, exceeding traditional variables such as climate, water availability, population density, political orientation, and levels of economic development (Wolf, 2004). Further, the historical record indicates an increased likelihood of basin conflict where
institutions are unable to accommodate to changing political and hydrologic needs. Yet where international water institutions exist, relations among riparian states are generally more cooperative than in basins without treaties or other cooperative management mechanisms (Wolf, Yoffe, and Giordano, 2003).

**Regional Accords**

Regional organizational initiatives have served further to encourage co-riparian cooperation. Through the creation of region-specific guidelines, multinational bodies such as the Organization for Economic Cooperation and Development (OECD), the European Union, and the Southern African Development Community (SADC) have formulated agreements and protocols supporting collaborative water resource initiatives. In the 1970s', the OECD Council recommended the management and protection of transboundary resources relevant to international rivers. European governments have addressed regional water issues through such agreements as the Convention on Environmental Impact Assessment in a Transboundary Context (1991) and the Convention on the Protection and Use of Transboundary Water Courses and International Lakes (1992). In 2000, the SADC member states established the Protocol on Shared Watercourses in the Southern African Development Community (Wolf, Giordano, 2003)

**BASIN TREATIES**

The highest levels of cooperative water management are located within water basins with corresponding treaties extending back to 2500 B.C. The Food and Agricultural Organization of the United Nations has documented more than
3600 international water treaties from AD 805 to 1984. Although a vast majority of these agreements concern navigational issues, a growing number address water scarcity.

There are three distinguishing characteristics in developing interstate water accords. They are shared values, creativity, and adaptability. First, co-riparians share several hydrologic linkages. Agriculture, industry, recreation, hydropower, flood control, environmental integrity and human health are connected. While individual sectors and countries have exploited their riparian position or dominance, basin states have demonstrated a remarkable ability to cooperate upon their shared interests. For example, the 1986 Lesotho Highlands Water Project Agreement, South Africa supports the financing of hydroelectric/water diversion facility and in turn, receives the rights to drinking water for its industrial use in Guateng province.

Second, basin states have illustrated a great deal of creativity in formulating treaty provisions that meet the unique hydrological, political, and cultural settings of their individual basins. As part of the 1994 Treaty of Peace, Jordan stores water in an Israeli lake while Israel leases Jordanian land and wells. India, under a 1966 agreement with Nepal, plants trees upstream in Nepal to protect its own downstream water supplies (Wolf, 1999).

Third, effective accords require adaptability. Precedents exist for incorporating provisions into basin accords to accommodate changing needs and values. The 1987 Agreements on the Action Plan for the Environmentally Sound Management of the Common Zambezi River System allows for additional riparian
states to sign the treaty. Other flexible treaties include the 1996 Treaty between India and Bangladesh on Sharing of the Ganga/Ganges Waters at Farakka, the 1986 Lesotho Highlands Water Project Agreement, and the 1992 Komati River Basin Treaty between South Africa and Swaziland (Wolf, Giordano 2003).

The Freshwater Data Base offers the most comprehensive source for interpreting interstate freshwater accords.17 One hundred forty-five water related treaties were signed in the twentieth century. Of these, 124 (86%) are bilateral and conversely 21 are multilateral. It is unclear why an overwhelming number of treaties are bilateral. One possibility is that only two states share a majority of international watersheds. Yet, according to negotiation theory, the number of disputing parties reduces the chance for conflict resolution. This is problematic because in basins with more than two riparians, preference for bilateral agreements can preclude the comprehensive regional management long advocated by water resource managers (Wolf, 2000).

Most treaties focus on hydropower and water supplies. 57 (39%) discuss hydroelectric generation and fifty three (37%) distribute water for consumption. Nine (6%) mention industrial uses, six (4%) navigations, and six (4%) discuss pollution. Thirteen of the 145 (9%) focus on flood control.

However, few treaties allocate water. Clearly defined allocations account for 54 (37%) of the agreements. Of that number, fifteen (28%) specify equal proportions, and thirty nine (72%) provide a specific means of allocation. All but three multilateral agreements lack definite allotments, although a few establish advisory and governing bodies among states (Wolf, 2000). Fifty seven of the

---

17 Created and maintained by Aaron Wolf and Meredith Giordano at Oregon State University
treaties (39%) focus on hydropower. Power generating facilities bring development, and hydropower provides a cheap source of electricity to spur developing economies.

Groundwater is only addressed in three interstate accords. The most recent is the 1995 Israeli-Palestinian agreements. However, there are serious limitations, because this accord does not provide a quantitative measure for water sharing. The 1989 Bellagio Draft treaty between the United States and Mexico provides legal framework for groundwater negotiations. The Draft requires joint management of shared aquifers and describes principles based on mutual respect, good neighborliness and reciprocity. While this framework is useful for future groundwater diplomacy, data collection is expensive and hence, difficult to obtain (Wolf, 2000).

Water and non-water linkages are often negotiated together. For example, if pollution causes trouble in a downstream country, an upstream riparian may compensate a downstream neighbor by paying for a treatment plant in lieu of reduced inputs or reduced withdrawals. Here, water quality is of greater importance than water quantity. If successful, this method has the capacity to increase water quantity benefiting all nations at risk. Increasing the scope of negotiations is reflected clearly in interstate water accords. Financial compensation is most evident in interstate accords. 44 cases (30%) addressed capital exchange, territorial or political consideration were much smaller (6 land transfer cases (4%) and two cases of political concession (1%). There are an additional 10 cases (7%) that address non-water linkages. While many prominent
accords exhibit creativity and adaptability, the reality is that over half of the existing accords are quite limited. 83 cases (57%) of total interstate water accords do not have any non-water linkages. This means that a simple treaty is more vulnerable to collective action breakdown because a nation could default on its commitment without concern of reprisal.

Treaties encompass support from technical and basin commissions as well as from government officials. Fifty two (36%) of the treaties provide for an advisory council or conflict addressing body within the parties governments. 14 treaties (10%) refer disputes to a third party or the United Nations. Thirty two treaties (22%) make no provisions for dispute resolution, and 47 treaties (32%) of the texts are either incomplete or uncertain as to dispute resolution mechanisms (Wolf, 2000).

Lack of unified guidelines (as indicated by the available data) suggests that interstate water accords (which govern the world’s international watersheds and predominantly are based on international law) are in their respective infancies. More than half of these treaties do not include monitoring provisions, two thirds do not delineate specific water allocation mechanisms, and four fifths have no enforcement mechanism (Wolf, 2000). Therefore, interstate water accords offer cautious hope. Empirical evidence states that nations can overcome strident political and social obstacles and cooperate over water resources. Yet, it is uncertain how effective these accords will be in addressing current and future freshwater scarcity problems.
Looking forward, there are four key components which can be used for developing future interstate water accords. First, adaptable management structures incorporate a certain level of flexibility, allowing for public input, changing basin priorities, and providing for new information and monitoring technologies. The adaptability of management structures must also extend to non-signatory riparian nations by incorporating provisions addressing their needs, rights, and potential accession.

Second, there should be clear and flexible criteria for allocations and quality. Allocations, which are at the heart of most water disputes, are a function of water quantity and quality. Therefore, effective institutions must identify clear allocation schedules and water quality standards that simultaneously provide for extreme hydrological events, new understanding of basin dynamics, and changing societal values. Additionally, riparian states should consider prioritizing uses throughout the basin.

Third, there needs to be an equitable distribution of benefits. This subtle concept differs from equitable use or allocation. It involves the distribution of benefits from water use from hydro-power, agriculture, economic development, or preservation of aquatic ecosystems rather than simply the benefit of water itself. These benefits allow for greater positive sum-agreements, whereas dividing the water itself allows only for winners and losers.

Fourth, many basins must continue to experience disputes even after a treaty is ratified or signed. Therefore, incorporating clear mechanisms for
resolving conflicts is an inelastic prerequisite for long term effective management. Negotiation theory contains suggestions how this might accomplished.

Freshwater scarcity is a serious geo-political phenomenon which affects all societies and cultures. While natural ecological factors contribute to scarcity conditions, current data reveal it is more human induced. Freshwater scarcity cannot be shared evenly by all disputing nations because many water poor countries do not have the institutional capacity to effect such positive change. Therefore, comprehensive international cooperation is essential for mitigating freshwater scarcity problems (Danilav-Danilan, 2003).

There is much hope for the future success of interstate water accords. They are resilient even as other strident socio-political considerations remain. This axiom will be tested with increasing levels of fresh water scarcity. Freshwater scarcity impacts water quantity, quality, and pollution levels. If unmitigated, water reduction will affect the internal stability several nations as well as serve as a catalyst to increase tensions among various social and ethnic groups. If the current projected models are accurate, water will be the major political issue for many nations as the twenty first century progresses. Interstate water accords offer a measure of hope to mitigate this crisis, but greater study is required especially in understanding how riparian states engage in early coordination strategies to reduce water conflict.
PSYCHOANALYSIS AND CONFLICT BETWEEN THE MUTUAL NURTURANCE
DRIVE AND SOCIAL SURVIVAL

Abstract

Psychoanalysis focuses mainly on relieving "neurotic" suffering generated by old unconscious conflict which, once ameliorated, often leaves patients with psychological suffering from other sources. For Freud, this is the ordinary misery of living, not susceptible to psychoanalysis. If he were writing today, I suspect he would agree that more recent data indicate the origin of much of this residual suffering is what I call societal psychotoxin, generated by current unconscious conflict between the universal human drive toward mutual nurturance and the imperatives for survival and "success" in modern society. This increment of psychological suffering, via changed therapeutic emphasis, can be brought within range of psychoanalysis.

Societal psychotoxin imposes pervasive underlying tension and distress separate from that derived from neuroses. Its two causative conflicts are preconscious and so, with gradual social evolution, are emerging spontaneously into general consciousness. In contrast, the existence and effects of the psychosocial toxin they produce remain less accessible to awareness. By directing analysis away from the neurosis and onto societal psychotoxin, psychological suffering can further be reduced. This work ordinarily occurs during the termination phase. In some patients, however, the process is best begun earlier, as it may be prerequisite for analysis of the neurosis. (Clinical illustrations in full paper.)
Today I want to discuss with you a source of psychological pain of which I believe many of us have intimations, but which hitherto has not been confronted because of unconscious dread of threatening our security in society. The cause of this suffering is conceived as a continuous conflict in our daily lives between a universal human drive toward mutual nurturance and the imperatives for social survival that tend to stifle it. This conflict generates what I call a "societal psychotoxin" that keeps us all in psychological pain. Because the scope of my topic is so broad, I will have to speak more categorically than usual. And because my awareness of all this is so intimately connected with my own development as a person, a scientist, a psychiatrist/psychoanalyst, to illuminate it I will have to speak more personally than ever before.

When I was six in 1930, I was heartbroken about unwanted cats shivering in the freezing streets of Manhattan, some with kittens whose ribs you could count. My friend Allan also worried about them. We got permission from our folks to go to the candy store. But we spent our allowance instead on hamburger to leave on icy curbs for starving kittens. And, oddly, we did this secretly, intuiting somehow that our parents would disapprove.

Then I noticed the skinny people on breadlines. I understood that the cats and the people were starved. And, as Mom or Dad tucked me in at night, I realized that little balls of hamburger or loaves of stale bread wouldn’t change much.
I asked my parents about the hungry cats and people. They told me that those cats had no homes or people to take care of them. And that the people stood in line to get free bread because they had no money to buy food. I asked why the cats had no homes and the people had no money. I was puzzled, but somehow not surprised, by the uneasy glances they exchanged.

Nevertheless, the next day I risked another why, "Dad, why do the people on line for bread have no money?"

My father tugged at his collar and mumbled, "Because the people don't have jobs. Let's take your tricycle out on the sidewalk."

I swallowed the next question, "Why don't they have jobs?" and put on my coat and mittens.

Allan and I fantasized about affection we'd get from these cats in return for care. But we both knew better than to ask to adopt them, his parents responses being similar to those of mine. We were distressed by our inability to relieve the deprivation of these fellow beings, but were even more upset by our inability to get the customary support of our parents to help us understand such deprivation. The usual unconscious conflicts of childhood must have heightened our concern, but my sense is that the actual source of our pain was different and separate from that of "neurosis." I believe it was the conflict identified above that our parents and we were experiencing between our drive toward mutual nurturance and the dollars-and-cents imperatives of survival in our modern society that compel us to repress awareness of it. The questions that Allan and I posed were basic ethical ones about how we treat animals and each other that could "rock the boat" on social arrangements everyone experienced as not only crucial, but inescapable and immutable. This conflict, and the "societal psychotoxin" it generates, causes anxiety, guilt, and an abiding sense that "something is wrong" with our lives.
My hope is to demonstrate that this is not just a cute "kid anecdote," but an instance of a
universal human conflict worthy of analytic scrutiny.

Psychoanalysis, even with the many modifications and additions of recent
decades, has tended to focus on relieving the kind of psychological and emotional pain
that is rooted in old unconscious conflicts. Once these sources of distress have been
ameliorated, patients are often left with residual suffering from which they and we wish,
often vainly, we could also provide relief.

For Freud, and some of us still, this residue is entirely the ordinary misery of living, and
therefore not susceptible to psychoanalysis. If he were writing today, however, I suspect Freud
would agree that newer understanding of evolution (both biological and cultural) substantiates
that much of this residual misery is not ordinary in that it is not universal in all societies, and in
fact has been prominent during only the last five to six thousand years. I surmise further that he
would include now in his panoply of drives the hitherto unrecognized universal human drive
toward mutual nurturance. I suspect that he would trace much of seemingly irreducible residual
suffering to the conflict I've described. And that he would concur that, with changed therapeutic
emphasis, this increment of psychological suffering, can be brought within range of
psychoanalysis.

At age six, Allan and I sensed that our concerns were not fit to mention in even
generally humane adult company. Many years later, in analysis, it became clear to me
that unemployment, poverty, and war -- and their sad causes and consequences -- had
been more taboo for our progressive parents to discuss with their children than all the
details of where babies came from. Despite current much greater general conversance
with economics, the stock market, the balance of trade and so on, this seems to me even
more true today.
This avoidance was specially odd in my family because soon afterward I was invited to listen as my Dad and Yip Harburg composed their song "Brother, Can You Spare a Dime?" which wonders deeply about the same thing. It begins:

“They used to tell me I was building a dream, and so I followed the mob. When there was earth to plow or guns to bear, I was always there, Right there on the job.

They used to tell me I was building a dream, with peace and glory ahead.

Why should I be standing in line, just waiting for bread?”

That song taught me, among many other things, that adults can sing things to children they can’t say. As I also learned later through analysis, such avoidances reflect anxiety that confronting questions like Allan’s and mine might rouse impulses to challenge fundamental mechanisms of social survival. By 1965, having worked through Freud’s instinctual theories and the contributions of many others, I encountered then-current literature touting what anthropologist Ashley Montagu called "the new litany of the innate depravity of man." These included writings by Raymond Dart, Konrad Lorenz, Robert Ardrey, Desmond Morris, Anthony Storr, and the early socio-biologists, all of whom, variously and erroneously -- and troublingly to me -- explained that we are compelled to pursue cruel and hateful ways by biological instincts inherited from apelike ancestors. By lucky chance, I met Ashley Montagu socially, sought his wisdom, and wound up as his mentee until his death in 1999. Much of what I have to tell you about human characteristics is based on what he taught me.

There are three main roots of evidence substantiating the universal drive toward mutual nurturance, its associated conflict, and societal psychotoxin: Ordinary experience, the development of babies, and the development of society.
Ordinary experience trumpets the predominance of mutual nurturance in our everyday exchanges, such as stopping at red lights so the cross traffic will shortly do the same for us. Then there are unusual but ubiquitous emergency rescues of one another, in which the return to the giver may be literally nothing but self-satisfaction.

A 28 year-old philosophy grad student walking in Los Angeles suddenly saw an elderly lady about to leap from a third-floor window from which flames broiled. He held out his arms and caught her, saving her life -- at the cost of a fractured collarbone, pelvis, and femur. When asked why he did it, he said "I dunno -- Yesterday my Dad told me I’m a spoiled brat who never thinks of anyone but himself." Now, let's ask ourselves what this grad student likely would have been told had he discussed his rescue action with others in advance: "Don't be a sucker, Take care of number one, Don't be a bleeding heart, What'd they ever do for you? You the Red Cross?" thereby diminishing likelihood of his nurturant behavior. Thus do our conventional mores besmirch the mutual nurturance drive and fortify repression of both it and of societal psychotoxin.

The developing baby: After nine months of gestation, the baby is still so immature that it cannot possibly get along outside the womb without a cascade of baby care. Then comes the sudden violent earthquake of labor, which continues for many hours. Every contraction propels the baby into and through a painfully narrow passage that constricts and bruises it, until finally the new person is born -- into what? Montagu says that what the baby desperately needs and expects is "a womb with a view." But what does the baby get? Too often, terrifying bright light, noise, cold, suspension by the ankles, slaps on the fanny. All this is coupled with sudden necessity to learn to breathe, regulate body temperature, convert her/his mouth into a suction pump in order to imbibe nourishment -- and maybe isolation from mother in a truly "sterile" bassinet. In contrast, baby and mother need the kind of gentle, quiet, dimly lit conditions provided in many "primitive" societies, such as those which deliver the baby into a pool of warm
water, and then keep mother and the baby together, to continue their life-sustaining closeness in mutual nurturance.

Why is the nurturance "mutual?" The newborn baby's urgent need for lifesaving care, and the mother's ability to provide it, are instantly evident. But is the obverse also true?

Yes. One illustration is the little-understood fact that both mother and child are equipped to confer the most critically needed life-saving nurturance upon each other. If baby is simply placed face down on the mother's upper abdomen as she joyously studies her darling's new face, its owner will crawl to one of her nipples, root about to grasp it with her/his mouth, and quickly learn to suckle colostrum that contains vital nutrients. But by this same act, the baby will also simultaneously provide exactly the nurturance most urgently needed by mother. The suckling stimulates reflexes and hormones in the mother that eject the placenta and contract her uterus to stop bleeding. If this beautiful exchange of lifesaving mutual nurturance, which initiates bonding immediately, becomes the predominant model for most child-parent interactions, the character of the emerging person is, in any society, more likely to be loving, sociable, peaceable and, by identification mutually nurturing, than if it does not. Every grown person is alive only because someone has provided a tour de force of nurturant baby care. Because in infancy our life rests in that person's hands, we have no choice but to win her/his love and to identify with the life-preserving behavior, which we then hunger to repeat throughout life both as receiver and as giver -- in relation to people, animals, even pet rocks. It was those life-assuring experiences we enjoyed in infancy that compelled Allan and me six years later to be so emotionally stirred by the predicament of starving cats and people. And that have compelled me to search all these years to understand the drive toward mutual nurturance, its social saboteurs, and how to treat the psychological pain of its vicissitudes.
The development of societies. For three million years our ancestors survived in small nomadic bands of 25-30 gatherer-hunters, most of whose interactions were consonant with the drive toward mutual nurturance. They lived in relative material scarcity, often sharing scanty resources with neighbors because they were their only social security. Sharing also helped maintain material equality and resultant harmony within the small group. This behavioral trait was intensified by natural selection across 50,000 generations.

Then, merely 12,000 years ago, clever people invented the first technology of civilization: agriculture/herding, which for the first time created surpluses and, in turn, fostered settlement in fixed villages of 400-500. Now people could generate, preserve, and store supplies for later use, becoming thereby better provisioned than ever they could be through the meager help of a friend. Without full recognition of what was happening, more and more people began to negate the mutual nurturance drive and let hungry neighbors starve. That way, you could not only keep leftovers for yourself, but convert that former friend into the most valuable commodity of all: cheap labor. You could grow rich and powerful, while she/he became poor and weak, initiating concentration of wealth, emergence of classes, nations, and states -- and worse: war.

In some places, the mutual nurturance drive continued to govern some human relations, for example in the communal harvestings and barn raisings of our colonial forebears. Nevertheless, the counter-nurturant trend has escalated. And despite the mutual nurturance drive, and constant religious injunctions and secular philanthropy in support of it, the changed strategies of civilized life have created our present "dog-eat-dog" world, in which we increasingly survive not on good will but on goods, not by taking care of each other but by taking advantage of each other, not by ameliorating poverty but by exploiting it. This "nurturance conflict," is the first of two social conflicts that breed societal psychotoxin.

The other is the "low social synergy conflict" described by anthropologist Ruth Benedict in small yam growing societies. She distinguished "secure" nonaggressive and
friendly societies from "insecure" aggressive and hostile societies on the basis of their high and low "social synergy." In a secure society persons are relaxed because (like the mother-baby duo described above) they can satisfy individual needs and those of the community simultaneously by the same act. By contrast, in an insecure society persons are driven into conflict because social arrangements demand opposed actions.

For example, in a "secure" yam-growing society yams are used only for food, so that both the community and the person who grows many yams benefit simultaneously by the same act. In an "insecure" yam-growing society, yams are used also as currency to exchange with a neighboring tribe for axeheads. Therefore, persons who raise many yams are conflicted, because food-producing acts that benefit the individual and community also inflate the currency, raise the price of axeheads, and ultimately harm everyone. Moreover, people become, unequal in wealth, rivalrous, and motivated not only to outdo, but to undo, neighbors. The result is increased anxiety, animosity, and murder/suicide, findings with obvious relevance to inquiries concerning our social pathology and its remedy. My own studies show that Dr. Benedict's distinction between secure and insecure societies applies as strongly to the full range of societies over the last 3,000 years.

Clinical Vignettes

Despite mounting confidence in the validity of these concepts generally, I was hesitant to present their clinical application -- until another special experience. April was the smart seven-year-old daughter of a patient who told her mother “I want to see the mind doctor too -- alone.” With great distress, she asked me “What’s wrong with the world, and how can we fix it?” Alice’s question (and her explanation, which there isn’t time to detail) revealed that a half-century after I had queried my parents about starving cats and people the same kind of psychological pain was tormenting a child still. Her therapist confirmed the pivotal role of societal psychotoxin..
A 47 year-old male executive whose anxiety and compulsive character traits waned under analysis, reported new anxiety and compulsivity each day before leaving for work, where it was his distressing responsibility to issue downsizing pink slips. Two months of analytic work was successful in bringing into full awareness the sources and consequences for him of the mutual nurturance conflicts. He found another job where there was no need for mass layoffs.

A 34 year-old woman who worked for a non-profit recovered during analysis from most of her depressive and phobic symptoms, but was still much troubled by her distant emotional relationship with her twelve year-old son. She focused for the first time on the boy’s greatest interest, becoming a multi-millionaire through the stock market in whatever way would work the fastest. As she developed understanding of the mutual nurturance conflicts, her anxiety was relieved and replaced by a conscious dislike of her son’s emerging values, which by termination of treatment she and the boy at least were discussing.

A male virtuoso musician reluctantly came to terms with retirement because in his eighties he could no longer control pitch on his string instrument. With the help of 6 months of Prozac and a year of psychoanalysis, the depression lifted. He then looked for substitute activities, beginning with a first paid job conducting an orchestra. To his dismay, he lacked the talent for this new role. The depression recurred and he began to ruminate about suicide. One day he reported that his housekeeper, after a year of employment, had requested a raise from $9.00 to $10.00 per hour. At first he was outraged. Then he read in the paper that housekeepers in the big hotels in his area earned $12.00 per hour. He calculated what this would come to on an annual basis and decided that even that figure wasn’t enough for a woman alone to sustain herself and raise two children. After much working through of pertinent memories and a nightmare, he raised her pay to $13.00 per hour. The depression lifted without Prozac. At
termination, he was in good spirits and had decided to resume teaching music, this time to seriously underprivileged children, and gratis.

Discussion:

Patients come to us wanting relief of all their psychological suffering. Much of that relief derives from analysis of neurotic conflict. Some of the remainder can be relieved, I have found, by gently redirecting analysis onto conflicts between the mutual nurturance drive and societal psychotoxin (using other terms, of course). This work ordinarily occurs during the termination phase. In some patients, however, the process is best begun earlier, as it may be prerequisite for analysis of the neurosis.

In exploring both clinical and societal applications of these concepts, we must remember that the societal psychotoxin and its associated conflicts are pathogenic products of only the most recent 0.4 percent of human evolution, and that therefore they are much less deeply ingrained than the mutual nurturance drive itself. Because conflicts between them are clashes between an intra-psychic drive and the psychic representations of external social arrangements, they are much closer to consciousness than the more fully intra-psychic conflicts characteristic of the neuroses. Accordingly, with gradual social evolution, the conflicts over the mutual nurturance drive are slowly emerging spontaneously into general consciousness, with some resultant spontaneous amelioration of anxiety. Nevertheless, for the most part they remain far out of awareness because confronting them and having to take action contrary to them arouses such intense self-preservation anxiety. The lesson to be drawn is to proceed with psychoanalytic caution in both clinical and social venues -- but to proceed.

Guillain-Barré Syndrome (GBS) is an acute inflammatory disorder of the peripheral nervous system (PNS). Only one or two cases per 100,000 per annum are detected even though GBS is the most common cause of paralysis from a peripheral nerve disorder in the Western world (Steinberg, 2000). It is indiscriminate with respect to gender, race, and age, though more males than females are affected and incidence increases with age. In its mildest form, GBS causes muscle weakness and abnormal sensations, such as pricking, tingling, and numbness. It usually begins in the lower extremities, moving next to the upper extremities, and then works its way up the body. If the attack is mild, hospitalisation may not be required, but with a severe attack hospitalisation is absolutely essential. Severe paralysis of almost the entire body may occur in a frighteningly short space of time. Effects on the autonomic nervous system can bring about serious drops in heart rate and blood pressure and the patient may be in great pain. Death occurs in 2 to 10% of patients, such an outcome being more likely in the elderly and infirm. GBS is predominantly a motor neuropathy affecting either the myelin sheathing that wraps around most nerves or the nerves themselves. The cause of the disorder is unknown though in the majority of cases it follows on from some traumatic event, such as a bacterial infection, surgery, or even a simple bee sting (Steinberg, 2000).

GBS is usually treated as if its effects are strictly limited to the PNS (nerves external to the brain and spinal cord). However, there is mounting evidence for central nervous system (CNS: brain and spinal cord) involvement (Parry, 1993). For example, Capello et al. (2000) report the case of a patient who suffered from both GBS and multiple sclerosis (MS). The major feature of MS is damage to the myelin sheathing in the CNS. Interestingly, cases of MS have been reported where PNS damage has also occurred (e.g., Thomas et al., 1987). Other examples of CNS involvement in GBS include cases with papilledema (swollen optic nerve; Weiss, Banjwa, & Mehler, 1991), optic neuritis (Nadkarni & Lisak, 1993), raised intracranial pressure (Kharbanda, Prabhaker, Lal, & Das, 2002), encephalomyelitis (inflammation of CNS myelin; Amit, Shapira, Blank, & Aker, 1986), and inflammation of the meninges (strong connective tissue membranes surrounding the brain and
spinal cord; Parry, 1993). Maier, Schmidbauer, Pfausler, Schmutzhard, & Budka (1997) found 3 of 13 GBS patients to have degenerated spinal nerves and brainstem abnormalities. While all of the above authors suggest that GBS may sometimes involve the CNS, not all agree. For instance, Kalita, Misra, & Bansal (2001) found CNS nerve conduction times to be slowed in 30 GBS patients. This slowing is usually taken as an indication of nerve and/or myelin damage, but Kalita et al. argue that this is an expected side effect of the PNS nerve damage.

Whether or not CNS damage can be part and parcel of GBS or whether it is merely due to side effects is an interesting scientific question. However, the correct answer is of little consequence to the patient suffering from CNS symptoms or to the nurse who must watch for such symptoms.

Implications for nursing and rehabilitation

The nurse who is confronted with a GBS patient for the first time is unlikely to know much about this relatively invisible, frequently misdiagnosed disorder. The caregiver may initially be unaware of the severity of the paralysis and the pain in a patient who cannot speak or cry out. Most GBS patients suffer pain which needs careful management with frequent repositioning of the body using gentle handling techniques (Gregory M., Gregory R., & Podd, in press). In the most severe cases, improvement in the patient can be extremely slow; empathetic nursing and constant attention is required to help patients who may feel that they are going to die.

Nursing staff need to bring themselves up to date quickly if they lack specific knowledge about GBS. There are many sources of medical information but fewer sources that deal with the devastating psychological impact of the disorder. Strongly recommended are accounts of the disease written by people who have recovered (e.g., Heller & Vogel, 1986; Safranski, 2004; Wilcox, 2000). The patient’s perspective on an illness allows the caregiver to view the disorder in a very different light. Gregory, R. (1998) describes the important role nurses can play in simply teaching patients and their families
what the major medical terms mean so demystifying the experience. Another very useful tactic is to have a recovered GBS person visit and talk with the patient. GBS sufferers we have spoken with rate this as a most valuable experience.

GBS often comes like a bolt from the blue. A person can be fit and healthy one week and severely paralysed the next. Many patients are pessimistic about their chances of recovery. Thus, there are not only the nasty physical symptoms to deal with but also the psychological stress with all the attendant worries and fears. CNS problems such as those we have already described will be apparent, but there will surely also be CNS problems that manifest as emotional volatility, confusion, fear, memory loss, and other psychological effects. (We hesitate to call them “side effects”.) Family members can also be confused and perplexed. Often, there is a lack of understanding as to how serious the illness is. After all, there is no blood or physical damage to be seen; the patient “looks okay”. They may ask what all the fuss is about. The caregiver needs to nip such thinking in the bud, otherwise it may develop and continue into the often very long recovery phase – just when the patient is in the greatest need of family support and understanding. Weird sensations, numbness, and especially muscle weakness and fatigue may continue for months, if not years. Bourke (2001) found fatigue (93% of recovered people) and muscle weakness (84%) to be the two most common residual symptoms.

Throughout the illness and recovery period, caregivers must be constantly alert to increasing stresses and strains the disorder can put on patients and their families. Although the direct involvement of the CNS is GBS may not be that common, CNS abnormalities created by the psychological impact of the disorder are almost always very prominent characteristics. These can easily destabilise the family unit adding to the already existing difficulties associated with recovering from this debilitating disorder.

In conclusion, there can be little doubt that GBS is primarily a neuropathy of the PNS. However, a large number of studies attest to the fact that the CNS can be damaged too. From the patient’s and nurse’s perspectives, it matters
not whether these CNS abnormalities are viewed as part of the syndrome or as side effects. The fact of the matter is that they may exist and need to be dealt with. Additionally, the CNS is very much involved in GBS through the devastating psychological and social impact the disorder almost invariably has in its severe form. Both the patient and family members need to be provided with realistic information about GBS, the generally very slow rate of recovery, and the need to show empathy and understanding. Where this is not forthcoming, the strains that can develop may be sufficient to cause disintegration of the family unit.

Perceptions of post graduate contact sessions: Facilitation of deep learning or spoon feeding?

Rina Grobler
Department of Education Studies
University of Johannesburg, PO Box 524, Auckland Park, SOUTH AFRICA 2006
rcg@rau.ac.za

INTRODUCTION

Since 1994 when South Africa went through a process of huge political changes regarding the wrong of the past apartheid dispensation, the former Rand Afrikaans University (now merged with other institutions to form the new University of Johannesburg) started their program of distant education to help to redress some of the educational inequalities of the past (Grobler & Henning, 2001). Many historically disadvantaged groups who did not have an adequate higher education qualification were given the opportunity to further their studies. These students completed bridging courses such as an Advanced Certificate in Education (ACE) to finally allow them to enroll as Baccalaureus Educationis Honoribus (BEd Hons) students at this university. Therefore, many of these students did not have a university degree when they enrolled for this honors course in education.

In addition to this special arrangement, the university started distant centers such as Kimberley (Eastern Cape), Polokwane (Limpopo), Nelspruit (Mpumalanga) and Durban (Kwa Zulu Natal) to accommodate students from these provinces. Six times per year many lecturers/facilitators travelled to these centers to present various subject modules during the contact sessions.

PROBLEM STATEMENT AND OBJECTIVES

I became involved in these contact sessions in 2002. What was a cause for concern was that it seemed as if the majority of the students who attended these scheduled contact sessions did not prepare the specified work from their study guides and reading material. Therefore, these sessions became lecturer/facilitator dominated and the students completely relied on them for navigation of their personal learning experiences. The implication of this was that the lecturer and the students could not engage sufficiently with the course content to cultivate a disposition of inquiry and
critique, the espoused goal of a university education (Grobler & Henning, 2001).

The objectives of this research were threefold. The researcher wanted to investigate the reason/s why these students attended the scheduled contact sessions; what their expectations were for these sessions and if their expectations were met.

CONCEPTUAL FRAMEWORK
McInerney and Van Etten (2003) claimed that the conception of learning underlying all teacher education programs assume that students are curious and enterprising and wish to learn and try new things. In addition to this these authors claimed that students should be given independent responsibility for their own learning. At the same time, however, it is emphasized that learning is not only a matter of independence but also a matter of team work and a sense of community, stressing the importance of learning in interaction with others.

In addition to this, a socio-cultural view of learning supports a characterization of engagement as meaningful participation in a context where the to-be-learned knowledge is valued and used (McInerney & Van Etten, 2004). Furthermore, Gravett (2001) stressed the fact that adult educators need to approach their teaching task as a process of facilitation, guiding and mediation of learning.

THE INVESTIGATION
A total of 32 students attending the scheduled second and third contact sessions in two provinces took part in this investigation. They were all enrolled for the course BEd (Hons) and the module I presented was Educational Perspectives which included Philosophical -, Psychological - and Sociological perspectives on Education. The group was homogeneous as they were all part of the ‘disadvantaged’ groups. All the students received the appropriate Study Guide, Reading Package and the Information Guide.

Data gathering collection and analysis
For the purpose of this report the students completed a compact questionnaire which encompassed biographical data (gender and age) and three open questions dealing with the research objectives. These open questions were:
1. Why do you attend these scheduled contact sessions?
2. What do you expect from the course facilitators at these contact sessions?
3. To what extent do you believe that you got what you had expected from the course facilitators? (Please indicate your opinion by encircling the appropriate number on the scale provided.)

The scale provided for the last question was:

<table>
<thead>
<tr>
<th>A lesser extent</th>
<th>A larger extent</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

The paragraphs written by the students to answer the first two questions were analyzed to extract main themes regarding the most emphasized reasons why they attended the contact sessions and the most emphasized expectations of the students. The outcomes of the last question were calculated.

**Description of the respondents**

A total of 32 students completed the questionnaire but 1 questionnaire had to be ignored as it was not completed in full. Therefore, the data from 31 of the questionnaires could be used. Eighteen of the students are female and 13 are male (see Figure 1). Four of the students indicated that they were between 25 and 30 years of age; ten were between 31 and 35; eight were between 36 and 40; five were between 41 and 45; and four were between 46 and 50 (see Figure 2).

![Figure 1: Gender of students](image-url)
Findings from the open questions

*Question 1: Why do you attend these scheduled contact sessions?*

- **Seventeen** students indicated that they attended the scheduled contact sessions to get the exam scope and/or guidance for the examinations. Some of the answers were:
  
  "... to get more information from the lecturers in order to pass ...”
  "... delimitation of the work due to constraints.”
  "... to enable me to write the exams.”
  "... to gain understanding of what the lecturer has to ask in the exams.”

- **Ten** students indicated that they attended the scheduled contact sessions to get clarity on their questions. Some of their answers were:
  
  "... to get clarifications on things that I fail to understand well while alone studying at home.”
  "... to get clarity (more) on assignment questions and preparation for the exams.”
  "... want lecturers to explain the information that might be difficult for us to understand from our reading materials.”
• **Nine** students indicated that they attended the scheduled contact sessions to **get information on how to answer assignments.** Some of the answers were:
  "... to get some guidance as to how to answer the assignments."
  "... to get guidelines on assignments."

• **Four** students indicated that they attended the scheduled contact sessions to **share ideas with other students.** Some of the answers were:
  "... to get other students' view."
  "... to speak to others students."

• **Three** students indicated that they attended the scheduled contact sessions to **meet the lecturers.** Some of the answers were:
  "... to come in personal contact with the lecturers of the material ..."
  "... to know lecturers expectations person to person ..."

• **Two** students indicated that they attended the scheduled contact sessions to **understand the reading material.** The answers were:
  "... to have a clearer understanding of the reading material."
  "... to get advise and information of how to go through our study material."

• **Two** students indicated that they attended the scheduled contact sessions to **get feedback from the lecturers on the assignments.**

• **One** student indicated that he/she attended the scheduled contact sessions so that **the lecturer can outline all the course material and explain all the notes.**

A diagrammatic representation of the above findings is given in Figure 3 below.
Question 2: What do you expect from the course facilitators at these contact sessions?

- **Eleven** students indicated that they expect the course facilitator to give printed hand-outs or at least use transparencies which they can copy in class. Some of the answers were:
  
  “Give the hand-outs so that I can revise what the lecturer was teaching.”
  “Use transparencies to guide the students.”
  “Lecture – with a few transparencies to copy.”
  “I would like the lecturer to give us hand-out notes rather than wasting time in writing them.”

- **Eight** students indicated that they expect the course facilitator to have group discussions / active involvement of the students in the class. The following paragraph covers the spectrum of ideas:

  “I would like there to be interaction between the lecturers and students. Sometimes it gets boring to just listen to a lecturer, sometimes you don’t understand what he/she is trying to say. There is not much learning taking place from just copying notes from the transparency. I would rather prefer active involvement in learning to take place at lectures.”
• **Five** students indicated that they expect the course facilitator to **focus only on the main points of the reading material**. Some of the answers were:

  “The lecturer should focus on the main points of the reading material rather than giving the students two Reading Packages to learn from.”

  “I wanted to know which aspects in the book I have to study before the exam.”

• **Four** students indicated that they expect the course facilitator to **concentrate only on exam issues**. Some of the answers were:

  “We only need information for exam purpose and not personal opinions.”

  “I want to know which aspects in the book I have to study before the exam.”

• **Four** students indicated that they expect the course facilitator to **spend more time discussing students’ problems**. Some of the answers were:

  “I would like the lecturer to give us more opportunities to present our problems.”

  “Lecturers should spend more time talking and discussing problems that we encounter, maybe set time aside to listen to difficulties of the students.”

• **Three** students indicated that they expect the course facilitator to **give an actual lecture to save time**. As one student stated it:

  “Lecture method is good because it saves time and a lot of information is received in a short span of time.”

• **Two** students indicated that they expect the course facilitator to **explain the guide**. This was stated as follows:

  “Explain systematically the study guides. Give to us what you believe are the important aspects of the study guides.”

• **One** student indicated that he/she expected the course facilitator to have **given the students exercises to complete in the class** (revisions).

  A diagrammatic representation of the above findings is given in Figure 4 below.
**Figure 4: Students’ expectations of course facilitators at contact sessions**

- **Hand-outs and copy transparancies**
- **Active student involvement**
- **Focus only on main points of reading material**
- **Concentrate on exam issues**
- **Discuss students’ problems**
- **Give lectures to save time**
- **Explain study guide**
- **Give exercises to complete in class**

**Question 3: To what extent do you believe that you got what you had expected from the course facilitators?**

**Nineteen** students encircled the “4” or the “5” to indicate that they believed to a large extent that they got what they had expected from the course facilitator and **eleven** students encircled the “3” to indicate that they were not sure whether they got what they had expected from the course facilitator. Only **one** student encircled the “1” to indicate that he/she did not get what he/she had expected from the course facilitator.

A diagrammatic representation of the above findings is given in Figure 5 below.
Implications of the most important findings

The majority of the students were female. This was expected as school teaching is still seen as a superb career for woman as they tend to be the most basic nurturers of children. By giving disadvantaged woman the opportunity to get a higher academic qualification will not only enrich their own life but also the life of a lot of disadvantaged children. We would also like to see more men in our education courses because true to the African traditional culture, the men are the ultimate authoritative gender. This might be a helpful factor to increase low level of discipline in many schools.

58% of the students who attended the contact sessions were in their 30’s. This may be a cause for concern as this is the age group which is highly affected by HIV/AIDS. One would like to see more of the younger age group which was between 25-30 years. These would be the students who might be more willing and able to cope with the challenges of Outcomes Based Education (OBE) which is a relatively new way of teaching in South Africa.

The majority of the students came to the contact sessions to get a ‘scope for the exam’ (see Figure 3). It was as if they expect from the course facilitator to give the
exam questions and only focus on that specifically. Independent responsibility for own learning (McInerney & Van Etten, 2003) was almost none existent. The impact of this was that the facilitators had to fall back on the outline of the course material, explaining to them how to use the Study Guide and Reading Package and give guidance on how to do the assignment. This is not what should be done at honors level because the facilitator as the adult educator is not a dispenser of knowledge (Gravett, 2001). To try and rectify this problem, we now have an enrolment stipulation of an average of 60% in the previous qualification.

It is clear from Figure 4 that the majority of the students indicated that they expect hand-outs or to copy transparencies in the contact sessions. This may be seen as if they are dependent on the facilitators’ ‘spoon feeding’ and not being responsible for their own learning. The students should realize the importance of learning in interaction with others (McInerney & Van Etten). Without preparation for these sessions these ultimate ideas regarding learning, especially the notion of a ‘deep understanding of learning’ (Gravett, 2001) cannot be fulfilled.

Finally, according to Figure 5, 62% of the students indicated that they believed that they got what they had expected from the course facilitators. On the one hand, we should be happy to receive this recognition for our hard work but at the same time this is a cause for concern. Do we fall back on being the dispenser of knowledge and the navigators of the students’ personal learning experiences? Should we not be there to engage with the students to cultivate a disposition of inquiry and critique?

**Conclusion**

From my point of view, the ideal would be to create an environment where small numbers of students are able to learn through collaboration and inquiry which would be guided and mediated by the facilitator. To be able to do this, it is imperative that the BEd Hons students prepare the content of the prescribed study material for the scheduled contact sessions. If this is not the case, then the facilitator has to transfer the content knowledge which can be seen as ‘spoon feeding’ and is most definitely not the best way for learning to take place on this level of academic endeavor.
REFERENCES

People are faced daily with stereotypical images of many different occupations. A profession of which many people hold stereotypical views is that of the librarian. The film, Party Girl, provides an excellent backdrop for presenting these views and examining how adornment can reinforce or challenge stereotypical beliefs.

**Film and Character Background**

In the 1995 Columbia/Tristar Studios release Party Girl, Parker Posey plays Mary, an irresponsible, haughty, and capricious young woman who makes her living throwing illegal parties in New York City loft apartments. When the police arrest her for hosting one of her “promotions,” Mary asks her stern librarian Godmother for financial assistance. Her Godmother agrees to help, but under the condition that Mary takes a position as a library clerk at the public library branch where the Godmother works. Mary indignantly accepts her Godmother’s offer and during the course of the movie, learns that
she truly enjoys working in the library and appreciates the order that is added to her life.

By the end of the film, Mary even decides to pursue a master’s degree in Library Science so that she may become a “librarian,” and not just a “library clerk.”

Aimed toward the Generation X audience, *Party Girl* tells the story of Mary’s immersion into the world of libraries and the Dewey Decimal Classification system and the subsequent organizational effects on her life (i.e. she organizes her funky, unconventional wardrobe by color, designer, and era as well as surprises her deejay roommate with an organizational overhaul of his record collection, complete with a card catalog that cross references the albums by title, artist, and genre). Additionally, aspects of her wardrobe during different scenes illustrate the extant stereotype of the occupational role of librarian. Mary undergoes twenty-seven costume changes in *Party Girl*. Table 1 provides an in-depth description of her wardrobe in each scene.

**Librarianship Background**

Although the very first librarians were male (i.e. court scribes in Ancient Egypt and Mesopotamia; monks in the Middle Ages) (Marinelli & Baker, 2000), librarianship became a field dominated by females in the mid-1800’s when Melvil Dewey introduced the Dewey Decimal Classification (DDC) system and opened the doors of librarianship as a career to women (Online Computer Library Center [OCLC], 2004). Like many occupations, the librarian has endured a particular stereotype: when asked what one envisions a librarian to be like, the majority of the public will respond with characteristics such as quiet, mean or stern, conservatively dressed in drab or muted colors, wearing
eyeglasses, hair pulled back tightly in a bun, and prudish (Walker & Lawson, 1993; Kirkendall, 1986).

According to Storm (1987), stereotypes “are organized biases, which influence out behavior by giving us rigid expectations. They are examples of logical error based on generalizations, which are never truly accurate because they assume that a group of traits automatically go along with one attribute” (p. 111). Thus, some librarians may embody the stereotypical traits associated with their profession while others, even the majority, may exemplify polar opposite qualities.

Roles and Situational Influences on Mary’s Adornment

In the film Party Girl, Mary dresses differently for her role as a library clerk than for her role as a “party girl.” The film opens with Mary taking money from people coming to a party that she planned. She wears a bright red satin blouse with a plunging neckline, her breasts pushed up and out, with very short black sparkly hot pants over red patterned stockings. Her shoes are black with chunky high heels and she wears her hair down and curled. Her outfit is wild yet appropriate in a trendy party situation and accentuates the female erogenous zone of cleavage and legs. When Mary visits her Godmother at the library to ask for money, she remains in her “party girl” mode despite the bookish backdrop; at this point in the film, Mary has not yet agreed to work as a library clerk.

</table>

While some pieces of Mary’s clothing may be considered conservative, her outfits bring together elements of different styles in a very unique, unconventional manner. For example, in the first visit to the library, she wears a white blouse with a ribbon around the
collar, a black vest, a very short, tight red skirt over red patterned tights, blue high heeled shoes, and a leopard-print wrap. The white blouse may be considered conservative, but the pairing with other more unusual elements of her costume causes it to lose its conventionality.

The two wardrobe changes after Mary’s first visit to the library echo her party girl mentality: loud, carefree, and slightly obnoxious. However, the scene depicting her first time working as a library clerk (Table 1: Scene 5) shows Mary more toned down and even stereotypically librarian-like. In this scene, she wears a brown print hooded shirt with the requisite horn-rimmed eyeglasses and her hair pulled back in a loose bun. She dresses for her occupational role as a library clerk following guidelines set for a stereotypical librarian. In the next scene showing Mary working in the library (Table 1: Scene 8), her wardrobe is again simplified and more austere than the clothes she wears out of the library: a black dress with her hair in a French twist, a pencil stuck through the arrangement. Although she wears a long necklace, her makeup is very minimal and she does not wear lipstick.

The following library scene (Table 1: Scene 10), however, shows a marked difference in the clothing choice for her library clerk role. In this scene, Mary wears a hot pink shirt with a multi-colored waistband, short denim shorts, blue striped tights, and combat-like chunky black boots. Her accessories are equally wild: huge gold hoop earrings and a hair barrette adorned with multiple pieces of plastic fruit which she wears in her free-flowing hair. This costume selection is more relative of her role as a hip socialite party girl than of her role as a library clerk that was displayed in the two previous library scenes. Because of this definite difference, it is important to note that in
this scene, Mary’s Godmother severely reprimands her for making mistakes in coding books with the Dewey Decimal Classification system. Perhaps determined to prove her intelligence to her Godmother or perhaps fueled by martinis and beer, Mary sneaks into the library that night to secretly study the intricacies of the Dewey Decimal Classification system. While she is wearing the same clothing during her clandestine trip to the library, her hair is pulled back in a French twist and she no longer wears the fruit barrette; her style is slightly more subdued while she is serious about studying library-related material.

The next time we see Mary working in the library (Table 1: Scene 14), she wears a tailored tan print suit with a white blouse underneath the jacket. While the suit has an unusual, vintage look to it, Mary’s diligent studying pays off for the first time: she happily and proudly assists a library patron with difficult information. The next seven wardrobe changes show Mary either at a falafel stand on a New York City street corner or while she is in her apartment. Among the clothing she wears in these scenes are short hot pants with patterned stockings underneath, black leather pants and a matching jacket, high-heeled boots, and a short skirt: less conventional attire than what she usually wears to work at the library.

When Mary appears again in the library, she is dressed simply in black, the only accessory a gold heart necklace. The following scene also shows Mary at work, this time allowing herself to dress slightly less conventionally than usual for her library clerk role, though more modestly than when she is not at work (Table 1: Scene 23). In this scene, Mary loses her job because of her seeming nonchalance and irresponsibility, despite the fact that she is learning to love her job more each day. The costume in scene 25 (Table 1) illustrates the lengths Mary will go to in order to dress for her “party girl” role: she wears
an elaborate costume for a Middle Eastern theme party where she is a host (none of the guests dress in costume). She wears a light blue layered chiffon dress over embroidered satin pants. The top half of her hair is piled high on her head, the other half is down, loose, wavy, and much longer than usual, assisted by a wig or extensions. She wears very heavy eye makeup, a large gold necklace with an Arabic character, huge dangling earrings, and many rings and bracelets.

Mary wakes the next morning after passing out on the staircase and rushes to the library, still in the previous night’s clothes, ready to ask her Godmother for her job back and to gather as much information as possible about graduate programs in the field of Library Science. She discusses the pros and cons of different Library Science schools with librarians and arranges to meet her Godmother at her apartment that night to talk to her about her future plans.

When Mary returns home that evening expecting to meet her Godmother, she is instead met by a surprise birthday party in her honor. Her wardrobe in this scene makes it evident that she wants her Godmother to know that she is serious about a career in Library Science and thus she dresses in the style of a stereotypical librarian: a black turtleneck, a boxy dark suit jacket with a gold brooch on the lapel, a matching skirt, her hair pulled back in a tight French twist, sensible black low-heeled shoes with a gold decoration at the toe, and horn-rimmed eyeglasses: even her friends notice that she is “working a new look.” Despite her initial prudishness, Mary joins the festivities of the party when her Godmother agrees to let her return to work at the library. The viewer is left with an image of the party: Mary dances with her friends, a sliver of a “party girl” remaining within the present library clerk and the future librarian.
Wardrobe Analysis Relating to Stereotype

The film *Party Girl* is an excellent example of how dress changes with occupational roles. The clothing that Mary wears when she throws illegal parties or socializes at nightclubs is often very different than her attire when she is a library clerk, especially during the scenes when she enjoys her job and feels confident in her knowledge of the duties of a library worker. The differences in her clothing depending on her role also illustrate the librarian stereotype. As a librarian clerk, Mary’s appearance is more conservative (i.e. eyeglasses, hair in a bun or French twist) and her clothing is of a more muted palette (i.e. tan, black, gray) than her wardrobe as a “party girl.” Because of the bright colors and whimsical style of her “party girl” wardrobe, she nonverbally communicates to others that she is fun, outgoing, and carefree, while her comparatively somber appearance as a library clerk suggests to others that she fits all aspects of the librarian stereotype (i.e. quiet, mean/stern, prudish).

Mary’s wardrobe differences also demonstrate the idea of dress congruence: Mary’s apparel is generally appropriate for both her personality and for the situation (or job) in which she is involved. Although Mary’s wardrobe exemplifies and communicates many aspects of her life, her status and social class is learned through dialog in the film, rather than through her clothing. It is evident that she enjoys and even relishes designer label clothing, but whether she has enough money on a regular basis to buy it is questionable. In scene 7 (Table 1), she steals a designer dress from a closet at a party she attends. Furthermore, she must sell a large portion of her designer wardrobe to a consignment shop in order to pay rent after she loses her job as a library clerk (see Table 1: Scene 24). These details, however, are learned through Mary’s apparel.
Conclusion

Just as in any other profession, librarianship sees every facet of the human spirit. The major difference seems to be that a stereotype has been affixed to this profession and is now ingrained in the public’s eye. Despite the growing inclusion of professionals within the Library Science field who do not fit the common librarian stereotype, it is uncertain whether the stereotype will change or disappear in the near future or if the librarian stereotype has become too embedded in the public’s mind to dissolve.

Seeding the pathways
Enhancing the skills and knowledge of women in the Australian grains industry

Patricia Hamilton

Abstract

The focus of this paper is to highlight the changing role of women in the 21st century as they seek recognition and acknowledgment as recognised partners in the family farming business. Historically, women on family farms in Australia have not been recognised as a skilful and knowledgeable labour source. Men were the farmers. Women were the wives, daughters and mothers of farmers and did not need farming skills and agricultural knowledge to achieve this purpose. However, during the last two decades family farming, as a result of government policies, globalisation and new technologies, has become a highly complex business. This paper is divided into four sections. Firstly, I briefly examine the gendered nature of farming in Australia. Secondly, I explore counterpoints during last century, which challenged the gender relations and social practices in farming. I argue that agricultural organisations and communities accept women as sharing the farming partnership when the country appears under threat and, also, in times of economic and social hardship. In particular I point out the impact of World War 11 and the women’s movement on the social practices of farming. Thirdly, I discuss a strategy that women in the Australian grains industry have developed to challenge their secondary position in the grains industry by evaluating a capacity building program called Partners in Grain. The Australian grains industry through its Grains Research and Development Corporation acknowledges that the future of the industry depends on every member of the farming family being well-informed, embracing new technologies and having the skills to increase the profitability, productivity and sustainability of farming practices. Hence, the industry has funded a capacity building program to increase the confidence, skills and technical knowledge of women and young people to participate in the family farming business more effectively. Finally, I examine whether this commitment to involving women in core activities such as farm management is another short-term solution.
Cell Phones and Social Practices: Electronic Oral Culture

An international/intercultural analysis of the impact of Mobile Telephony

Cell Phones and Social Practices

Perhaps no communications technology in history has experienced more rapid diffusion than the cell (mobile) telephone. What makes this particular technology so intriguing is that it seems to have infiltrated many societies around the globe, affecting individuals (albeit differently) in many countries, from the industrialized to the developing world, all within a relatively short period of time.

The very rapid diffusion of cell phone technology is, in itself, a fascinating subject that requires examination of both national fixed phone infrastructures and the rise of small, lower cost means of telecommunications that extend the ability to communicate over distances, but comparing different cultural experiences—particularly in countries where the users of cell phones leapfrog over traditional fixed phone systems also provides an interesting snapshot of the way in which some oral cultures adapt to a different, electronic orality made possible by electronic communications technologies.

This study compares the experiences of individuals in a number of countries representing different regions of the world, to better understand the role of the cell phone and what it means to individuals to be able to speak over distances anywhere, anytime. This presentation focuses on how cell phones are changing social practices in a few countries with the purpose of examining a framework for measuring social change. It is one aspect of a much longer, and more systematic study that delves further into the impact of social change caused, in part, by the presence and availability of cell phones, but for purposes of this conference, the scope of the study must be limited. The primary focus of this presentation, then, will be to examine the electronic orality and impact of cell phones in countries that are leapfrogging over traditional fixed telephone systems.

Two research questions guide this study:

1. How have mobile telephones changed communications opportunities for new social patterns and the behaviors of individuals in countries that have made mobile telephony available to their publics?

2. How do people understand and describe the experience of this type of communication? For example, how do they understand and describe the features they use, and how does the mobile phone fit into their lifestyles? Do individuals see this type of communication as a necessity or a luxury? What changes do cell phones provide to traditional cultures and communication patterns?

There is a vast body of literature on the impact of technologies on individuals, and within cultures, ranging from studies of technological diffusion to the social and economic impact of new technology, effects on literacy, and technology for development purposes. Theoretical positions incorporate historical, economic, political, cultural, religious, political-economic, and linguistic perspectives. For purposes of this paper, however, two theoretical perspectives and bodies of literature underscore the investigation of the impact of cell phones in two specific contexts; in countries representing the “most” technologically developed, like the U.S. and in northern European countries where fixed telephone systems are pervasive and available, and in the least technologically advanced regions of the world where mobile telephony has leapfrogged over systems of fixed telephony.
By comparing these two “types” of cell phone experiences, we can analyze the cell phone from the perspective of media ecology, and from the new, emerging theoretical position of network theory. These two perspectives are offered as a means of developing a comparative dimension of social change that is appropriate for a technology like cell phones. After all, while cell phones do indeed have unique characteristics, they also, in some cultural contexts, can be viewed as extensions of oral communication (McLuhan (1964), Ong (1982), Postman, (1985). Their social consequences cannot be divorced from their social use. Also, they carry the cultural baggage of earlier technological systems and available communications patterns in whatever situation in which they may be examined.

Perhaps the best known “media ecologist” was Neil Postman, whose theoretical position reflected the work of Innis (1951), Ellul (1964), and McLuhan (1964). While Postman often cited the “unique characteristics” of a medium as one of McLuhan’s greatest contributions to understanding the impact of any communications medium, he also embraced the cultural-change dimension of Innis (p.33) who drew attention to the important dimension of how knowledge was disseminated or changed over space and time, and the way the medium’s characteristics influenced social use within a cultural setting. Postman called the environment created in the face of a medium/socio-cultural setting relationship a major determinant of how different media would react to their cognitive, linguistic, cultural and social impact. The media ecologist examines the interaction between people and their communications technology and how media affect human perception, understanding, feeling and value. In the examination of cell phones and media ecology, it is possible to also draw from Meyerowitz (1985) who adds that “…the addition of a new medium to a culture alters the functions, significance, and effects of earlier media.”

But as we investigate the complexity of social interaction and telephone systems (fixed and mobile) on an intercultural/international scale, there can be a tendency to think in terms of cultural relativism. To counteract this possibility, the emerging study of network theory is used to find the resulting patterns, irrespective of intercultural/international difference.

Barabasi (2003) has written that the new field of network theory has begun to offer a paradigm shift that helps explain the organizing principles that shape the complex dynamics of converged technologies, like cell phones, or the Internet (227). The key issues involve the myriad numbers of nodes that technologies like cell phones and the Internet involve. When the number of points of contact in which there is both a human and a technological interface increase, network theory offers a way of combining seemingly incompatible systems, such as biological, ecological, cultural, economic, technological, infrastructural, etc. What productively emerges is a system of hierarchical structures that allow greater depth of analysis among what appear to be incommensurate issues and artifacts. By examining overlapping patterns of technological/social uses of a technology, the environment, as influenced by the presence of the cell phone can serve as a focus of analysis.

Network theory is counter to a scientific reductionism that emerged in the 20th Century (Barabasi, p. 6). As Barabasi writes; “Today we increasingly recognize that nothing happens in isolation. Most events and phenomena are connected, caused by, and interacting with a huge number of other pieces of a complex universal puzzle. We have
come to see that we live in a small world, where everything is linked to everything else. We are witnessing a revolution in the making as scientists from all different disciplines discover that complexity has a strict architecture. We have come to grasp the importance of networks (p. 7).

The Issues

Intercultural and international comparisons of cell phone use must be prefaced by the obvious reality that not all countries are equal, nor do they have similar experiences with fixed line telephony. The history of telephony and any wired system of communication (television, Internet, etc.) in a country provides a needed backdrop to understanding the way in which individuals can communicate over distance in every country. But while there are surveys and analyses of telecommunications penetration from every perspective (from governments, industries, NGOs, and international organizations like the International Telecommunications Union (ITU) and the United Nations Education, Scientific, and Cultural Organization (UNESCO), most studies until recently, focused on the “digital divide” meaning the unequal “balance” of communications technologies in and among countries. Very few studies have actually focused on what people do with communications technology once they have it, or, more importantly, how they change behavior once a new technology is available.

There have been two primary problems with fixed telephony; the cost to the user and the cost of developing, maintaining, and upgrading the expensive infrastructure necessary to facilitate fixed line calls. With mobile telephony the scenario changes a bit. Figuring out how to develop technologies that use the same technical standards and computing the cost to the user(s) are still important, but in the cell phone industry, change is more rapid than in any other communications technologies. While we might be familiar with “Moore’s Law” which states that the ability to put microprocessors on a computer chip doubles every 18 months; the actual upgrade to the next standard of cell phone is now possible every 6 months (Ganswindt, 2005).

The Examples

Ask any college student in the United States today who spends on average, $40-80 a month on cell phone use (but protests the high cost of textbooks) about the sophistication of the average U.S. cell phone, and they will tell you that the best phones have photographic ability, text messaging, ring tones, and expanded memory for phone book functions. It is difficult for them to conceive of the myriad of functions that cell phones in other countries have, such as the ability to download songs, WiFi, gaming, streaming video, and IP capabilities, often at a significantly lower rate than that charged to users in the U.S. When it comes to cell phones, the United States is very much behind the times.

The U.S. and Other Industrialized Nations

Without a doubt, cell phones take on one set of meanings in countries that have also had a significant history with fixed phones. In the U.S. where deregulation of the telephone industry spurred a level of competition among regional companies (most especially the Baby Bells), fixed line telephony is in reach of 98% of the population. Calling prices that frontloaded costs to businesses while reducing home phone line cost, despite the local/distance disparity, made cell phones in the U.S. a luxury in the early days of cell phone use. Almost all cell phone manufacturers in the U.S. first marketed the cell phones as either business tools, or, touted the safety features of having a cell
phone for the family. Only after the switching systems became compatible, did the actual use of cell phones really flourish in the U.S. The U.S. is also unique in the world because of the features of advanced PDAs, like Blackberries, which seem to fit in a culture where Americans “live to work” while in other countries, the idea of constant contact with work is less popular (Gandswindt 2005).

In many other parts of the world the 3G cell phones have features that we do not yet embrace in the U.S. In Japan, for example, 3G phones enable full motion video on cell phones. In a culture where the people have often long commutes on public transportation, the ability to watch TV or a film on a cell phone makes more sense than it does in the U.S., where we often drive to work, and no matter how long the commute, other services are available (like subscription radio).

In other industrialized countries where fixed line telephony was present, the cell phones actually ushered in an era of communication that was at a lower cost than the fixed line service. In some countries, like Finland (the most “mobile” culture), the size of the country did not require compatible systems that could link over great distances. Once third generation phones (3G) were introduced, the calling distance became greater. But what most industrialized countries other than the U.S. have in common is that the pricing structure for phone use was radically different than in the U.S., where a cell phone user is charged time for incoming and outgoing calls. In most other industrialized countries (and indeed, throughout most of the world), callers pay only for messages they send, but not those they receive. This feature significantly contributed to rapid diffusion of cell phones in those countries.

Additionally, features like text messaging and other interactive services became critical features of the cell phone’s success. Unlike the U.S. where the Internet had infiltrated many homes and instant messaging and e-mail became much more popular than traditional mail or phone systems, other industrialized nations used these services far more than Americans did.

Cell Phones in the Third World

Without a doubt, the cell phone has contributed greater change in third world nations where fixed line infrastructures were either too expensive, outmoded, or nonexistent. With comparative costs of cell vs. fixed line, the cell phone became a popular alternative to traditional communication. In most of these countries, additional, enhanced services have ushered a new communications environment. It is in these countries, too, where some of the greatest social changes have begun to take hold. For example, social relations in Islamic countries where there has been a traditional separation of males and females may now see centuries of tradition change within a short period of time. Young men and women have traditionally been kept separate; marriages are often arranged, and parents strictly control their children’s interactions. But with cell phones in Turkey and Saudi Arabia, for example, cell phones used by young people may be breaking down that traditional separation of the sexes. Phone calls that can be kept private have allowed greater interaction among young people. Phone dating, and even phone sex are now common in some of the world’s most traditional cultures.

Some of the examples are somewhat humorous, but demonstrate the impact of social uses of cell phones. Korea is an excellent example of cells gone wild; in 1960
South Korea had only one fixed line phone for every 300 people. Today, 90% of the households have fixed line phones, and three-quarters of the population carry mobile phones. Among the features on a typical cell phone in Korea, include access to financial accounts (like bank accounts), on-line computer games, ring tones and avatars (little cartoon-like characters) that appear as “digital representatives” on mobile phone screens and in on-line games. Some new phones even have the ability to transmit high-quality video, and LG Electronics has introduced a phone with a built-in video recorder which switches to a record mode when the user has to take or make a call (The Economist, 2005, April 2-8, p. 8-9.)

Similarly, other countries and regions have spurred the growth of many new content services and industries. According to the March 12-18, 2005 issue of The Economist:

Catholics can sign up for daily inspirational text messages from the pope simply by texting “Pope On” to a special number. The Irish Jesuits offer a service called Sacred Space, accessible via smartphone which encourages users to spend ten minutes reflecting on specially chosen scripture for the day. In Taiwan, limited-edition phones made by Okwap, a local handset-maker, offer Matsu wallpaper and religious ring tones, along with a less tangible feature—each one has been specially blessed at a temple to Matsu. And Muslims around the world can use the F700 handset, launched last July [2004] by LG of South Korea, both to remind them of prayer times (the phone has an alarm system that works in 500 cities) and to find the direction of Mecca using the handset’s built-in “Mecca indicator” compass (Technology Quarterly, pp. 12 and 15).

Belief in the importance of numbers is also a personal thing. James Katz, an authority on cell phones and social practices has written that: “It’s not uncommon even for migrant workers to pay up to a month’s salary for a lucky telephone number (Katz, as quoted in The Economist (2002, p. 15).”

Belief in the voice and the spirit is also evident in some countries. In Finland, a service was shut down because it claimed to provide text messages from Jesus for the equivalent of $1.55. In the Philippines, some people would ask for absolution from their sins and receive absolution via text messaging (The Economist, p. 15).

Wireless Broadband: WiBro

In many countries around the world, the technologies that facilitate growth and low cost of cell phones and services increasingly embrace wireless broadband (WiBro) which multiplies the options for cell phones at no appreciable additional cost. Examples of new services that are available in some regions include the ability to check radio frequency tagged goods (like the date of milk or produce) for everyday use. Already it is possible to make purchases over the handset and pay for goods in some regions. Simpay in Spain is a company that will allow users to pay for goods over the handset (starting summer, 2005), but could easily transfer to the entire EU.

There are also creative approaches toward making telephony available in some of the poorest regions of the Third World:
Phones are widely shared and rented out by the call, for example by the “telephone ladies” found in Bangladeshi villages. Farmers and fishermen use mobile phones to call several markets and work out where they can get the best price for their produce. Small businesses use them to shop around for supplies. Mobile phones are used to make cashless payments in Zambia and several other African countries. Even though the number of phones per 100 people in poor countries is much lower than in the developed world, they can have a dramatic impact: reducing transaction costs, broadening trade networks and reducing the need to travel, which is of particular value for people looking for work. Little wonder that people in poor countries spend a larger proportion of their income on telecommunications than those in rich ones (“The real digital divide”).

Analysis
Traditional arguments about the inequities of the digital divide seem to be in question when it comes to the diffusion of cellular phones. Once again, part of the answer might lie in the way they allow individuals to leapfrog over traditional communications media that required literacy or significant infrastructural development. A bevy of articles in recent issues of The Economist magazine predict a great future for cell phones, opining that perhaps cell phones will be the engine of creating greater economic growth in the developing world.:

… when it comes to mobile phones, there is no need for intervention or funding from the UN: even the world’s poorest people are already rushing to embrace mobile phones because their economic benefits are so apparent. Mobile phones do not rely on a permanent electricity supply and can be used by people who cannot read or write.

The digital divide that really matters, then, is between those with access to a mobile network and those without. The good news is that the gap is closing fast. The UN has set a goal of 50% access by 2015, but a new report from the World Bank notes that 77% of the world’s population already lives within range of a mobile network (Calling across the divide).

But though the availability and use of cell phones may grow rapidly, every technological development also comes with some not-so-pleasant issues as well. Rule has articulated the position that the possibility of cell phones contributing to more of a surveillance society is worthy of consideration (Katz and Aakhus 2002).

Likewise, the dominant countries who will become leaders in the cellular technologies will also see some shifts from traditional players to new leaders, like the Chinese, who may well become the world leaders in wireless technology using 3G (Steinbock 2003).

Media Ecology and Network Theory

The real impact of cell phones in various cultures does, however, suggest using new methods to interpret the importance of social change. To consider how media ecology and network theory operate conjointly as a framework for analysis, it is possible
to remember Harold Innis’ movement toward evaluating economic and social indicators together. To do this it is possible to retrace some of Innis’ writings which underscore both theories. “…Innis postulated a six-dimensional concept of social action and then dealt with the interaction of social phenomena as seen from the point of view of each dimension. By clear implication this interaction involved two independent factors, physical constraints and values (Neill 1972, 84).”

To describe Innis’ ideas, we could chart them as:

**PHYSICAL CONSTRAINTS**

<table>
<thead>
<tr>
<th>Physical forces</th>
<th>Social forces</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i.e. infrastructures, economy)</td>
<td>(i.e. education, religion)</td>
</tr>
</tbody>
</table>

**VALUES**

If one were to begin to examine the impact of cell phones in the industrialized world, it would be possible to start with issues of the physical constraints and move systematically in a clockwise manner until all logical connections were made in the cultural analysis. To examine changes in cultures that have traditionally favored oral communication, the pattern would be reversed; one would start from the bottom section on values and proceed in a counterclockwise rotation to link the various components in a manner that would honor the traditions of an oral society. The end result however, whatever the status of the region and the direction of the inquiry, would result in all of the critical components being addressed, and therefore, comparisons would be along the same criteria, though the approach from a different, more culturally sensitive perspective.

While Innis might not have been able to predict his contributions to a systematic understanding of network theory, his components do give order and structure to developing a coherent approach to comparative case studies and contexts. Tied to media ecology as an explanation of what happens in the process of an emerging environment, Innis’ contributions to network theory take on an even greater import.

In the case of the impact of cell phones in the developing world, we can see that the traditional values of an oral society take precedence over social organization and perceived utility of the communications medium. If we consider that oral societies have a strong connection to homeostasis (Goody and Watt 1968, pp. 31-4) which grounds action in the present. The “structural amnesia” that results is also critical to understanding how using a technology that merely extends the verbal/oral values is a boon to this type of technology’s use.
Secondarily, oral societies reify the sense of the spirit; therefore, the use of cell technology for religious purposes, as evidenced in our examples, may be less surprising in a developing society than in an industrialized one, where we might question the use of the technology for such a seemingly “heathen” purpose.

Finally, but most importantly, it is the communal aspect of the oral society that has lent itself so well to the communal sharing of cell phones for specific purposes. The sense of shared property is then, not an obstacle, but rather, a means of participating in the traditional culture despite the addition of the technology; completely antithetical to the values of the industrialized nations where sole ownership and individual contract/control/ownership is a part of the activity of using a cell phone.

The one traditional variable that does change in the examples given of using cell phones in developing countries has to do with the creation of a location of privacy. Cell phones by their portable nature, can be used for very private communication in communal societies. It is not surprising though, that the shift of using cell phones in public places for private conversations is the most upsetting feature of using cell phones in industrialized nations!

Media ecology definitely describes the new environment that is the result of any social change caused by technology. But on the case of oral societies that undergo changes, we can see how an ordering of principles goes along with the social change. To avoid major culture shock, adopting and diffusing technology through traditional means demonstrates how well a technology can introduce change in a non-threatening way. For that, cell phone technology may be unique.

An International Study of Gender Differences of the Fourth Graders in Reading
Literacy Achievement and Non-Achievement Self-Measures

SHIQI HAO
University of South Carolina

Abstract
This study investigated gender differences in reading literacy achievement, and self-reported measures of reading attitude, self-perception of reading ability, reading development behavior including in- and outside-school reading activities, reading for homework, computer use, and home possessions and reading resources at fourth grade in the cross-national and cross-cultural international settings. Multivariate analysis of variance (MANOVA) and discriminant analyses were conducted, using the data of Germany, Hong Kong, Iran, Morocco, and the United States from the Progress in International Reading Literacy Study (PIRLS) 2001 database. Findings indicate that Iranian fourth grade males significantly outscored their female counterparts on the scale of overall reading literacy development behavior, though across the five nations or region females generally outperformed their male counterparts on all the reading achievement measures and outsored the male peers in most of the self-reported measures. Findings also indicate that at both upper and lower quartiles, fourth grade females tended to show more positive attitude toward reading literacy than males although males tended to have more frequent access to computers and more home literacy resources than their female peers.
Key words: gender difference, reading literacy attitude, perception of reading ability, reading literacy development behavior, reading literacy achievement, self-reported measures, fourth graders, cross-cultural and international study, multivariate and discriminant analysis.

Introduction

Reading literacy development is a complex process. The PIRLS framework (Campbell, Kelly, Mullis, Martin, & Sainsbury, 2001) identifies three major reading and literacy learning contexts: national and community context, home context, and school context. Related to these contexts are national demographics and resources, home-based language fostering activities, language at home, home resources, home-school connections, student’s outside school literacy activities, school environment and resources, teacher and instruction related factors (Campbell, et al., 2001).

Past studies have explored a broad range of social and personal factors to explain differences in school achievements. Among those social factors are home environment and possessions (Bloom, 1986; Keith, Reimers, Fehrmann, Pitterbaum, & Aubrey, 1986; Verna & Campbell, 1999), classroom or school structure and community learning environment (Alexander & Pallas, 1983; Bryk & Driscoll, 1988; Murimba, Moyo, Pfukani, Machingaidze, & Mtembo, 1994; Purkey & Smith, 1983); parent backgrounds and support (e.g., Christenson, Rounds, & Gorney, 1992; Lynch, 2002; National Center for Education Statistics [NCES], 1977), and socioeconomic status (SES) (e.g., Balli, 1996; Bracey, 1996; Rosenthal, Meline, Ginsburg, & Baker; 1981; Sojourner & Kushner, 1997).

I would like to thank Dr. Diane Monrad for her thoughtful review and feedback upon an earlier draft of the paper.
Social-cognitive and developmental behavior researchers (e.g., Bong, 1999; Eccles, Wigfield, Harold & Blumenfeld, 1993; Pintrich & Schrauben, 1992; Wigfield & Eccles, 1992) also investigated multiple personal factors such as motivation, attitude, self-concept or self-perception of ability that could affect students’ school performance, particularly achievement in reading literacy and mathematics. Past studies have found association between students’ attitude/self-concept and reading literacy achievement (e.g., Byrne, 1986; Diamond & Onwuegbuzie, 2001; Hansford & Hattie, 1982; Shavelson & Bolus, 1982; Wilgenbusch & Merrell, 1999).

Diamond and Onwuegbuzie (2001) investigated reading achievement and attitude as a function of grade, gender, ethnicity, and socioeconomic status for grades K-5 students, and found a significant relationship between reading achievement and attitudes toward reading. Hansford and Hattie (1982) conducted a meta-analysis of 128 studies and found correlations between self-concept and achievement ranged from -.77 to .96.

For many decades, the issue of gender difference has been one of the popular topics in educational, behavioral, and sociological research. Boys and girls grow, socialize, and learn quite differently. This is even more salient under different cultural and international contexts.

Studies and reports on gender differences in reading achievement within many countries and cross countries have been generally in favor of females (Elley, 1992, 1994; Mulli, Martin, Gonzalez, & Kennedy, 2003; Thorndike, 1973; Wagemaker, Taube, Munck, Kontogiannopoulou-Polydorides, & Martin, 1996).
In a reading study conducted by the International Association for the Evaluation of Educational Achievement (IEA) in 1991, nine-year-old girls significantly outperformed boys in 19 out of 27 countries (Elley, 1992, 1994). In the Progress in the International Literacy Study (PIRLS) 2001 (Mullis and colleagues, 2003), overall results showed that the fourth grade females had significantly higher achievement than their male peers for both reading purpose scores and overall reading literacy achievement in each country, and more pronounced for achievement in the section of the literary experience purpose than that for the informational purpose.

In their synthesis of an extensive literature review, Bond and Dykstra (1997) reported that females consistently outperformed males in reading achievement, regardless of the age of the students, according to various research results (i.e., Balow, 1963; Carroll, 1948; Gates, 1960; Heilman, 1961; Puley, 1951; Tomplin, 1957; Wejen & Gramlis, 1963 [as cited in Bond & Dykstra, 1997, and Diamond & Onwuegbuzie, 2001]).

Probably the most well-known demographic or social factor related to students’ school achievement is socio-economic status (SES). Although methods of operationalizing SES may vary, most often cited SES indicators include lunch status, family income, parent educational level, house location and age, and home possessions. Many studies have found association between students’ socio-economic status and their academic achievement, especially in reading literacy (e.g., Alwin & Thornton, 1984; Diamond & Onwuegbuzie, 2001; Purcell-Gates,

In an 18-year longitudinal study, Alwin and Thornton (1984) found a strong relationship between SES and verbal ability, current placement, and amount of schooling that one receives. They also found that high school grade point average was related to socioeconomic status, and that effects in the early developmental years (i.e., preschool and early elementary school) were stronger. They concluded that socioeconomic factors might have a greater impact on schooling outcomes, including reading achievement, at earlier ages.

In another reading study of fifteen countries conducted by the IEA in 1973, results indicated the socio-economic status was one of the most important contributing predictors for reading achievement (Thorndike, 1973). Walberg and Tsai (1984) documented that 13-year-olds with higher SES had higher reading achievement scores on the 1997-1980 NAEP tests than did students from low SES families. They included in the determination of SES such factors as educational level of parents and the presence of books and magazines at home.

In a more recent investigation, Walker and others (1994) reported that children from low socio-economic homes had lower scores on reading and spelling standardized achievement tests across the elementary grades. Differences were attributed to early language experiences that were associated with low SES, with those from low socioeconomic homes being at a distinct disadvantage.

Taking into account the association between SES and student achievement, SES, as an important factor or indicator, should be included in this study of the
relationship between teachers’ assessment practices and students’ reading literacy achievement.

Much of the literature on the studies of gender differences in attitude toward reading also favors females, especially for children of young age or early grades (Anderson, Tollefson, & Gilbert, 1985; Parker & Paradis, 1986; Shapiro, 1980, 1990; Stevenson & Newman, 1986; Wilgenbusch & Merrell, 1999). Females also tended to show more positive attitude toward reading with increased years of schooling than those of their male counterparts (e.g., Barnett & Irwin, 1994; Davies & Brimber, 1993; McKenna, Kear, & Ellsworth 1995; Kush & Watins, 1996).

Anderson, et al. (1985) studied the attitude toward reading of 276 intellectually gifted students in Grades 1 through 12. Overall, females in the study reported statistically significantly more positive attitudes toward reading than did males. In a study involving students enrolled in public schools in the Rocky Mountain region, and using a random sample, Parker and Pardis (1986) found significant differences between males and females in Grade 4 through 6, with females reporting statistically more positive attitudes toward reading than did males.

In a meta-analysis of 22 articles on gender difference, Wilgenbusch and Merrell (1999) found that, females reported a higher level of self-concept in verbal than male participants across sample groups (i.e., total sample, mixed sample, elementary grade sample, and secondary-grade sample) although in other content areas or constructs (i.e., Global, mathematics, physical appearance,
athletic/psychomotor coordination, emotional/affect) the pictures of gender differences are mixed.

Studies undertaken outside the United States have also supported the above-findings in attitude toward reading among male and female students. Davies and Brimer (1993), in their investigation of gender differences in a British primary school, reported that the attitudes of females aged 6-11 years toward reading and reading materials were more favorable than were those of their male counterparts.

In relation to their differences in reading literacy achievement, how males and females differ in multivariate (i.e., social and psycho-cognitive) dimensions is of great interest to educational decision-makers, and educators at large, for understanding the general pattern of gender differences in terms of their literacy development behavior will help us to find best practice and optimize our educational resources and pedagogy that fit different gender. This paper intended to compare and examine how 4th grade males and females differed in their self-reported measures including perceptions and attitudes, and behavior toward reading literacy, and in their actual reading literacy performance across nations simultaneously. As past studies indicated boys and girls differed in multivariate self-measures across ability levels (gifted versus low-achievers) (e.g., Derevensky, Hart, & Farrel, 1981; Long, Manning, & Manning, 1985), this paper also investigated whether and how fourth grade males and females differed in self-measures at different level of ability or achievement (i.e., at the top and bottom level of achievements).
Therefore, the purpose of this study, as one of the secondary analyses to the PIRLS 2001 Database, was to investigate multi-differential gender-related factors that interplay in the 4th grade students’ reading literacy development and reading literacy performance in culturally and linguistically diversified countries or regions. More specifically, it examined the multivariate relationships between 4th graders’ reading literacy development factors (particularly, self-perception and attitude toward reading, home study environment or resources, classroom learning environment, in school and outside-school reading activities, and computer use), and reading literacy achievement across genders at international level. The study explored the following research questions:

1.) Do the 4th grade boys and girls differ in overall reading literacy development behavior and/or in reading literacy achievement across the five nations in the same way?

2.) What are the distinctive features that differentiate the higher reading literacy achieving boys and girls in relation to their reading literacy development behavior and their reading literacy performance under cross national settings?

3.) What are the distinctive features that differentiate the low reading literacy achieving boys and girls in relation to their reading literacy development and their reading literacy performance under cross national settings?

Methods

Based on geographical locations, and language types, a stratified representative sample of five nations or region (i.e., Germany, Hong Kong, Iran, Morocco, and the United States) were selected from the 35 nations or region in the PIRLS 2001 database.
This sample, to a certain degree, represent culturally, and linguistically diversified countries. The population of the study was the fourth graders in the five countries or region mentioned above, and the samples comprised approximately, 25,000 cases merged for the five nations or region from the PIRLS 2001.

Two types of study were conducted: multivariate analysis of variance (MANOVA) and discriminant analyses. The variables used for the 1st study include the outcome variables-- students’ reading literacy assessment scores which is composed of three aspects (i.e., reading achievement score for acquiring or using information purpose, reading achievement score for literary experience purpose, and overall reading achievement score), as assessed by the PIRLS-2001 achievement test. The non-achievement self-measures included student’s attitude toward reading literacy, students’ self-concept of reading literacy, students’ reading development behavior (i.e., in class and outside of classroom reading literacy-related activities, follow-up reading assessment activities, reading for homework, TV watching behavior, student’s home environment or resources, students’ feeling about classroom and school literacy learning environment as measured by the student questionnaire) (see Appendix for the descriptions of the variables).

Correlations among the reading achievement scores (criterion variables), and self-measures were studied. A factorial multivariate analysis of variance (MANOVA), using the six scales—reading for acquiring and using information, reading for literary experience, and overall reading achievement, reading attitude, self-perception in reading literacy, and overall reading development/practice as repeated measures, was conducted
to investigate the multivariate relations among various self-measures and the criterion variables.

For the second study, a subset was used that contains only the upper quartile (75th percentile and above) and the lower quartile (25th percentile and below) data points of the above-mentioned five nations or region on the international benchmark.

The first discriminant analysis was conducted in order to describe the gender differential features that may distinguish boys and girls at or above the upper quartile across the five nations or region, using the gender as the classification variable, and a series of self-measures as indicator or discriminating variables (e.g., self-concept, reading attitude, home reading literacy resources, in class and outside school reading activities, reading for homework, and reading literacy-related home possessions) gathered from the student questionnaires.

The second discriminant analysis was conducted to describe the differential features that set apart boys and girls at the bottom 25th percentile across the five nations or region. Similar to the top students' study, gender was used as the classification variable, and self-concept of reading, reading attitude, home literacy resources, in school and outside school reading activities, reading for homework, and reading literacy-related home possessions along with the criterion variables were used as discriminating variables.

Results

Study 1

**Correlation of Variables and Multivariate Analysis of Variance of Six Measures or Scales.** Table 1 illustrates the correlations among the self-measures and the criterion variables. For both boys and girls, students’ self-perception about reading was moderately
positively correlated to their overall reading achievement \( (r = .309, \text{ and } r = .344 \) respectively). Students’ attitude toward reading was slightly positively \( (r = .114, \text{ and } r = .041, \) respectively) related to their overall reading achievement. Student home language use and home possessions are positively \( (r = .466^a/454^b, \text{ and } r = .542^a/.528^b, \) respectively) correlated to their reading achievement. Students’ second portion of things outside school, and their home learning resources are slightly positive related to their reading achievement. Moderately negative correlations were found between students’ overall reading achievement—the criterion variable and the first port of students’ things outside of school \( (r = -.232^a/-245^b) \), between the criterion variable and students’ after-class reading assessment activities \( (r = -.359^a/-370^b) \), and between the criterion variable and student reading for homework \( (r = -.293^a/-268^b) \). Slightly negative relations were found between the criterion variable and students’ computer use \( (r = -.085^a/-060^b) \), and between the criterion and students’ feeling about school \( (r = -.006^a/-022^b) \). A comparison of the correlations cross gender did not show any significant difference between girls and boys among the correlations between the criterion variable—overall reading achievement and self-measures although noticeable gender difference was found on the correlation between the criterion and the students’ attitude toward reading, and the correlation between the students’ literacy practice and their reading self-perception.

----------------------------------------------------------------------------------------------------------------------

Figure 1 visually depicts the gender differences in overall reading literacy development practice or behavior across the five nations or region. Table 2 provides the descriptive statistics of the six scales across the five nations or region.

\[ \text{the correlation coefficient for the girls, and } \text{the correlation coefficient for the boys.} \]
The six scales included (1.) reading achievement for acquiring and using information, (2.) reading achievement for literary experience, (3.) overall reading achievement, (4.) reading self-perception, (5.) reading attitude, and (6.) overall reading literacy development behavior (see Appendix for the details of variables).

As consistent with the PIRLS 2001 Report, across the five countries or region, girls showed higher mean scores on five of the six scales—reading achievement for acquiring and using information, reading achievement for literary experience, overall reading achievement, reading self perception, and reading attitude.

However, on scale 6 (overall reading literacy practice or development behavior), Iranian 4th grade males showed higher mean scores than their female counterparts. For other four nations or regions, girls on average outscored boys on this scale, too.

As shown in Table 3, the multivariate analysis of variance (MANOVA) of the six scales (repeated measures) indicated three significant interaction effects (a country × scale × sex three-way interaction, two significant two way interactions: scale × sex, and scale × country), and a scale main effect. As a secondary research to the PIRLS 2001, the current study focused on the sex by scale interaction.

As illustrated by Table 4, the follow-up multiple t-tests of scales between boys and girls indicated that except for Iran, girls did significantly better than their male
counterparts in all the six scales. As for Iran, girls outdid the boys in five of the six scales. On the sixth scale of overall reading development practice, however, Iranian boys outsored the girls significantly. To maintain the overall Type I error rate at .05, a significant level for each test was set at .0008. All the tests were significant at the adjusted Bonferroni alpha level.

Study 2

Discriminant Analysis 1 for Boys and Girls at the Upper Quartile International Benchmark. As shown by Table 5, at and above the upper quartile international benchmark for the five nations or region under discussion, girls outperformed boys on all the subscales in relation to reading literacy achievement, i.e., on the measures for reading achievement for acquiring and using information purpose, reading achievement for literary experience purpose, and for overall reading achievement. As for the self-measures, girls scored higher than boys on some aspects of “[reading literacy] things outside of school [portion 1]” (see Appendix for detail), reading follow-up assessment activities, reading attitude, self-perception of reading ability, feelings about school literacy learning environment, home possessions, whereas boys scored slightly higher than girls on the subscale of “things outside school” [portion 2], reading for homework, home oral language use opportunity, and overall home reading literacy resources.

As shown by Table 6, for higher achievers, correlation coefficients between each of the three reading dimension scales and the self-measures are moderate or weak,
ranging from naught to about .23 (e.g., \( r = .23 \) for reading for literary experience purpose [plausible value 1] and home oral language use, \( r = .21 \) for reading for literary experience purpose [plausible value 1] and student reading perception, and \( r = .20 \) for home reading literacy resources, \( r = .21 \) for overall reading achievement [plausible value 1] and student reading perception). The associations among most of the background variables or self-measures are weak. Moderately positive correlations are found between “things outside of school” portion 1 and portion 2 (reading practice outside school, see Appendix for detail) and student follow-up assessment activities, between reading practice outside school 1 (see Appendix for detail) and student reading attitude, and between home oral language use opportunity and home literacy resources, and between home possessions and home reading literacy resources. The highest positive correlation (\( r = .87 \)) was found between computer use and home literacy resources as they share something in common.

<table>
<thead>
<tr>
<th>Insert Table 6 here</th>
</tr>
</thead>
</table>

Table 7 and Table 8 provide eigenvalues and significant test of the function. The eigenvalues for the discriminant function for top student boys and girls is .091 and canonical correlation is .289. Wilks’ Lambda for the test of this function (.916) and Chi-square statistics (322.947) indicates this discriminant function is significant (\( p < .001 \)).

<table>
<thead>
<tr>
<th>Insert Table 7 here</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Insert Table 8 here</th>
</tr>
</thead>
</table>
As shown by Table 9, when we examine the standardized function coefficients for top portion of the students, home reading literacy resources (Tothmres) makes the greatest contribution. Students’ reading attitude (Totratti) and computer use (Totcompu) also contributed significantly. All other variables make no significant contribution to the function.

When we examine the within-group correlation between the variables and the discriminant function (see Table 10), student’s attitude toward reading has the highest correlation (.651), followed by student’s feeling about the literacy learning environment (.382), computer use (-.347), and home reading resources (-.306). This function might be characterized as the “reading attitude-home reading resources” continuum dimension.

Table 11 illustrates the group means at centroids. We may infer that top boys and girls across the five above-mentioned nations or region mainly differed in their attitude toward reading literacy development. The boys tended to show low scores in their attitude toward reading scale, whereas the girls tended to indicate high scores in this scale that were assessed by the PIRLS student background questionnaires. Upper quartile boys also tended to have more frequent computer use, and more abundant home reading resources than their female counterparts.
Discriminant Analysis 2 for Boys and Girls at the Lower Quartile International Benchmark. As shown by Table 12, at the lower quartile international benchmark for the five nations or region under discussion, girls outperformed boys on the most of the subscales in relation to reading literacy achievement, i.e., on the measures for reading achievement for acquiring and using information purpose (asrinf01-asrinf05), some portions of reading achievement for literary experience purpose (asrlit01 and asrlit04), and for overall reading achievement except for asrrea03. As for the background or self-measure subscales, girls outscored boys on the aspects of “[reading literacy] things outside of school,” “reading practice after class” or assessment activities, reading for homework, reading attitude, reading self-perception, feeling about school literacy learning atmosphere, home oral language opportunity, home possessions, whereas, boys outscored girls in the subscales of reading for literary experience purpose (asrlit02, asrlit03) and overall reading achievement (asrrea03), and in their responses to the aspects of computer use, and home reading literacy resources.

As shown by Table 13, for lower literacy achievers, correlations between each of the three reading dimension criterion scales and the self-measures are weak, and mostly negative, ranging from naught to about -.21 (e.g., r = -.21 for asrinf01 and “things outside of school” portion 1, r = -.21 for reading to acquire and use information

---

For each aspect of reading achievement, PIRLS 2001 has five plausible values or replicated scores (e.g., asrinf01-asrinf05, scores for informative purpose). Each of them is a valid measure.
[plausible value 1](asrinf01) and student follow-up assessment activities, and $r = -0.214$
for reading to acquire and use information [plausible value 1](asrrea01) and “things outside school” [portion 1]. The associations among most of the self-measures are moderate or weak. Moderately positive correlations are found between “things outside of school portion 1 or portion 2 (reading practice outside school, see Appendix for detail) and student follow-up assessment activities ($r = 0.59$, and $r = 0.47$), between reading practice outside school (portion 1) and student reading attitude ($r = 0.423$), and between home oral language use opportunity and home literacy resources ($r = 0.46$), and between students “things outside of school” (portion 1) and feelings about school literacy learning environment ($r = 0.32$). Similar to the findings with higher achievers, the highest positive correlation ($r = 0.92$) was found between computer use and home literacy resources as the subscales may overlap or share something in common.

Table 14 shows the eigenvalue for the discriminant function is 0.074 and the canonical correlation is 0.263. Wilks’ Lambda test (.931) in Table 15 indicates that the discriminant function is statistically significant ($p < .001$).

As shown by Table 16, for the lower achievers—bottom portion of the students, home reading literacy resources (Tothmres) makes the greatest contribution. Computer use (Totcompu) makes next most significant contribution.
Variables of overall reading achievement (asrrea04), reading for information purpose (asrinf03), reading for literacy purpose (asrlit02), and home oral language opportunity (homelang) also contributed significantly to the function.

In examining the correlations between the discriminant function and variables (Table 17), we find that students’ attitude toward reading has the highest correlation (.482), followed by “things outside school” (portion 1) (.434), and students’ “feeling about school literacy learning atmosphere” (.313), “reading for homework” (.292) and reading perception (.257) with moderate positive coefficients. Thus, this function is mainly concerned with reading attitude and perception, and we may call it the “reading attitude and perception” dimension.

Examining the group means at centroids for the bottom portion of the five nations or region (Table 18), we find that similar to the findings with the top students, for lower achieving students, boys tended to be low in reading attitude scale measure, whereas girls would tend to hold more positive attitude toward reading literacy.

Summary and Discussion

The multivariate analysis of variance of the six scales (three achievement scales and three non-achievement measures) indicated a significant scale by
gender interaction effect, and the post hoc univariate analysis provided evidence that across the five nations or region, girls generally outperformed boys in all the aspects of reading literacy achievement tests, and girls also had higher scores in self-perception of reading, reading attitude, and outside school reading activities than boys. This finding is consistent with the IEA previous studies and PIRLS 2001. However, Iranian boys outscored the Iranian girls in respect of overall reading literacy practice or development activities. As the five nations or region chosen represent different national performance levels, and Iran was at the low performance level as compared with Germany, the United States, and Hong Kong, and the only Islam nation chosen, the differences across gender in literacy achievement and in their responses to some of the categorical scales may be country-specific or culturally determinate, for in Islam countries females are usually more constrained in socialization and this may negatively affect their self-perception of ability and attitude toward reading and thence their overall reading literacy developmental practice or behavior.

An examination of the correlations between the criterion variables (the three aspects of reading literacy achievement and the non-achievement self-reported measures indicated that only moderate positive association was found between students’ self-perception of reading and the criterion variables, and weak relations were found between the criterion and most of the self-measures. Although negative correlations were found between students’ reading achievement--criterion variable and the first portion of students’ outside-of-school reading activities, between the criterion variable and students’ after-school reading

20
assessment, and between the criterion variable and student reading for homework, between the criterion variable and students’ computer use, and between the criterion and students’ feeling about school, we should be cautious of interpretation and implication as the magnitude of the correlation was so small. It may indicate that those classification measures or constructs need to be redefined; or, those classification variables are highly inter-correlated, but only marginally correlated to the criterion variables, and therefore multi-collinearity remains, which calls for further analyses.

For both top and bottom portion of the students, girls tended to have more positive attitude toward reading literacy than boys although boys tended to have more frequent access to computers and/or home reading literacy resource than do girls. The results are consistent with previous studies on gender differences in reading attitudes (e.g., Anderson, et al., 1985; Davies & Brimber, 1993; Parker & Paradis, 1986; Diamond & Onwuegbuzie, 2001; Hansford & Hattie, 1982; Shavelson & Bolus, 1982; Wilgenbusch & Merrell, 1999). The results indicate that attitude and self-perception of reading stand out as a distinctive feature between the fourth grade males and females. This gender attitudinal difference at early age and at later grades may explain why females usually outperform their male peers in reading literacy achievement.

The results did not show evidence to support the hypothesized positive association between computer use, or home reading facilities/resources and overall reading literacy achievement. The results were inconsistent with previous
studies (e.g., Darter & Phelps, 1990) that indicated positive impact of computer use on the part of students and their reading achievement. One possible explanation might be that these young children (particularly, boys) did not make good use of the computers or facilities for literacy learning purpose, but rather for non-literacy learning purposes (e.g., computer/video game or entertainment purpose). Teacher- or parent-guided use of computer especially for early age children may play a vital role in children’s positive reading behavior development. It is recommended that further experimental studies be conducted on the relationship between student achievement and the guided and non-guided use of computers on part of students.

This current study is limited in some ways. First, as no experiment was involved in the PIRLS 2001 study, we could not draw causal relationship between the criterion measures (reading literacy achievement) and the self-reported non-achievement measures even if high correlations or high discriminant coefficients were found.

Constrained by the design of the PIRLS 2001, for the United States and Morocco, no parent questionnaire was administered. Thus in this study I did not include some important home and parent related variables such as SES, parental educational level, parental sexual orientation, parental attitude and perception of reading, and parental involvement or support. It is recommended that future studies should include these variables so as to gain a more complete view-point of gender difference issues under broad social contexts.

Note: Test was weighted by totwgt (total sstudent weight). Scale 1 = PLAUSIBLE VALUE: INFORMATION BLOCKS PV1(Asrinf01), Scale 2 = PLAUSIBLE VALUE: LITERARY BLOCKS PV1(Asrlit01), Scale 3 = PLAUSIBLE VALUE: ALL BLOCKS PV1(Asrrea01), Scale 4 = student reading perceptions about reading (Totrpert), Scale 5 = student reading attitude (Totratti), and Scale 6 = student total literacy reading practice score (Litpract).

F = females. M = males. The first of the five plausible values for each of the three aspects reading achievement scores was used in this part of analysis.

He also works as a research assistant at the Office of Program Evaluation, College of Education, University of South Carolina, and has participated in the evaluation of several federal- or state-funded programs such as South Carolina Reading Initiative (SCRI), South Carolina Reading First, and Engineering Bridges Project. His research interests include research methodology, measurement and assessment issues, program evaluation, interdisciplinary and international studies, and gender issues.
Influence of School Characteristics on A Regional Literacy Program Effect of Individual Teachers

Shiqi Hao
Office of Program Evaluation, College of Education
University of South Carolina

Abstract

This study investigated the differential effect of school (organizational) characteristics on the South Carolina Reading Initiative (SCRI) individual teachers’ end-of-program responses about their beliefs and practice of reading and literacy instruction as measured by the Reading Profile (RP) by using a two level hierarchical linear model. Results showed that administrative and staff support as an important school level characteristic made a difference on the school teachers’ average program effect in terms of RP.
responses scores. More specifically, schools that showed support to the SCRI teachers would yield high average teachers’ RP scores than those non-supportive schools. Other school compositional factors such as high minority status, student-per-teacher ratio, Title 1 school district status also made a difference in predicting overall mean school RP scores. The results did not support the implied hypotheses that the pretest of the Teaching Orientation to the Reading Profile (TORP), or that gender would well predict a teacher’s response to the RP although some of the level 2 predictors did contribute to the gender difference in predicting a teacher’s response in a typical school to the Reading Profile. Implications of the study and directions for future study were also discussed.

Introduction

Over the years, educational researchers and program evaluators have observed the multi-level or multi-layered effects in their studies of the program effects, and recommended the application of hierarchical linear modeling in the multilevel data analysis (e.g., Adcock & Phillips, 2000; Burstein, 1980; Koopmans, 1998; Raudenbush & Sampson, 1999; Wang, 1999, Yen, Schafer, & Rahman, 1999; Young, 1999). School systems are generally hierarchical or nested in layers (Barr & Dreeben, 1981; Purkey & Smith, 1983). Following this line, often the effects of a program are multi-layered: at one end we would like to see how a program affects individuals (e.g., students or teachers as compared with classroom and school or superordinate organization); at the other end we see individuals are nested in the classrooms, schools, districts or a larger unit. Therefore, superordinate factors (i.e., classroom, school environment or compositional characteristics) can often play an important role in the overall program effect on individuals.
Previous studies have utilized Hierarchical Linear Modeling (HLM) to investigate both student level and school level factors and program effects (e.g., Kobrin et al., 2003; Lee & Bryk, 1989; Lee & Coladarci, 2002; Marzano, 2000, and 2001; Pellerin, 2000; Rumberger, 2002; Stage, 2001; Yamaguchi et al., 2003). Kobrin et al. (2003) used HLM to examine student- and school-level predictors of the discrepancy between students standardized high school grade point average (HSGPA) and standardized total Scholastic Assessment Test (SAT) scores. At the student level, they used academic curriculum intensity, socioeconomic status (SES), the difference between a student SAT mathematics and verbal scores (SATM-V), and gender to predict the HSGPA-SAT discrepancy within each school. At the school level, they chose four factor aggregated scores (economic advantage, school size, computer technology, and school resources) to predict variation in the intercepts (average scores) and slopes (variations) across schools. They found that all of the student-level variables except for curriculum intensity were significant predictors of discrepancy scores, and level 1 intercepts as well as slopes for gender varied significantly across schools.

Luyten (1998) compared elementary and secondary schools in the Netherlands with respect to the consistency of achievement scores across subjects at individual and school levels. They found that there was less consistency at the student level within schools, and lower consistency in secondary education than elementary schools at the school level.

One of the interesting areas in social and educational research is the relationship between a program effect on individual (e.g., students or teachers) and the mediated effect of the organizational characteristics (i.e., school environment or backgrounds).
across the schools. Bryk and Driscoll (1988) used the Administrator and Teacher Supplement of the High School and Beyond Survey to investigate how characteristics of school organization were related to teachers’ sense of efficacy in their work. They hypothesized that teachers’ efficacy would be higher in schools with a communal, rather than a bureaucratic, organizational form. Their results indicated that teacher efficacy was substantially higher in schools with a communal organization, even after controlling for compositional differences among schools.

Armor et al. (1976) examined the program effect of 20 Los Angeles schools participating in a special program to improve reading. The authors suggested that the following school characteristics were associated with gains in reading performance: (a). teachers’ strong sense of efficacy and high expectations for students; (b) maintenance of orderly classrooms; (c) high levels of parent-teacher and parent-principal contact; (d) ongoing in-service training of teachers with topics often determined by teachers, together with frequent informal consultations among teachers in implementing reading programs; (e) principals who achieve a balance between a strong leadership role for themselves and maximum autonomy for teachers, and (f) teacher flexibility in modifying and adapting instructional approaches.

The literature in the study of school effectiveness has also indicated the students’ improvement in learning and general program effect were influenced by the climate of the school or school culture (e.g., Rutter, 1981; Rutter et al., 1979; Wynn, 1980; Purkey & Smith, 1083). “A school culture perspective rejects the view that schools are relative static constructs of discrete variable. Instead, schools are thought to be dynamic social systems made up of interrelated factors “ (Brookover et al., 1979) (as cited by Purkey and
Based on research on effective schools (e.g., Averch et al., 1972; Mayeske, et al., 1972; Edmonds, 1979a, 1979b, 1981; Purkey & Smith, 1983), effective schools were characterized of the following five aspects: (1.) strong administrative leadership; (2.) high expectations for children’s achievement; (3.) an orderly atmosphere conducive to learning; (4.) an emphasis on basic-skill acquisition, and (5.) frequent monitoring of pupil progress. Although HLM as a research tool has been widely used in the analysis of multilevel data, particularly in the studies of students’ achievement and classroom or school characteristics, few recent studies by way of HLM has been found on school organizational characteristics and their mediating effects in a program on teachers.

South Carolina Reading Initiative (SCRI) was a three-year longitudinal state-wide intensive staff development effort designed to improve reading skills and strategies of children and to increase the teachers’ knowledge about reading research and provide teachers with administrative and in-class support they need to be consistent with reading research. One of the program effects is how teachers’ beliefs and practice of reading and literacy teaching methodology in their classroom were aligned with the SCRI Reading Profile (RP) after the three-year period of the project. It was of primary interest to the investigators how an individual teacher’s beliefs and practice in terms of literacy teaching strategies improved toward more (or less) alignment with the SCRI RP was related to the school level characteristics. These school environment characteristics included such variables as whether the administration (e.g., principal) and staff was supportive to the project or not, whether a school district was of Title 1 or not, student population size, component of minority students, etc. The purpose of this current study was to investigate the differential effect of school (organizational) characteristics on the individual teachers’
end-of-program responses about their beliefs and practice about reading and literacy
instruction as measured by the Reading Profile (RP) in the SCRI by using a two level
HLM model. Thus, this study investigated both individual teacher effect and the school
level effects upon the teachers. It was hypothesized that an individual teacher’s final year
responses on the RP in terms of alignment with SCRI classroom literacy theory and
practice was not only determined by individual personal effect, but was also influenced
by his or her school characteristics as mentioned above. In this study the following
research questions were explored:

1.) Would school compositional characteristics (e.g., administrative supportive or
not, proportion of minority students, student-per-teacher ratio, Title 1 school or
not) be related to the average school Reading Profile score (school program
effect)?

2.) Would school compositional characteristics be related to the gender difference of
a typical school teacher’s responses to the Reading Profile at the end of the three
year program?

3.) Would the pre-test--Teaching Orientation to Reading Profile (TORP) prior to the
SCRI project be a significant level one predictor while controlling gender?

4.) Would gender make a difference in predicting a teacher’s end-of-program effect
(RP scores) while controlling the TORP prior to the project? The current study,
which empirically investigated both teacher level factors and school level factors, would
shed light on some common distinguishing features or characteristics between a potential
successful or unsuccessful school in a regional program implementation, and therefore
contributed to the literature in school influence research.
Method

The data for the current study was collected from the South Carolina Reading Initiative (SCRI) teachers’ Reading Profile and TORP survey data. The level 2 units contained 156 public elementary or intermediate schools involved in the SCRI across South Carolina, USA. The level 1 (teacher) dataset contained 994 data points. The level 1 variables included SCRI teachers’ Reading Profile scores at the end of the three-year program (as the outcome variable), teachers’ gender, and their TORP scores (as a pre-test prior to the program introduction), and their years of teaching experience. The school level variables included the administrative and staff supportive status (a dummy dichotomous variable with 1=support and 0=non-supportive), group mean TORP (pre-test), student-per-teacher ratio, student enrollment or population size, Title 1 school district status (dummy-coded with 1 being a Title I school district, and 0 otherwise), and high minority student school status--an indicator variable with value 1 if a school has more than 50% minority enrollment and 0 otherwise (for details of variable codings, please refer to Appendix).

As summarized in Table 1, on the RP (a 60 item Likert-scaled, and 4-point scale survey), with a possible maximal total score of 240, SCRI teachers’ average RP score was 220.66 with a standard deviation of 13.88. On the TORP (a 28 item likert-scaled, and 5-point survey), out of a maximal possible total score of 140, SCRI teachers scored on average about 84 points with a standard deviation of 9.85 prior to the first year of the program. On level two, 79% of schools had administrative and staff support, and 93% belonged to a Title 1 school district. High minority student schools made up 47% of the

1 I would like to thank Dr. Diane Stephens, the PI and professor of reading instruction at the University of South Carolina, for allowing me to use the SCRI data to accomplish this study.
156 schools sampled. School student population sizes ranged from 125 to over 2000, and students-per-teacher ratios varied from approximately 6 to 18. School mean TORP (mean pre-test) scores ranged from 97 to about 100.

In analyzing the data, the author of the current study tested several two level hierarchical linear models. In order to determine the total amount of variability in the outcome (SCRI teachers’ responses to the Reading Profile at the end of the program), I first ran a baseline model (a random effect ANOVA model) without predictors for either level 1 or level 2 equations. The average school mean RP was estimated as 220.62, and the pooled within school variance was 128.63 (See Table 2). Next I added the predictors of gender and pre-test (TTORP1) (group-centered) to level 1 equation while at level 2, I added six predictors, i.e., MTORP, HIMINORI, STTRATIO, ENROLL, TITLE-1, and SUPPORT to level 2 equation, thus making it a conditional full or saturated model.

In the initial analysis using the full model, several of the estimated coefficients were trivially small (ENROLL, $\gamma_{04}$, $\gamma_{14}$, $\gamma_{24}$ and $\gamma_{34}$; MTORP1, $\gamma_{11}$, $\gamma_{21}$, $\gamma_{31}$, etc.). Therefore, each of these corresponding level-2 predictors were deleted and a reduced model was estimated. Finally, I selected an intercepts- and slopes-as-outcomes model:

Level-1 Model: $Y_{ij} = \beta_{0j} + \beta_{1j}(GENDER) + \beta_{2j}(TTORP1) + r_{ij}$

(TTORP1 was group-centered).
Level-2 Model:

\[
\beta_{0j} = \gamma_0 + \gamma_1 (\text{HIMINORI}) + \gamma_2 (\text{STTRATIO}) + \gamma_3 (\text{SUPPORT}) + \gamma_4 (\text{TITLE}_1) + \mu_{0j}
\]

\[
\beta_{1j} = \gamma_{10} + \gamma_{11} (\text{HIMINORI}) + \gamma_{12} (\text{STTRATIO}) + \gamma_{13} (\text{SUPPORT}) + \gamma_{14} (\text{TITLE}_1) + \mu_{1j}
\]

(The residual school-specific random effects, \( \mu_{0j} \) and \( \mu_{1j} \) were each assumed normally distributed with mean 0 and variance \( \tau_{00} \), and \( \tau_{10} \), respectively)

\[
\beta_{2j} = \gamma_{20} .
\]

(TTORP1 was fixed across schools, assuming there was not much variability as to the pre-test scores between schools). The level-1 variance has been reduced to 148.64 from 168.23 after taking into account of teachers’ gender, and the pre-test TORP. The increment proportion of variance explained by this Level 1 model is 

\[
\frac{168.23 - 148.64}{168.23} = 0.12.\]

The reliability estimate for the intercept \( B_0 \) was 0.602, and for gender slope \( B_1 \) was 0.468. The results for the final chosen model are presented in Table 3 in the results section.

Results

School Mean Reading Profile Score. As shown in Table 3, mean RP was lower in schools with high minority concentrations (\( \hat{\gamma}_{01} = -14.32, t = -2.68 \)), and in schools with higher student-per-teacher ratio than those with lower student-per-teacher ratio (\( \hat{\gamma}_{02} = -4.26, t = -2.96 \)) (see Table 3). Title1 schools would achieve higher average RP scores than non-Title1 schools (\( \hat{\gamma}_{04} = 14.36, t = 1.58 \), but also with large standard error of 9.07). Those schools where teachers received administrative and staff support achieved higher RP than those schools where teachers did not receive administrative and staff support (\( \hat{\gamma}_{03} = 23.75, t = 2.89 \)). More specifically, on average, the SCRI schools with
administrative and staff support would usually achieve about 24 points more on the total score for the RP than those schools without the support.

**Gender Difference.** Gender difference in RP was higher in high minority student schools than non-high minority student schools ($\hat{\gamma}_{11} = 11.80, t = 2.24$), and in those schools with higher student-per-teacher ratio than otherwise ($\hat{\gamma}_{12} = 4.72, t = 3.23$) (see Table 3). But gender slopes were significantly weaker in Title 1 schools than non-Title 1 schools ($\hat{\gamma}_{14} = -21.37, t = -2.38$) and in the schools with administrative and staff support than otherwise ($\hat{\gamma}_{13} = -18.80, t = -2.22$). This means that other things being equal, male and female teachers were more homogenous in their end-of-program RP response in Title 1 schools than non-Title 1 schools and in supportive schools than non-supportive schools.

**Mean Pre-test (TORP1) Difference.** As shown in Table 3, all the level 2 or school-level variables of interest did not contribute to the significant difference of teachers’ responses on the pre-test on the SCRI teachers’ orientation of Reading Profile (TORP). On average, mean pre-test difference for all the schools was only less than 1 point.

Discussion and Conclusion

The results of analysis confirmed that administrative and staff support as an important school level characteristic made a difference on the school teachers’ average program effect in terms of RP responses scores. More specifically, schools that showed administrative or staff support to the SCRI teachers would achieve approximately 24 points more on the RP on average than those non-supportive schools. This result is
consistent with previous studies on effective schools (e.g., Edmons, 1979a, 1979b, 1981; Purkey & Smith, 1983). Other school compositional factors such as high minority status, student-per-teacher ratio, Title 1 school district status also made a difference in predicting overall mean school RP scores between schools. The data did not support the implied hypothesis that the pretest Teaching Orientation to Reading Profile (TORP) or that gender would well predict a teacher’s response to RP although some of the level 2 predictors did contribute to the gender difference in predicting a typical school teacher’s response to RP. Moreover, none of the level 2 predictors or school level factors significantly contributed to the explanation of the slope of TORP gap across schools. This may indicate that TORP as a pretest was not related to those school characteristics such as high minority student component, student-per-teacher ratio, student population size, and Title 1 status. The result of data analysis also suggested that school mean pretest TORP, school student population size were not a significant school level predictors (at least for this sample) that contributed to the level 1 slopes (regression coefficients).

As shown in Table 3, there is still quite a lot of variance that remains unexplained in level 1 model. This may mean that there are more important predictors that have been excluded. For future studies, it is recommended that level 1 variables of interest may include teachers’ salary, teachers’ first year or not, teachers’ educational background, and certified or subjects of teaching, and prior experience or involvement in similar programs. School level compositional factors may include average student SES status, average teachers’ salary, average PACT score, school teacher turnover rate, and so on. It is also recommended that future studies may incorporate a growth model that can measure
longitudinally the teachers’ level program effect (teachers’ change over time) and school
environment or background effects on the program effect of teachers across schools.

Panel Abstract:
In this panel, we explore how cultural encounters are being re-theorized and how the concept of culture is changing in the process. Much recent anthropological writing points out that culture is always emergent through interactions and encounters with the Other. Mary Louise Pratt and James Clifford provide us with the useful notion of "contact zone" as a space in which culture emerges through power-laden encounters of people from different places and positions. Building on their insights, we examine exactly what happens in terms of cultural production in the
cross-cultural encounters, how differences and similarities are articulated, and how elucidating the process of encounter contributes to anthropological theories of culture. Examples are drawn from East European Indianists reenacting North American Native peoples; strategic collaboration in Yoruba culture production between Yoruba performers, an Austrian sculptor, and a German scholar; Japanese tour guides interpreting Canadian nature; and Western travel narratives of cultural contact and recoding in New Guinea. After presentations of each panelist's research, we will open the discussion with the audience.

**Spearheading American Indian Cultures:**

**Cultural Appropriation and Military Encounters in Europe and the Middle East**

*German V. Dziebel, Stanford University*

On the basis of fieldwork in Eastern and Western Europe in 2000-2001, I will discuss the phenomenon of the appropriation of American Indian cultures in Europe and especially its utilization in military contexts. I will focus on the case of the use of American Indian war “magic” and gear by a platoon of Russian Special Forces in Chechnya, and position it, on the one hand, within the highly diversified culture of the reenactment of “traditional” American Indian cultures by contemporary Europeans and, on the other, within the history of American Indian support of the U.S. military incursions. I will argue that the globalization of the American Indian cultural heritage during the 20th century and its exportation into Europe have been taking place in close connection with changing patterns of internal relationships between American Indian communities and the U.S. government, both at peace and at war. Culture, instead of being seen as a temporally and spatially boxed entity, should be interpreted as the coalescence of several power interests that cross the boundaries of nation-states and tribal communities to form a sovereign symbolic structure of action and interpretation.

**Sculpting Osogbo: Strategic Collaborations among Yoruba Artists, an Austrian Sculptor, and a German Scholar**

*Debra L. Klein, Vassar College*

This article maps out an alternative history of Yoruba culture production in Osogbo, Nigeria by charting the paths and relationships of two key foreigners, Susanne Wenger and Ulli Beier, who have consistently participated in the cultural and spiritual life of Osogbo since their arrival in 1950. By examining the stories of an Austrian artist and a German scholar in Osogbo, I shift the anthropological gaze to the collaborative process of transnational, transcultural brokerage in creating identities and movements. I illustrate how the process of sculpting a town-specific identity—Osogbo Yoruba—is a strategic collaborative endeavor that implicates European
assumptions about the Yoruba Other as much as Yoruba artists’ desires to reclaim themselves. I trace the tendril-like process of generating excitement about Yoruba culture, as it emerged out of conversations, encounters and casual talk during my field research in the 1990s.

**Enchanting Nature: Japanese Tourism in the Canadian Rockies**
Shiho Satsuka, Stanford University

This paper examines the role of Japanese tour guides as mediators in Japanese overseas tourism. In particular, I analyze how Japanese tour guides in the Canadian Rockies became enchanting commodities for tourists from Japan in their work of interpreting Canadian natural landscape. Drawing ethnographic examples from guide training sessions, I discuss how tour guides were struggling to translate different notions of humanity in the process of transforming themselves into an attractive commodity for Japanese tourists. Through this discussion, the paper explores how the subjectivity in the post-industrial capitalism has been produced through travel encounters.

**Cultural Recoding in, by, and of Contact Tales from the New Guinea Archive**
Susan Harding, University of California, Santa Cruz

Much Western travel literature, including tourist studies, produces and enacts, even as it criticizes, Western domination. It does so by obscuring autonomous and semi-autonomous interests and power in play and the extent to which the outcomes of cross-cultural encounters, including tourism, are complex, contingent, and constantly subject to negotiation. A contact zone approach to tourism, and to travel encounters more generally, brings these dimensions to the fore, among other ways, by focusing on the recoding practices of all sides in cross-cultural encounters. Recoding presumes a degree of intimacy and sustained contact, though may begin within hours of “first contact,” and involves taking up the discourse of the other and revoicing it, redirecting it toward one’s own ends. Although at moments recoding may be a conscious, even a cynically manipulative, process, it is mostly and more often unconscious, spontaneous, and open-ended, an inescapable aspect of all cross-cultural encounters. Western travel literature, including much of tourist studies, is an aggressive set of narrative conventions for recoding cultural others and elsewheres in ways that enact Western domination through the constant erasure of its own recoding practices and those of encountered others, thus masking the dialogics of engagement in favor of tropes of superiority and/or domination. In this paper, I re-view some classics from the travel archives of Western/New Guinea contact (“First Contact,” “Cannibal Tours,” “Cannibals and Crampons”) as well as an alternative, “contact zone” account (“Paradise”), show how recoding practices are variously figured, and discuss the narrative politics of those figurations.

6. African American mainstream film in the 1990s, “black city spaces existed within limited historical parameters in which the city had always existed in its present form, or, perhaps, as it appeared in blaxploitation films from the 1970s.” Her project, along with that of Jacqueline Najuma Stewart in her forthcoming Migrating to the Movies: Cinema and Black Urban Modernity, is to broaden the historical context of the black city by examining earlier representations by black (and to a lesser extent white) filmmakers. Some films, however, have attempted to frame the urban experience as a process of historical decay represented cinematically and accounted for by forces both from without and from within the African American community. One such film discussed by Massood, Menace II Society, chronicles the downward spiral of Watts since 1965. An overlooked film that appeared after Massood’s book was published, Bones, ingeniously uses a ghost story to contrast the present-day decrepitude of a fictional black urban landscape with the roots of its decay in an idealized 1970s as resulting from individuals’ actions, social and political developments, and mythical/supernatural influences.
Uncertainty Principles:
Emerging Ethical Consciousness and Narrative Strategy

As writers create stories within fragile and contested territories, they are often confronted by difficult ethical questions. When the lives of people from different cultures, races and genders intersect, whose story should be told? Does the person of white, European ancestry have the right to tell his/her part of that story? Does a man have the right to tell a woman’s story? If so, from whose point of view? If not, should stories be peopled only with one’s own race, one’s own gender? What is the responsibility of the writer to create stories of the world she/he observes and lives in rather than the ideal one in which most of us would like to live? As South African writer, Mognane Wally Serote so aptly asked, “How shall we look at each other then?”¹

These questions are not just philosophical for the writer. The answers may determine what we will or will not permit ourselves to write, especially if

¹ Looking toward a post-apartheid South Africa, Serote posed this question in A Tough Tale.
we want to approach story-telling with a sensitive eye to the power of literature to show readers a world of diverse and intersecting experiences.

This paper examines social and political questions facing today’s writers and explores emerging ethical strategies for entering the space of intersecting experiences shared by disparate characters who find themselves caught in the same uncertain moment. Techniques of perspective such as witness/reflection, circular surveillance, montage, and pronoun bridging will be examined in the works of South African writer, Nadine Gordimer and Australian writer, Janette Turner Hospital.

Abstract
"From the Other End of the Leash: A Look at Animal-Assisted Therapy from the Animals' Perspective"

By Alison Hatch
Department of Sociology
University of Colorado at Boulder
Alison.Hatch@colorado.edu

Over the last couple of decades, Animal-Assisted Therapy (ATT) programs have gained in popularity. Accompanying, and perhaps in part fueling, the relative abundance of AAT programs is a vast array of literature that attests to the many benefits such programs are said to have for humans. The prevalent perspective for current research on AAT is "what can non-human animals do for us?" with little or no consideration to what such programs may be doing for, or to, the animals involved. It seems reasonable to expect that those involved in AAT programs should be (or would want to be) concerned about animal welfare and the humane treatment of therapy animals. Recent sociological work affirms the capacity for animals to be minded actors with distinct selves, and have the capacity to feel and display a range of emotions. Given such findings, AAT programs should ideally be beneficial and rewarding to the animals as well as to the humans involved.

Based on 19 interviews with human volunteers who are involved in an AAT program sponsored by a local animal shelter, and including some of my own first hand experiences as a AAT volunteer, this study investigates the role and experience of the animals (primarily dogs) in AAT. Specifically, this study compares the use of shelter animals as "volunteer therapists" in comparison to the use of the human volunteers' own companion animals. Results indicate that AAT programs do raise some ethical concerns for the animals involved. Specifically, the animals from the shelter were more likely to experience physical and mental/emotional suffering (i.e., fatigue, dehydration, stress and fear). These findings indicate that more attention needs to focus on the experience of non-human animals in AAT programs. Additionally, this study raises some questions about the ethics involved in using shelter animals for AAT.

7. Paper with Title
Juvenile Crime in Detroit 1993-2003: Are There Racial Implications?

by

Homer C. Hawkins
School of Criminal Justice

Michigan State University
East Lansing, MI 48824
ABSTRACT

This study focused black and white juveniles in Detroit from 1993 to 2003. A comparison was drawn with black and white juveniles. The central direction of this study was to explore arrests for violent crimes and arrests for narcotic law violations during the 1993-2003 time period. There were significant correlations for murder, rape, robbery, and aggregated assault when correlated with narcotic law violations for black juveniles. Additionally, there were significant correlations for murder and robbery when correlated with narcotic law violations for white juveniles.
The problem of the black offender deserves attention on the part of researchers, criminal justice professionals, lawmakers, and others. Information regarding juvenile arrests can contribute to greater understanding to the nature and dimension of the problem.

In this paper, the 1993-2003 data relative to arrests for crimes against the person (homicide, rape, robbery, and aggravated assault) and for narcotics law violations will be examined. The data, which will be drawn from Detroit and will be viewed from a racial perspective.

Questions to be addressed include the following: What changes, if any, have occurred between 1993-2003 in the number of arrests of black offenders for violent crimes and narcotic law violations? What does the data suggest about the relationship between arrests for narcotics law offenses and arrests for violent crimes?

Researchers have investigated various factors that may be related to crime--factors such as the family, education, economic status, and drugs. In this paper, a review will be presented of literature on the possible relationship between the general development of criminal behavior and such factors as poor educational opportunities, poverty, and the usage and selling of drugs. The relationship between drugs and violent crime will be the basic thrust of the paper.
Factors Related to the Development of Delinquency

Family

Many articles have been written over the years concerning the relationship of the family to delinquency. Various factors such as family size and family structure have been examined. With respect to the family size, some of the data suggest that large family size is related to delinquency. There tends to be more delinquency emanating from families where there are a large number of children. Fisher (1984) noted that a review of the literature shows that a large family size is related to greater delinquency. The relationship remains when a number of variables, i.e., income, social economic status, parental criminality, and family composition have been controlled.

Another issue related to large family size is that it is often more difficult for parents to supervise their children. Fisher (1983) suggested that a possible hypothesis for explaining the relationship between family size and delinquency is that in large families, it may be more difficult for parents to provide adequate supervision than is the case with smaller families.

The structure of the family is another factor that is often suggested as being related to delinquency. There is a frequently mentioned premise in criminology that links broken homes to juvenile delinquency. In discussions of the lifestyle of families that produced juveniles who became delinquent, a broken home is an often-mentioned factor. Zimsmeister (1990) noted:

The most important source of violence among children is family breakdown. More than 60% of all children born today will spend at least
some time in a single parent household before reaching the age of 18. That kind of collapse of family structure is historically unprecedented in the United States and possibly in the world. For many black teenagers, according to a report by one child welfare organization, marriage is now an almost forgotten institution.

It has been suggested that juveniles from poor, minority families headed by a female tend to show an increase in delinquency. Moynihan (1959) suggested that the absence of a father in the household is related to juvenile delinquency.

Stern et al. (1984) pointed out that the father seems to provide the prime teaching and the deterrent force in the family through his role of value transmitter and disciplinarian. The authors went on to note that a father who is geographically removed from a family setting will be less effective in fulfilling these functions. It has often been noted that the absence of the father in the black family is enhanced by government requirements that the father be absent if the mother is to receive welfare payments. If he is unemployed, he is actually helping the economic situation if he is not present in the household. Ceinkovich and Giordano (1987) focused on the factors that lead to a broken home rather than on the effect of living in the situation after it has occurred. They note:

Far more important than the effects of the actual parental separation and on living in a broken home, are familiar problems and conflicts that brought about the separation in the first place. It seems as though it is generally accepted that harmonious, yet physically broken homes, are far less detrimental to the mental health of the children than are physically
intact but psychologically broken homes. Farnsworth (1984), in considering this same issue, raised questions with the thesis that a broken home is related in any meaningful way to juvenile delinquency. In her study, she pointed out:

The results from this analysis suggest that the importance of family structure for delinquency has been highly aggregated in the popular thesis linking broken homes to delinquency. The failure of broken homes to explain most delinquency within the present sample for either males or females is especially provocative so the broken home thesis is being populated into a context of observations of low income black families in Moynihan’s influential report. These results argue for an alternative explanation for high rates of official delinquency among lower class black juveniles. It is interesting to note, for example, that when family structure is implicated in delinquency within the sample of low, low income families, an integral feature of structure is parental employment. When both parents are employed and the father is present, the delinquency is reduced. This suggested a fruitful research focus in the future may be the economic dimensions of black families rather than their structure.

Roberts (1987), in viewing the mother as a social agent, noted that when children get into trouble, people are quick to place the blame on the mother who is raising her children alone. What seems to be overlooked is that most of these women are trying to be effective parents. It is very difficult, however, because their efforts to do so are undermined by the
social conditions that envelope their lives and are beyond their control. Their lives are based on a number of insecurities, both financial and emotional. McLoyd (1990) focused on the former concern when she noted:

Significant drops in income owing to a wide range of circumstances (e.g., divorce, job loss, cutbacks in work hours) occur more frequently among black families; consequently, relatively more black children than white children fall into poverty. In the last two decades, low wages, increasing levels of black male unemployment as a result of entrenchment in the manufacturing sector of the economy, and, relatedly, the rise in duration of stay in female-headed households have conspired to threaten the economic well-being of black children seen more than earlier times.

Weber et al. notes “that the establishment of a family identity in the youth that does not allow for delinquency appears to be linked to a reduction in delinquency. They go on to note that adolescents that are allowed to roam unsupervised are logically more likely to become involved in delinquent activities.” Zoglin (1996) in agreement with this same line of thinking suggested that “lack of supervision, broken homes, abusive parents, and negative role models are just some of the factors contributing to teenage crime. Thornberry (1987) argued that the attachment to parents has a stronger influence on the life of a youth during early adolescence rather than at later ages. He further suggests that the family is the most salient arena for social interaction and involvement. Jang (1999) noted that delinquency provides ample evidence of the importance of an adolescent’s relations with family, school, and peers in explaining his or her behavioral pattern. Thomas et al. (1996) noted that black
male adolescents were found to have fewer problem behaviors when nonresident fathers were not involved in single-mother families than did white male adolescents in single-mother families. This is not to suggest that problems do not exist; however, it is pointing to the idea that black families are not the only ones affected by their situation.

Balasco-Barr (1995) noted that family services should focus on children who are at risk of becoming future criminals. At risk children are those born into disorganized families and communities, whose environment caused them to develop formative behavior that continue the intergenerational cycle of criminology begun by their families. Intervention programs should emphasize not only prevention, but on services that can break the cycle.

Poverty

Many studies have found that there appears to be a relationship between poverty and violent crime in America. Also, poverty has an effect on both academic failure and extreme delinquency (Pagani et.al. 1999). Studies of police records have shown that homicide offenders are disproportionately drawn from the poor segments of the population (Schmid and Schmid, 1972; Wolfgang, 1958). In addition, there have been comparative studies showing that homicide rates are positively related to indicators of deprivation such as low education, substandard housing, high infant mortality rates, and low-income (Venture, 1975; Smith and Parker, 1980).
Other researchers argue that poverty is not linked to violent crimes. Messner (1982) and Blau and Blau (1982), for example, suggested that poverty is not related to homicide rates. One criticism of these studies has been that the single variable of income was used as the indicator of poverty. Loftin and Parker (1985) concluded that the studies that use multiple indicators of poverty (e.g., high infant mortality, substandard housing, low income) generally find significant positive effect, while those which rely on a single variable of income find weak and inconsistent effects.

Good, et al. (1986) argued that there is a link between employment and delinquency. They suggested that improving the employability of youths will have a positive immediate payoff by reducing juvenile criminality. They also suggested that young repeat offenders are less employable, and that successful efforts to reduce their criminal tendencies will increase the probability of their taking part in legal forms of employment. The problem is that often times young members of minority groups find it very difficult to find employment in inner cities. Economists say that the people who are having the most difficulty finding jobs are those who have always had it the hardest: young members of minorities form the inner cities. Mydans (1992), in focusing on Los Angeles, suggested that as working class whites are pushed down the economic ladder, they are displacing from the ladder those who have long occupied the bottom rung, young blacks and Hispanics, mostly from the inner city and with little hope of improving their situation. Given the fact that few jobs are available, many of these youths turn to selling drugs and feel that that is a job. They feel that it takes talent and that it is not easy selling drugs. They feel that
you have to look over your shoulder constantly or you could be arrested or killed, and that takes talent.

Hawkins (1983) noted that "to the extent that criminal violence is caused by economic deprivation and powerlessness, homicide rates will occur at a higher rate among the black under-class and among the black middle-class." This suggested that poverty and powerlessness are related; and as such in this type of environment, the probability of violence is higher. It is clear that the risk for violent crimes among black youth are on the rise. Wright et al (1999) suggested that various classical theories of delinquency have posited a negative relationship between socioeconomic status and delinquency, however, empirical studies have found little statistical association between them. They go on to suggest that socioeconomic status has a negative effect upon delinquency through some mediators and a positive effect upon delinquency through other mediators. They went on to suggest that these negative/positive effects co-exist and cancel each other out. They also noted that it has been suggested that individuals in the upper and lower strata of society have the highest proportion of involvement in criminal offenses and that the middle strata had the lowest. They suggested that this would imply a u-shaped relationship between socioeconomic status and delinquency. There is evidence of a negative of a negative and significant relationship between market wages and participation in crime(Williams and Sickles 2002). The presence of traditionally low-paying service-sector employment influence delinquency by weakening families and attachment processes(Bellair and Roscigno 2004).
Tatum (1996), in her study, pointed out that she did not find support for the hypothesis that communities characterized by high rates of black adult and black juvenile unemployment, low black median income, a high percentage of black families below the poverty line, and a high percentage of black males not working, will have higher rates of black juvenile arrests. She suggested that the main factor is the percentage of the black population and that affects the rate of black juvenile arrests. In other words, if you have a higher percentage of blacks in a particular area, this will have an affect on the rate of black juveniles arrested because there are simply more blacks in the population. Wright et al (1997) noted that their study, based on a national sample of 1775 youths exploring the relationship of labor market work on delinquency revealed that working while in school, as measured by hours employed each week, increased delinquent involvement among high risk males. They suggested that these findings caution that unless carried out carefully in conjunction with other treatment modalities, delinquency prevention programs based on employment are likely to be ineffective if not criminogenic.

**Drugs**

The strength of the relationship between drug usage and crime is open for discussion, but the literature suggests that the use of drugs can reduce ones inhibitions and make the individual freer to commit crimes. In addition, it is suggested that individuals may commit crimes in a revenue producing effort in order to purchase drugs. Gandossy et al. (1980) found that a select review of the literature on criminal behavior patterns of addicts revealed that addicts frequently take part in income-generating crimes. This becomes apparent when an analysis is made of the charges against drug users,
convictions of addicts in prison, arrest records of penal populations, and observations of street addicts. Some researchers have suggested that the tendency to commit violent crimes has become more prevalent among contemporary addicts, compared with addicts of the 1950s (Chambers, 1974; Stevens and Ellis, 1975). Other research suggests that deviant attitudes and deviant peers are related to crime and drug use (Baron, 2004). Watson (2004) notes that research over the last 20 years has established a relationship between substance abuse and juvenile delinquency.

Innes (1988) noted that in a 1986 study that he did focusing on state prison inmates, that 35 percent reported that they were under the influence of drugs at the time that they committed their current offense, as compared to 32 percent in the 1979 survey. It was also noted that the greater the offenders' use of major drugs (heroin, methadone, cocaine, PCP, or LSD), the more prior convictions the inmate reported.

An area that needs greater attention is the trafficking of drugs in American society. The Bush administration’s top drug policy official said on June 19, 1991, that Americans spent more than $40 billion on cocaine, heroin, marijuana, and other illicit drugs (Johnston, 1991). Clearly, the sale of drugs is big business in this country. In addition, there is a tremendous amount of violence involved in the drug traffic process. Drug-related murders that stem from the entrepreneurial side of drugs are daily occurrences in most large urban areas. Much of the literature describes the fears of residents in urban areas have because of crimes committed by drug users who are high and irrational. In addition, the literature focuses on drug users’ attempts to gain revenue to support their addictive habits.
A greater fear held by urban residents involves the violence related to drug traffickers. Nadelmann (1988) noted:

The drug/crime link is the violent, intimidating, and corrupting behavior of the drug traffickers. Illegal markets tend to bred violence - not only because they attract criminal minded individuals, but also because the participants of the market have no resort to legal institutions to resolve their disputes. Most law enforcement officials agree that the dramatic increase in urban murder rates during the past few years can be explained almost entirely by the rise in drug dealer killings.

In this environment, we have the juvenile offenders who follow suit and interact in urban areas just as their adult counterparts. The juvenile offender has become part of a drug violence that permeates urban areas. In Detroit there were 258 cocaine-related juvenile arrests in 1980 and 647 in 1987. In New York City the arrests increased from 349 to 1,052. In Washington the figures were 315 and 1,894; and in Los Angeles there were 41 cocaine-related juvenile arrests in 1980 and 1,719 in 1987 (Ward, 1989). Selling crack cocaine is extremely lucrative, and when individuals feel that their territory is being invaded, they respond with violence.

The involvement of the young in drug trafficking was described in an Associated Press article (1989):

As the crack problem grows ever larger, its victims have become ever younger. The latest two in New York - an 11 year old alleged to be a drug
courier and a 10 year old crack dealer - left officials wondering if they are losing the drug fight.

“Crack and drugs are so pervasive that of course it trickles down into lower grades” said a spokesman for the United Federation of Teachers. “You have young kids used everyday as drug runners.”

The involvement of juveniles in drug related violence is becoming more prevalent. A Gannett News Service (1989) article noted: “In the past week a 16 year old was shot at a suburban Maryland high school, 13 people were shot and 3 killed on Valentines Day, and a 15 year old was arrested with a sawed-off shot gun.”

In the mid-eighties, drug related violence escalated in Detroit and in other large urban areas. Drug related arrests in most of the U.S.A.’s top 50 cities increased from 1983-1987. During this period, Atlanta showed an increase of +40.3 percent; Cleveland, +54.6 percent; Los Angeles, +47.4 percent; Miami, +147.7 percent; New York, +68 percent; and Detroit, +54.8 percent (Greenberg et al., 1989).

In 1980 the rate of drug abuse arrests for white and black youth was approximately the same. Between 1980 and 1989 the drug abuse arrest rates for persons under 18 increased by 17 percent. However, drug abuse arrests declined for whites dropping by 33 percent. In contrast, drug arrest rates for blacks remained relatively constant through 1984. There was a dramatic increase between 1984 and 1989 with the rate of drug abuse arrests for black youth increasing by 200 percent. This meant that the 1989 black rate had climbed to nearly 5 times the white rate (Snyder, 1992).
Our urban areas appear to be becoming war zones where gunfire is a daily occurrence. Most black youths either know someone or are related to someone who has been killed by a handgun. Homicide by the use of a handgun is becoming an epidemic in the black urban population. This is a problem where no end is in sight. In Detroit in a 9-year period covering 1980-1988, the all cause mortality rate for children (1-18 years of age) increased almost 50 percent for the urban population. In 1980 the mortality was 49.48 per 100,000 population and this figure in 1988 rose to 73.20 per 100,000. By the same token, neither white males nor white females in the urban population nor any gender-or-race specific suburban group showed any significant change in all-causes of morality during the 9-year period. The black urban male showed a consistent and highly significant increase in all-cause mortality over the period with an increase of 74 percent from a low of 68.5 per 100,000 in 1980 to 119.2 per 100,000 in 1988. Although not as striking, black urban females showed a 50 percent increase in the all-cause mortality rate over the interval. The rate increased from 29.9 per 100,000 in 1980 to 44.7 per 100,000 in 1988. The increase in homicides, specifically firearm related homicides, in the urban population accounted for the increase in overall mortality rates. This increase in homicide rates was significant for the 10-14 year old males and the 15-18 year old male and female portions of the black urban populations (Ropp et al., 1992).

Blumstein (1995) pointed out that the predominant change in homicide is linked to dramatic growth in youth homicides beginning in the mid 1980s and attributed that growth to the recruitment of young people into illicit drug markets. Because those markets are illegal, the participants must arm themselves for self-protection, and the resulting "arms
race” among young people results in more frequently resorting to guns as a major escalation of the violence that has often characterized encounters among teenage males.

An interesting finding centers around what appears to be a shift in terms of teen drug use in America. Joseph Califano, Jr., President of the National Center on Addiction and Substance Abuse at Columbia University presented some interesting findings to the U.S. Conference of Mayors in Washington. He notes that we have a situation where eighth graders (in small towns) are using drugs at much higher rates, whether it is crack, methamphetamines, alcohol, or tobacco. Researchers analyzed data for federal, state, and local sources including the Department of Health and Human Services, the National Institute of Justice and local police. This study showed that rural eighth graders in the past month were: twice as likely to have used amphetamines, including methamphetamines, than those in large metropolitan populations (5.1% of rural teens versus 2.4% of urban teens); 83% more likely to have used crack; 50% more likely to have used cocaine; 34% more likely to have smoked marijuana; 29% more likely to have drunk alcohol, and 70% more likely to have been intoxicated (Villalva 2000).

INCIDENCE OF ARRESTS IN DETROIT

This section will focus on arrests for violent crimes as well as for narcotics law violations in Detroit. With regard to arrests for violent crimes, the focus will be on homicide, rape, robbery, and aggravated assault. Arrests for violation of narcotics law will encompass all forms of violations, such as possession or selling of heroin, marijuana, or cocaine. For the most part, this discussion will view narcotics law violations as a joining
together of sales and usage, rather than breaking the violations down into separate categories. There is no breakdown in reporting arrests for the various forms of drug law violations in Michigan; instead, everything is lumped under the framework of narcotics law violations. Thus a correlation was made between narcotics law violations arrests and arrests for violent crimes.

In order to put the data in perspective, the percentage of black and percentage of white in the population, as well as the racial breakdown of the total population are reported. These figures are based on the 1990 and 2000 census data and are displayed in Table 1.

Arrests

Table 2 represents data on the numbers for blacks and whites arrested for the various categories of crimes. The numbers are compared for blacks and whites for 1993 and 2003. Fluctuations took place during the period and this is indicated in the table. Table 3 focuses on a correlation of crimes against the person with arrests for narcotic law violations.

Detroit

For crimes involving murder the number of arrests for black juveniles decreased from 73 in 1993 to 6 in 1998. This downward trend continued and the murder arrests was down to 2 in 2003. For whites there also was a downward trend. In 1993 there were 8 arrests for murder and 5 in 1998. This downward trend continued to a low of 1 in 2003.

The number of arrests of blacks for forcible rape decreased from 38 in 1993 to 28 in 1998. The arrest level dropped to 7 in 2003. The number of arrests for whites for forcible rape was 3 in 1993 and rose slightly in 1998 to 5 and then dropped to 0 in 2003. Black arrests for robbery were 382 in 1993 and decreased to 138 in 1998. This figure dropped to 41 in 2003. For whites, the number of arrests was 10 in 1993 and dropped to 0 in 1998 and rose to 16 in 2003. The number of arrests for blacks for aggravated assault in 1993 was 271 and this decreased to 171 in 1998. A downward movement was in evidence in 2003 with the number of arrests for aggravated assault dropping to 11. For whites the number was 32 in 1993 and dropped to 13 in 1998 and was 12 in 2003. For narcotic law violations for blacks, the figure was 236 in 1993 and dropped to 156 in 1998. This decrease continued and

was 77 in 2003. For whites the number of arrests in 1993 was 8 and dropped to 2 in 1998 and made a tremendous increase to 165 in 2003

Population Issues

When there is a decline in arrest levels, it is important to look at a number of issues. A key fact is population. A decline in arrests can mean that there are fewer individuals committing crimes because there are fewer people. However, a decline in population may not be as large as the arrest decline and this was the issue in Detroit for white juveniles

In the above discussion, particular years were identified and were cited in terms of their fluctuations. To amply on the data, averages will be given for time periods and they will blocked off and compared. The changes will be explained as they relate to changes in the 1990 and 2000 censuses. In 1990 the juvenile population was 307,154 and there was a decline to 284,132 in 2000 which represents a 9.2% decline. The black population was
262,134 and this figure dropped to 261,115 in 2000 or less than 1%. The white population was 47,132 in 1990 and dropped to 23,134 or by nearly 49.4%. In viewing periods of time as they relate to arrests there have been some interesting changes. The arrest rates have dropped well beyond population changes for blacks; but this was not the case for whites.

The average number of arrests for blacks for murder, rape, robbery, aggravated assault and narcotic law violations for the period 1993-1996 was: murder-52, rape-48, robbery-261, aggravated assault-270, and narcotic law violations-236. The average number of arrests for 2002 and 2003 was: murder-3 or a 94% reduction, rape-7 a 85% reduction, robbery-27 a 90% reduction, aggravated assault-91 a 7.5% reduction, and narcotic law violations-46 an 80% reduction. There has been a big change in the arrest rates for black, pointing to a reduction in crime.

The average number of arrests for whites for the time period 1993-1996 was: murder-3, rape-3, robbery-11, aggravated assault-28, and narcotic law violations-16. The average number of arrests for 2002 and 2003 was: murder 1 or a 66% reduction, rape-0 a 100% reduction, robbery-10 a 9% reduction, aggravated assault-16 a 57% reduction, and narcotic law violations-83 a 93% increase. The data relative to murder, rape, robbery, aggravated assault with regard to arrests shows some fluctuations. The numbers for murder and rape are so small that it is difficult to draw any conclusions. What stands out is the huge increase in narcotic laws violations for 2003 for white juveniles.
Relationship Between Drug Arrests and
Arrests for Violent Crimes

In the literature and various newspapers there have been numerous articles concerning the relationship between drugs and violent crimes. Upon examination of this issue, the Spearman (rho) was used in this paper in correlating narcotics arrests with arrests of crimes of violence in each of the four cities studied. Correlation were done for the population (black and white) for Detroit (Table 3). There were significant correlations when murder, robbery, and aggravated assault when correlated with narcotic law violations for blacks. There were correlations for murder and robbery for whites. Arrests for violent crimes and narcotics law violations showed a precipitation downward trend for blacks. Blacks represented the highest percentage of arrests for violent crimes and narcotic law violations; however, this was not true for narcotic laws violations in 2003. Drugs and violent crime have been a part of the literature focusing on the urban scene in the last decade. The data from this study for blacks suggests a strong relationship between drug law violations and all of the violent crimes correlated. There was an across the board decline. The same was true for whites for murder and robbery.

Conclusion

This paper has presented a review of selected literature related to the problem of black offenders—particularly those arrested for violent crimes. The review included a research on the possible relationship between the general development of crime and such factors as poor educational opportunities, poverty, and usage and selling of drugs.
The literature review was followed by a presentation of information on the number of total arrests in Detroit. Data on arrests for narcotic law violations and arrests for violent crimes were examined to assess the possible relationship between the two types of criminal behavior. For violent crimes, the number of arrests for the total population had a precipitous downward trend from the early 1990’s to 2003 for black and white juveniles, except for the narcotic law violations for white juveniles.

The problem of the black and white juvenile offender must be addressed by both the public and the private sectors, using multiple strategies; providing equal high quality educational opportunities, reducing poverty, and controlling the usage and sale of narcotics. Prevention must be the approach as we begin the 21st century.

abstract

The lecture is based on the observation that social work - despite of the confrontation with various professional, socio-political and managerial demands for modernization – has not been able to generate an independent notion of professionalism.

The current discourse on professionalism in social work is dominated by the premises of New Public Management: instruments of private markets like competition, benchmarking, contracting out are applied. Furthermore the seeming crisis of the public budget induces a political demand for more efficiency and effectiveness of social work. Promising this, case management is rapidly elaborated in theory and systematically implemented in practice: it unites economic, political, managerial with professional demands. Consequently within the Enabling State and Third Way agenda case management is presented as a professionalization strategy of social work.

The background of the analyses is a theoretical perspective on social service delivery, granting privilege to the demand side and focussing on the citizen status of the users. Thus Social Work has to ensure that persons are able to participate in democratic processes in institutional as well as in everyday life. However the concept of social service delivery may also be connected to the paradigms of the Enabling State or Third Way: As people-processing and people-changing institution case management contains the “production” of profilings, integration plans, the organization and coordination of assistance and so on - and it is coupled to massive control mechanisms and sanctions. This form of consultation may contradict a social work ethos as the consulting process is not based on principles like voluntariness, confidence and result-openness which are subordinated to the euphemistic principle of emphasizing the notion of responsibilities.

By referring to the theoretical background of governmentality studies this lecture argues that social work is fundamentally *gouvérnemental*, but that there are possibilities of opposition and criticism. So firstly the lecture works on the question, to what extent case management
can be identified as a concrete governmental technique and secondly, which effects the guiding principle case management has on social work professionalism. This has to take into consideration that there is an ambivalence in the service paradigm: processes of co-production in social service theories may analytically refer to both kinds of „products“ like consultation, information, assistance and qualification as well as to control, coercion and deterrence.

Summarized - on the background of this ambivalence - the lecture seeks to analyze, how different professionalization strategies effect Social Work professionalism, its acting principles and ethos and how the concept of social service delivery can be strengthened by developing a substantial notion of professionalism.

Abstract and full paper:

Abstract:

During the 2004-05 academic year ten Oklahoma State University graduate students worked with math, science, and social studies teachers to introduce GIScience technologies (geographic information systems, the Global Positioning System, and remote sensing) within 6-12th grade classrooms in three rural Oklahoma schools. Supported by the National Science Foundation's Graduate Fellows in K-12 Education (GK-12) program, the Rural Alliance for Improving Science Education (RAISE) is a partnership between Oklahoma State University and the three rural school districts. This presentation describes the objectives, organization, and implementation of RAISE over the course of its first year. The unique challenges and opportunities of introducing GISci technology into public school classrooms will be discussed along with lessons learned, activities designed, and the impact our program has upon graduate students, teachers, and 6-12th grade students.
Lessons Learned from Integrating GISci Technology in Rural Schools

Joel W. Helmer
Thomas A. Wikle

Background

Science and social science teachers in rural communities face unique challenges. Small teaching staffs mean that faculty sometimes must provide instruction in subjects outside their training. Compared to urban areas, rural areas often have relatively low high school graduation rates and fewer college-bound students. New federal initiatives such as “No Child Left Behind” mandates improved student performance without additional funding. Operating within an environment of limited resources and new forms of accountability, teachers look for ways to make science and social science instruction relevant, engaging and effective.

In an effort to address some of the problems facing rural schools in Oklahoma, faculty and local teachers submitted a proposal to the National Science Foundation’s Graduate Fellows in K-12 Education (GK-12) program. NSF’s GK-12 Program was developed in 1999 to enhance science technology, engineering and math (STEM) education by creating opportunities for graduate students to interact with K-12 teachers and students in classroom settings. In addition to impacting student learning, GK-12 is intended to improve communication and team building skills among graduate students while providing an opportunity to learn about and teach within K-12 schools. GK-12 also provides professional opportunities to teachers to improve their skills, and enhances
the relationship between higher education institutions and school districts. In October of 2003 Oklahoma State University’s proposal was selected from among 26 nationwide to receive funding.

The Rural Alliance for Improving Science Education (RAISE) pairs ten OSU graduate students with 6-12th grade science and social science teachers to develop exercises, lesson plans and other activities involving applications of geographic information science (GISci) technology. GISci is an umbrella term for three related technologies: 1) geographic information systems (GIS) used to collect, store and analyze spatial information, 2) the Global Positioning System (GPS) that provides opportunities to navigate or collect geographic information in the field, and 2) remote sensing technologies that offer capabilities for the analysis of data collected by sensors attached to aircraft or satellites. GISci technologies offer an opportunity to introduce inquiry based learning (see Bednarz 2000) and have been used in K-12 settings since the early 1990s (see Tinker 1992, Brown Burley and Jon Bryan 1996, and Carlstrom and Quinlan 1997, Keiper 1999). An important benefit of GISci technologies is that they promote active learning where the student is a participant in the learning process rather than a passive receptacle of information (Meyers and Thomas 1993).

Organization of RAISE

Compared to its use in higher education, GISci is not widely integrated into K-12 schools curricula. Therefore, RAISE provides an unparalleled opportunity to explore possibilities for integrating GISci in K-12 settings through a partnership involving higher education and school districts. The specific goals of RAISE are to: 1) improve the
science learning environment by making science more engaging, exciting and fun, 2) enhance students’ observation skills to help them better understand relationships between science and society, 3) improve science literacy as demonstrated by standardized test scores, and 4) increase the number of college-bound students from rural areas (especially from underrepresented groups). This paper describes the organization of RAISE along with a discussion of unique challenges faced by OSU graduate students (called RAISE scientists) and teachers over the last year as they’ve introduced GISci lesson plans and activities into 6-12th grade science and social science classrooms.

RAISE is being implemented within rural areas and small towns with low average incomes and large numbers of students who are not ordinarily college-bound, many of them Native Americans. Leadership for RAISE is provided by a Steering Committee of three OSU faculty members and three teachers. Teachers on the Steering Committee also serve in the role of “District Coordinator” within their respective school districts, facilitating interaction among scientists, students, and teachers in their district. By helping to address the day-to-day interaction of teachers and scientists, District Coordinators have proven to be the key to successful project implementation in partner schools.

Another important element for project success has been successful recruiting of high quality graduate scientists to serve as scientists. Information about RAISE was distributed among graduate advisors in OSU graduate programs. The initial applicant pool was narrowed for interviews conducted by the Steering Committee. The ten graduate students (scientists) selected for the program included five from Geography, three from Zoology, one from Environmental Science and one from Plant and Soil
Science. Most had experience with at least one GISci area. The ten scientists who were selected participated in a graduate seminar during the summer of 2004 to evaluate GISci software and lesson plans.

To prepare both teachers and scientists the Steering Committee sponsored an intensive week-long summer workshop at OSU several weeks prior to the school year. For scientists this week focused on introducing them to the challenges and opportunities of working in 6-12th grade classrooms while also equipping them with skills necessary to work effectively. They attended seminars that dealt with topics such as pedagogy, writing effective lesson plans, working with culturally diverse and disabled students, and on how to develop lessons involving inquiry based learning. Teachers were introduced to GISci technologies by working through various lesson plans and completing hands-on field activities with the guidance of scientists. They also participated in GISci lectures and presentations by OSU faculty members. During the final day teachers and students were paired based upon similar interests and positive relationships developed during the week.

During their first few weeks in the schools scientists observed their teacher's classroom to become familiar with their teaching style. Considerable time was spent outside of class discussing approaches for addressing learning outcomes specified in state and national science education standards. Some scientists worked with their teacher to develop innovative projects to address a local environmental problem while others adapted lessons and activities available via the Internet. During the Spring 2005 semester scientist/teacher teams began to refine lesson plans and share activities with teams located in other school districts. In this way scientist/teacher teams serve as reviewers for
curricula developed at other sites. Materials will be posted to the RAISE website for national dissemination, review and refinement during the first semester of the project’s third and final year.

The beginning of our second year provides a moment for reflection concerning the introduction of GISci activities within rural Oklahoma schools. Although we believe that the outcome of our experiment has been overwhelmingly positive, there have been barriers and challenges to the integration of GISci lesson plans, exercises and activities within our partner schools. These issues are summarized in the eight “lessons learned” that follow.

Lesson 1: *Schools offer limited technical support for maintaining GISci software and campus-wide networking capabilities.* We found that all schools within our three partner districts had computer equipment that was adequate to run GISci software. However, technical support was another issue. School districts were hard-pressed to provide network or support technicians who could provide teachers and students with daily assistance with hardware and software. Although one district had a full-time network technician he was unfamiliar with the requirements of GIS software. Including this person in the summer workshop might have alleviated some problems. There is also intense competition between teachers for computer laboratory space and time. In some instances increased demand for computers by our participants was viewed negatively by other faculty because of the large amounts of time needed in the lab. As a result of problems encountered in the first few weeks of the school semester, scientists focused on introducing students to GPS receivers that could be used independently of
computer labs. We have also found that utilizing internet-based GIS mapping is effective in avoiding unstable networks and lack of technical support (see Baker 2005).

Lesson 2: **GISci can be intimidating to teachers.** Most teachers can use prepackaged GISci modules but few have time to prepare their own exercises or activities. Training is extremely important to enable teachers to feel comfortable with the technology. The training we provided to science and social science teachers during the summer workshop focused initially on introductory sessions demonstrating the benefits of using GISci in their instruction. This was followed by more in-depth use of GISci and one-on-one instruction. In the future we plan to offer workshops where RAISE teachers train other teachers or new scientists, a learning environment that should be extremely beneficial. Beyond the initial training they receive, ongoing support and training is also crucial for teachers struggling to integrate GISci within their curriculum.

Lesson 3: **GISci exercises should focus on problems instead of training students how to use software.** It is important that GISci technologies be viewed as tools for problem solving with an emphasis on their capability for exploring rich spatial datasets through zooming, panning, measuring, querying, and calculating simple statistics. Although time is required for students to become familiar with software, these skills can be taught in conjunction with integrated lessons.

Lesson 4: **Teachers must be willing, and administration supportive, of utilizing new teaching techniques and technologies.** Teachers who have rigid and often ingrained teaching styles often find it difficult to integrate GISci activities. Since lessons often involve fieldwork or computer laboratory components, teachers must be willing to interact with students in various settings. Administrators must be willing to
accommodate and support teachers who are trying to improve student learning through these activities.

Lesson 5: **Students often lack basic computer skills.** Working with students with a wide range of computer skills creates unique challenges. Some students complete lessons quickly, while others struggle with relatively basic concepts. Although this is common in any type of instruction, it is particularly the case with GISci technology since students can become "lost" within certain software programs. Significant one-on-one time is needed to assist students. It is also important to make activities challenging, particularly in classes with high student/teacher ratios. This issue can also be addressed by preparing an additional or advanced activity for students who complete assignments quickly.

Lesson 6: **Use of local datasets for examining local environments is most productive.** Students respond more enthusiastically when GISci technologies are used to teach or analyze local issues. RAISE scientists created datasets with U.S. Geological Survey TIGER data for the region surrounding their teacher’s school that could be used to display roads, highways, rivers and other points of interest. This data was superimposed over digital orthophotos that showed the locations of buildings, fields, and wooded areas. The use of local data was found to authenticate learning while demonstrating that it is unnecessary to travel to remote locations.

Lesson 7: **The traditional 45-55 minute instructional period makes integration challenging.** Since many lessons must be conducted outside the home classroom or even the school building (nearly always the case with GPS) there is often insufficient time to complete an activity. Multi-period lessons require saving projects and therefore
increasing logistical complexities by requiring access to secure folders. One-day projects are often preferable.

Lesson 8: **Student assessment is vital to success.** Students not held accountable for their work are not as attentive in completing activities. Teachers not familiar with using technology also may have difficulty assessing student progress towards and/or comprehension of targeted skills or objectives. We found that students also enjoy seeing a hard copy of completed maps.

**Conclusion**

The success of implementing RAISE over the last year has reinforced our belief that GISci offers a powerful tool for teaching science and social science in K-12 classrooms. By enabling students to collect, analyze, and display data, GISci promotes active learning and the integration of diverse types of information. However, our experience demonstrates that successful implementation of GISci technologies within K-12 education requires three elements: 1) dedication on the part of teachers to training using GISci equipment and software, 2) a willingness to integrate GISci activities into the curricula, and 3) a commitment on the part of school administrators to provide support for hardware and networking. As with other types of instruction tied to computer technology, acquiring hardware and software is a relatively minor investment factored against the time needed to use it effectively.

Why German-US Relations still Matter – One Year after the War in Iraq

This paper is based on research about transatlantic tensions with a focus on German-US relations. Three phases were identified: the pre-Bush, the Bush and the post-9/11-Bush phase.

1. The so-called pre-Bush phase dealt with the long-term stabilization in the Balkans and a common European security and defense policy. The following question was addressed: Does the US want Germany to play a stronger role in the European Union and/or NATO?

2. The so-called Bush-phase lasted from Presidential Elections of George Bush in November 2000 to September 11, 2001, including the first two visits of Bush to Europe in Summer 2001. Main case studies were missile defense and NATO enlargement.

3. The so-called post-9/11-Bush phase started on September 11, 2001, which arguably changed parameters defining transatlantic relations. By autumn 2001, “NATO for-ever-transformed” became the major focus and case study of this research project.
More than one year after the Iraq war, one unfortunate impact of troubled German-US relations seems to have concerned the European theatre itself. What do I mean? Strong German-US relations contribute to intra-European stability. Without them, France started complaining about the too strong British influence in the transatlantic theatre, suggesting, EU could formulate its own common policy on Iraq, which would then isolate Great Britain. On the other side, after Schröder did not succeed in London by the end of September 2002, to get Tony Blair to help him restore US-German relations, Schröder’s focus shifted across the Rhine, as to get France to join ranks to counter US-UK policy on Iraq.

So, where do transatlantic and intra-European relations stand in early 2005? Where do they stand more than three years after September 11, 2001? Where are we – the Atlantic community – now, given the re-election of President George W. Bush in November 2004?

6. Abstract
Recent statistics indicate that the number of Muslims in North America is growing. While this group of immigrants is becoming larger in the United States, there is still little psychological research done on them. Our study contributed to the current research on immigrant populations within the U.S., and focused on exploring the Muslim population in the United States. Previous research on the psychological well-being of various groups of immigrants and refugees had found that perceived discrimination and psychological well-being are negatively correlated, that ethnic identity and psychological well-being are negatively correlated, and that religious commitment and psychological well-being are positively correlated. This study investigated perceived discrimination, religious commitment, and ethnic identity, and their relationship to the psychological well-being of Muslims living in the United States. We had a sample of 266 participants, between 15 and 84 years of age. 161 of the participants were male and 105 were female. 218 of the participants were Muslim, 43 were non-Muslim, and 5 didn't specify a religion. We plan to run correlations between all variables in the Muslim sample. We anticipate that we will support the current research on immigrant populations. Since the United States is becoming a more multicultural society, the findings will be clinically significant for serving the Muslim immigrant population.

Abstract

Supply chains concern the flow of materials from suppliers through manufacturers to customers and are critical to the overall business success. Indeed, all companies need to excel in getting the right product to the right place at the right time and in many cases global air cargo services play an important role in this process. Furthermore, even though airfreight traffic makes up only about two percent of all tonnage shipped worldwide it represents more than a third of the total value of all international trade. Also, the transportation of goods like computers, auto parts, and perishable items has become one of the most effective ways to reach world markets.

This paper will review the current global Air Cargo system and discuss the post 9/11 operations of several Air Cargo companies. Different types of carriers will be defined and communication issues surrounding the management of Air Cargo systems will be addressed. Given the current business climate it is critical for supply chain managers to establish and sustain an effective network of business relationships. To assist in this endeavor this work will present research on trust and relationships between supplier and shipper, security standards for international air cargo, and the concept of dependence in international supply chains. Finally, this paper will provide communication strategies for shippers to turn the recent challenges associated with 9/11 into a global competitive advantage.

ABSTRACT

Flogging a dead horse? Neo Marxism and indigenous mining negotiations.

Mining in remote regions of Australia often represents one of the few opportunities for Indigenous Australians to participate in the broader capitalist economy. And despite the ideal of ‘equality of influence’ for all in democratic capitalist societies, Indigenous Australians have historically been marginalised, both economically and politically, in mineral development processes in Australia. The Australian state structures the interaction between Indigenous people and mining companies through general legislation and policies, and in marked contrast to the experience of Indigenous peoples in other settler societies, when the British Crown acquired sovereignty and beneficial ownership of the land in Australia, it also assumed ownership of all mineral resources. Thus the state plays a crucial role in the mineral development process in Australia, one that is deserving of critical scrutiny. The research that informs this paper is based on qualitative data from a case study of a mineral negotiation process involving Indigenous people from the Gulf of Carpentaria in Northern Australia.

This paper aims to reaffirm the utility of a neo Marxist approach for theorising the role of the state in western democracies. While there has been a noted tendency to consign Marxist theorising to the history books, with many intellectuals arguing it is an exercise in ‘flogging a dead horse’, this paper contends that neo Marxist theorising of the state is still an important theoretical tool for analysis of the structured inequalities that remain a key feature of contemporary democratic capitalist societies. Recent neo Marxist approaches do not privilege class as the only, or primary site of inequality. Rather, they acknowledge that race, ethnicity and gender are also crucial bases of structured inequality which are inscribed in the forms and functions of the state. Thus this approach offers contemporary scholars critical insights for analysing race and ethnicity in democratic capitalist systems.
SOCIAL CONSTRUCTIONS ON GENDER IN MONTERREY TV AUDIENCES

Social constructions on gender in Monterrey TV audiences

Abstract
This document explores the relationship between television’s exposure and the way as Monterrey metropolitan area (Mexico) inhabitants construct their reality. Specifically, asks about the influence of television on social construction on gender constructions. The independents variables are quantity, type of program and origin of program on television exposure. The dependent variables are a) stereotypes of males and females, b) representation and females’ vulnerability. As control variables are taken sex, family arrangements of the respondents, socioeconomic level and age. The theoretical framework is supported in the cultivation analysis approach. It sustains that television system of messages is a mainstream tool influencing strongly the social construction of the reality, mainly between heavy viewers. This is a strong current in television and media analysis in the USA, lacking of evidence in Latin America. There is one research questions: Is there a relationship between television exposure in the Monterrey metropolitan area and the social construction that their inhabitants sustain about the females social distribution, vulnerability and stereotypes? A phone interview was run in the Monterrey metropolitan area in summer 2004. Evidence shows that television exposure impact is weak and other social influences are better predictors of social constructions, like education, sex or age of the respondents. As a preliminary conclusion, is stated that evidence support cultural studies approach saying that audiences negotiate or even resist the television’s message, but not support cultivation analysis theoretical approach.
Introduction

Within mass media studies, the social construction of reality perspective has been called the cultivation hypothesis (Potter and Chang, 1990, p. 313) or cultivation process theory (Gerbner, Gross, Morgan and Signorielli, 1986). According to its traditional approach, television is a telling-stories system cultivating the values reflected in its messages (Gerbner, Gross, Morgan and Signorielli, 1986, p. 18; Morgan and Shanahan, 1997). Television is an efficient tool mainstreaming how things are, how they should be and why (Gerbner, 1993, 1996); in short, TV is considered “the central arm of the mainstream” (Gerbner and Gross, 1976, p. 175).

According to Morgan and Shanahan (1997) cultivation process theory is trying to show some consequences of a cultural industry celebrating consumption, individualism, power and status quo. Originally, this theoretical approach was conceived as a research strategy separated in three kinds of analysis. The first one, called institutional process analysis, asks for the systematic pressures and the economical (and political) specifications affecting the media system, including how messages are selected, produced and distributed. The second one, called messages system analysis, recollected data of the unbalanced media contents in violence stereotypes, gender roles, minority people, occupations and related matters. The third one, called cultivation analysis, explores how television contributes to the audiences conceptions about real world (Morgan and Shanahan, 1997, p. 3). In spite of this broad design, there are not frequent holistic analyses including the three phases of the whole strategy; more specifically, the evidence is accumulated in the strategies 2 and 3.

A typical hypothesis in this approach considers television exposure as the independent variable and the cultivation (an estimation or belief about something in real
life) as the dependent variable (Potter and Chang, 1990). There is a relative preeminence of studies considering violence as the dependent variable (Gosselin, DeGuise & Paquete, 1997; Huerta-Wong, 1999; Sander, 1997), but also studies examining family beliefs (Fudge Albada, 2001; Olson & Douglas, 1997), gender relations (Holbert, Shah & Kwak, 2003), political orientations (Grosswiler, 1997; Morgan & Shanahan, 1991), alien issues (Sparks, Nelson and Campbell, 1997), vulnerable people orientations (Sotirovic, 2003), environmental issues (Shanahan, Morgan & Stenbjerre, 1997), and professional stereotypes (Chory Assad & Tamborin, 2003; Valkenburg & Patiwaël, 2000). Systematically, data supports the hypothesis stating the relationship between TV consumption and conservative opinions, beliefs and attitudes.

Morgan and Shanahan (1991) found that politically reprised Argentineans stated that people had to be obedient with the political system and be quiet with their political opinion in a common environment. Watching television was negatively associated with showing political attitudes, a typical expression of the liberal movements. Grosswiler (1997) tested the exposure to different media and the political position derived of common sense sentences, and found that to watch television was positively associated with a conservative political position; meanwhile to read newspapers was associated with a liberal one. Consistently, heavy viewers show a tendency to think about poverty as an individuals’ matter, not a social issue (Grosswiler, 1997; Morgan y Shanahan, 1991; Sotirovic, 2003).

The hypothesis stating that television exposure is a factor influencing the manners reality is perceived has been tested through a plethora of data collection techniques and audiences including household surveys (Gerbner, Gross, Morgan & Signorielli, ), phone surveys (Sparks, Nelson & Campbell, 1997; Sotirovic, 2003), surveys on teenagers
Beyond data collection techniques, its proponents have specially focused in how to measure the variable of television exposure. The classic approach is that global content on television is uniform (Gerbner, Morgan y Shanahan, 1997). This is the reason why an item could be simply validated as an exposure measure, for example, “please tell how many hours you watch television in a common day”. Typically, this kind of data could be analyzed with T-test or ANOVA procedures, obtaining categories in the independent variable as light and heavy viewers, or light, medium and heavy viewers.

More sophisticated indexes have been constructed to measure the independent variable. Some studies have tested recall capacity in respect to what the viewer watched the day, the afternoon or the week before (Shrum, 1997), others have asked for the frequency to exposure to a specific type of programming (Huessmann, Lagerspetz & Eron, 1984) or specific program watched each week, some weeks, the majority of the weeks or never (Reeves as quoted by Potter, 1991).

Other measures for television exposure variable include the sum of hours of “TV viewed on an average weekday and an average weekend day” (Hawkings, Pingree, & Adler, as quoted by Potter and Chang, 1990, p. ); the average of two measures, “amount of television watched yesterday (a weekday) and amount of television usually watched on an average weekday (Rubin, Perse, & Taylor, as quoted by Potter and Chang, 1990); or the average of the hours spent watching television “before noon”, between noon and 6 PM”, “between 6 and 10 PM” and “after 10 PM” (Mares, 1996).

As the television exposure measure, also statistical analyses have increasingly become more sophisticated. Beyond total exposure, more evidence is consistently showing
that is not global exposure, but exposure to specific types of television what explains the cultivation process. Holbert, Shah and Kwak (2003) found that the exposure to liberal drama programs/sitcoms was positive and strongly related with a sympathetic perspective about women’s rights. Also they found that the exposure to conservative drama programs/sitcoms was negative and strongly related to the same perspective.

Sparks, Nelson and Campbell (1997) tested the TV viewers’ beliefs in paranormal phenomena, finding that general TV exposure does not work as a predictor of these beliefs, but supportive program exposure does.

Potter and Chang (1990) tested in college students 5 types of measuring television exposure: 1) total exposure, 2) exposure to program types, 3) exposure to type controlling for total exposure, 4) proportional exposure among program types, and 5) weighted proportions (proportion for each viewing type multiplied by the total number of hours of weekly television viewed). Their results indicated that the less successful way to operationalize the television exposure was the total hours of exposure. The best way was the proportional exposure measurement. Generally, all the alternative ways to operationalize were better predictors of cultivation measurements than the total hours dedicated to watch TV. The authors disclaimed risks in the way to operationalize alternatively that could limit multiple regression analysis results. This paper and Morgan and Shanahan’s (1997) suggest that because it is difficult to analyze separately TV and other social influences, the best way to test the variables in a multivariate analysis is partial correlation.

While Morgan and Shanahan (1997) stated that the cultivation process analysis has been supported also by international literature, the evidence indeed lacks in other regions, specifically Latin America. Even though Morgan and Shanahan (1991) reported that a
study conducted in Argentina revealed a similar pattern by audiences being influenced by the television’s lesson, other theoretical perspectives suggest that culture plays a role in how TV influence the viewers’ construction of reality.

One example can be observed in studies testing the relationship between television, stereotypes and gender. There is a growing corpus of evidence showing the unbalanced treatment to gender roles in television contents. Hardwood and Anderson (2002) found that prime time television is mainly composed of males’ characters. If appear, females are consistently represented in traditional roles (Barner, 1999; Elasmar, Hasegawa and Brain, 1999). The unbalances include educational children shows (Barner, 1999). On the world of television, strength and power are represented as male characteristics and grace is represented as a female one. Masculinity is represented as hyper-masculinity, or coldness and cynical attitudes (Scharrer, 2001). Even though in Mexico the evidence is scarce about stereotypes issues, a few studies show that *telenovelas* (Latino soap operas) tend to show sex stereotypical roles (Quintero Ulloa and López Islas, 1999).

However, the evidence is not clear in showing how genders expose and appropriate television messages. In Mexico, boys exposed to Pokemon, an *anime* cartoon where male characters were stronger than female, assumed girls did not have to control power symbols (Cerda Cristerna, 1998). However, other studies did not support the male power hypothesis in relation with the television system (Huerta Wong, 2003).

While studies in industrialized nations as Germany (Rogge and Jensen, 1992) or Britain (Morley, 1992) found that the bread-winner role influences the domestic power relationships, studies conducted in Colombia (Muñoz, 1992), Venezuela (Barrios, 1992), Chile (Fuenzalida, 1992), Mexico (Huerta-Wong, 2003), or even China and India (Lull, 1997) showed the relative power of the housewives in managing the remote control, with
particular emphasis in watching *telenovelas*. This perspective is consistent with the principles of cultivation process, stating that less powerful groups are indeed negotiating or refusing mainstreaming ideas, including a male-centered perspective.

In addition, gender studies suggest that traditional roles of gender relations are not itself oppressive in Latin America. In a survey conducted in Mexico, Carmona (2003) measured gender attitudes as a 35 item scale related to the male and female responsibility to care for children, domestic work and economic roles. Her findings show females assumed more traditional roles than males. There was some balance between genders in their perspectives about issues as children care or even domestic/not domestic work. However, respondents (especially females) stated that the bread-winner role is a male job. More than gender, education was the main predictor variable.

As summarizing, while there is a plenty of evidence supporting the hypothesis that television exposure influences social construction of reality among viewers. The lesson of television about gender is that gender relationships are traditional and male-centered. However, the evidence also suggests that the mainstreaming lessons of television are not uniform but especially concentrated in some types of programming and specific shows. Cultivation evidence is scarce in Latin America, and there is no antecedents talking about what is happening at this respect in Mexico, even though other theoretical approaches and fields suggest that culture seems to play a role in the relationship between television and viewers.

There are stated a research question as follows:

RQ1. How television exposure is associated to social constructions of gender issues, as stereotypes, females’ representation and females’ vulnerability?
Method\textsuperscript{1}

Variables

**Independent variable**

Television exposure has three components. The first one is the quantity of exposure, computed as the average of the sum of hours watched in an average weekday and on weekends, using a similar daily scale as Mares (1996). The second one is the exposure type, or the frequency of hours spent in watching the main types of programming transmitted by open Mexican TV on a weekly basis. The third one is the origin of the television program, or the frequency of hours spent in watching the main types of programming depending if the show has a Mexican or imported origin.

**Dependent variables**

**DV 1.** Stereotypes, or the attitudes toward the moral/body strengths, intelligence, fidelity, and work moral of males and females.

**DV 2.** Representation, or the mean of four representations measured in percentages: females, females as family leaders, married females on the job market, and single-mothers. Cultivation analyses showed the sub representation of specific populations by TV viewers, potentially influencing their presence and status.

**DV 3.** An important part of females’ under representation is the idea of females as victims. According to the second-order cultivation analysis, this is a cognitive level of viewers’ appropriation. A typical variable in this theoretical perspective is the females’

\textsuperscript{1} Although only the guidelines about the instrument and the variables are shown here, a complete operationalization and scales can be requested for free by e-mail to the author at jehuerta@itesm.mx
vulnerability index, or the difference between the estimations of females as violence perpetrators and females as victims. (Gerbner, 1997).

**Control variables**

Sex, education and age were used as control variables. Education is measured as completed education degrees (elementary, junior high, high school, bachelor and graduate).

**Population, sample and procedure**

This paper reports a phone survey conducted in the summer 2004 in exploring the relationship between television exposure and social construction of family and gender relationships in Monterrey, Mexico. The study was supported by funds of the Tecnologico de Monterrey’s Audiovisual Media and Globalization in North America Research Program.

A multiple-stage process was followed to select a random sample. The relative anarchy of the telephone companies and people contracting telephone lines made especially difficult to get the final respondents, but an effort was conducted in such sense. The exact population is unknown, but it is estimated to be near to 543 thousand household with their telephone listed in the local phone book. While there are two companies in the metropolitan area of Monterrey, just Telmex offer their clients a phone book. As a consequence, the population is not composed of the total phone users in Monterrey, just Telmex’s clients. The white pages book consists of 1223 pages, each of 4 columns with 111 phone numbers as average. Each name was considered as an entry and each phone number as a household. The total, at least, included approximately 543 thousand households as the population. Random sample procedures were established in choosing page numbers, columns, and the final phone number where each questionnaire was administered. A list containing 500
phone numbers was used as the original sample, but after discarding businesses and non-existent phone numbers, the final sample was composed of 420 phone numbers.

In gathering data participated Tecnologico de Monterrey’s Audiovisual Media and Globalization in North America Research Program’s research assistants. They were trained in a couple of sessions and all their field work was supervised in any moment. Pilot tests were run until any research assistant easily got all the process.
Results

The total number of filled questionnaires was 401. Despite cautions as calling in different hours, the majority (62%) of respondents were females (Chart 1.1). Age appeared negatively skewed, and the average age was 39 years, with a mode of 18 years (Chart 1.2). Years of school was a bimodal variable, marking junior high (n=91, 22.7%) and bachelor (n=91, 22.7%) completed as modes (Chart 1.3).

People in Monterrey reported to be heavy viewers (m=3.6, sd=2.1), a finding consistent with a similar study conducted in 1999 (Huerta et al, 2000). Domestic programming (m=5.6, sd=6.4) was preferred, remarkably \textit{telenovelas} (x=3.08, s=5.1). Local news programs (m=3.79, sd=3.4) are also watched more frequently than national news (m=2.95, sd=3) (Chart 2).

Cronbach’s Alpha internal consistency tests were running by testing the measure of stereotypes. This measure ask for the respondents’ opinion (measured in a scale 1-10) toward strength, fidelity, health, intelligence, and work capacity between males and females. The result (.737) shows internal consistency good enough to work with it, considering the sample size. A similar test was running by testing the 4-item scale on representation of females living in Mexico, females as family leaders, family on the job market, and single-mothers. The result (.725) shows internal consistency also good enough to use the scale.

The partial correlation coefficients were computed to determine the degree of relationship for television exposure and stereotypes, and representation of genders on respondents. As independent variables were introduced global exposure, types and origin of
television. As dependent variables were introduced males’ assessment, females’ assessment ( stereotypes), females’ representation and females’ vulnerability index. Sex, education and age worked as control variables.

There was no result any association between watch television and females’ representation. Associated with this result, as the literature suggests, neither females’ vulnerability index was statistically significant (see Table 3). The findings indicate that watch television is associated with a positive males’ assessment (R=.207, p>.01), more than a positive females’ assessment. Also Mexican but not American programming is related to the males/females assessments.

The Acculturation of Muslim Egyptians in the U.S.

Dr. Mona Ibrahim
Lisa Peterson
Amanda Phillips

Abstract

This study explored the acculturation of 64 Muslim Egyptian adult immigrants and visitors in the U.S. Results indicated that two dimensional models of acculturation, which suggest that the acquisition of a new culture and the maintenance of one’s original culture are not two mutually exclusive options, describe the acculturation of this group accurately. Egyptian Muslims in the U.S. clearly believe it is both important and possible to develop ties to the U.S. culture while maintaining ties with the Egyptian culture. Our data also suggested that it is important to assess ethnic identification and acculturation attitudes separately and not to assume that they are interchangeable constructs.

Suggestions for future research are discussed.

Introduction

While the acculturation of several groups of immigrants and visitors to the U.S. have been the subjects of many research investigations, the Arabic-speaking Muslim immigrant and visitor population in the U.S. has not been very well studied. In an attempt to fill part of the gap in research with respect to this group, this study focused on exploring the acculturation of Muslim Egyptian adult immigrants and visitors in the U.S.

Hutnik (1986) proposed a model of acculturation based on four strategies for the individuals’ ethnic identification: Assimilative (i.e., the individual identifies only with the host culture), Acculturative (i.e., the individual identifies with both cultures), Marginal (i.e., the individual chooses to identify with neither culture), and Dissociative (i.e., the
individual identifies only with the first-culture). This study explored whether the two-dimensional ethnic identification model of acculturation applies to this group. Specifically, the study aims to answer the following questions:

1. Which acculturation option best describes Muslim Egyptians’ acculturation in terms of their ethnic identification?

2. Do Muslim Egyptians in the U.S. identify independently with Arabic and American ethnic groups?

The best-known two-dimensional acculturation model is the one proposed by J. W. Berry (Berry, 1984, 1986, 1992, 1997). According to Berry et al. (1989), immigrants living in the host society must decide on two basic questions for themselves: (1) "Is it considered to be of value to maintain one's identity and characteristics?" and (2) "Is it considered to be of value to maintain relationships with the other groups in the host society?" (e.g., Berry et al., 1989; Berry, 1990). Even though Berry’s model is based on a different aspect of acculturation (attitudes) than Hutnik’s model (ethnic identification), both models basically report the same four profiles of acculturation: assimilation, separation, integration and marginalization. Yet, while Berry and his colleagues have generally found that integration, or biculturalism, involves favoring both contact with the first-culture and with the host culture, some studies that used ethnic identity measures of acculturation have given different results. These inconsistent results have supported suggestions that the degree of identification with minority and majority ethnic groups may be relatively independent of the acculturation attitudes people have (Hutnik, 1986; Noels et al., 1996). Consequently, another aim of this study is to research the following questions:
(3) Which acculturation option best describes Arab Muslims’ acculturation in terms of their acculturation attitudes?

(4) Do the different acculturation profiles observed using Hutnik’s two-dimensional model of ethnic identification correspond to the acculturation profiles observed using Berry’s acculturation attitudes model?

Methods

Participants

A sample of 64 Muslim Egyptian adult immigrants and visitors in the U.S. was studied. The sample was recruited mainly from North Dakota (26%), Michigan (19%), Texas (14%), and Connecticut (8%), South Carolina (6%), in addition to eight other states (27%) within the U.S. Roughly one fourth of the immigrant sample had been in the U.S. for 20-35 years, another fourth for 8-19 years, another fourth for 4-7 years, with the remaining one fourth reporting that they have been in the U.S. for 1-3 years. The majority of the immigrants (44%) are U.S. citizens, with 23% reporting that they are permanent residents and 33% on temporary visa. It was very difficult to recruit random participants because of the tensions following the events of September 11, 2001. Because of that most participants were recruited through the personal acquaintances of the primary investigator.

The sample had roughly equal numbers of males and females. The average age was 43 for males and 40 for females. 94% of the participants were married. The highest degree attained by the majority (65%) of the sample was a graduate or a professional degree. About 50% of the sample were unemployed or worked part-time, with the remaining 50% working 40 or more hours per week.
Procedure

A packet of questionnaires was used to solicit the responses of participants. It was translated into Arabic and then back translated to English and compared for meaningfulness by two research assistants. The participants were given a choice of answering the questionnaires in Arabic or English. Questionnaire packets were mailed to participants and returned in self-addressed stamped envelopes. Each participant was paid $10.

Measures

Two measures were used in this study. The internal consistency reliability (Cronbach alpha) of the measures for our sample were calculated when appropriate, and are reported below. Four-point Likert scales (ex. 1=strongly disagree, 2=disagree, 3=agree, 4=strongly agree) were used, rather than five-point Likert scales, in order to force a choice from the participants. The investigators were concerned that given the nature of the research topic and given the sensitive time it is conducted in, most participants may opt for the neutral answers, rather than expressing their actual opinions. Thus the decision was made to eliminate the fifth, or neutral, choice. Average scale scores, and subscale scores when relevant, were computed and used in the analyses of this study’s data.

Ethnic Identification Scale (Alpha=.89). Ethnic identity was assessed separately along two bipolar scales, with the first scale measuring identification with the host (American) culture and the second scale measuring identification with the native (Egyptian) culture. A 16-item scale modified from Phinney's Multigroup Ethnic Identity Measure (MEIM; Phinney, 1992) was used, with half of the items designed to assess identification with
Egypt and the other half assessing identification with the U.S. The measure includes items (on a 4-point Likert scale with 1=strongly disagree, 4=strongly agree) to tap 2 components or subscales of ethnic identity: 1) The Interest subscale, which measures whether a person has spent time learning about the culture and history of an ethnic group, and 2) The Commitment subscale, which measures positive feelings and a sense of pride and belonging toward an ethnic group. An example of items from the Interest subscale is: “I have spent time trying to find out more about my ethnic group.” An example of items from the Commitment subscale is: “I have a strong sense of belonging to America.”

Acculturation Attitudes Scale. Acculturation attitudes were assessed using three statements related to three different acculturation domains: 1) culture and society, 2) language, and 3) marriage. For each domain, the participants were given four statements to choose from, each expressing one of four different acculturation attitudes: assimilation, integration, separation, or marginalization. The participants were asked to circle the statement that is closest to their personal attitude. This technique for assessing acculturation attitudes was adopted from that developed by Berry and colleagues (1989). An example of a separation statement from this scale is: “Because we live in America, we must be careful to emphasize our distinct cultural identity and to protect it from gradually getting lost, by restricting our association with American society.”

Results

(1) Which acculturation option best describes Egyptian Muslims' acculturation in terms of their ethnic identification?

Frequency analysis of the responses to the ethnic identification scale revealed that 49% of the immigrants in our sample identified more with the Egyptian culture than
with the U.S. culture (separation), while 39% identified equally strongly with both Egypt and the U.S. (integration), 6% identified mostly with the American culture (assimilation), and 6% did not identify strongly with either culture (marginalization).

(2) Do Muslim Egyptians in the U.S. identify independently with Arabic and American ethnic groups?

The correlation coefficient of the relationship between identification with Egypt and identification with America is \( r = -.15 \) (\( p=.23, \ n=64 \)). Similarly, factor analyses yielded 2 independent factors. This means that our data supports the two-dimensional models of acculturation.

(3) Which acculturation option best describes Arab Muslims' acculturation in terms of their acculturation attitudes?

Frequency analysis of the responses to each of the three acculturation attitudes domains were performed. In the culture domain, 75% of the immigrants in our sample indicated that they believe it is equally important to maintain or acquire the cultures of both Egypt and the U.S. (integration), 22% indicated that they believe it is neither important to maintain their Egyptian culture, nor is it a good idea to acquire the U.S. culture (marginalization), while the remaining 3% indicated that they think it important to maintain the Egyptian culture, but there is no value in acquiring the U.S. culture (separation).

In the language domain, 94% of respondents indicated that they believe it is equally important to maintain or acquire the languages of both Egypt and the U.S. (integration), 5% indicated that they think it important to maintain the Arabic language, but there is no value in acquiring the English language (separation), while the remaining
1% reported that they think it important to acquire the English language, but there is no value in maintaining the Arabic language (assimilation).

In the marriage domain, 73% of the immigrants in our sample indicated that they believe it is an equally good idea for their children to marry an Egyptian or an American who is a Muslim (integration), 19% indicated that they think it important that their children marry Egyptians, but it is not a good idea that they marry Americans (separation), 5% indicated that they believe that marriage between their children and either Egyptians or Americans is not a good idea, as it will not be a happy, successful one in either case (marginalization), and 3% indicated that they think it a better if their children marry Americans than if they marry Egyptians (assimilation).

In general, across all domains, it was clear that the dominant acculturation attitude among our sample was the integration attitude.

(4) Do the different acculturation profiles observed using Hutnik’s two-dimensional model of ethnic identification correspond to the acculturation profiles observed using Berry’s acculturation attitudes model?

For the culture domain, 66% of our sample were categorized, based on responses to the acculturation attitudes scale, into an acculturation category that did not match the ethnic identification category that their responses to the ethnic identification scale placed them in. For the language domain, the percentage of participants whose attitudes did not match their identifications was 61%. And, for the marriage domain the percentage was 48%.

As can be noted in the data reported for questions 1 and 3 above, it seems that while most Muslim Egyptian immigrants think and believe that integration is important
and valuable (an “integration” attitude, they tend to feel that they belong more to the Egyptian culture (a “separation” identification). This may be explained by the fact that over one third of the participants in our sample reported that they feel unaccepted in the U.S. society and that they have been treated unfairly because of their ethnic background. In other words, the immigrants may have the desire to be integrated, but they may be forced into a “separation” identification because of the perceptions and actions of the members of the host society in which they live.

Discussion

In light of recent, post September 11 of 2001, events, it is not surprising to see a high percentage of Muslim Egyptian immigrants showing a “separation” ethnic identity. Perhaps identifying with one’s original culture and ethnic group in these difficult times is an attempt be the immigrants to find a supportive group that can help them provide meaning and sort out feelings about the events of the word. Dissociation may also be a psychologically protective strategy that helps preserve the immigrants’ self-esteem and sense of worth at a time when the host society may be questioning their worth and value as members of the U.S. society.

Our data lent support to the two dimensional models of acculturation. This means the despite the current tensions that Muslim immigrants in the U.S. face, they do not feel that they have to choose between two mutually exclusive options. They do not feel that to identify with American culture constitutes a betrayal of their original ethnic group, nor do they believe that to have pride in their Egyptian heritage is to not belong or identify with the U.S. culture. Furthermore, the data on acculturation attitudes indicates that Muslim Egyptian immigrants clearly believe that it is both important and possible to
relate and connect to U.S. society. Integration between the two cultures is possible once the social and political climates facilitate its development.

Our findings on the mismatch that exists between feelings (identifications) and beliefs (attitudes) highlight the importance of heeding warnings against assuming that the two are interchangeable (Hutnik, 1986; Noels et al., 1996). It would be a methodological error in research on acculturation to assume that measuring either variable would be sufficient as an index of both identification and attitudes. The two constructs are independent and should be treated as such in future research studies.

Further research is currently underway in order to cross-validate the results of this study on another, larger, sample of Muslim Egyptian immigrants. Future research will also attempt to follow the immigrants in our sample in order to obtain longitudinal data on acculturation. Future plans also include testing the generalisability of our findings in describing the acculturation of other groups of Muslim and Arab immigrants to the U.S., such as non-Egyptian Muslims, and Christian Egyptian groups.

The Psychological Well-Being of Muslims in the U.S.

Mona Ibrahim

Psychology Department, Concordia College, 901 8th St. S., Moorhead, MN 56562

Abstract

While the psychological well-being of many immigrant groups in the U.S. has been extensively researched, the Muslim population in the U.S. has not been very well studied. In an attempt to fill part of this gap, this study focused on exploring the psychological well-being of first-generation Muslim adult immigrants in the U.S. The life satisfaction, self-esteem, sociocultural adaptation, and psychological distress of 182 Muslim adult immigrants in the U.S. were measured using a set of questionnaires. Our sample consisted of 74 females and 104 males. The mean age of the sample was 36 years. The participants had lived in the U.S. for an average of 14 years. 70% of the participants had earned at least a college degree. About 54% of the participants are U.S. citizens and about 59% are married. The Muslim immigrants in our sample mostly came from non-Arabic speaking countries (74%). Despite the stressors that Muslims in the U.S. are experiencing today because of the political tensions, this population seems to be psychologically healthy. They have high levels of self-esteem, low levels of psychological distress, and moderate levels of life satisfaction. The mean scores on life satisfaction, self-esteem, and psychological distress (all measured on a scale of 1 to 4 where 1 indicates a low level of the construct and 4 indicates a high level) were 2.8, 3.4, and 1.6 respectively. In terms of percentages, 82 percent of the respondents in our sample obtained a mean score of 3 or more on self-esteem and 80 percent of the participants had a mean score of 2 or less on psychological distress. Life satisfaction was not as high as the other measures of psychological well-being for this sample, with only 43% of the respondents indicating that they agree or strongly agree that their life is satisfactory. Possible factors, such as religious commitment and educational level, that help buffer this population against psychological distress and low self esteem despite having lives that they do not perceive as highly satisfactory are explored. Implications for health care, social services workers, and agencies that offer services for immigrants are discussed.
In the Tradition of Apprentice and Master

In the tradition of apprentice and master, the relationship developed between a mentor and student cannot be denied with regards to its importance in the development of the skills necessary for the chosen pursuit. Before moving into the realm of professionalism in art, one with a passion for the subject usually begins in a group play setting such as Montessori, Waldorf, or most often kindergarten. Only later does the interest of the student develop into the sensibility where they question “art for its own sake” many times under the tutelage of a master.

The early years of art and play stimulate a creative fire that can last for a lifetime. If one looks at the many preschool systems in place that stimulate creativity, there is open encouragement and much investigation of materials. It is these forays into new experiences, failures, and explorations that contribute to the child’s understanding that anything and everything they create will be hung on the refrigerator, exhibited for all to see. It is not expected of a four-year-old to produce accurate renderings of human form, nor have a deep conceptual rooting in art history. This is where the system of art making is at its purist, albeit rudimentary, form.

With cutbacks in funding there is not much money left for the art in primary schools, as budgets have been stripped to what is considered essential. When the student progresses through the youthful hierarchy of art education, coloring between the lines becomes more important. Often grade school art is relegated to a series of predetermined craft projects where written instructions are handed out, and the students are expect to spend their time silently on the project. Rather than a creative exploration into the media, art production becomes an exercise in dexterity and following instructions. While true that one achieves freedom through technique, it is unfair for a student to be criticized for not following wrote procedure, breaking boundaries and experimenting with materials.

As the student advances in age, gone are the undying encouragements to pick up a medium and look for a mode of expression. At this stage boys and girls are already beginning to be put into categories and separated from the play aspects of the creative process. Imagine a popular Thanksgiving-turkey art project where the instructor distributes a list of tasks that include the tracing of ones hand, the gluing of googlie eyes in the biologically correct place, and proper placement and length of pipe-cleaner legs. Again fathom the great chastisement a student receives from both peers and instructor
when he, because of his lack of dexterity, has accidentally cut off a paper finger-feather, has chosen to put on more than two eyes, and has legs that do not match in length. His creation, a breed of animal different than the other twenty-four classmates, is met with sarcasm, rather than praise.

When the separation of play and art occurs, there is much more at stake than rendering skill or the ability to color. Early experiences with art often set up a negative relationship with the idea of art as a mode of expression that requires facility to participate. The spoken word does not breakdown or cease from being used when a youth’s speech is grammatically incorrect. He or she will continue to speak, and through general use, teacher review, and peer input, improvement is well marked. Because the negative feedback regarding a child’s art can be so painful, he or she may stop expressing himself or herself through art completely. Children, when they have been criticized, may consider themselves “not creative” or use the excuse “I can’t draw”. Because the aversion produced by the negative feedback is so powerful, they no longer consider creating in a pictorial rather than verbal way.

These early experiences discourage many from pursuing the arts, and those that are praised for their skill and appreciated by their teachers (often for their physical facility and ability) are then groomed for more advanced levels of art education. That is, play no longer has an association with art, and art is looked upon more as an academic endeavor in high school. From this point, criticism, rather than encouragement, is the rule. Art is affiliated with competition, as fairs and school contests are the norm. At best this can be healthy, as it rewards hard work and prepares the artist for the judgments of a world that tries to understand what he or she is expressing. At worst, for those that do not receive accolades, the creative endeavor will cease.

If by chance the individual who is practicing the artistic discipline continues to the next level in college, they will be exposed to myriad experiences ranging from life skills, cultural events and dorm residency to seething art gallery parties, mingling, and networking. It seems that the greater emphasis in the university setting has become the aura surrounding the art rather than the studio process itself.

As many things are in life, the collegiate and post-collegiate “art world” is filled with superficiality and hostility. The university/institution would be better served if it considered
grooming fine artists by creating a nurturing environment, full of exploration and play, for the artists to mature. Dale Carnegie, the well-known author and businessman, states, that when you are free and “lavish in your praise” (248) individuals will be more likely to give of themselves, a necessity for the review and critique process.

The strategy to facilitate involvement in the review, and conjure engagement in an artists’ peer dialog is not a well-documented one. The term “critique” is very close to critical, which in itself has connotations in the most negative sense. It has become popular to say constructive criticism is an asset to artists. When commentary is critical it is neither constructive nor objective in most cases. “In matters of any kind we usually listen to, and take not of, not only the opinions of those who are acquainted both in theory and in practice with the matter at hand, i.e., the so-called specialists. Only for art and literature is an honorable exception made. It’s precisely in this sphere that any fellow can pronounce with a kluge Grimasse, loudly with all weighty authority, ‘Now this is beautiful, but that’s no good at all’” (Kandinski, 35).

To encourage play in the more advanced setting of the university it is important to be conscious of language, as it can, at times, be more powerful than that of the visual. The Stroop test demonstrates a cognitive dissonance that appears when color and language are confounded. When a word list of color names was written in non-corresponding ink (“red” written in green), the duration of time that was needed to successfully identify the color of the type was considerably longer than when the ink color and color name were identical (“red” written in red). Therefore, the words that one uses to discuss work are essential to the success or failure of the dialog as Kandinski further notes, “…how can it (the artist) not heed the audacious ignoramus who proclaims his vulgar ‘truths’ with such authority and inspiration?” (35). Listening to the constant bombardment of subjective comments and negative remarks discourages many artists from taking further risks in their practice.

For example, say a student shows a large photograph in the review setting. Typically, his or her classmates first direct comments at the student, as peer feedback is essential. Then the instructor will often chime in when necessary. The role of the facilitator cannot be merely one of laying back, they need to be active in directing the critique. It must not fall into the category of merely subjective likes and dislikes. Viola Spolin notes in Improvisation for the Theater that it is important for the review facilitator to encourage
and make the students feel secure, and that “evaluation must be on what was actually communicated, not what was ‘filled in’ by either the (artist) or the audience and not any personal interpretation of how something should be done” (27).

In this particular case, Spolin notes the failures of assumption, as it is important to talk about what was presented rather than what one would like to see.

Moving back to the photographic example we can also look to linguistics as a key to unraveling the critical system. “Furthermore, it is difficult (if not impossible) to give a plausible account of the meaning of but in terms of conventional implicature, pragmatic presupposition, or felicity conditions” (Iten, 1). When a student presents a piece and his peers are asked to comment we often hear...

“I like what you’ve done here, but your color balancing is off.”
“You have great compositional skill, but your focus is wrong.”
“You have a wonderful eye for this subject, yet I’m not feeling a relationship.”

All of these statements are similar in that they are qualified, the words but, yet, however have no place in the review setting. It is important to keep the room a constructive one that will free the artist to pursue even more risks, as they will no longer be fishing for approval, if there is no criticism. Each of these statements could be made in the same way, constructing and building the person’s confidence rather than hurting it.

“I like what you’ve done here, and this print could be even more amazing if your color balancing improves a bit.”

“You have great compositional skill, and when you tighten up this focus, it’s really going to pop.”

“You have a wonderful eye for this subject, and when the relationship you have with her is clearer, it’s going to really work.”

Spolin notes that, “This group (of encouraging reviewers) helps in solving problems, removes the burden of anxiety and guilt from the player. Fear of judgments (one’s own as well as those from others) slowly leaves the players (read artists) as good/bad,
right/wrong reveal themselves to be the very chains that bind us, and they soon disappear from everyone’s vocabulary and thinking.” Here we can see the resurgence of play in the review where “…they trust the scheme and take a further step into the environment” (26). It is therefore essential that the sense of play and encouragement be a device to further encourage risk taking in art, as Bates alludes, it’s the only way one can make order of chaos (13).

Moving on to practical critique structures from the theoretical one must ask, what methods can be employed to improve the present system of critique? How can it become more play like? Below are a few exercises where the focus may be best directed back to the students in a play environment to extract the essentials of the artwork:

**Explain what you see:** Each student that is called upon will speak only about what he or she sees without judgment, thereby opening a dialog about what is exhibited in the work, rather than subjective likes and dislikes.

**Press Release:** The student pretends that he or she is a very well know gallery owner, and has many of the exhibiting artist’s works for sale. What would he or she say about the work to get people to buy it?

**What would ***** say:** This game is collaboration between two students and the person exhibiting. Student one picks an artist that is well-known. then student two talks about the work as if he or she were that artist. The review continues with many students assuming the personality of other well-known artists and making statements about the exhibitor’s work.

In summation, education in the arts has a significant tradition of master/apprentice relationships. Because of the current state of transmissive education, where one instructor is responsible for 15-20 students at a time - for only one semester at a time, individual mentorship is rare. In the stead of mentorship, it is essential for the art teacher, desirous of a competent graduating class, to pursue a course of action where group support, play, and objectivity are paramount to wrote instruction, criticism, and subjective judgment. For maintaining the standard art education, that of a vocational program, will only lead to “Timidity, self-distrust, and conformity...” (Bestor, 149).

LIL’ RED RIDIN’ THRU ‘DA HOOD: A PILOT STUDY OF THE USE OF THEATER IN NUTRITION EDUCATION FOR LOW-INCOME AFRICAN-AMERICAN CHILDREN

by

CAREE J. JACKSON, MS

(Under the Direction of Rebecca M. Mullis, PhD, RD, LD)

ABSTRACT

In recent years, childhood overweight has become a major public health concern in the United States. Poor dietary patterns and lack of physical activity are major contributors to the problem of overweight. Because overweight children are more likely to become overweight adults, many diet related diseases follow overweight children into adulthood. Data reveal African-American children are at a higher risk for overweight than their Caucasian counterparts. Thus, early intervention is critically needed in this population to reduce rising rates of childhood overweight.

One potential way of successfully communicating nutrition messages in school-based settings is via theater productions. To date, limited research has been conducted in the use of theater to communicate nutrition messages to children, especially, low-income African-American children. In this study we sought to determine if a culturally appropriate theater production is an effective way of conveying messages about healthy eating and physical activity to low-income African-American children in school-based settings. Overall acceptance of the use of theater in nutrition education suggests that theater is a viable medium for introducing health for this target population.

INDEX WORDS: nutrition education, theater, African-American children, overweight
Statement of the Problem

Rising rates of childhood obesity, especially among children is a major public health concern in the United States. Teaching children about the importance of good nutritional and physical activity habits is particularly important because overweight children are more likely to become obese adults. Showing that a culturally appropriate nutrition theater production is an effective means for disseminating health knowledge and influencing the behavior of children may lead to assistance in decreasing the number of overweight children as well as adults in the population.

Purpose and Hypotheses

The purpose of this project is to pilot test a culturally appropriate theater production, Lil’ Red Ridin’ Thru ‘Da Hood, in order to determine if theater is an effective way of conveying messages about healthy eating and physical activity to low-income African-American children in school-based settings.

We hypothesized that viewing a nutrition theater production designed specifically for low-income African American children and completing related school-to-home educational materials will:

1) increase student knowledge about the importance of making healthy food choices and increasing physical activity (PA).

2) influence student intentions and behaviors related to making healthier food choices and increasing PA.
Background

Childhood Overweight: A Major Public Health Concern

In recent years, obesity has been a major contributor to the declining health status of many Americans (Kumanyika, 2001). Unfortunately, obesity has also become more prevalent among our youth (Styne, 2001). Childhood overweight is a major public health concern in the United States (Styne, 2001). Data from the 1999-2000 National Health and Nutrition Examination Survey (NHANES) reports that roughly 15% of youth ages 6-19 are overweight (Ogden, CL, Flegal KM, Carroll MD, Johnson CL, 2002). Furthermore, obesity disproportionately affects members of minority populations in the US (Crawford PB, Story M, Wang MC, Ritchie LD, Sabry ZI, 2001). NHANES (1988-99) data reveal that Mexican-American boys, ages 6-11, have the highest percentage of overweight at 17.7%; and followed closely by Non-Hispanic black girls, ages 6-11, at 17.1% (Crawford et al, 2001). Overweight children are more likely to become overweight adults. Subsequently, many diet related diseases follow these children into adulthood (Styne, 2001). Thus, early intervention is critically needed to reduce rising rates of childhood obesity (Fitzgibbon ML, Stolley MR, Dyer AR, VanHorn L, KauferChristoffel K, 2002).

Although genetics plays an important role in the development of obesity, many environmental factors have also served to increase the number of overweight children in the population (Styne, 2001). Poor dietary patterns and lack of physical activity are major contributors to this public health concern (Crawford et al, 2001). Less than 1% of our children consume meals with adequate nutrients (Perry et al, 2002). Moreover, children are less likely to encounter intense physical activity at school, and when students are
away from school, they spend nearly 25% of their time watching television (Cowley & Robinson, 2000, 2001).

Increased intake of fruits and vegetables and increased physical activity have been shown to reduce the risks for many of the nation’s leading chronic diseases, including, coronary heart disease and cancer (Johnson, 2000). African Americans have experienced an increase in the incidence of diet-related chronic diseases, as compared to Caucasians (Suminski, Mattern, & Devor, 2002). Also, many African Americans demonstrate low levels of physical activity (Resnicow et al, 2000). Thus, effective strategies for educating African-Americans about the importance of increasing fruit and vegetable consumption and physical activity to prevent chronic disease must be implemented and sustained. Influencing children to make healthier food choices has a direct effect upon the food choices made by their parents (Steckler & Linnan, 2002). The question then becomes, how do we effectively educate at risk populations, specifically children, effectively?

The Use of the Arts to Educate Children

Many innovative forms of the arts are currently being utilized to educate children. Various art forms such as dance, art, poetry, music and creative drama have improved student motivation for learning and increased achievement in reading, writing, and math (Milner, 2001).

Childhood memories of elementary school experiences with the arts are often recalled during adulthood (Peyton, 1991). For example, Chorpenning, a famed director of children’s theater, discovered that a student who attended theater experiences at the Goodman Theater as a child could not only recall a scene from a play he viewed during childhood, but he had also unconsciously recalled specific lines from the play during a
prior conversation (23). She further states, “Our audiences do not only experience our plays; they may also have the urge to live out what they see! This urge may spring into action immediately or bury itself in their deep subconscious, a buried memory to emerge during adulthood” (Chorpenning, 23).

**Preliminary Studies**

Presently, theater is used to educate children in a variety of subject areas including health education, drug education, environmental education, and nutrition education (Perry et al, 2002). To date, however, few studies have been conducted to test the effectiveness of using theater to communicate nutrition messages (Perry et al, 2002). In a study conducted by the University of Minnesota, researchers evaluated a theater production about eating behavior of children entitled, “All’s Well That Eats Well.” The play was produced in twenty elementary schools in Twin Cities, Minnesota during the winter of 2000 by the National Theater for Children (Perry et al, 2002). Messages in the play were reinforced via follow-up classroom activities as well as take home activities (Perry et al, 2002). Pretest and posttest questionnaires were given to participants who viewed the play and evaluated it for significant differences in food knowledge, food choices, and food recall (Perry et al, 2002). Findings produced statistically significant effects on improved food knowledge and food choices related to increasing fruit and vegetable consumption in students in grades 1-6 (Perry et al, 2002). The implications are that theater productions can be a cost effective way to deliver nutrition messages to children and can yield at least short-term effects on children’s food knowledge and behavior (Perry et al, 2002).
A similar study in communicating nutrition messages to children via theater has been conducted at Tufts University (Singer, 2000). The National Theater for Children produced the nutrition theater production, “The Prince of the Pyramid,” in New Jersey schools during the fall of 1999 (Singer, 2000). The study design included the use of pretest and posttest evaluations as well as classroom workbooks used to lead kids through activities that reinforce the messages in the play (Singer, 2000). Although results from the intervention have yet to be published, researchers suggest that viewing the play actually motivates the students to complete the curriculum activities, making both components integral parts of the intervention (Singer, 2000). There is limited data, however, about the use of theater to communicate nutrition messages to low income African American children.

**Theoretical Basis of Intervention**

The use of nutrition theater to educate children is grounded in Bandura’s Social Cognitive Theory (Perry et al, 2002).  

![Figure 1.0](Pajares, 2000)
Social Cognitive Theory recognizes the individual as the self-determining factor in his/her reaction to external stimuli (Bandura, 1986). This theory further recognizes that exposure to new ideas alone, will not result in behavioral changes (Bandura, 1986). In order for an individual to initiate behavioral changes, changes in their social norms must occur (Bandura, 1986). Greater acceptability of changes in social norms can be accomplished if individuals model behaviors of others around them (Bandura, 1986). This study attempts to alter social norms through behavioral modeling in a play production using culturally appropriate characters. The messages conveyed by the characters in the play will be reinforced through the completion of school-to-home activities.

**Project Objectives**

1) To develop a culturally appropriate nutrition theater production for low-income African American children that will educate students about the importance of healthy foods and physical activity.

2) To develop classroom activities consistent with Georgia Quality Control Curriculum objectives.

3) To provide school-to-home education materials and activities that will engage parents and students in the discussion and action of making healthy food choices and increasing physical activity.

4) To evaluate the effectiveness of the theater production by measuring student and teacher attitudes toward the production and evaluating students’ reported changes in food knowledge, food choices, intentions, and behaviors related to healthy food selection and increasing physical activity.
**Innovative Aspects of Project**

Three of the unique and innovative aspects of the Lil’ Red Ridin’ Thru ‘Da ‘Hood project are:

1) The use of theater, dance and hip-hop music to capture the attention of kids, while delivering important messages about good nutrition and physical activity.

2) The play was written to specifically address the barriers that low-income children may encounter when trying to adopt a healthy lifestyle.

3) The use of an integrated approach of classroom instruction that is reinforced with school-to-home activities to engage parents in the project as well as children.

**Methods**

*Lil’ Red Ridin’ Thru ‘Da Hood* was performed for students in grades 3 and 4 during the spring of 2004. The population sample was drawn from a sample of four inner city elementary schools that were selected on the basis of having 90% participation in the free and reduced school lunch program and a high enrollment of African American students. In February of 2004, all participants (N=298) enrolled in the study were administered a pretest that was read aloud by a University of Georgia (UGA) staff member. The test took approximately 15 minutes to complete.

One week after taking the pretest, students attending intervention schools viewed *Lil’ Red Ridin’ Thru ‘Da Hood*. Members of the UGA Black Theatrical Ensemble performed the play for a duration of approximately 30 minutes. The play performance at both intervention schools took place on the same day. One audience viewed the play in the morning (beginning of school day), and the second performance took place in the
afternoon (near the end of the school day). During the three weeks following the play performance, participants were asked to complete school-to-home activities. Teachers and parents were asked to assist students in the completion of the school-to-home activities. The school-to-home activities are worksheets that emphasize the nutrition and physical activity messages conveyed in the play. The activities were designed to take approximately 10-15 minutes to complete.

One week after taking the pretest, students attending control schools participated in reading a reader’s theater play with the assistance of a UGA staff member. Reader’s Theater is a simple and effective means to present literary works in dramatic form. Students are actively involved in reading a short script aloud without a stage or props. The strategy helps students blend the performance arts and reading. Reader’s Theater improves fluency and comprehension among students. Students read a reader’s theater play entitled, “The True Story of the Three Little Pigs,” story by Jon Scieszka and Reader’s Theater script by Bridget Scofinsky. This particular reader’s theater script was chosen because it was an adaptation of the familiar children’s story, The Three Little Pigs, just as Lil’ Red Ridin’ Thru ‘Da Hood was a variation of the well-known childhood story, Little Red Riding Hood. “The True Story of the Three Little Pigs,” however, contained no references to improving nutrition or increasing physical activity. The duration of the play is 15 minutes.

In March of 2004, after a period of three weeks, all participants were administered a posttest that was read aloud by a UGA staff member. In addition, teachers completed a paper and pencil evaluation form about the play and intervention. Figure 2.0 summarizes the implementation phase of the study design.
Summary of Evaluation Methods

Study findings were evaluated using Pretest/Posttest measures from an adaptation of a previously validated instrument. Using the pencil and paper format, Pretests/Posttests for students measured 1) student knowledge of the importance of healthy food choices and physical activity choices, 2) student intentions to increase healthy food consumption and physical activity, and 3) changes in behavior related to healthy food selection and increased physical activity. In addition, teachers completed a Teacher Evaluation Form to assess their opinions about the overall effectiveness of the intervention.
Results

See Appendix A to refer to food choices items (Q5-Q14) and physical activity choices (Q44-Q53).

Summary of Results

One hundred percent of students reported that they enjoyed the play. One hundred percent of teachers gave the show a rating of "Excellent" and reported that the play effectively conveyed health and nutrition messages for this population. Significant findings included a major impact upon students’ food choices as well as significant changes in students’ physical activity choices. Additionally, students reported an increase of ½ serving of fruits and vegetables. Our data indicated that students are already knowledgeable about healthy foods and activities. Other reported changes related to student knowledge, intentions, and behaviors were not statistically significant.

Conclusion and Future Research

Our research demonstrates that theater serves as an engaging catalyst to get students interested in nutrition and physical fitness. Theater alone, however, will not produce behavioral changes. Further research on how to reinforce nutrition messages introduced by theater productions must be conducted. Our results and the work of others indicate that substantial knowledge about healthy eating and physical activity does not directly influence behavior. Engaging interventions must also occur after the theater production in order to maintain children’s interest in healthy behaviors. Conclusively, both student and teacher acceptance of the use of a culturally appropriate theater production in nutrition education for low-income African American children makes this innovative educational approach a viable medium for introducing nutrition education messages in school based settings.

Section I:

71. How often are you physically active?

☐ 1 Everyday  ☐ 2 4 to 6 days  ☐ 3 2 to 3 days  ☐ 4 1 day  ☐ 5 Not at all

72. How often should a kid be physically active for good health?

☐ 1 Everyday  ☐ 2 4 to 6 days  ☐ 3 2 to 3 days  ☐ 4 1 day  ☐ 5 Not at all

73. Do you plan to be more physically active in the next few weeks?

☐ 1 YES  ☐ 2 NO

GREAT WORK!!

Thank You!!!
Section J: The following questions ask about the nutrition play that you saw and the activities that you did in school and at home. Please put an X in the box that you choose.

74. Did you attend the play about eating healthy and exercising with Lil’ Red, Big Boy Gran’ma Jackson?
   ☐ 1 YES ☐ 2 NO

75. Did you enjoy the play about Lil’ Red, Big Boy Gran’ma Jackson?
   ☐ 1 YES ☐ 2 NO

76. Which of the characters in the play became sick from eating unhealthy foods?
   ☐ 1 Lil’ Red ☐ 2 Gran’ma Jackson ☐ 3 Big Boy

77. How did Lil’ Red and Big Boy end up ridin’ thru ‘da hood?
   ☐ 1 In Aunt Candy’s candy apple red Escalade
   ☐ 2 On the Bus
   ☐ 3 On their bikes
   ☐ 4 In Gran’ma Jackson’s car

78. Which of the following is NOT one of the four ways to do “What’s Best 4 Me!” that you learned about in class?
   ☐ 1 Eat 5 fruits and vegetables a day
   ☐ 2 Eat a variety of foods
   ☐ 3 Eat candy and potato chips everyday
   ☐ 4 Choose low fat foods
   ☐ 5 Move and Groove by doing heart thumpin’ exercise everyday

79. Choose the “Go High” Food?
   ☐ 1 Hot wings
   ☐ 2 Cheeseburger
   ☐ 3 French Fries
   ☐ 4 Apples
   ☐ 5 Honey bun

China’s Labor Disputes Resolution Mechanism: Institutionalized Step by Step

by Yi Kang

Abstract

Labor disputes increase at an exponential rate accompanying China’s drastic changes in industrial relation. The state has responded by designing various institutions to handle labor dispute issues. Mediation, arbitration and litigation integrate the legal proceedings of the government’s institutional arrangement for labor disputes resolution. The earlier popularity of enterprise-level mediation has suffered a steep decline ever since the enterprise reform and direct access to local-level arbitration was permitted. However, there is an increasing tendency to reject an arbitral judgment and to appeal to the courts in these years. How and why has the dominance shifted from one institution to another within this mechanism? How is the mechanism utilized and evaluated? What are workers’ responses to government’s institutional arrangements? These are the questions to be answered. This study seeks to explore how the Chinese government has institutionalized the labor disputes resolution mechanism, and how these institutions have influenced workers attitudes and actions in protecting their own rights and interests by examining the case of labor disputes resolution mechanism in Shanghai. What are the factors affecting the functioning and limitation of each institution within the labor disputes resolution mechanism and causing the shift of importance from one to another? To what extent are these institutions effective? How do these institutions shape workers’ attitudes and actions, or in a more general way, how do they affect workers legal and rights consciousness development? By answering these questions, the study tries to find out how institutional arrangements set structural parameters in shaping social actors’ cognition and action, and how the actors’ attitudes and strategies in return affect the institutional development.

Tracking the sex workers along the roads of Lahore city and exploring the unsympathetic social behaviors in social GIS aspects

Abstract:
Fornication exists in every country. However, its moral values are different in different countries. The country like Pakistan, fornication is well organized in elite class but the sex workers standing on road side are living in more miserable condition than higher class sex workers are. There are many pull and push factors, which force these, sex workers to hunt the clients to earn to run their living expenses. The people have very unsympathetic behaviour towards them without knowing ground realities that compel these sex workers to fall in this evil. There is no any rehabilitation institution for these workers. The flaws in jurisdiction also increasing the roadside sex workers. It is also feared that these sex workers have the maximum potential to carry epidemic disease like AIDS/HIV. In addition, this disease can explode any time the country, but we still have taken negligible precautionary measures. Roadside sex workers are living full risky life concerning health, security and brutal adultery treatments. They have to hide their profession from their relative family members and neighbors. Therefore, they have to cover a long distance in the city to hunt their clients. For the first time GIS tools are used for social GIS analysis for this ignited issue to get ground realities of the sever problem.

Key words
Roadside Sex Workers, GPS, Proximity Analysis, Pull and Push Factors, AIDS/HIV, Red area

Introduction
Sex is a bitter or sweet reality that cannot be overlooked. Its legal efforts are the security for the survival of human being. Pakistan is announced as Islamic country and has a specific law that prohibits prostitution. Under the Suppression of Prostitution Ordinance 1961, running a brothel, enticing or leading a woman or a girl to prostitution and forcing a woman or a girl to have a sexual intercourse with any man are punishable crimes.(The Constitution of Pakistan-Chapter-2). However, this law found only in the books and its violation can be observed in all over the Pakistan. In each city of Pakistan, we found the red areas of sex workers near bus stand or railways stations. Before partition, royal families visited these areas and the elite class learns literature and etiquettes in these brothels. Therefore, many sex workers also become fame in the field of poetry. (Montgomery 1860). The civilization and typical culture portrayed by Lakhnao, Delhi and Lahore cities of sub-continent India have deep impact of these red light areas. But these areas do not only fulfill the sexual requirement of common people to elite class, but they also perform dance and singing in wedding ceremonies or in folk fun fairs which is a part and parcel of sub-continent India. The renowned poets of sub-continent also regularly visited these areas to recharge their emotions and intuition of their poetry. (Saeed, 1984).

In July 16, 1977, General Zia ul Haq dissolved the elected democratic government, and began to prolong his regime in the name of Islam. In this scenario, he also banned the red areas in all over the country, in the name of Islamic reforms. However, due to ban on this kind of work in particular and specified area, this interdict spread swiftly within the cities. In this way, Lahore city become one of the sufferers among the most prominent cities of Pakistan. Then this kind of work...
again alienated into different classes of sex workers from high class “call girls” to lower class sex workers (or in local word “gashtees”).

The Lahore city, is rich cultured and historic city of multiple races has one of the sever problems of sex workers. It is mega city with a dense population of 7.5 million located at 74-20' E longitude to 31-34 AND latitude. About 3000 sex workers are standing along the roadside, who can be distinguished, some step forward or backward from any bus stop with showy dress and masking face with third class costumes and perfume giving alluring looks. They usually appear after sunset and disappear or picked up by different category of clients after 11 O clocks at night. There are very rare chances to find any sex workers after midnight. Though, these road side sex workers are available 24 hours on the road but the peak timing of these workers started from sunset. In some cases, sex workers also play a lucrative role for corrupt police personnel to trap the client of sex workers to fleece a mass amount of money in the name of Islamic “Hudood Laws” which has a severe punishment like stone to death. About 5% of these sex workers are eunuchs and 8% are boy who indulge in sex entertainment.

The research on sex workers is being done by many scholars but mostly they confine there precious work on only marked red areas of the Lahore city. Many NGOs with collaboration on international donors like UNICEF, Action Aid, and HIV/AIDS Agencies are also working only on areas for their health and environment. Though the road side sex workers are being pointed out time to time in news papers who only depict them, as a sever evil that is collapsing the Islamic ethics and society but such feature do not explore the bitterness of ground reality.

The Problem
The main purpose of this research is to explore the status of road side sex worker and unsympathetic attitude of common people against them and to investigate the push and pull factors that force them to stand along the roads to sell their bodies for sex entertainment. Also seeking the probability of HIV/AIDS delivery as a carrier agent.

Objectives

The objective of the research was as follows:
- Tracking and mark the most probable location of sex workers on the road of Lahore city with GIS tools like GPS.
- Revealing the family background and family size of the sex workers including dependent and independent family members.
- Finding the fascinating factors that pull sex worker on the road.
- To make a proximity analysis to find the distance between the location of job and the home where they dwell.
- Seek out the root causes of this problem and find out the psycho-social and geographic factors by spatial social GIS analysis.

Methodology
The main research tools were semi-structured questionnaire and interview schedule with sex workers and some of their clients. GIS tools were also use like GPS receiver to mark the sex worker’s hot spots and then all these hot spots were transferred on digital map of Lahore city.
to perform spatial social and proximity analysis. After acquisition of primary data, it was compiled to explore the root causes and ground reality involving in sex business, that reinforce sex worker to come on the road. The population of this research was sex workers and sample was selected randomly from roadside sex workers, as has been described earlier. No doubt, it was a difficult task and it took one and half year to accomplish this research work. Total 280 respondent were interviewed, excluding clientage of the these sex workers. The delimitation of the study is the hypocritical nature and behavior of common people.

**Tacking the Sex workers on Road**

Roadside sex workers are available almost from 7 a.m to maximum 12 p.m in summer and 8 a.m to 11 p.m in winter season, where these sex workers are available almost in all roads but the most prominent roads and hot spots which were marked with GPS, are Mall road, Wahdat road, Canal road, Ferozpur road, Multan road, Circular road and Jail road(Figure 1) where the business of sex workers is at the peak from 7 pm to midnight. These sex workers are standing near bus stops or those locations where they can be distinguished easily from other commuters. They usually hunt the sex clients by waving their eyes and body movement to allure them for sex. They deal the persons according to their status and age. Their clientage includes all type of men pertaining to different type of professions like labours, students, businesspersons, caretakers, according to their pocket. They take decision in a short time to reject or select a person. If a client is pedestrian then auto rickshaw driver also came near to them to get double fair. The experience sex workers usually select those clients who have cars or at least motorbike. The deal is made according to the time and number of persons. In our sample, only 5% sex workers offer abode also. Otherwise, it is responsibility of client to arrange a secure space, which may be a flat in a plaza, hotel or any vacant house of concerning client. The rate is negotiable and it can be trusted or mistrusted by number of persons who are not narrated at the spot. Usually students do not give the exact number of clients. However, the person above 30 has nice behaviour with sex workers. Police and other security personnel have also links with some sex workers, who hunt the sex clients with the help of these sex workers and then make empty, the pocket of clients by threatening them in the name of Islamic law of Hudood. Among these sex workers, 65% respondent usually worried about police behaviour that if they captured by the police then they will be brutally raped freely and without any wages by whole police station at any time of the week or days. Such victims in roadside or call girl type sex workers at once change their location to get rid of these “Guards of Law”. The average earning of sex worker of 20-25 years of age is 20 to 50 US$/day. Teenagers and upto 30 years old sex workers have higher rates while above 30 years old sex workers attain 5 to 20 US$ per day depending upon their body physic and fitness. The minimum rate is 1.5US$ per hour. The most old women become supplier of young sex workers and get commission usually with half percentage.
Tracking the Sex Workers along Road Side in Lahore City

Figure 1 Family Background and Marital Status of Sex workers
Most of the sex workers belong to lower middle and lower class. They live below the poverty line. At least 45 million people out of the country's 140 million population live in abject poverty. (Ministry of Finance, 2003) Average family size of sex workers is 5-7 family members. 45% among married sex workers claim that their husband is unemployed and 21% say that their husband is drug addicted and the remaining 24% said that their husband is a labour and has no permanent job, to meet the family expenses. 88% of the sex workers claim, that they are still unmarried, and do this job due to large family size and dependent. The remaining 12% of unmarried sex workers do this job as a part time. They work in different private organizations, factories, restaurants, or shops like beauty parlors, boutiques, departmental stores family clinics, maternity centers, marriage bureaus, guest houses and after the end of job timing they pick the client to raise their earning. Divorced and separated sex workers are also active in this field. Married women are also active in this job, but they pretend as unmarried for inexperienced clients while habitual sex hunter can easily discriminate between married and unmarried women by some different physical features of sex workers.

![Marital Status of Sex Workers](image)

*Figure 2*

If we observe the education level of these sex workers mostly, they are illiterate or having education upto elementary level. Only 3% are graduate. And one out of total respondent has a master level degree from reputable university. The illiterate and primary level of education of these sex workers is high as 24% and 35% respectively. Mostly, the part time roadside sex workers have upto higher secondary level of education.
Milestone Sex Abuse that lead sex workers into this profession

It’s a very bitter truth that in our society, child abuse have in significant number, but mostly these incidents are concealed due to future of daughter because if any child abuse case happened to any small child then this stigma only goes towards female side and male remain innocent and worthy. When it was investigated that what was the milestone sexual related factors that forced the sex worker to adopt this profession, 20 % of total respondent admitted that first time, they were abused by relatives or neighbors that lead forced them to adopt this profession due to permanent stigma of “Gashti” (prostitute). Out of total sexual abuse, 34 %ere abused at the age of between, less than 8 to 12 (Figure 5). And this figure is very important because the news about children sex abuse are few and far between but from the above source, the ratio can stunned us by such horrible results that are usually put out of sight due to disgrace for the victim. A separate research may be conducted to reveal this reality. Mothers of sex workers also play an important role to compel their daughter to get this profession. In the same way, poor, drug addicted or unemployed husband also encourage this profession.(Figure 4). Some sex workers eloped with her boy friend who sells her to the pimps after some months, and then she was forcibly made prostitute. Such type of cases were observed 19% of the total respondent that is also not ignorable.
Milestone Factors that forced sex workers to adopt this profession

Figure 4

Sexual Abuse Factor for sex profession

Figure 5
Pull and Push Factors of Roadside Sex workers

There are many pull and push factors that forced sex workers to stand on the road. According to International Human Rights Monitoring (IHRM) group, as many as 44 percent women resort to the sex trade due to poverty, 32 percent by deception, 18 percent due to coercing, 4 percent due to surroundings (born to sex workers) and only 2 percent are involved in the sex trade at their own will. But these facts depict roughly all type of sex workers. The road side sex workers have some different. No doubt, poverty is a major factor but other factors cannot be neglected. No sex workers who start their business can take risk to start from their own Muhallah (zone like Union Council) or neighboring street or suburb. Because they live in lower middle class areas where all neighbors are very concerned to each other. Women as well as men particularly old age are in search of suspicious and thrilling stories. May be we find only few men in any union council that can be declared innocent or abstinent but we are so hypocrite about reality that when ever we find any sex workers in our neighborhood, all the people protest against them in the name of honour, filthy environment. So the sex workers have to evacuate their homes that are usually taken on rent. Then they can only live their under the auspice of Police. Otherwise, they have to go from there. If the sex workers give monthly (A type of bribery that is given to the police to save the whore’s residence). This observation can be seen on posh areas of Lahore city where elite class live and has no business concern about the type of work of their neighbors. However, road side sex workers do not want to reveal themselves as a prostitution but show themselves, as a factory workers or any kind of job where night shift is in practice. Therefore, including poverty, the common people’s unsympathetic and hatred behaviour push them to come on the road. There is also supplier or women pimps called in local language “Naika”, “Dalala”, or “aunties”, who get orders of clients and send sex workers along with them or to provide brothel in his own house without any external threat. But they charge half or some times 60 percent of total amount fixed for sex entertainment. So, the sex workers feel unease and try to get rid of such pimps and Naikas to get full money. Hence, they themselves pull towards the road to hunt client with their own efforts. Sometimes, when a woman becomes a sex worker, then she persuades or allures their other female friends to come on roads to earn some money and enjoyment. Most of the unmarried sex workers do not want to register themselves as prostitute to pimps or Naikas, because they want to remain concealed themselves and stand on the road to hunt clients by their own labors.

Role of Cellular Phone

After 2002, due to easy and low-priced availability of cellular phones, the business of sex workers boosts up 100 percent as compared to previous years. Now, 91 percent have mobile phone that is mostly gifted by the client. The cellular phone is very effective to sex workers to fix the time a place for mating. The phone number of sex workers passes through client friend of same category to contact them. But, in spite of presence of cellular phone, the clients abruptly change sex workers to taste different prostitutes. A client less than 25 and above 40 have contact with the same sex worker, not more than more than one year but the clients between 25 to39 continuously change the sex workers to avoid monotonous service of a particular sex worker. In this way, though, the cellular phone has great importance in their business, but ultimately, they have to come on road again to find new clients.
Proximity Analysis of Sex Workers

Proximity is a measure of the distance between features. It is most commonly measured in units of length but can be measured in other units such as travel time or noise level (Aronoff, 1995). But, here we will investigate the traveling distance from the dwelling of a sex workers to road and then to client abode. A road side sex worker travel from home to road an average of 5 to 15 kilometer and then almost same distance from road to client abode. This traveling becomes at least 20 to maximum 60 kilometer to return safe at home within the city. Here both client and sex workers covered the same distance to conceal his type of work from their friends and relatives. A sex hunter picks the sex worker far away from his home or known

![Figure 5: The distance covered by a sex worker](image)

places and sex worker prefer the same mode of business. In this way both client and sex host save their so-called honour. When ever the sex workers are exposed as a prostitute, they have to leave the area. So, they do not live more than a year in fixed place due to leakage of their kind of profession. They also change their residence remain to keep themselves hide from police also. Therefore, about 92% of total respondents live on rental home.
**Psychosocial and Geographic Aspects**

Why a sex worker is forced to sell her body for earning? In more developed countries, this has become an organized industry and hundred thousands of websites are available for cyber sex, porno, matching, dates etc. But in a third, world country like Pakistan has some other values and demands of society. It is believed that the grimmest hatred and a grievous sin in the society. It is not considered as a type of work but a condemned crime that is culpable, stone to death. It is not a luxurious entertainment at all but it is done just to carry the basic needs of the sex workers and their family. There is no honour of lower cast in Pakistan. The women of the lower cast usually sexually abused and the poor workers have no any power even to report the police. If media reveals any rape case report, then, sometime the action is taken against the perpetrator, but due to lot of flaws in jurisdiction system of Pakistan, such cases are usually neutralized in the favour of criminals or presented in such way that 90 percent criminals of adultery cases, being released from lot of haziness in the law. It is also seen that the influential personalities threat the victims and the case is dismissed or roll back. In this way, the ultimate guilty or stigma is pasted on the forehead of innocent women. Moreover, the domestic workers, who are mostly raped by the elders of the houses, where they work, but due to lack of equal law implementation, social difference and discriminations, most of the low cast girls do not bother to report the police to avoid further chaos. The low cast girls are also raped by middle class neighbors, which become the first step for those girls to lead them towards prostitution. Electronic media also fascinate the world of glamour and a girl eloped with
prince of their dreams and then these girls are soled to pimps who further uses them for their own earnings. In this stage, the woman can not go back, again at there previous parents home, because their parents never accept them again and tried to hide this incident. On the other hand, the male remain innocent and there is not practical law that can hurt him.( Rauf, 1988). If such case is noticed by the police then the FIR is written in such a way that the female side is proved culprit and sentenced to jail. In Pakistani Jail even rape case is adversely victimized the women and the culpable proved blameless again. Once a woman is blamed as prostitution or brutally raped, then she is never able to get dignity or any kind of honour in the society. She always become suspicious and hatred by others. In these circumstances, it is very difficult for her to escape from her hateful profession. The higher-class sex workers have affiliation with organized groups of pimps who have special perch in posh areas in collaboration of local police station. There is no any kind of security or registration for these sex workers in the law and it is strictly prohibited. The upper class sex workers have very fewer problems because they have relationship with highly influential personalities. But the roadside sex workers are helpless in all perspectives. Even if they are murdered, no one will peruse their case due to blemish risk of illegal relationship to her. There is no rule and regulation or NGO’s working for these sex workers. They are striving for their own survival in the most risky environment. Consequently, they have to hide their profession from their neighbors and other common people so only 24% of total respondents admit that their parents or family knows their kind of profession.

Hidden Threats
Although in our sampling only 8 sex workers out of 280, admit that they suffered, one two time, from hepatitis but the remaining strongly did not acknowledge any type of disease, they have. Whereas, their pale and withering faces in highly masking of cheap cosmetics depicting an other story of hidden dangerous reality. Only 3% forced their clients to use condom and only 0.5% client use condom or take any other precautionary measures. There is no restriction of client or sex worker in their activities. Some sex workers reveal that some of their co-workers died due to unknown disease. 68% of sex workers are familiar with the name of AIDS/HIV. But 72% among these do not give importance to this disease because their basic need is to earn some money to run the expenses of the their family for the current day without any saving. Officially it is announced only 246 people, 215 men and 31 women, found to have contracted AIDS in Pakistan.(GOP, Ministry of Health 2004) but they also explore that there are more than 90,000 unregistered HIV and AIDS patients in Pakistan.

In the same way, according to the National AIDS Control Programme, there are currently 235 registered cases of HIV and 1,785 reported cases of AIDS in Pakistan. Government officials’ claim 70,000 to 80,000 unregistered HIV and AIDS patients live in the country. Though no one can make authentic claims about the number of unregistered AIDS patients in Pakistan, they have some indications that there has been an increase in the recent past. Pakistan has a narrow window of opportunity to prevent a generalized HIV/AIDS epidemic. While the HIV/AIDS burden is still low. However, Pakistan’s many competing needs (including provision of basic social services and debt servicing and drug control expenditures) have made resource mobilization for HIV/AIDS difficult.(UNAID).
What is role of roadside sex workers in spreading HIV in the Lahore city, it is quite difficult to probe the actual situation. The symptoms of HIV or the most fertile carrier of HIV positive are the road side workers who have no any kind of check or intentionally heedless. But it may proved a dormant time bomb of HIV that can explode at any time to demolish our shallow ethical society and ruin our culture like the countries in Africa continent where this HIV monster is engulfing more than 30 percent of population like Botswana. In our society, if a person got HIV positive, he is treated a curse of God and sever hate him/her and even to touch him/her. The people think that an HIV positive person got this disease, only due to illegal relationship with other humanbeing. They don’t bother to know the reality and other causes of this disease. Therefore, if a person is diagnosed as HIV positive in him/her, then he/she never share his/she disease to his/she family or relative or friends due to enmity reaction from them. In this way, a person embraces death very shortly due to agonizing mental torture by carrying this disease. There are many scheme like “Nizam –e-Zakat” an official department to distribute a fix amount to destitute like old, divorced, poor students, needy families but this amount is so small that no one can live with this amount in an honorable way. So, these sex workers have to take support of fornication business.

Conclusion
No doubt, sex business in a society like Pakistan is the most condemned work, but we cannot close over eyes from the ground realities. Our hypocritical and hatred behavior against the deprived and forced sex workers never let them adjust or mix up in the society. Poverty with male dominant society, pull the women to sell their body not for enjoyment but to earn for her and their family. Even employed in different organization and shops do this job as part time. The discrimination in society based on cast and class, also make a push factors for women to adopt this filthy profession. The cause of unemployment and insecure future, continuous increasing inflation rate and surge of prices of basic needs also add the factors to adopt this kind of activity. The roads of city are full of this depressed class of sex workers who are deliberately ignored the facts that are deteriorating moral values of society. Also, unfriendly behaviour of common people against sex workers and HIV patients is add an explosive spread of this disease. One of the most risk still stand in roadside sex workers due to not giving them importance by different welfare organizations. Hence, they are the easiest carrier of different diseases including hepatitis to AIDS/HIV, and other epidemic diseases. Once a sex worker is declared as a prostitute, then she never been able to mix up as an honored women in the society. No one marry with her and no will like to help her. Even jurisdiction system do no favour her and she have to remain in this heap of rubbish zone. Although, roadside sex workers take very precautionary measures to hide themselves, in their dwelling vicinity and due to that fact, they have to cover a long distance from her residence, but even then, they are exposed in the neighbors. Consequently, they have to change their dwellings after between six months to one year. If a law is enforced to eliminate any evil in the society, then it is exploited by the law enforcing agencies and a new door of corruption is open for their lavish life. Cellular phone boosted the sex business but it can’t able to prohibit sex workers to come on the roads for new clients. The rates of sex workers are negotiable and from 1.5 US$ to 15 US$ for one hour to one night according to status of the client. One of the significant factor that
forced the sex workers to start this profession is sexual abuse in early age or forced by her mother or husband also.

Suggestions
♦ It is need to make amendments in Hudood Ordinance and promulgation of strict laws for adultery and rape that should equally treated to male and female.
♦ The awareness about epidemics like Hepatitis and AIDS/HIV should be familiarized upto lower class.
♦ Strive for the friendly behaviour for the AIDS/HIV patients.
♦ Roadside workers should be helped like other destitute to get rid of this filthy, risky and most hatred profession and government should take steps in collaboration with NGO’s to enhance their living standard of these sex workers and also earning to develop home industry.
♦ Use of condom and other precautionary measures should be forced to adopt by road sex workers with the help of female volunteers of NGO’s in a very friendly environment.
♦ Roadside sex workers should also be treated as if drug addicted and ethically and sick and psycho patients who have to keep in their mind the wrong justification of this profession, and their must be centers for honourable revival of these sex workers.
♦ A separate research should be organized in higher level to mitigate the child sex abuse that forced the women to adopt this profession.
♦ The system of “Zakat” should be reorganized in such a way, that every needy person meets his or her at least basic needs. However, from Zakat fund the money should be distributed according to family size of the needy persons. At government level many technical institute can be established to make these sex workers, valuable citizen of the country. The distribution of Zakat funds should also need to make it transparent also.
♦ The religious scholar can play a positive role for those sex workers who are single or divorced by arranging marriage for them.
♦ The law enforcement agencies should be varying careful to discriminate between sex workers and victim. The sex workers should be pursued for any alternative practical jobs.
♦ The problem of prostitution should be considered from its ethical root level that force a sex worker to sell their body and this issue should be settled amicably.
♦ A model work for rehabilitation of roadside sex workers equipped with GIS tools should be implemented in a small area of sex workers population that can be applied to other region of country.

ABSTRACT

Kosovo is an autonomous region of Serbia and mostly populated by Albanians. Due to lack of investment by the Serbian government, Kosovo is most underdeveloped region of Yugoslavia. Kosovars rejected to be part of Yugoslavia and intended to leave. Although Kosovo was granted an enlarged autonomy status which was equal with republics by 1974 constitution to solve ethnic problems in Kosovo, it was not enough for Kosovars. Although Tito gave enlarged autonomy to Kosovo, he didn’t give the republic status due to the existence of an Albanian state as a neighbour of Yugoslavia. If Kosova gains republic status, at the same time it would gain self-determination right and leave Yugoslavia.

Kosovars are giving struggle for independence almost since 1960’s. Nevertheles, after Tito died and Serbia changed Kosovo’s constitution in order to restrict autonomy of Kosovo, Kosovars intensified their struggle for independence. After diplomatic efforts for independence and creation a parallel state in Kosovo, Albanians created Kosovo Liberation Army and applied military tools for independence. As a result of Serbia’s military response to the Kosovar Albanians, NATO intervened Serbia. After dissolution of Yugoslavia and NATO’s intervention, Kosovo is depended to the New Yugoslavia Federation which is constituted Montenegro and Serbia.

At the present, there is a temporary governance in Kosovo run by international organisations, and the negotiations about the future of Kosovo still continues. One of the options about the future of Kosovo is to give Kosovo its independence. However, in international arena, some international actors constructing a link between Kosovo and Chechnya, even Taiwan, and claim that in the case of Kosovo’s independence, the Chechnya and the Taiwan will have right to gain independence.

In this context, the purpose of this paper is to examine whether Kosovo’s and Chechnya’ independence processes and progresses are similar or same. I explore whether Kosovo and Chechnya have right for independence or not. In this study I will use international law perspective.

OSCE AND SECURITY IN THE CAUCASUS : A Comparison With Balkans

by

Nesrin Kenar, Ph.D.
Kocaeli University,
School of Economics and Administrative Sciences,
Department of International Relations

ABSTRACT

The OSCE is one of the main organizations which is responsible to create and protect peace and security in Europe. Although at the beginning, the OSCE was responsible for peace and security in Europe, the OSCE has changed and improved its mission to cover peripheral regions, by 1990s. When multinational states, like Socialist Federal Yugoslavia Republic and United Soviet Socialist Republic are dissolved, OSCE saw that its mission is not enough to deal with such a kind of conflicts which appeared in the Balkans and Caucasus, hence, the OSCE decided to enlarge its region and sent its Missions to the Caucasus (Baku, Georgia, Chechnya and Yerevan), Balkans and even to the Central Asia. The OSCE succeed its mission in the Balkans but failed in the Caucasus.

In this context, the purpose of this paper is to examine and compare the functions and achievements of the OSCE in Caucasus and Balkans, and its role in the stabilization and democratization of the two regions. Since we reached the conclusion that OSCE failed to complete its mission in the Caucasus, but succeed in the Balkans, we explore its reasons and make some recommendations to create peace and security in the Caucasus.
Title of Submission: Constituent Factors of Death Anxiety: A Comparison among Adults in the Pre- and Post-Retirement Age.

Topic Area of Submission: Psychology

Presentation Format: Paper Session

ABSTRACT

Death anxiety refers to the fear and apprehension of one’s own death. Man’s awareness of his own death produces anxiety that can only be dealt with by recognizing one’s own individuality. Death can be seen as part of the life process, or can be viewed as a dramatic, painful, torturing experience both for the person and his family. All human drama is, to a great extent, a story of how human beings cope with the terror of death, and how they overcome death anxiety through a great variety of conscious efforts and unconscious defense mechanisms. How we view death and how we cope with death anxiety can profoundly affect every aspect of our lives - either positively or negatively.

Fear of dying involves not only physiological but psychological factors, too. Perception of death may be considered as a correlate of number of personal and environmental variables. Research findings do suggest that death anxiety is a complex construct that interrelates in a variety of ways that are not completely understood with a host of demographic and personality variables. It has also been found that religious belief and age have an influence on death anxiety. This paper proposes to examine the prevalence of death anxiety among the adult population. It is an attempt to examine various factors of death anxiety as perceived by adults in the pre and post retirement age.

The final sample in this study is of 84 adults in the age group 40-65 years with 42 adults in the pre-retirement age (40-58) and the remaining 42 adults in the post–retirement age (59-65). As a result of Factor Analysis, four factors emerged, which were labeled as - Nervousness, Apprehension, Aversion and Worry. The findings of the study reveal the prevalence of death anxiety among the 84 participants even though t-test result shows no significant differences found between the means of two groups.

Keywords: Death Anxiety, nervousness, apprehension, worry, aversion

INTRODUCTION

Death anxiety is defined as anxiety caused by conscious and unconscious fear of death and dying (Harmon-Jones et al., 1997). It measures the extent to which an individual fears his or her own death. Death anxiety (thanatophobia) is also defined as a feeling of dread, apprehension, or solicitude when one thinks of what happens after death, the process of dying, or ceasing to be. According to Belsky, J (1999) death anxiety is "the thoughts, fears, and emotions about that final event of living that we experience under more normal conditions of life". It is a state of non-being, the termination of biological and social life. The notion of death is a highly personal issue with its meaning varying from individual to individual. Everyone must at some point see death as a part of life. Therefore accepting one's death, one's mortality, is something everyone must face sometime during his or her lifetime.

The importance of death anxiety research rests on the idea that all humans will eventually die. Therefore, how people deal with the recognition of their death is a subject of considerable relevance to everyone. The subject of death anxiety and how the individual manages it is worthy of serious scientific investigation. Fear and anxiety are among the most frequently used words to characterize orientations toward death throughout the life span. Research investigations in general assume that death universally elicits anxiety. Where manifest fear is not present, defensive denial is inferred (Goldings et al., 1966; Jeffres et al., 1961). Conscious fear of death is thought to occur only when there is a serious breakdown of the individual’s defenses, as in extreme psychopathology (Kastenbaum and Costa, 1977).

Theories of Death Anxiety

Freud’s Concept of Death Instinct

Freud has termed life instincts as Eros and Thanatos as death instincts in “Beyond the Pleasure Principle”. Freud's notion of the death instinct was clearly linked to the constancy principle and was also associated with what he termed the Nirvana principle, which postulates that an organism strives to discharge internal tension and to seek a state of rest (Gabbard, 2000). Freud viewed it as a tendency of all organisms and their component selves to return to an inanimate state

Terror Management Theory

Terror management theory (TMT) is a theory based on existentialism which explains how fear of death underlies much of what we do. It was proposed by Jeff Greenberg et al (Greenberg et al., 1986; Solomon et al., 1991). TMT assumes that death-related anxiety is our most fundamental source of anxiety. Like other species, human beings have a basic self-preservation drive. Combining this drive with the realization that we will die creates in us a paralyzing terror of death. In order to ward off this anxiety, according to terror management theorists, we create and participate in culture.
Greenberg et al (2000) showed that people use two types of defense strategies against thoughts of death: proximal defenses and distal defenses. They make use of these two defense strategies under different circumstances, and in a different temporal order. When their mortality was made salient and these death-relevant thoughts remained in their immediate conscious awareness, people attempted to deny their vulnerability to death, thus suppressing or blocking out death-related thoughts. This denial of vulnerability operated as a proximal defense. People whose mortality had been made salient but for whom death-relevant thoughts were not in immediate conscious awareness used distal defenses. The distal defense consisted of affirming a cultural worldview. Because of the death denying function of the cultural worldview, the encounter with a different world view may pose a threat to the validity of our beliefs and the defense from death awareness that they provide. As a result, one may be motivated to reject the threatening worldview and defend one’s beliefs (Florian et al., 2001).

The defensive management of terror of death seems to be achieved by two psychological mechanisms. The first mechanism consists of cognitive and behavioral efforts aimed at validating one’s cultural world view. The second mechanism consists of cognitive and behavioral efforts aimed at increasing self-esteem by living up to those standards of value prescribed by the culture (Taubman-Ben-Ari et al., 2002).

**Meaning Management Model**

How we view death and how we cope with death anxiety can profoundly affect every aspect of our lives - either positively or negatively. This model (Wong, 2002) proposes that meaning management is more adaptive than terror management in dealing with death anxiety. Death is the only certainty in life. All living organisms die; there is no exception. However, human beings alone are burdened with the cognitive capacity to be aware of their own inevitable mortality and to fear what may come afterwards. Furthermore, their capacity to reflect on the meaning of life and death creates additional existential anxiety. According to Goodman (1981), "The existential fear of death, the fear of not existing, is the hardest to conquer. Most defensive structures, such as the denial of reality, rationalization, insulation erected to ward off religiously conditioned separation-abandonment fears, do not lend themselves readily as protective barriers against the existential fear of death".

The meaning management model emphasizes that human beings are born with the innate need for meaning, but it may lie dormant because of our preoccupation with the business of living and death and suffering awaken in us the urgent need to search for meaning and purpose for life and death. We can discover and create meaning in every situation, even in the face of death. It helps deepen one’s faith and spirituality and also enables to achieve a better understanding of the meaning and purpose of life. It helps construct a useful psychological and spiritual model that offers the best protection against the fear of death and dying. It motivates us to embrace life - to engage in the business of living, regardless of our physical condition and present circumstances.
Comprehensive model of death anxiety (Tomer, 1996).

This model postulates three immediate antecedents of death anxiety: past-related regret, future-related regret, and meaningfulness of death. *Past-related regret* refers to a person's unfulfilled aspirations that should have been achieved but were not. *Future-related regret* refers to the anticipation that, as a result of premature death, one cannot achieve important goals in the future. *Meaningfulness of death* refers to one's concept of death and ability to make sense of it. These three antecedents are related to death salience in a complex way, mediated by coping mechanisms and their effects on one's beliefs about self and the world. The coping mechanisms include like life review, life planning, identification with culture, and self-transcending processes.

**Stages of death and dying**

Dying is a process, the end point of which is death. In this sense dying is a terminal part of living. The coping responses during this particular segment of life are shaped by previous experiences with death, as well as by cultural attitudes and beliefs. Kubler-Ross (1969) postulates five stages that many dying patients pass through from the time they first become aware of their fatal prognosis to their actual death:

1. **Denial**
   On being told that one is dying, there is an initial reaction of shock. The patient may appear dazed at first and may then refuse to believe the diagnosis or deny that anything is wrong. Some patients never pass beyond this stage and may go from doctor to doctor until they find one who supports their position.

2. **Anger**
   Patients become frustrated, irritable and angry that they are sick. A common response is, “Why me?” They may become angry at God, their fate, a friend, or a family member.

3. **Bargaining**
   The patient may attempt to negotiate with physicians, friends or even God, that in return for a cure, the person will fulfill one or many promises, such as giving to charity or reaffirm an earlier faith in God.

4. **Depression**
   The patient shows clinical signs of depression - withdrawal, psychomotor retardation, sleep disturbances, hopelessness and possibly suicidal ideation. The depression may be a reaction to the effects of the illness on his or her life or it may be in anticipation of the approaching death.

5. **Acceptance**
   The patient realizes that death is inevitable and accepts the universality of the experience. Under ideal circumstances, the patient is courageous and is able to talk about his or her death as he or she faces the unknown. People with strong religious beliefs and those who are convinced of a life after death can find comfort in this stage.
Factors related to death anxiety

Many researchers have used age, gender, and religiosity as variables in looking at differences in death anxiety. Study by Bengtson, Cuellar, and Ragan, 1977; Pollak, 1980 Aday, 1985 found that religious belief and age have an influence on death anxiety scores.

Age and Death Anxiety

Age has been investigated as a factor influencing death anxiety in several studies with consistent results. In some studies on adult attitudes toward death, researchers found that older subjects had a greater fear of death than younger ones. Justin (1988) points out that most teenagers have never discussed dying with their families. Also young people are characterized as believing death is far off for them, they feel "immortal," while older people supposedly are closer to death and therefore, must face and deal with this reality. Study of Cox, 1993, says that before the twentieth-century, the highest death rates were found in the first 10 years of life; today, in industrialized nations, death rates are the highest for people beyond the age of 50. This means that most people are living at least 20 to 30 years longer than their ancestors, and they will have more time to ponder their demise.

However, a number of studies provide evidence that in a significant number of cases elderly people experience less death anxiety than younger people. As people age, they experience the loss of friends and families because of death. They learn to cope with the thought of their own death. These findings suggest that older people have resolved the question of death while young people have not resolved the question of death. Death to older people is not as anxiety provoking as it is to young people. It may be that the cognitive awareness of death and death phenomenon creates a feeling of acceptance of death and this is viewed as routine phenomenon. Study of Bengtson, Cuellar, and Ragan's (1977) on death attitudes and social categories of people between the ages of 45 and 74, found death anxiety to be the highest among those in the middle-age range (45-54). These respondents expressed the greatest fear of death, while those older (55+) reported low death anxiety. The ethnographic evidence suggests that the crisis of middle age heightens this groups awareness of finitude whereas the elderly have resolved their death concerns. However, Bengtson, Cuellar, and Ragan (1977) did not examine death attitudes of younger people, specifically, between the ages of 18-25.

Quinn and Reznikoff (1985) explored the relationship between death anxiety and sense of purposefulness in life and perceptions of time. The research showed that people with high death anxiety had a lowered sense of purposefulness to their lives, but an increased sensitivity to "time moving on." It suggests that people less oriented toward the future would have somewhat less death anxiety. An older adult’s decreased awareness of the future may, in fact, be a healthy way to respond to death, helping to lower anxiety.
Gender and Death Anxiety

Recent and past studies on death anxiety and sex differences have concluded that females have higher means on fear of death scales than males. Males usually fear punishment in the hereafter, while females usually fear self-annihilation. The explanation for this phenomenon lies in the notion that death does not have the same meaning to both genders. Death to females signifies an end to interpersonal relationships, while to males it signifies an end to accomplishments. Females are usually thought of as placing more importance on interpersonal relationships, while males place more importance on careers and personal accomplishments (Cox, 1993). Robbins (1989), in her study of gender and death anxiety, found that females reported significantly higher death anxiety than did males.

Environment and Death Anxiety

Studies have also attempted to measure the impact of environment on death anxiety. Goebel and Boeck (1987) examined the effects of different types of dwellings with regard to death anxiety. They found that ego integrity was a significant additional factor affecting the impact of living environment on death anxiety. Specifically they found that low ego integrity people living in a nursing home reported higher death anxiety than low integrity people living in an apartment complex. In contrast, no difference in death anxiety was reported in high ego integrity individuals living in either environment. The authors concluded that high ego integrity individuals have a greater sense of control within themselves that help them deal with external factors, such as are imposed in a nursing home environment or with increasing dependence on others due to aging in general. Similar situations in people with low ego integrity would result in a sense of less control over their environment and situation.

Another study (Duff and Hong, 1995), related to both the concept of living environment and age, examined death anxiety among people living in six different retirement communities. Contrary to the expectation that people living in homes with a higher average age would have a higher death anxiety than those living in "younger" homes, this study supported Goebel and Boeck’s (1987) finding that there is no relationship between living environment and death anxiety. Low ego integrity people do not have a sense of control within themselves, which may cause them to experience greater stress, especially as it relates to an issue as uncontrollable as death. The result would be a higher level of death anxiety.

Religiosity and Death Anxiety

Research suggests that high degrees of religiosity (such as orthodoxy, or ritualism, or devotionalism), is associated with lower levels of fear of death (Powell and Thorson, 1991). Leming (1979) proposes that the role of religion is often that of relieving anxiety and fears about the unknowns and uncertainties of life. Death, to Leming, is perhaps the main source of religious belief since it is something that produces feelings of apprehension or fear in everyone. Taking a symbolic integrationist perspective, any
meaning of death must be socially constructed. Christianity in the West has an enormous influence on people's death attitudes. Religion's role in society is often viewed as giving humans solidarity as well as controlling behavior (Leming, 1977). Christianity teaches that people should live a good moral life and in return God will give them eternal life. This belief in afterlife is one of the central tenets of Christianity. People often modify their behavior in order for them to feel that they are worthy of this afterlife.

Malinowski (1948) also suggests that hope for a life after death is the only thing that makes the fear of death manageable. Religious belief reduces the fear of death for many people by offering hope of eternal life; it is this hope that makes life worth living. Leming (1979) in his study on death anxiety and religion, cites Homans who believes that religion, specifically Christianity, arouses a sense of anxiety concerning death and then alleviates the anxiety it creates. Religious belief is often seen manifesting itself in people's behavior. Also religious belief is negatively correlated with death anxiety. Researchers have observed that people scoring high on a religiosity questionnaire (such as Glock and Stark's Dimensions of Religious Commitment), indicating they are highly religiously motivated, have lower death anxiety than those who do not score high. Likewise people who report little or no religious belief, using a religiosity questionnaire, have lower death anxiety than those reporting a low-commitment--often referred to as the lukewarm.

Leming (1979) also cites ten studies that demonstrate that religious factors such as religious commitment, orthodoxy, practice, and devotionalism are significantly related to the reduction of fear of death or death anxiety (Bond, 1994). Research study was conducted to explore various psychosocial correlates associated with how Chinese react to death and dying. A total of 282 Chinese participated in this study using the death anxiety scale. It was found that that younger Chinese as compared with older participants were having higher death anxiety level and women as compared with men tended to be more death anxious. Past research has not looked at death anxiety and age or gender using religiosity as a variable. The findings also explain why inconsistencies are often observed in death anxiety research. If religious belief has such an immense influence on a person's death anxiety level (especially older females), then it would need to be controlled for in future death anxiety research. Leming (1979) proposes that the role of religion is often that of relieving anxiety and fears about the unknowns and uncertainties of life.

Religion is a prime source of strength and sustenance to many people when they are dealing with death. Different religious theories explain the inevitability and even necessity of death from different perspectives. According to the Gita, soul is not destructible but immortal. It says that death of the body is certain and irrelevant but eternal Self or the universal Self is immortal, therefore there should be no grief over what is inevitable, even necessary. It further explains that the Self instead of dying, merely goes on to take a new body and start the process all over again, therefore it is pointless to worry about the discarding of the present body (Srimadbhagavadgita, ch. 2, verse 11, 22, 23; Kamath, 1993). In The Bible also, death has been viewed in a positive manner. It says “Blessed are the dead who die in the Lord from now on…….that they may rest from their
labors, and their works follow them (Revelations, ch. 14, verse 13)”. This verse captures well the Christian views about death that there is no life after death; one has to rejoice death as it is means of entering into God’s kingdom depending on their deeds on earth. Spirituality and religiosity have been reported to play significant role in managing death anxiety and enhancing sense of well being, as mentioned by various researchers. Alvarado et al (1995) report that persons with lower death anxiety had greater strength of conviction and greater belief in afterlife.

Duff and Hong (1995) also examined the effects of religiosity on death anxiety. According to them, death anxiety is lower in communities with a higher rate of attendance to religious services. The retirement community with the highest frequency of attendance of religious services scored significantly lower in death anxiety when compared to the other communities. When all of the retirement communities were taken into account, attendance of religious services was again supported and found to be the strongest predictor of death anxiety. It is worth noting that simply attending religious services was more predictive of death anxiety than the importance of religion to the individual. Another study, done by Powell and Thorson (1991), investigating death and religion found that death anxiety was much lower in participants with high intrinsic religious motivation. People with genuine religious convictions were found to have lower death anxiety than those simply going through the motions.

**RESEARCH OBJECTIVES**

1. To see the prevalence of death anxiety among the adult population (40-65 yrs) in India
2. To identify the constituent factors of death anxiety among adults in the age group 40-65 years.
3. To examine the difference in death anxiety levels among adults in the pre and post-retirement age.
4. To investigate the relative importance of the constituent factors of death anxiety among the adults in the pre and post retirement age.

**RESEARCH METHODOLOGY**

**The Study**

An exploratory investigation to identify the constituent factors of Death Anxiety amongst the adult population and to examine the difference in death anxiety levels and the relative importance of significant constituent factors amongst adults in the pre and post retirement age.
The Sample

The final sample is of 84 adults in the age group 40-65 years with 42 adults in the pre-retirement age (40-58) and the remaining 42 adults in the post–retirement age (59-65). The data is collected on random basis. The extraneous or additional variables of sex, status and educational background are controlled by randomization and elimination.

Tools for Data Collection

Data is collected with the use of standardized Death Anxiety Scale developed by Upinder Dhar, Savita Mehta and Santosh Dhar and published in 1998. The scale consists of ten items and scoring is done by Yes/No. The Scale is having high reliability as well as validity.

Tools for Data Analysis

After tabulation, the data was subjected to factor analysis by Principal Component Method using Varimax Rotation. To determine the inter correlation between factors and their correlation with the total score of the scale, Pearson’s Coefficients of Correlation was calculated. The statistical tools of mean, standard deviation and t-test were used to see the significant difference between the means of death anxiety scores (including factor-wise scores) of the two groups.

RESULTS

- As a result of Factor Analysis, four factors emerged, which were labeled as - Nervousness, Apprehension, Aversion and Worry.

- Factor 1 (Nervousness) is constituted of 3 items (7, 8, 6) on tenseness, destiny and dread with a total factor load of 2.055. The factor had 18.3 percent of variance. Nervousness refers to the quality, state or character of being fearful and timid.

- Factor 2 (Apprehension) is constituted of 3 items (1, 10, 4) on dislike (for old age), fright and terror with a total factor load of 1.8257. The factor had 14 percent of variance. Apprehension refers to an anxiety or fear that something bad or unpleasant will happen.

- Factor 3 (Aversion) is constituted of 2 items (2, 5) on suspicion and escapism with a total factor load of 1.4106. The factor had 12.8 percent of variance. Aversion refers to strong dislike or disinclination.

- Factor 4 (Worry) is constituted of 2 items (3, 9) on panic and fear (of the unknown) with a total factor load of 1.388. The factor had 11.7 percent of variance. Worry refers to being anxious about somebody or something.
• The correlation of all the four factors with the total Death Anxiety score is significant showing that all these factors significantly contribute towards death anxiety. Correlation between nervousness and apprehension, nervousness and aversion and nervousness with worry are significant showing close similarity between these factors.

• Among the participants in the pre retirement age (40-58 yrs), the total mean anxiety is 6.42 where nervousness (M=2.16) was found to be the highest followed by apprehension (M=1.64), worry (M=1.35) and aversion (M=1.19)

• Among the participants in the post retirement age (59-65yrs), the total mean anxiety is 6.57 where nervousness (M=2.16) was found to be the highest followed by apprehension (M=1.70), worry (M=1.50) and aversion (M=1.40).

DISCUSSION

The results of t-test (Figure 6) indicate that there are no significant differences between the means of the four dimensions of death anxiety in terms of age group. The correlation table (Figure 2) shows that age is not significantly correlated with any of the four dimensions of death anxiety and all the four dimensions are significantly and positively correlated with total death anxiety score. However, among the four dimension of death anxiety only nervousness factor is having significant correlation with the other three dimensions of death anxiety - apprehension, worry and aversion.

The findings do suggest that death anxiety is a complex construct that interrelates in a variety of ways that are not completely understood with a host of demographic and personality variables. Pollak (1980) and Aday (1985) also point out that researchers often examine death anxiety on separate dimensions based upon the assumption that death anxiety is a multidimensional construct. The findings reveal that there is no significant difference in the death anxiety levels of the two groups under study. The initial theories held that as people got older and closer to death, they would have more anxiety about death (Belsky, 1999). It is often assumed that young people put off the thought of death, while older people presumably are nearer to the time of their own death and therefore think about death more often. It is plausible to believe that older people would be more preoccupied with death and think about it more often than younger people. Younger people have not developed the cognitive awareness of death that can only come with age. Therefore it is reasonable to expect older people to have higher levels of death anxiety than younger people.

The results of this study can be explained on the basis of Erikson’s psychosocial theory. According to him, people progress through a series of crises as they age and that in the later stages of life “ego integrity” is attained. When a person reaches late adulthood he engages in a life review. If a person finds meaning or purpose in his life, he has integrity. Contrary to this, if a person sees his life as a series of missed opportunities he does not attain ego integrity (Belsky, 1999). Thus, older adults who find ego integrity should have
lower death anxiety. In another study by Stevens et al (1980), it was found that adults above the age of 60 had significantly lower scores than younger adults (Stevens, Cooper, and Thomas, 1980). In another study, examining the relationship between death anxiety and age, Rasmussen (1996) suggested that the differences in death anxiety might be due to a third variable, psychosocial maturity. Rasmussen’s and Erikson’s theories are related because both refer to psychosocial development. A person with high psychosocial maturity would have less death anxiety, and both age and psychosocial maturity were inversely related to death anxiety. If one can equate psychosocial maturity with ego integrity, her findings could be considered to support Erikson’s studies. Rasmussen (1996) concluded that psychosocial maturity was a stronger predictor of death anxiety than age alone.

Hickson, Housely, and Boyle (1988) examined the relationship of "locus of control" to life satisfaction and death anxiety. The authors concluded that an older adults’ sense of control affects life satisfaction, which in turn affects death anxiety. They found an inverse relationship between life satisfaction and death anxiety. Frankl (1969) contends that people can face pain, guilt, despair and death in their confrontation, challenge their despair and thus triumph. It also postulates that a distinctly human characteristic is the struggle for a sense of significance and purpose in life. Study of Yalom, 1980 shows that death anxiety is inversely proportional to life satisfaction when an individual is living authentically, anxiety and fear of death decrease (Richard, 2000).

Moreover, some studies have found no age differences in death anxiety scores. Goebel and Boeck’s (1987) study found no relationship between death anxiety and age, but the participants used in this study were over the age of 70. In this limited age sample they found low death anxiety scores across the range of ages. In a way, this study also supports Erikson’s theory because the participants in this study could be viewed to be in the ego integrity stage and experiencing less death anxiety. Since there are no meaningful differences between the people in this study; therefore we may expect to find no significant differences between them. Older adults experience less death anxiety, but age is not a significant factor in determining the degree of death anxiety when examining only late adulthood.

CONCLUSION

Death is still an unknown phenomenon and it is the only certainty in life. All living organisms die; there is no exception. However, human beings alone are burdened with the cognitive capacity to be aware of their own inevitable mortality and to fear what may come afterwards. In this enlightened age, man still reacts to death with fear. Fear and anxiety are among the most frequently used responses to characterize orientations toward death throughout the life span. This is because human beings have a basic self-preservation drive. Combining this drive with the realization that death is inevitable creates in them a paralyzing terror of death. However, awareness of death is a basic human condition which gives significance to living and human suffering can be turned into human achievement by the stand an individual takes in the face of it. It is necessary to think about death if we are to think significantly about life. If we defend ourselves
against the reality of our eventual death, life becomes insipid and meaningless. But if people realize that they are mortal, that they do not have an eternity to complete their projects and that each present moment is crucial, the awareness of death can be the source of zest for life and creativity. It appears that ego integrity, or a personal sense of accomplishment and fulfillment, whether founded in religion or some other measure of fulfillment and accomplishment, is probably the biggest factor in death anxiety.

**IMPLICATIONS**

- The study may be useful for old age counselors and family members to determine the factors responsible for Death Anxiety and develop coping strategies accordingly.

- The study suggests the importance of ‘purposefulness in life’ as a significant factor affecting the anxiety state. Further research work may be done in this direction.

- A review of the literature on aging and death anxiety also shows that little evidence has been gathered comparing or contrasting young people's death anxiety attitudes with older people's attitudes.

- Other factors like gender and religiosity may also be studied as correlates of death anxiety.

IMPACTING THE NEWS: HOW GENERAL MOTOR’S $7 MILLION PRODUCT PLACEMENT OF THE PONTIAC G6 AUTOMOBILE ON THE OPRAH WINFREY SHOW PLAYED IN NEWSPAPERS ACROSS THE UNITED STATES

A research paper presented at the 2005 Hawaii International Conference on Social Sciences

ABSTRACT

General Motors invested more than $7 million into Oprah Winfrey’s fall season premiere show on Sept. 13, 2004 giving away 276 of its new Pontiac G6 automobiles to the talk show superstar’s audience. This study analyzed United States newspaper coverage using a “before” and “after” scenario, utilizing two seven-day periods surrounding the day of the event. Specifically, this study revealed what brand benefited most from the event and asked, based on the magnitude of event, who was the winner? Concentrating on the Oprah, Pontiac, and G6 brand units of analysis, it was found that frequencies of mentions in newspapers climbed dramatically for all three brands when comparing publication days up through the shows airing and the days following the event. More impressive was the fact that all brands received increased prominence with regard to placement following the event and were discussed in a more evaluative context following the event as opposed to the factual context found prior to the shows airing. Interestingly, Oprah received more increased prominent placement than the brands that actually paid for the product placement. However, it was also found that Oprah’s negative contextual mentions doubled following the event. In sum, all brands benefited in terms of raw publicity and the distinction between what can be considered content, product placement, and blatant advertising has forever been blurred. The impact of this event on future product placement events is discussed.
I. INTRODUCTION

Did the credibility of the Oprah Winfrey brand and arguably the biggest television product giveaway event in history mean proportional positive publicity for the brand names involved? General Motors invested more than $7 million into Oprah Winfrey’s fall season premiere show on Sept. 13, 2004 giving away 276 of its new Pontiac G6 automobiles to the talk show superstar’s audience. This study investigated who benefited most from the event and asked, based on the magnitude of event, who was the winner? Did the G6, the product being placed in the show, win? What type of publicity was garnered by the individual brands involved in the show? What brand benefited the most, in terms of newspaper coverage across the nation, from this extravagant product placement event?

The event

Recently, the popularity of product placement has exploded on the talk-show circuit, led by The Oprah Winfrey Show. The show has been recognized as an effective vehicle for influencing customer behavior. When the immensely popular television talk show host launched a book club, selections that were featured in the broadcast were virtually guaranteed a spot on bestseller lists. Winfrey annually highlights a variety of products on her “Oprah Favorite Things” shows. The most recent installment of “Oprah’s Favorite Things” featured a variety of products worth thousands of dollars and was given to a selected studio audience of teachers. But without a doubt, when Winfrey, the queen of the talk shows (Vranica, 2004) teamed up with General Motors they redefined the traditional product placement concept.

During an internationally broadcasted Oprah Winfrey Show in September, nearly half of the one-hour show focused on the Pontiac G6. A taped segment showing Oprah visiting the automobile’s manufacturing line was inserted in the show; specifically the talk-show host praised
features of the product and each of the surprised 276 audience members received one of the automobiles. Because of the focus on the G6, the product dominated the show.

Overall, General Motor’s investment of more than $7 million equaled what they spent on advertising a single GMC truck during the 2004 summer Olympics. For additional perspective, it is estimated that a 30-second commercial during the syndicated talk show sells for about $70,000 (St. Louis Post-Dispatch, 2004). These comparisons illustrate both the opportunities and fundamental challenges advertisers face in today’s technologically advanced landscape.

II. LITERATURE REVIEW

Advertising environment

Many advertisers fear the demise of the 30-second television advertising spot and are relying more on product placement to achieve marketing communication objectives. Current product placement is an updated version of the product placement techniques developed in the 1950s. Traditionally, product placement has differed from advertising in the sense that an advertisement in any form is not created around the product; instead, the product is placed in a talk show or elsewhere within existing content. In product placement, the content of the television show normally comes before the product. General Motors and the Oprah Winfrey Show blurred this distinction.

Product placement

Although product placements have existed for several decades, they have attracted researchers’ attention and resources only recently (Pola, Balasubramanian & Klassen, 2000). Once viewed as an inexpensive vehicle to build immediate exposure is now a media channel that rivals traditional advertising outlets. One definition of product placement is “…the inclusion of a
brand name, product, package, signage, or other trademark merchandise within a motion picture, television show, or music video (Loiacono, Taylor & Watson, 2001).” A more accurate term for product placement may be brand placement (Babin & Carder, 1996).

Important to these definitions, principles and this study are three elements that further define key product placement elements: product placement strategies; product placement executions; and the context of the programming vehicle utilized.

According to d’Astous and Seguin (1999), product placement strategies can be classified into three main categories: implicit; integrated explicit; and non-integrated explicit. An implicit product placement strategy is one in which the brand name or product is present in the program without being formally expressed and is passive. Integrated explicit product placements have an active role and are formally introduced in the program demonstrating the benefits of the product. The final product placement strategy, non-integrated explicit, is when the brand or product is formally introduced but is not integrated into the program (ex. “This program (or segment) is (was) sponsored by Pontiac.” Or it may be incorporated in the show’s title: for instance, Pontiac). Once the strategy is established, planning of the execution of the product placement is critical.

There are primarily three product placement executions: screen placement; script placement; and plot placement assuming that the audience can be exposed to the product via both auditory and visual channels (Russell, 1998). After the strategy and execution are selected it is important to consider the context of the program incorporating the brand and product. Regarding context, three categories of television programming have been defined implying different viewer motives: need for entertainment (quiz/variety shows); need to identify oneself with characters (mini-series/dramas); and need for information (information/services magazines.) (d’Astous & Seguin, 1999).
This study involves an integrated explicit plot product placement context because of the significance of the automobile giveaway in a variety themed talk show that best characterizes the syndicated Oprah Winfrey Show.

Theoretical foundations

A variety of theoretical principles help develop an understanding of consumer behavior regarding product placement. Product and sponsor relationships, classic conditioning and the modeling paradigm all help explain key product placement dynamics. Similar to the inherent risks of utilizing an endorser to promote products; selecting a television series, movie, or talk show that matches up with the brand and products being placed is critical to success. Media and public perception can impact the effectiveness of product placement efforts. Several studies have shown the importance of a strong link between the sponsor and the sponsored event or entity. In general, when the link between show and product is strong the impact on the sponsor’s image and the attitudes toward the sponsor are more positive (d’Astous & Bitz, 1995; McDonald, 1991; Meenaghan 1983; Parker, 1991).

The central principle of classic conditioning in persuasion (Gorn, 1982) is the development of a positive “paired-association” between an unconditional stimulus (e.g. a favorable show image) and a conditional stimulus (e.g., the product). It is theoretically easier to establish this association through product placement than solely with the backing of a traditional advertising campaign. Finally, the modeling paradigm (Bandura, 1977) is relevant in that product demonstrations through models (e.g., actors) can facilitate learning, particularly when they experience positive consequences following product use (Balasubramianian, 1994). These
principles provide a foundation for investigating the acceptance of this product placement by the media.

III. RESEARCH QUESTIONS/HYPOTHESES

The literature review of product placement outlined previously led to five hypotheses that guided this research project, which focused on coverage of the Oprah Pontiac G6 car giveaway show in major daily newspapers across the United States.

Hypothesis one intended to simply measure how many times the Oprah, Pontiac and G6 brands were mentioned in the newspapers before and after the show aired. H1: Product placement on the show will result in increased frequencies of mentions in newspapers for Oprah, Pontiac and G6 brands compared to frequencies of mentions before the show.

The second hypothesis was designed to measure whether the Oprah, Pontiac and G6 brands were placed in more prominent pages in the newspapers after the show aired compared to before the show aired. For example, were the mentions of the brands more likely to show up on section fronts or front pages, rather than inside pages after the show aired compared to before the show aired? H2: Product placement on the show will result in more prominent page placement in newspapers for Oprah, Pontiac and G6 brands compared to page placement before the show.

Hypothesis three aimed to measure whether the Oprah, Pontiac and G6 brands were placed in more prominent story placements in the newspapers after the show aired compared to before the show aired. In other words, were the brand mentions more likely to show up in prominent placement positions such as headlines, paired with graphics or pull quotes, or were they more likely to be buried in the body of the story? H3: Product placement on the show will result in more prominent story placement in newspapers for Oprah, Pontiac and G6 brands compared to story placement before the show.
The fourth hypothesis was designed to measure whether mentions of the Oprah, Pontiac and G6 brands in the newspapers had an improved tone after the show aired compared to before the show aired. Were the mentions more factual or evaluative? The assumption here is that an evaluative mention, so long as it was not negative, would provide added value beyond simple frequencies of mentions. H4: Product placement on the show will result in improved tone for the Oprah, Pontiac and G6 brands in newspaper mentions compared to brand mentions before the show aired.

Hypothesis five asked whether mentions of the Oprah, Pontiac and G6 brands in the newspapers were more positive after the show aired compared to before the show aired. This is another value added situation since positive attributes of the products would likely provide readers with positive impressions about the products. H5: Product placement on the show will result in more positive attributes associated with the Oprah, Pontiac and G6 brands compared to before the show aired.

IV. METHODOLOGY

Researchers conducted a quantitative content analysis of newspaper articles from United States newspapers, gathered using the Lexis-Nexus database, published Sept. 9, 2004 through Sept. 20, 2004. This resulted in a yield of 963 mentions of Oprah, Pontiac or G6. Since the car giveaway on the Oprah Winfrey show aired on Sept. 13, 2004, this resulted in seven publication dates before the show aired, seven publication dates after the show aired and one publication date on the day the show aired, for a total of 15 publication dates.

The authors reasoned that coding newspaper mentions of the brands in a time period that encompassed one week before until one week after the show aired would represent an adequate benchmark for publicity levels in the newspapers for the brands before and after the show aired.
Oprah and Pontiac did enjoy some level of publicity in newspapers prior to the car giveaway airdate. In the case of the G6, this particular Oprah Winfrey show was part of a major product launch for the car, so it was expected that there would likely be few mentions of that brand on publication dates before the show; this did prove to be the case.

The unit of analysis was any mention of Oprah, Pontiac or G6 brands published in any part of the newspaper stories archived by Lexis-Nexus. The independent variable was the brand name (Oprah, Pontiac or G6). Dependent variables were page placement (front page/section front or inside page), story placement (text in headline, cutline/pull quote/attached to a graphic or body text), tone (factual/informational or evaluative/analysis) and positive/negative (positive, negative or neutral). Each mention of Oprah, Pontiac and G6 was coded separately. Two coders achieved 100 percent agreement on all variables after three rounds of training.

V. RESULTS

Table I demonstrates that H1 was strongly supported. Frequencies of mentions in newspapers climbed dramatically for all three brands when comparing publication days before the show aired and publication days on the day of the show and after the show aired.

Oprah was mentioned 99 times in the newspapers before the car giveaway show aired and 397 times after the show aired, a 400 percent climb. Pontiac was mentioned 57 times before the show and 286 times after the show, a 500 percent gain. The G6 model car climbed from 20 mentions before the show aired to 77 mentions after the show aired, a 385 percent increase. All three brands together enjoyed a climb from 176 mentions to 760 mentions, a 432 percent increase overall.
TABLE I: BRAND NAMES IN NEWSPAPERS BEFORE AND AFTER THE SHOW

<table>
<thead>
<tr>
<th>Brand</th>
<th>Before Show</th>
<th>Day of and After Show</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oprah</td>
<td>99</td>

<td>20</td>
<td>77</td>
</tr>
<tr>
<td>Total</td>
<td>176</td>
<td>760</td>
</tr>
</tbody>
</table>

Note. N=936.

Table II shows strong support for H2. Before the show aired, mentions of Oprah and Pontiac were virtually equally likely to appear on the front page, but frequencies for mentions of Pontiac and Oprah on the front page or section fronts were both very low. There were no mentions of the G6 on front pages or section fronts before the show aired.

A dramatic increase occurred after the show aired. The G6, with 29.9 percent of its mentions on the front page or section fronts, was slightly more likely to show up in that prominent location than Oprah or Pontiac. After the show aired, Oprah’s mentions on front pages and section fronts climbed from 21 to 108, and Pontiac mentions in that location increased from 12 to 71, while the G6 brand showed up 23 times in the prominent page placement.

Note. N= 936; Chi-Square= 65.26; df= 10; p <.001.

H3 was supported, as seen in Table III. Before the airing of the car giveaway show, mentions of Oprah and Pontiac appeared overwhelmingly in the body of newspaper stories, while 15 percent of the G6 mentions appeared in the headline position.

After the show aired, Oprah was most likely to appear in headlines, followed by Pontiac;
only one mention of the G6 was in a headline. However, the G6 was most likely to appear in other prominent story placements such as cutlines, pull quotes or paired with graphics. Although a strong majority of mentions for all three brands remained in the body of newspaper stories after the show aired, Oprah and Pontiac did move into more prominent story placements compared to before the show aired.

</tbody>
</table>

Note. N= 936; Chi-Square= 37.28; df= 10; p <.001.

H4 was strongly supported. As Table IV demonstrates, 66.7 percent of Oprah’s mentions in newspapers before the car giveaway show aired were factual or informational. All of the G6 and 91.2 percent of the Pontiac mentions were factual or informational before the show aired.

A marked shift in tone was evident after the show aired. Oprah’s mentions became least likely to be factual or informational and the most likely to be evaluative. The G6 and Pontiac brand mentions became more evaluative than they were before the show aired as well. This suggests that after the show aired newspapers were more likely to include evaluative or analytical statements about the brands. If the evaluations were positive, that would provide added value to the brand names beyond factual or informational reporting, as was generally the case before the show aired.
TABLE IV: BRAND NAME BY TONE BEFORE/AFTER SHOW

</tr>
</tbody>
</table>

Note. N= 936; Chi-Square= 118.5; df= 5; p <.001.

H5 found strong support for the hypothesis that mentions would become more positive after the show aired. Table V shows that before the car giveaway show aired, newspaper mentions of all three brand names were strongly neutral, with Oprah being most likely to have positive mentions. Negative mentions were almost non-existent.

After the show aired, positive, negative and neutral attributes of the brand mentions changed. The percentage of positive mentions for Oprah, who was still most likely to have positive mentions after the show aired, almost doubled. Interestingly, the percentage of Oprah’s negative mentions also doubled, but the frequencies of these were still very low.

The G6 and Pontiac brands also showed strong increases in positive mentions and small increases in negative mentions, yet the majority of mentions for these two brands remained neutral.

VI. CONCLUSIONS

Support for the hypotheses of this study provide numerous points for discussion and can direct significant future research pursuits in product placement.

H1 found that frequencies of each brand name increased after the event. Each brand associated with the product being placed experienced nearly a 400 percent increase in mention frequency. At the most fundamental level, this shows support for the effectiveness of significant events generating publicity. An intriguing item is the fact that the show, and in this instance the endorser, generated an enormous increase of publicity. In general, traditional product placements seldom generate significant publicity much less publicity for the show they are placed within.

Building on the foundation established by the first hypothesis, H2 and H3 were both supported, establishing the impact of the event in terms of placement prominence in the newspapers. Front page placement frequencies increased for all three brands following the event when compared to the pre-event time period. Interestingly, the G6 received the highest percentage of mentions on the front page. Numerous theories can account for this finding but critical to the product placement field is what scenario elevates the product or brand being placed to prominence above the actual content of the show. Clearly all brands benefited, but because of the significance of the G6 giveaway and focus on the product throughout the show, the product became the show resulting in significant front page placement in the newspapers analyzed.

Increased frequencies of each brand inside stories after the event supported H3. Before airing the car giveaway shows the brands only appeared in the body of stories. And although a strong majority of mentions for all three brands remained in the body of newspaper stories after the show aired, all three brands did move into more prominent story placements after the event.
The fact that the show and featured brands received headline placement is remarkable based on traditional definitions of product placement opportunities. But this was no traditional product placement event. Will this be the goal of future product placement events or will increased product awareness by viewers be enough? Will the next prominent product placement event to rival the G6 give-away receive the same level of publicity? H4 and H5 addressed what kind of publicity this event received.

Some strategic communication professionals would argue that there is no such thing as bad publicity. After investing $7 million into a project, it would be easy to assume that positive public awareness and image projection would be a priority for a new product launch. Because of the size of the event, it was predictable that newspapers would latch onto the story. H4 was supported when it was found that not only did the newspapers pick up the story, they also evaluated and analyzed each detail of the event and public reaction toward the show and car giveaway. Mentions of all three brands were increasingly more evaluative following the show than factual stories released prior to the event. Because of the impact of the event and numerous individuals that were impacted by the give-away it seems that future events should invest efforts in not only the basic investment but also in the strategy to create events that impact people and generate stories that increase the amounts of positive publicity.

H5 was supported finding that positive mentions of each brand name increased significantly after the show aired. The car giveaway tie-in with hand-picked deserving individuals that desperately needed transportation coupled with the power of Oprah generated a synergy that resulted in positive newspaper coverage. Interestingly, negative Oprah mentions may have increased due to coverage that highlighted the fact that recipients of the automobiles would have to pay sales tax. The irony being that Oprah paid nothing for the vehicles and
technically was only a media channel to deliver the vehicles to her deserving audience, but she received both the negative and positive publicity based on media perception.

Future research should investigate the evaluative brand mentions following the event in terms of critical analysis of the impact of this on the advertising and television industry. Will similar events become the expected, making it difficult for other marketers to capitalize on the G6 lightning in a bottle? If marketers try to compete and replicate this event will product placement permanently be redefined? Is it possible that because of the positive publicity gained by Oprah following this event, other personalities will soon follow by altering their shows to accommodate product and brand placement events?

In sum, all brands benefited in terms of raw publicity. Additional questions must be asked regarding the objectives of General Motors and future brands that commit significant resources to product placement events. If positive publicity is an objective, what is an acceptable return on investment? It is possible that $7 million is an affordable price tag for launching a new brand but what avenue will other brands pursue to compete with this event? Because this explicit integrated product placement has generated so much attention, it is predictable that all subsequent product placement relationships with talk show personalities will be measured against this Oprah event. The bar has clearly been raised and the distinction between what can be considered content, product placement, and blatant advertising has forever been blurred.

The Influence of Expectancies on Perceptions of Physiological Arousal: The Placebo/Nocebo Effect

People are often faced with potential health threats (e.g., pollutants), as well as given promises with health-enhancing substances (e.g., oxygen bars, health drinks). How do beliefs and expectations influence the experience of these substances, especially if the chemicals themselves are benign? According to a model proposed by MacGregor & Fleming (1996) cognitive factors (e.g., explanatory frameworks, expectations) directly influence the perception of bodily sensations. Explanatory frameworks are believed to impact perceptions of somatic change through selective monitoring of physical sensations (Goldman, 1999; Pennebaker, 1982). The subjective label assigned to a given stimuli determines the amount of attention allotted and the experience of a sensation (Cioffi, 1991). A recent study (Lange & Fleming, in press) corroborated this model by showing that identical physiological arousal (i.e., two minutes of exercise) was experienced by participants as illness or normal exercise arousal depending on external cues. The current study plans to expand these findings by determining if the same somatic activity can be experienced as illness or health merely by manipulating explanatory frameworks.

Participants (n = 180) were randomly assigned to beverage description type (health, pollutant, or control) and arousal (exercise, no exercise) conditions. Individuals in the experimental groups consumed a supposed chemical additive described as Exothol. Only the control group was correctly informed that the drink was merely carbonated water. Half of the participants in the experimental group were told that Exothol was a new, fast-absorbing health supplement and half were told Exothol was a fast-absorbing pollutant commonly found in well water. Following beverage consumption, participants
rested or jumped across a line for two minutes. A visual acuity test was used to distract participants from the true purpose of the experiment. All participants were asked to complete an arbitrary eye exam before and after beverage consumption. Physiological measures (i.e., heart rate, respiratory rate) were monitored throughout the experiment and participants reported attributions for and intensity of physical symptoms following the two-minute exercise/rest period.

Manipulation checks showed that explanatory framework and arousal manipulations were effective in influencing appropriate symptom attributions and increasing heart and respiratory rate. Further statistical analyses showed that explanatory framework manipulations influenced perceptions of somatic activity. Individuals in the health group reported a greater degree of positive, health-enhancing sensations (e.g., increased vigor, vitality, stamina). Conversely, individuals in the pollutant group reported a greater degree of negative, health-inhibiting symptoms (e.g., headache, dizziness, tightness of chest).

Normal bodily sensations were perceived differently in accordance with expectations of beverage effects. Beverage descriptions influenced attributions of physiological activity, resulting in the activation of expectancies for health/chemical exposure. These findings suggest that people have a general set of expectations for the deleterious effects of pollutants, as well as for the health-enhancing effects of supplements. Further, these expectations serve as a framework for interpreting somatic activity. Even though all participants received the same benign beverage, participants in the experimental groups reported expectation-consistent symptoms as they selectively attended to bodily sensations. These results are intriguing as they demonstrate that
consumption of identical beverage can be experienced as causing illness or health via cognitive mechanisms.

Rags to Riches: The Magic of the Dick Whittington Myth

Abstract

This paper examines the story of Dick Whittington, a penniless young man who came to London in 1357, seeking fame and fortune. With the help of his cat, Whittington amassed a fortune, served as Mayor of London four times, and left a legacy of charity and good works that is evident to this day. This paper first surveys the literature on social mobility in the United Kingdom and discusses initiatives by the Labour Party to achieve social mobility in the UK. The paper then considers the historical figure of Dick Whittington, as well as, the development of the myth of his journey from rags to riches. Particular attention is paid to the means by which the myth is transmitted to children every year during the Christmas holidays, in a panto. Lastly, the paper catalogues the continued charity of Dick Whittington through the Mercers Foundation. An appendix takes readers on a walk through the streets and alleys of London to sites associated with a man fondly remembered by the British to this day.
And you poor country lads,
Though born of low degree
See by God's providence
What you in time may be.

Introduction

This ballad published in the 1640s is a wonderful example of the power and influence of the myth of Dick Whittington. Singers, writers, and actors tell his story to people who want to believe in the possibility of upward social mobility. His remembrance by the people of England is extraordinary, as is his effect on British society and culture. The major political parties in the UK agree that social mobility is a key issue and Blair’s Labour government has promised programs to improve the chances of people from different backgrounds of attaining different social and economic positions.

This paper explores the sociological import of a historical as well as a literary figure. Its principle assertion is that the British people constructed reality in the form of a socially utilitarian myth that inculcates people in the value of social mobility. This paper is divided into four sections: social mobility, the historical figure, the myth, and Whittington’s testament today. An appendix contains a description of a walk researched by my wife, Pat, and I. We walked down College Lane, the narrow cobblestone lane that led to Whittington’s house, and listened to the Bow bells. This experience helped us understand his life and inspired this paper.

I. Social Mobility

The legend of Dick Whittington tells us much about the importance of social class and mobility in England. Whether religious motives or social obligation motivated Whittington’s charity is immaterial. People benefit from that charity and his life story, because it reassures the English people that their children can live a better life.

Review of the Literature - The purpose of this review of the literature is to outline the principle positions established by scholars on social mobility. Pitirim Sorokin’s groundbreaking work *Social and Cultural Mobility* (1959), copyrighted in 1927, grew out of the turbulent times after World War I. Sorokin broke with Marxist sociologists, who attached little importance to social mobility, and classical liberals, who ignored the subject (Goldthorpe, 1980: 3). Sorokin defined social mobility as “any transition of an individual or social object of value created or codified by human activity, from one social position to another” and offered valuable distinctions
such as vertical, horizontal, ascending, and descending social mobility (1959: 133). He devoted three chapters of his book to vertical mobility in western countries, offering as evidence a chart labeled percent of “Upstarts Among Monarchs and Presidents” that assigned a political mobility value of 48.3 percent to the US and 5.0 percent to the UK (Sorokin, 1959: 143).

Seymour Lipset helped establish the framework for post World War II research. He argued in *Political Man, The Social Basis of Politics* (1963) that social mobility benefited society, but also accepted the notion that class inequality spurred social change. He asserted that “only the give-and-take of a free society’s internal struggles” offered some assurance that “the products of society will not end up in the hands of a few power-holders” (Lipset, 1963: 439). He contended that sociologists used biased and inaccurate data to arrive at rankings of social mobility among countries and that Americans mistakenly believed that social mobility was high when in fact “total vertical mobility in the United States was not substantially different than most other relatively developed countries” (Lipset, 1963: 268).

**Social Mobility in the UK** - British sociologists and socialists are indebted to the research of D. V. Glass from the London School of Economics on social mobility in Britain during the years immediately after World War II. Glass contended that the phrase equality of opportunity, meaning careers open equally to all, in a society in which those in groups with a strong economic position exploited people in groups with a weak position, was little more than a cruel joke (Goldthorpe, 1980: 23).

Glass’ disciple, John H. Goldthorpe, expressed his devotion to the positive view of mobility, “with a tendency toward greater equality of chances of access, for individuals of all social origins” (Goldthorpe, 1980: 27). He influenced the next generation of sociologists in the UK with his work *Social Mobility and Class Structure in Modern Britain* (1980) in which he provided data proving that social mobility remained stable in the UK for the last forty years.

Stephen Aldridge, an economist for Tony Blair’s Labour government, asserted that the economic efficiency of a nation depends on making the best use of the talents of everyone and that people who believe they can improve the quality of their lives demonstrate higher levels of inclusion and social cohesion. Aldridge seconded Lipset’s argument that rates of social mobility between western countries demonstrate a remarkably high degree of similarity over time. He asserted that fluid societies like Sweden and Australia exhibit higher rates of social mobility than less fluid societies like the United States and the United Kingdom (Aldridge, 2001: 4).
Aldridge presented contradictory evidence on social mobility in the UK. Earnings mobility declined over the past twenty years. However, upward mobility increased when the school system educated working class students for technical and professional jobs. More people enjoyed upward mobility because of increased employment in the professional classes. Yet, the rate of growth for this phenomenon diminished over the years (Aldridge, 2001: 3).

Prandy, Lambert, and Unt, researchers at Cardiff University, contended in their study *Long-Run Changes in the Significance of Social Stratification in Britain* (2004) that social mobility in the UK decreased during the last forty years and that previous studies ignored contradictory evidence. Their study presented data indicating that parental background and educational attainment were significant factors in the social mobility of men, while women’s social mobility operated entirely through the educational attainment process (Prandy, et al., 2004: 2). British politicians find such studies useful in their attempts to persuade the voting public that their programs promoting social mobility are the most likely to succeed.

The British counterpart to America’s Horatio Alger is Samuel Smiles, whose book *Self-Help: With Illustrations of Conduct and Perseverance* (1997) emphasized that upward mobility lay not with equality of condition and opportunity, but with qualities of character like determination and perseverance. In line with classical liberal tradition, Smiles argued that “the best institutions can give a man no active help,” and that reform could be effected only through, “individual action, economy, and self-denial; by better habits, rather than by greater rights” (Smiles, 1997: 1).

This review of the literature shows that modern British sociologists believe social mobility takes more than personal effort and persistence. It takes equality of condition and opportunity. In this sense, the Whittington story is a myth built on a false foundation. Even though questions about the premises of the myth and its historical accuracy are worthy of research, they pale in comparison to the fact that the British people cherish the Whittington story so much that it has become part of the national consciousness.

**The Politics of Social Mobility** - The Labour Party adopted social mobility as an issue after World War II and implemented the Beveridge report. Their slogan became “a future, fair to all” (Labour Website, 2004: 1). Tony Blair in *New Britain* (1996) denounced, “class snobbery and economic elitism based on an unequal and antiquated social system” and promised to remove barriers to social mobility so that people could realize their full potential (1965: 161).
The political argument comes down to how much money should be spent on education and what are the effects of that investment. Will Hutton of the Observer argued in a column entitled Education Is Not Enough to Scale Class Barriers (2004) that “education cannot be characterized as an easy win-win that solves class conflict and creates a meritocracy” (2). He cited Aldridge’s study and a new paper by John Goldthorpe, Education, Employers, and Class Mobility (2004), indicating that the values and skills one learns in a middle class family are increasingly more important in finding a job than educational qualifications.

It’s a short step from the argument over social mobility in the UK today to a 15th century cloth merchant. If one asks Britons how they came to believe in social mobility, they invariably mention the Whittington story. Berger and Luckmann in The Social Construction of Reality (1996) defined legitimation “as the process of ‘explaining’ and justifying” (193). The Whittington legend used everyday language and the entertainment of common people to explain why social mobility was integral to a well-functioning society. Even though the seductive myth overshadows the historical figure, much is known about Whittington and how he lived.

II. The Historical Figure

Seest Thou a Man Diligent in his Business?
He shall Stand Before Kings.

Whittington was born in 1357 in Pauntley, nine miles from Gloucester. He was the third son of Sir William Whittington, Lord of the Manor of Pauntley. Besant and Rice in Sir Richard Whittington: Lord Mayor of London“ (1894) noted, “He came of good old stock and was neither a country clown nor a gutter born lad” (32). His eldest brother inherited the estate upon the death of their father, according to the rules of primogeniture. Younger brothers customarily went into the clergy, military, or trade. According to Morna Daniels, author and researcher for the British Library, Whittington’s father died when Richard was a toddler. He left home at the age of 15
after the death of his mother (Daniels, 2004: 1). He traveled to London, where he found employment at the hospital of St. John’s Clerkenwell until the prior secured an apprenticeship for him as “mercier,” or dealer in luxury cloth.

London city records noted Whittington as subscribing five marks to a city loan in 1379 (Museum of London, 2004: 1). He married Alice Fitzwarren of Dorset, a noblewoman of substance in 1381. He made his living selling luxurious fabrics to the nobility, including King Richard II, who appointed Whittington Lord Mayor of London in June 1397 to fill out the term of a mayor who died (Gloucestershire Website, 2004: 1). Richard II owed Whittington 100 pounds when Parliament deposed the king in 1399.

King Henry IV settled the debts owed by his predecessor and became one of Whittington’s best customers, buying luxurious fabrics. In 1401 the king borrowed money for his daughter’s wedding. Whittington supplied the dress, which cost £215 (Daniels, 2004: 3). Usury laws prevented Whittington from collecting interest on the loans he made to the king, so the King offered him favors such as granting him the license to ship wool from London without paying export duty and appointing him collector of duty on wool.

Whittington loaned money to the next king, Henry V, to finance his wars in France. The story is told that Whittington burned bonds worth £30,000 at a banquet celebrating the English victory at Agincourt in 1415, thus freeing the king from his debt. It seems unlikely that one man could stand such a loss, especially since Henry V repaid his creditors. Perhaps Whittington made some gesture during the riotous celebrations in London upon the king’s return. In any event, Whittington’s reputation for generosity gained another embellishment.

The court of aldermen elected Whittington Lord Mayor in 1398, 1406, and 1419. City records indicate an extraordinary list of accomplishments. Whittington found guardians for orphans, established a prison at Ludgate, legislated fishing in the Thames, established a public market at Leadenhall, and fixed the price of ale. This last act endeared him to the drinking public because he established a very low price. Out of his own funds, he purchased land for his parish church, funded a library, provided for a public water-tap, and founded a refuge for unmarried mothers at St. Thomas’s Hospital in Southwark.

Whittington rebuilt his parish church, St. Michael Paternoster Royal, as a suitable place to bury his wife, who died around 1414. Daniels theorizes that perhaps Whittington’s wife died in childbirth, since the couple was childless (2004: 2). On 5 September 1421, in the ninth year of
the reign of Henry V, Richard Whittington dictated a will that demonstrated remarkable social conscience. He stipulated his burial “in the church of St. Michael Paternoster Royal in London, that is on the north side of the high altar of that church” and left assets estimated at £5,000, the equivalent of £5m today (Florilegium Urbanum, 2004: 1). The executors of the will, John Coventre, John Carpenter, and William Grove, established a trust fund administered by the Mercers’ Guild to carry out Whittington’s wishes. The trust established an almshouse, provided stipends for “poor women of good character” who were over 55 years of age, granted pensions for members of the Mercers’ Company, and made funds available for the relief of persons in conditions of “need, hardship and distress” (CharitiesDirect.com: 2004, 1).

The executors carried out the sentiments expressed in Whittington’s will in drafting the ordinances for an almshouse in 1424. “The strongest desire and greatest preoccupation of a prudent, wise, and devout man should be to plan ahead and make provisions for the state of his soul at the termination of his short life, through acts of compassion and benevolence” (Florilegium Urbanum, 2004: 3). The ordinances required residents to dress in dark brown garments commensurate with their station and to say prayers on behalf of Whittington’s soul. Whittington provided stipends for thirty members of the clergy with the understanding that they also would pray for his soul. He left £100 for the marriage of virgins and a small remittance for the poor, prisoners, and lepers.

Whittington asked his executors to use his great wealth for the benefit of the people and trusted them to use good judgment in funding worthwhile projects. They established Whittington College for priests, a library, and carried out a number of public works, including a public lavatory. John Good Holbrook noted in his article “From Rags to Riches” in the program for the Qdos panto Dick Whittington that gratitude of Londoners for these charities fueled the growth of the myth, but that one must join Whittington at the beginning of his “remarkable journey – to see if the streets of London really were paved with gold (2005).

III. The Myth

The story of Dick Whittington became part of British oral tradition soon after his death, a tale told by a grandparent or a parent to listening children. An unknown playwright presented the first play about Dick Whittington in 1605, however, the script has not survived (Holyoake, 1983: 1). The first extant play about Whittington dates from 1606. Ballads, puppet shows and skits told
the story of Whittington and his cat at fairs and markets. Soon the story was firmly ensconced in popular imagination and culture (Robbins, 2002: 175).

**The Myth Takes Shape** (Clark, et al., 2004:2)

Cheap books called clap-books told his story in the 18th and 19th centuries. The London Guild Hall Library has in its collection a small (3”x4”) book published in 1814 designed for children that sold for a penny, entitled *History of Dick Whittington, Lord Mayor of London with the Adventures of His Cat*. The anonymous author described young Whittington upon his arrival in London “as ragged as a colt” (2). The Hockliffe Collection contains a digitalized version of a similar book, *Whittington and His Cat*, on their website (1820).

Andrew Lang’s *The Blue Fairy Book* (1969) is the most popular rendering of the Dick Whittington myth. Lang emphasized Whittington’s humble origins. “Dick Whittington was a very little boy when his father and mother died; so little indeed, that he never knew them, nor the place where he was born” (1969: 208). Whittington traveled to London where he had heard the streets were paved with gold. The young boy found work washing dishes in a kitchen where “he was cruelly beaten by the cross cook” (Anon 1814: 2). When his rich employer sent a ship on a commercial voyage, he invited all his servants to invest in the venture. Dick had only a cat to send on the ship. He looked into Puss’ green eyes and said “You may help to solve my problem” (Museum of London, 2004: 1).

The master of the ship accepted Puss aboard and the ship set sail. Discouraged at the prospect of a life of drudgery and the loss of his cat, Dick ran away. He got as far as Highgate Hill, where he sat down to consider his options. “But while he was there ruminating, Bow bells, of which there were only six, began to ring and he thought their sounds addressed him in this way, ‘Turn again Whittington, Thrice Lord Mayor of London’ ” (Lang 1969: 211).

Whittington returned and soon thereafter the merchant ship sailed back to London. Whittington’s cat rid an African kingdom of rats, and in gratitude, its potentate sent a rich treasure to Whittington. These new riches had a salubrious effect on Whittington. “He in a little time lost the sheepish behavior occasioned by a depression of spirits and grew a sprightly
companion” and married Alice, his employer’s daughter. (Anon 1814: 15). Hugh Cunningham described the joyous marriage in The Life and Times of Dick Whittington: An Historical Romance (1841) “How Dick’s heart beat! And How that of Mistress Alice fluttered!” (327). The tale related that they lived happily, had several children, and sponsored a number of public works for which King Henry V knighted him. The story may seem farfetched, but the power of myth should not be underestimated, especially in the minds of young people.

**Panto** - The inscription “To wake the soul by tender strokes of art” is inscribed just above the proscenium arch in the Richmond Green Theater. These words are particularly apt in regards to the Pantomime, a particularly British form of family theater that, contrary to its name, relies on the spoken word. Panto incorporates song, dance, lavish sets, and buffoonery. Audiences are invited to participate, as they are in melodramas. Companies traditionally perform pantomimes at Christmas based on familiar stories such as Cinderella, Aladdin and Jack and the Beanstalk. Panto has a number of remarkable conventions. Young women often play the leading male character or principal boy. A man always plays the scolding cook or dame. Today’s directors often cast popular television stars in these roles to attract a larger audience.

**Dick Whittington** unlike other pantos is based on a historical character. Playwrights added new characters and situations to enhance the rags to riches message and maintain the appeal of the play to modern audiences. New characters like Idle Jack played the foil to hardworking Whittington. Audiences expressed their hatred of evil King Rat with hisses and boos. The scolding cook reminded audiences of the difficulties faced by Whittington, and at the same time provided numerous opportunities for humor, both high and low.

One modern version of this panto portrayed a gullible Dick Whittington tricked into sweeping the streets of London to find the gold beneath the grime. The actors encourage the audience to inform him of the true nature of the ruse and the audience responds with cries of “No No! Don’t be tricked! (Ardern, 2004, 3). Famous theaters such as Drury Lane and the Lyceum served as venues for the Whittington pantomime in the twentieth century.

The panto Dick Whittington presented at the Richmond Green theater, Richmond UK, by Qdos Entertainment Ltd. From 9 December 2004 to 16 January 2005 featured John Inman, a popular comedian from the long running television series Are You Being Served? as Wanda the Cook. Basil Bush, a red fuzzy fox puppet, played the role of Alderman Foxwarren. Two generations of British children have grown to love this popular television star. Barbette
Langford’s exuberant young dancers added élan and vitality to the production. The excited children, proud parents, and doting grandparents in the attendance testified to the truth of panto expert David Drummond’s observation that “the tale of industrious Dick Whittington and the cat that won him riches still has magic for the children of Britain” (2004).

**The Myth Debunked** - Such is the creative power of myth that people believe what they want to believe. However, in the interest of accuracy, the historical record does note that Whittington came from a well-to-do family and mayor of London four times, not three. There is no record the king ever knighted him. People never called him “sir” during his lifetime.

There is no direct evidence Whittington had a cat. Artists reinterpret reality in an effort to tell a more engaging story. There are two engravings in the British museum by Robert Estracke. One pictures Dick Whittington with a skull and the other with a cat. No one really knows why the engraver added the cat. One story is that the public so loved Whittington and his cat that they demanded that Estracke alter his engraving. Walter Besant and James Rice solve the problem nicely in *Sir Richard Whittington: Lord Mayor of London* (1894). They cite the figure of a cat on the gate of Newgate jail and the existence of a heraldic cat on a carriage at the Mercers’ Guild as evidence that “if Whittington’s executors wished to commemorate the Cat legend, it must have been true” (137).

A statue of Whittington’s cat sits on Highgate Hill, too distant from St. Mary-le-Bow to hear the bells. However, Gregory Holyoake offers a logical explanation. The bell of St. Mary-le-Bow tolled one time at 5 in the morning and 9 at night to delineate the apprentices’ day. Once churches lying further out heard the bells, they rang their own bells, thus echoing the call to rise and curfew to the far reaches of London. (1983:55).

**The Myth Triumphant** - Attempts to demystify the Whittington story have met with little success because it explains a relevant life lesson. Bill Moyers asked Joseph Campbell in *The Power of Myth* (1988), “So we tell stories to try to come to terms with the world, to harmonize our lives with reality?” (2). People of all circumstance living in one of the world’s great financial capitals relate to a story that involves leaving home, an adventure, ordeal, and financial success. They know firsthand that the streets of London are metaphorically paved with gold for those willing to work for it. They find Whittington’s cat irresistible because the cat’s story is a mirror image of its owner. The difference is that Whittington, being human, understood one of life’s great lessons, with great wealth comes great obligation.
IV. The Whittington Legacy Today

The executors of Whittington’s will established an almshouse next to St. Michael Paternoster Royal. Subsequently, the directors of the Mercers’ Company, who assumed direction of the trust, moved it to Highgate in the 1800s and then to West Sussex, in 1960. There are accommodations for sixty elderly women and a few married pensioners laid out as a village within a village. Whittington’s endowment grew so much over the centuries that in 1822 the directors extended its charge to cover paying an allowance to 300 people of very low income. In the twentieth century the fund expanded its grant to include other institutions benefiting the sick and the poor. The fund established a medical day care center for the elderly in Streatham in partnership with St. Thomas’s Hospital in 1986. The key statistics for the Whittington Trust are:

Conclusion

Though he is gone and dead, Yet lives he lastingly. Those bells that called him so, Turn again Whittington, Call you back many more, To live so in London

The myth propagated by a ballad written by Richard Johnson in 1612 lives on to this day. (Spraggs, 2004). The promise of fortune still calls people of different origins and social class to London. The British are reserved when discussing social class. Their reticence belies a strong belief that social mobility is the answer to the inequalities of class that have plagued their society. The Whittington myth teaches English children they can make it if they try. Their parents seek to create a society in which the dreams for their children can come true.

The story of Dick Whittington is about class obligation and social mobility. Whittington came from a genteel family, married a woman of wealth, and his riches came from his connection with royalty. Whittington’s charity toward the merchants and townspeople with whom he worked was commensurate with the obligations of someone of his social class. He followed the example of his father, a country squire whose station in life obliged him to look after the welfare of the peasants who worked on his estate. Whittington’s motives are not nearly as important as the fact that needy people benefit from his charity, 600 years after his death.
Appendix, A Whittington Walk

Samuel Johnson advised Boswell, “Sir, if you wish to have just a notion of the magnitude of this city, you must . . . survey the innumerable little lanes and courts” (Boswell 298). Whittington’s world becomes all the more meaningful when one walks the route outlined on the following map. You won’t get lost, because the two churches are parish churches of St. Paul’s and if you look around you can always orient yourself by finding the famous dome of the Cathedral in the distance.

### A Walking Map of Whittington’s London

1. **St. Mary-le-Bow** - The church is a short walk down Cheapside Street from the Bank station Underground Station. This was a market area in the middle ages. The word “cheap” means to barter. The streets took their names from the product sold there, such as Honey and Bread Street. Peddlers still frequent this area. The Mercers’ Guild Hall, headquarters for the Whittington Trust, is a few blocks down Cheapside Street, located in a modern building off Ironmonger Lane. Continue along Cheapside Street until you came to Bow Lane, formerly called Hosiery Lane. Rick Steves graphically described this Bow Lane in his book *London 2004* (2004).
“When Shakespeare bought tights and pointy shoes here, the shops were wood, the streets were dirt, and the bathroom was a ditch down the middle of the road” (90).

St. Mary-le-Bow, dating from 1097, is situated a few paces down the narrow lane. The name of the church comes from the arches of its vaulted crypt that look like bows. Richard Jones related the church’s history in Frommer’s Memorable Walks in London (2003). The roof blew off in 1091 and in 1271 the tower fell, killing 20 people. In 1284 the friends of a murder victim killed a local goldsmith in the church. In 1331 a church balcony collapsed, injuring Queen Phillipa, and in 1666 the Great Fire burned the church to the ground (Jones, 2003: 16).

Christopher Wren considered St. Mary-le-Bow one of his finest buildings. It was the most expensive of the 87 parish churches that he reconstructed. Wren designed two pulpits for the church. The parish clergy have used this novel arrangement to question notables such as Diana Rigg, star of the television series The Avengers. Wren’s famous 224-foot spire contains all five classical orders, the Bow bells, a clock, and is topped with a weathervane in the shape of a dragon (Michelin, 2003: 175). This was the bell that called Dick Whittington back to his fate. Whittington must have heard the bells early in the morning, for it woke people up at 5:45 A.M. British historians called the Bow bells the most famous in Christendom. The BBC broadcast the 12-bell peal as a sign of their continued resistance to the Nazi’s during World War II (Panton, 2001: 66).

There is a vegetarian restaurant in the crypt and a tablet on the church’s wall commemorating John Milton, who was born nearby on Bread Street. Next to the church lies a pocket garden filled with daisies, white hydrangeas, and begonias. It offers a soothing escape from the bustle of the city. In it stands a statue to Captain John Smith, who led the colony of Jamestown and became Governor of Virginia. In their book London City Churches (2003), Middleton and Hatts relate the fact that Smith conducted discussions in the church on the feasibility of colonizing the Americas (68).

2. Williamson’s Tavern - Continue south on Bow Lane. Sandwich bars, pubs, and clothing shops line this narrow, cobbledstone alley. A few blocks down an even narrower lane leads to a courtyard and Williamson’s Tavern. Visitors pass through a wrought iron gate, a gift of William and Mary. A multitude of hanging flower baskets overflowing with magenta petunias decorates the tavern’s facade. There are benches and picnic tables in the shade, a delightful spot to sample the ales and steak sandwiches for which the tavern is justly famous.
Williamson’s holds the oldest excise license in London and is notable for its fireplace built of Old Roman Tiles. The location of the tavern marks the center of the old Roman square mile that is known today as the City of London. The Lord Mayor’s house stood on this site until the Great Fire of London destroyed it. The city rebuilt the Lord Mayor’s residence until Robert Williamson converted it into a tavern in 1763.

3. St. Michael Paternoster Royal - Walk to the intersection of Bow Lane and Cannon Street close to the Mansion House Station. Turn left on Cannon Street (east), cross Queen Street, and turn right onto College Hill Lane and you can see Whittington’s house and the parish church in which he is buried, St. Michael Paternoster Royal. The church dates from 1219. Middleton and Hatts in London City Churches (2003) reported that the rosary makers that lived nearby gave the name Paternoster to the church. The royal in the church’s title is a reference to the port in France from which they shipped Bordeaux wine to London (Middleton and Hatts, 2003: 78).

St. Michael Paternoster Royal was the last church built by Christopher Wren after the great fire. The spire is a three-tier octagonal lantern marked at each angle by an ionic column. Wren placed cherub-head keystones above the door and windows. Story has it that at one point, the vicar dug up Whittington’s coffin looking for valuables and found not the treasure he sought, but the remains of a cat. Once again myth triumphs over reality.

German bombs demolished the church in 1944. The Anglican Church reopened the refurbished church in 1968, marked the location of Whittington’s grave with a gold engraved stone, and added a stained glass window portraying Whittington, his cat, golden streets, and the seal of the City of London. The mission of this church today is to minister to sailors and seafarers around the world, a charge that Dick Whittington, who was active in the shipping trade, would have approved (Harrison, 2004).

City workers enjoy the shade and lovely fountain in Whittington Park adjacent to the church. A nearby pub and bookstore add life to the area. Unlike their medieval predecessors, Londoners go home to the suburbs after work and the area is very quiet after working hours and on the weekend. In fact, the church is closed on Sunday. Today’s city planners are trying to lure people back to the city. The quiet of the Whittington garden afforded us the peaceful setting we needed to put the Whittington myth into the context of the social fabric of his day and our own times. In the process, we committed ourselves to return in the near future, a promise we soon fulfilled.

“Disabled Labels in 2005: Gay, Straight, Neither, Or All”

This is a short, observational study of nightlife and social life of homosexual community and individuals. The project emerged from a research paper written for a graduate course in Social Theories. Performed and analyzed by actual observations at a gay bar in Southern California, the paper takes a qualitative, ethnographic approach. The Analysis section applies the observed data to various theories of contemporary theorists such as Baudrillard and Foucoult.
“Music: Together and Separate In Contemporary Sociology”

This is a discussion of somewhat nascent and emergent topic of the relationship between sociology of music and popular culture (both on an individual and sociological level). Derived from profound interests and semi-expertise of music, this work-in-progress study attempts to understand and examine the role of music in contemporary sociology. The collection of various references addresses the issues of music sociology as being autonomous and/or as a part of another discipline of sociology; in areas such as popular culture, race and ethnicity, political sociology, social movements, etc.
Survey performed in an ideal world would entail no limit on any resources. As a project in Research Methods class for our graduate program, Sandy Koh and others joined together under the premise of an idealized way of conducting a mail-in survey. With CRD (California Research Design) as our fictitious identity, the ultimate aim of the project was to discover and present the most effective methods to maximize the response rate of a mail-in survey.

South East Asian Married Women in Northern California:
Acculturation and Coping Strategies

Abstract

Purpose of this research was to prepare profile of married South East Asian women residing in Butte and Sutter counties in Northern California and study their covert and overt socio-emotional needs. Research provided insight on strengths and challenges faced by them and implications for multicultural social work practice are discussed.
Does the Answer Change the Question?
A Formal Analysis of Survey Response-Scale Biases

Although often used to measure the public’s attitudes and opinions, surveys have inherent flaws. In addition to numerous instances of random error such as misheard responses and simple typos, surveys and survey responses often suffer from systematic sampling and structural issues. Our paper focuses on response scales, a prevalent form of systematic structural bias. Two common types of response scales are numerical and categorical. A numerical scale that uses negative numbers may create “bunching” within a set of responses due to a negative avoidance effect. A categorical response scale, meanwhile, runs the risk of respondents misinterpreting the middle category as the “average” answer, and therefore using this category as a reference point. While psychologists have accumulated evidence regarding the impact of response scales on respondents’ cognitive processing, relatively little work has been done to formalize biasing effects (see, for example, Sudman, et al, 1996). In this paper, we use this existing evidence to derive adjusted statistical estimators that account for data obtained via response scales known to be biased. More specifically, we focus on survey questions that attempt to measure individual emotional responses.

We define a “psychological” bias as the difference between emotions as detected in “ideal” situations (i.e. with a completely unbiased—and fictional—response scale) and those that result from using existing, imperfect response scales. We posit that response scales introduce systematic bias in statistical estimators that are known, via psychological evidence, and may therefore be accounted for in a statistical analysis. The most salient changes may shift the mean and the variance, depending upon the construction of the scale. Although we do not consider all varieties of response scales, we do propose a typology that can be widely applied to response scales that attempt to measure emotion. Our analysis advances survey methodology and political science in two ways: first, a formalization of response scale biases; and second, a means of adjusting statistical results to deal with these biases.

Terrorism or An Act of Jihad; Implications for Counseling
Yoshiya Kurato, Ed.D. (Kansai University, Osaka, Japan)

Purpose
This study is a psychological study aiming at raising an awareness of issues on terrorism in terms of values. To this end several acts of terrorism occurred in Japan were introduced and how they affected the Japanese people. Also aimed was to find its implication for counseling.

Definition of Terms
Definition of terrorism is complex and controversial according to the Britannica 2005. The below is the citation from the Britannica (2005) and Terrorism edited by O’Day, A.,(2004). It is because of the inherent ferocity and violence of terrorism, the term in its popular usage has developed as intense stigma. Terrorism is not legally defined in all jurisdictions; the statutes that do exist, however, generally share some common elements. Terrorism involves the use of threat of violence and seeks to create fear, not just within the direct victims but also among a wide audience. The degree to which it relies on fear distinguishes terrorism from both conventional and guerrilla warfare. Although conventional military forces invariably engage in psychological warfare against the enemy, their principal means of victory is strength of arms. Similarly, guerrilla forces, which often rely on acts of terror and other forms of propaganda, aim at military victory and occasionally succeed (e.g., The Viet Cong in Vietnam and the Khmer Rouge in Cambodia). Terrorism proper is thus the systematic use of violence to generate fear, and thereby to achieve political goals, when direct military victory is not possible. This has led some social scientists to refer to guerrilla warfare as the “weapon of the weak” and terrorism as the “weapon of the weakest.”

Al-Qaeda merged with a number of other Islamic organizations, including Egypt’s Islamic Jihad and the Islamic Group, and on several occasions its leaders declared jihad (holy war) against the United States. In 2001, 19 militants associated with al-Qaeda staged the September 11 attacks against the United States. The US government responded by attacking Taliban and al-Qaeda forces in Afghanistan, killing and capturing thousands of militants and driving the remainder and their leaders into hiding. Despite the subsequent capture of several of its key members, al-Qaeda and its sympathizers purportedly continued to stage acts of terrorism throughout the world.

Fear for Terrorism in Japan
1) Al-Qaeda’s Attack
There is a fear of terrorism among Japanese as probably seen in any other countries. The end of October 2004 in Iraq, south of Baghdad, one Japanese tourist was captured and killed. Before that 3 Japanese freelance journalists were killed and also 3 Japanese volunteers who were helping the people of Iraq were kidnapped but were released after a week. This is because Japan is claimed to be an ally to the US and sends the self-defense army to Iraq. Therefore an implication to these incidences to the most Japanese people at home is that we’d better withdraw our self-defense army from Iraq. Otherwise we may well be a target and attacked by not only Iraq people but also al-Qaeda although our purpose is to help the people in Iraq from a humanitarian concern not to fight with them. One of the al-Qaeda leaders was hiding in north Japan up to a year ago. So, the Japanese
populace in general is either fear for the attack by the Iraq terrorists or ready to protect from the terrorism by organizing neighborhood vigilante corp.

2) North Korea’s Missiles with Nuclear Bombs

North Korea is one and half-hour distance by air plain from Japan. So she is our neighbor. Before we had abductees’ problem which is still in a process of negotiation with North Korea, we feared if North Korea would attack us with missiles with nuclear bombs. They got nuclear weapons all right. Especially old generations who knew our exploitation over to Korea fear if we get revenge from her. But at the moment the fear was decreased to some extent since we are in the process of reopening diplomatic relations between us.

3) Sarin Gas Spreading in Tokyo

March 20, 1995, a chemical gas, the Sarin gas, was purposely spread on Tokyo subways. It was an act of the domestic terrorism prepared by members of the cult called AUM Shinrikyo which teaches supreme truth. In the gas attack 12 people were killed and nearly 6,000 citizens were injured that was the most serious terrorist attack that has ever occurred in Japan's modern history. So, even now, people, especially those who commute by subways either to go to their jobs or schools fear a lot to take the subways.

4) 9.11

In the 9.11 terrorists' attack to the World Trade Center in New York four years ago, some 43 Japanese, mostly business workers, were victimized in the attack. The Ministry of Education and Sciences and the Ministry of Health and Labor sent several physicians and counselors to New York and engaged in helping the families who were left behind. They have suffered from the Acute Anxiety Response or civilians catastrophe to begin with, and have gradually developed in some cases PTSD according to the DSM IV.

5) Other Domestic Concerns

In addition to acts of terrorism that threaten us in Japan, we have quit a few things to take care of domestically, that is, stealing, kidnapping, child abuse, and so on.

Recently a 6th grade elementary girl killed another 6th grade girl with knife. Another instance also a 6th grade elementary girl was kidnapped and killed by a newspaper delivering service personnel. On another occasion a 17 year-old high school boy entered an elementary school and attacked pupils there with a knife. Several of them were killed or injured. We have many problems such as these that appeared on TV and newspapers and we are busy watching them and worry about these incidences. In other words, we rather fear shocking events that are occurring in our daily life. We are psychologically occupied by these events. Consequently we fear not only terrorism but also something that is unknown and overwhelmingly threatening. This causes irritation and uneasiness in us. This is because what we live in is highly modernized and complex urban cities in which we don’t know where we are going in an unpredictable and unstable society.

A Survey on Terrorism

With the concerns stated above I wondered how the Japanese looks terrorism. Therefore, I conducted a little survey on terrorism. The method carried out in the study was a questionnaire consisting 3 items; 1) Do you believe that al-Qaeda would attack Japan since they claimed on the TV that Japan would be the next or after the next of their target? 2) Do you fear for the attack with missiles by North Korea? 3) Do you fear for domestic terrorism something like the one that happened in the Tokyo subways with the sarin gas? The S’s were totally 361 who were asked to write comments on those 3 questions, including 253 high school students, 87 college students, and 21 adults.
Result

As a whole, results that were calculated with \chi^2 -squire tests for 3 categories of terrorism showed a linear tendency, indicating that the fear of terrorism increased counter age-wise, that is, the high school and college students got threatened more than adults. This is true for all types of terrorism whether it was from al-Qaeda, or from Northern Korea, or from domestic cults.

Results from Question 1, as shown in Table 1, indicated that 58.0% of high school students, 28.8% of college students, and 14.7% of adults have a fear of attacks by al-Qaeda. The high school students tended to fear the most, which was as high as 58%, followed by college students, and adults. However, there was no statistical significant difference between adults and college students.

Discussion

1) On the Survey

A liner tendency in the fear of terrorism found in this study indicated that the younger the subjects the more fearful they were for the attacks from terrorism. This is rather serious matter for us if it is because the young people are easily and emotionally involved in what they see on TV whereas the older age groups seem to be able to behave with knowledge and consideration. On the other hand, the young people are the ones who will shoulder the future destiny of Japan, and are hoped to be rest upon peace, not threatening by the terrorism. Here, as mentioned later, there are something that the counselor can do for them.

2) On the How to Relate To Victims

As to the psychological or psychiatric symptoms caused by terrorism, complains, fear, loss, uneasy feeling, depression, disorientation, or another concerns including health problems are observed according to the psychiatrists and counselors who were sent to New York and took care of the families left behind. This coincides my experience working with the earthquake survivors who had almost same symptoms.

To relate as a counselor with those who have such symptoms, I needed first of all a skill to attend to the survivors. I sat together not saying anything but tried to be alive and showed that I was there with you. Then, gradually invited them to speak out. This was debriefing. What was all about debriefing was to help those who feared speak out what he or she wanted to say how fearful or miserable it was or how angry he or she was. This can well apply to the victims of terrorism or to those who have the fear of terrorism.

From my experience dealing with the AUM cult students who came to see me it was also equally important as well to attend to them and listened to what they wanted to say. They seemed to have issues on interpersonal difficulties and psychological problems such as isolation from families, victims of bullying, or ill treated, or failure to get into good schools, and so on. Hence they had a lot of hate, anger, and desire to revenge in order to show their existence. They were well obsessive in their belief and act as missionary of their own thought. They had their own reason to get involved in their terrorism.

3) On the Values: An Implication for Counseling

What is important for counselors is to understand that it is a value system underlying what we think and do. In this sense it is a value system that led the people to terrorism. We say it is terrorism, but for those who get involved in terrorism it is a jihad. Jihad is a sacred act for terrorists. However, for us, or the rest of the world, it is a mean act and is not fair. Hence, not allowed in any sense. On the other hand, as some social scientists refer guerrilla warfare as the “weapon of the weak” and terrorism as the “weapon of the weakest,” it seems very important, in generally speaking, how to relate with “the weaker.” Any power-imposing act of the so-called “the stronger” upon “the weaker” is not also fair and not effective to deal with the problems that we are encountering in the world. “An eye for an eye and a teeth for a teeth” will not work in the global age. Talking with a face to a face manner or mutual conversations to express and exchange what we think and do will give us a hope to co-exist without loosing own culture, religion, economy, political and social system, or historical background. In the above, the term such as “difference” is distinguished from “disagreement.” “Difference” refers to difference in interests, tastes, or thoughts that creates a variety and colorful way of living, whereas disagreement leads to nothing but a power struggle. According to Satire,V., the
functioning family shares and allows “difference” among family members. This may be a counselor’s bias or value judgment. However, I hope it may offer a thought in finding a way out from the disaster in the age of terrorism.

The below is a counselor’s approach of mine in dealing with terrorists or possible terrorists. First of all, we had better to attend to terrorists including possible terrorists and listen to what they want to say along with their value systems. Not imposing counselor’s value or judgment. Rather invite free and personal self-disclosure. It worked well when I met the AUM cult students. Thus, there may be other ways that we counselors can do in the field of terrorism.

ENCYCLOPÆDIA BRITANNICA (2005)

A COMMUNITY SUPPORT PROJECT FOR CHILD REARING IN JAPAN
Yukiko Kurato (Department of Human Sciences, Otemon-gakuin University)

Problem
Recently community support for child rearing has become an urgent and important issue not only among young mothers but local governments in Japan. It is because birth rate is declining at the point of 1.29 in 2003, which was 1.79 in 1978. This declined birth rate causes one reason to get a less communication in neighborhood. Another is that parents are loosing knowledge and skills of how to raise their children due to the nuclear family living in a huge complex apartment where parents tend to become isolated from other families. Mothers are supposed in most cases to be responsible for child rearing whereas fathers are busy working, which often causes a tendency of neurosis among young mothers. It is because mothers stay with their children in a small apartment for almost 24 hours. And in case the child gets sick or not feeling well mothers does not seem to know how to deal with it and often get confused. Meantime child abuse rate is increasing in that 26,569 cases were treated at the child guidance clinics in 2003, which is 24.13 times more than the figure in 15 years ago.

Yet another study (Harada, 2004) indicated 46.3% of mothers had irritation in their child rearing, which was 16.5% in 1980. To add the above stated, the fact that changes in young people and their family structure have to be noticed. The young people in some cases used to suffer from a phobic tendency in interpersonal relations and erythrophobia (a blushed face) when the family structure was that of the patriarchy. It was up to 1950’s. Then followed were school refusals in the family with a education-minded mother in 1960’s, violent behavior within a family in a new family (father in child rearing) in 1970’s, bulling and school violence in a single mother family in 1980’s, and victims of child abuse in retaining a separated family name in their parents (Ushijima, 1999). Another was that young mothers tend to feel difficult and overwhelmed in their child rearing and hence, is inclined to give up child rearing. All in all, the child rearing is a nation-wide concerns in Japan. Therefore, the Ministry of Labor and Welfare has provided a financial support to help local governments to do something for mothers in concern.

As one of the local government projects in accordance with the central government, I have been involved in a project to support young mothers in a local suburban city of Osaka, Japan. We have organized together with other professionals and city personnel a child-rearing project. One thing we have done is a survey that indicated our problems and needs for child rearing.

Purpose
This study aimed at finding any cues in helping young mothers in the process of child rearing. In the Study I, a questionnaire in finding difficulties and needs in child rearing was disseminated to mothers in a local suburban city. Study II was to gather information from observations and experiences in mild counseling with mothers at the Clinic for Child-Rearing Support at Otemon-gakuin University.

Study I: Survey for A Community Support Project at a Local Suburban City of Osaka

In order to find how the mothers were feeling about their child rearing and what kind of assistance they needed was surveyed. The survey was disseminated to 3,020 mothers, of which 42,4% was returned. In general results showed that 53.2 % of mothers felt “very hard” or “hard” and “burdensome” in their child rearing, as compared to 30.3% of mothers felt “not so hard” and “not so burdensome” and 3.7% of mothers responded as “nothing hard” and “nothing burdensome.” The survey indicated needs and concerns according to ages of the child (Table 1)

As to the needs or assistance the mothers were looking for were as follows; How to do with the child when he or she cried, ill-behaved, or in sick or injured, and most of mothers expected to have their child cared in nursing homes.

**Study II: Experience at the Clinic for Child-Rearing Support at Otemon-gakuin University**

The Clinic for Child-Rearing Support at Otemon-gakuin University offers a program for mothers whose children have psychological, developmental, or emotional problems in the neighboring communities. About 17 mothers and children came to the clinic in 2004 and received psychological assistance for once a week for a year or some cases 10 sessions in a period of 3 months. However, a main aim at the clinic was to help mothers speak out with each other in a free talking manner about whatever came out in their minds along with worries and things they wanted to know. There was a chief clinical psychologist in the free talking but seldom gave suggestions and advices. Rather invited a free talking in which mothers could say anything they want to. While they were engaged in talking their children were taken care of in a playroom where there were clinical psychologists and graduate students majoring clinical psychology and played with the children.

After a year or 10 sessions at the clinic mothers reported they enjoyed and learned a lot from the free talking; most of them could reduced their stress because they could share their concerns with others; they have become able to obtain a distance from their children, not getting involved everything with children every time; they have become acquainted with other mothers whose children have same problems; they could share their worries about how their children would do when entered in elementary school; they have become tolerant even if their children behaved wrong; they have become confident in child rearing to know that it was alright as they were; they have become to like and love their children and their families; they were afraid to talk to their mothers in low about the problems their children had, but now became strong enough to talk and share opinions about how to relate with children; and so on.

**Discussion and Proposals**

Study I indicated that there were many mothers who worried and felt hard about their child rearing. They seemed to hesitate, or even afraid to how to do with child rearing. At
the same time most mothers in the survey responded that they were isolated and have few chances to talk to others. Hence, they have developed an inclination to have a fear in relating others. Some wrote that it was very hard deciding things and hence, they did not know what to do. It showed irritation and confusion. It may due to the rapid change not only in child rearing but also in motherhood in young mothers. Interpersonal relationship is getting less and less observed. It may have to do with social and economical changes in Japan as well. At the same time, problems such as autistic, Asperger syndrome, leaning disability, mild developmental problems, easiness to get angry, and abused children are increasing. We question why it is so. It seems it may well have to do environmental changes in Japan where industrial or urban nuisances disturb our health. This is an ecological concern and is a fundamental quest for us to be able to survive. But for the time being, we have to think what to do. Here are some thoughts of mine from my experience in working with the mothers in the project in a local city; To provide a place in a community center where mothers can get together and chat each other whenever they want; to build a network with mothers; to offer a group work with professional workers; consultation with health and mental health care professionals; a group to acquire social skills to relate others; and so on.

As for the mothers whose children have psychological and physical problems, I propose almost the same ones as stated above. I may add the followings: To provide a place to get together and an atmosphere where they feel safe, warm, and easy to speak out their concerns along with the presence of professionals in medicine, clinical psychology, or special education; offer both individual counseling and group counseling; offer consultation by specialists in special education; a chance to help mothers develop their own activities in need.

In conclusion, I feel we need something that helps or facilitates to develop our sense of self-support and ability to cooperate with others. I propose to create classes in school where we learn how to live in a mutually respecting way.

Bibliography
Constructivism is a relatively new IR theory which stresses on the study of identity and its effects on International Relations. As a relatively new theory, it needs refinement through empirical application. Yet in such a hot issue as cross-strait relations, where numerous other approaches have been applied to explain it, Constructivism has rarely been applied to explain. In recent years, identity across the strait has become more split than ever. Constructivism is perhaps the most appropriate theory in investigating the impact of identity on cross-strait relations. In this thesis, I will focus on how the difference in identity affects their relationship from a Constructivist point of view. I will look at how they define interest, their norms, and how they consider prospective institutions governing their future relationship. I will employ a longitudinal qualitative analysis. I intend to both fill the gap of explanation in cross-strait relations and to improve on Constructivism as a theory through this application. I may also compare the strengths and weaknesses of Constructivism and Political Psychology Theory in understanding cross-strait relations, both of which belong to the cognitive approach, posing a challenge to the dominant position of traditional positivism in the study of cross-strait relations.

An Innovative Teaching Approach Using Course Web-Enhancement to Facilitate Active Learning, Course Relevance, and Community Outreach

The current project aims to develop an innovative instructional strategy that links the classroom with the community and promotes self-discovery, course relevance, and research and critical thinking skills in students. The project has the unique opportunity of providing outreach to the community while fostering knowledge and understanding of course content. This teaching strategy requires the development of a website consisting of three main components: 1) internet surveys and assessments; 2) student publishing outlet; and 3) a database. These components will allow students to complete self-assessments, publish articles on-line, and collect and analyze data on topics related to the course. Whereas this web format could be used for many courses in psychology and other disciplines, the example outlined in this manuscript is the web-enhancement of a stress management class offered at the University of North Florida (UNF). The addition of a website to this course will foster an interactive learning environment for students and bridge the gap between the course and the community.

*Internet Surveys & Assessments*

The first component of the course site, *personal stress assessments*, will allow students in the course to take assessments and learn about their personal stress. These assessments will also be available to the entire university community and beyond, including all internet users. This component will provide a service to the community as individuals will be able to learn more about their personal stress as well as strengths and areas of concern. A need exists in the university population, as stress has been identified as a major factor on college campuses (Katz, Davis & Findlay, 2002), relating to adjustment and retention (e.g., Prichard & Wilson, 2003).
The personal stress assessment portion of the website will contain student generated, as well as standardized (contingent upon author approval), stress instruments. Individuals will click on assessments and answer specified questions to measure the degree of stress in their life, physiological indicators of stress, and coping strategies. Their answers will be scored and a summary profile comparing their scores to collected normative data will be provided. Summary profiles will provide percentage levels for each individual assessment score across predetermined categories (e.g., gender, age, city, region).

Student Publishing Outlet

The second component of the website, information articles on stress, will be available to the UNF community and all web users and will contain sound information on stress as well as healthy coping strategies for the management of stress. Students will write articles on stress and its management based upon current scientific knowledge and empirical evidence. All articles will be reviewed by the instructor and, contingent upon approval, will be added to the website. The instructor will work with the authors to ensure, through revisions if necessary, that the article meets the necessary criteria for publication on the website. The purpose of the stress articles is twofold: 1) to provide students the opportunity to critically evaluate, synthesize evidence, and write about a particular topic in stress, and 2) to communicate this information to the community. Too often, falsities and unfounded information is provided regarding stress via the internet and media. Because of the creation process and evaluation of articles included on the proposed course website, individuals can obtain credible information on stress management by use of the course website. Students will learn and apply critical thinking skills, which translates in to direct relevancy, as they are responsible for providing sound advice to the community. The typical anecdotal testimonials and nonreferenced statistics will be met with skepticism in generating
Innovative Teaching Approach

articles to include on the website, and students will refer to refereed journal articles in writing their articles. Students will choose topics they would like to address, but I foresee that the various articles will cover such topics as social support, stress and illness, relaxation strategies, test anxiety, and time management.

Database

The third component of the website, the database, will store assessment answers and scores to be summarized and analyzed by students enrolled in the course. Students will use this data to conduct descriptive and correlational analyses as a group assignment. For example, students may choose to characterize top stressors across various populations. One study found that the top stressors for college students at a mid-sized Midwestern University were change in sleeping habits, vacations/breaks, change in eating habits, increased work load and new responsibilities (Ross, Nieblin, and Heckert, 1999). Students in the stress management classes could conduct analyses on webdata to assess whether students at their university have similar or different stressors to students at other colleges and universities and additionally analyze how stressors may differ across other dimensions such as age, gender, major and student status (nontraditional/traditional; freshman/senior). The possibilities for analysis are numerous and student findings may likely be presented at student conferences and/or communicated to the campus so that administrators (counseling, career services) might create programs to target specific needs identified through such analyses. Certainly there are a number of factors involved in student stress and adjustment, including social support (McGrath, Gutierrez & Valadez, 2000), lifestyle (e.g., alcohol/drug use; exercise/nutrition; Bates, Cooper & Wachs, 2001), self-efficacy (Coffman & Gilligan, 2002/2003), nontraditional and traditional student status (Dill & Henley, 1998; Kirby, Biever, Martinez & Gomez, 2004), time management (Misra & McKean, 2000),
Innovative Teaching Approach

Students would be afforded the opportunity to describe stress in various populations (e.g., first generation college students, gender differences) and characterize campus stress as well investigate the relationship of stress with various factors (e.g., time management, health).

This class has a unique opportunity to allow students to discover and learn positive and healthy coping strategies so that they can become more effective in their lives as students and improve their overall quality of life.

Evaluation of Outcomes

The method of evaluation to determine the success of the proposed website will include assessments of the teaching innovation (course site) as well student learning outcomes.

Assessment of the Website. Server logs will be used to gauge the success of the course website. Analyses will identify numbers of people who visited the site over a given time, how many pages were viewed and what pages were most popular. Logs also will be used to assess the geographic location of readers and identify numbers of individuals within the UNF population that access the website.

The website will be evaluated by students and external reviewers as to how well the site is meeting the goals for the website. Website goals include: 1) provide an interpretable assessment system to help individuals understand their stress and identify problematic areas and 2) provide credible and informative content on stress and stress management. Students and outside individuals will be asked to rate their progress on these goals and will furthermore rate aspects of the website that were helpful in achieving these goals as well as providing recommendations for what else could be done to facilitate progress on these goals (Jaffee, 2003). Students and select website users will be asked to anonymously rate the value of the website and
components and will be asked if they learned anything else (outside of the objectives) from this site. This assessment will be conducted after the site has been created during beta testing and will be conducted during the class term at mid and end points. The website additionally will be evaluated by external and student reviewers according to usability and the Web Content Accessibility Guidelines (1999) during the beta testing phase, and will continue informally during the class session.

Assessment of Learning Outcomes. Educational goals of the current project are: 1) enhance learning through active participation and discovery-based projects 2) teach skills in the measurement and assessment of stress, 3) increase students’ understanding of scientific methods and summary and analysis, and 4) increase the relevance of the course to student’s lives as they learn about their own stress and provide educational components for the community. Integrating a web-component to the course will provide opportunities for collaborative learning and will familiarize students with the use of technology to disseminate and collect information. Broader implications of the project include community outreach for the campus, Jacksonville, and internet users with access to stress assessments and information on how to manage and relieve stress through healthy coping.

The student-written articles on stress will be used as an authentic assessment of knowledge and skills students possess at the end of the course. Students are asked to write for authentic purposes about stress management topics and create a final product that will be publicly displayed in a website forum. Wolf (1989; 1993) suggests that working on tasks that resemble writing in the real word are engaging activities that become “episodes of learning” for the student. Authentic tasks foster worthwhile skills and strategies as students learn and practice how to apply important knowledge and skills to develop products that can be applied to and used
by others. Records will be maintained regarding the number of completed documents loaded on to the website in addition to any presentations or further publications from the work in this course.

Another authentic assessment of student performance that requires students to engage in higher order thinking is the summary and analysis of stress assessment data. Students will exercise their literary and analytical abilities as they practice research skills that are valued in society. In a collaborative group effort, students will carry out the process of identifying a research question, conducting appropriate statistical summary analyses, and will demonstrate their literacy abilities by writing a report.

Educational goals for the student members of the stress management class will be assessed in a repeated measure fashion throughout the semester. At the beginning of the semester, students will be asked to report on their beliefs about stress. A similar questionnaire will be administered at the end of the semester, to gauge the depth, accuracy and breadth of understanding of the topic of the course.

Summary

This project is especially exciting because it affords the opportunity to academically and personally benefit the students as well as the community. In addition, students will benefit from their experience in contributing to an effort that can help people directly through assessment and the dissemination of information on stress. A major goal of this website is to provide a venue for students to communicate sound information to the campus and public. Students will utilize theory and empirical work in writing articles and likely will be motivated and rewarded to see their work contribute to something that others can benefit from. This is a creative and unique instructional innovation that not only enhances learning, but provides meaning and opportunities
for students to apply course content to the real world and serves a need in the campus and broader community.

Regenerating the Post-Industrial City: The Role of Heritage and Diversity in the (Re)creation of Cultural Quarters

Michael Edema Leary
Department of Urban, Environmental and Leisure Studies
Faculty of Arts and Human Sciences
London South Bank University
learym@lsbu.ac.uk

Current urban policy in the UK and EU has a strong element of culturally led regeneration. These types of policy interventions are often underpinned by a reliance on an embrace of diversity and cosmopolitanism. The 2012 Olympic bid and enthusiasm for the European city of culture initiative signal the commitment of UK central and local government. Paradoxically the UK currently is enduring a moral panic about immigration that feeds on a fear of difference. European integration can be aided greatly by major cities demonstrating the success of cultural regeneration. Much of the struggle to demonstrate success is operationalised through complex representations of space. This paper is based on research which seeks to describe and explain the importance of representations of space and conceptualisations of heritage and diversity for the creation of new spaces of consumption in a post-industrial city. Drawing mainly on the theoretical insights of Lowenthal and Lefebvre, the paper focuses on ongoing research examining how a post-industrial city in the north west of England is managing the process of re-imagining itself through strategies of public and private investment in urban regeneration projects in certain parts of the city centre and its borders. Manchester is a multi-ethnic city that has rich historical legacies going back to Roman times. The city is and has been represented in differing ways that draw on; the part it played in the industrial revolution, Liberal politics, notions of cosmopolitanism, and latterly as a post-industrial space of cultural consumption. A unique variety of cultural quarters mark the city out a leading exponent of culturally led regeneration. The most famous is the Gay Village but other less well known city spaces are important locally, such as, the Castlefield, Northern Quarter, the Curry Mile and the Millennium Quarter. The paper argues (following Lowenthal) that heritage is used as a tool to imagine and construct new spaces in the city drawing on a selective reading of the city’s history. Some aspects of the past are remembered and celebrated, others expunged. The paper asks how is Castlefield understood? Has it become a site of preservation and pervasive nostalgia or conspicuous consumption? A rhetoric of inclusiveness is deployed by public agencies to attract public and political support to fund regeneration projects. Whilst the strategy to re-imagine the city is in many ways a success, it is argued that this may be at the cost of social exclusion, continuing privatisation of public space and uneven development across the city, resulting in the relative neglect of spaces with little or no potential for re-imaging as sites of consumption. Urban planners need to be aware that they work with representations of the city and that these representations may run counter to those of many city dwellers.
Abstract:

This presentation is on the religious discourses of Korean American Protestant churches and their roles in forming Korean ethnic solidarity. The strong influence of immigrant Christian churches on Korean immigrant lives and communities has received attention from scholars in diverse disciplines. I am concerned with the religious meanings that church leaders have produced within Korean immigrant churches; for example, they have tried to make legitimate biblical settings for and religious explanations of Korean national history and immigrant experiences. These religious discourses have contributed to the establishment of Korean ethnic solidarity among Korean immigrant Christians and to the maintenance of Korean ethnic churches.

Pursuant to that goal, my paper makes a case study of the commemorative Centennial Celebration of the Korean American church, which was held in LA in 2003. Commemorative events or festivals serve as crucial places for participants to manifest and establish their public memories. Plans for this Centennial Celebration were initiated by church leaders and the Christian Herald, a leading Korean American Christian magazine in Los Angeles. Christian leaders in Los Angeles were motivated by a desire to assert consent from all the generations and denominations for maintaining Korean American ethnic churches. Therefore, the examination of this event will show how religious leaders and participants tried to build their common immigrant stories by honoring their church founders in Korea and in the United States, mediating the first generations and the second generations interests through religious language, and also illustrating how they projected the future of Korean ethnic churches in the United States by promoting their identities as Korean Americans. I will focus on addresses, sermons,
prospectus papers, letters, and testimonies by church leaders and community leaders, as well as photos and images displayed during the Centennial Celebration. These materials are predominantly written in Korean and English, making a multilingual approach essential in this presentation.

“This Becoming Korean Americans through religious discourses within Korean immigrant Protestant churches: focusing on the Centennial Celebration of the Korean American church in LA.”

This presentation is part of my project, “Becoming Korean Americans through religious discourses within Korean immigrant Protestant churches.” In this project, I am dealing with church narratives and religious discourses within Korean ethnic Protestant churches as ways to demonstrate how ethnic churches have constituted Korean American solidarity through Christian frameworks. Their religious discourses and rhetoric show how ethnic groups perceive themselves and what kind of prospects they are pursuing in the future as Korean Americans.

The strong influence of immigrant Christian churches on Korean immigrant lives and communities has received attention from scholars in diverse disciplines. I am concerned with the religious meanings that church leaders have produced within Korean immigrant churches; for example, they have tried to make legitimate biblical settings for and religious explanations of Korean national history and immigrant experiences. These religious discourses have contributed to the establishment of Korean ethnic solidarity among Korean immigrant Christians and to the maintenance of Korean ethnic churches. For that goal, my paper will make a case study of the commemorative Centennial Celebration of the Korean American church, which was held in Los Angeles in 2003.

Plans for this Centennial Celebration were initiated by church leaders and the Christian Herald, a leading Korean American Christian magazine in Los Angeles. Christian leaders in Los Angeles were motivated by a desire to assert consensus from all the generations and denominations for maintaining Korean American ethnic churches. I will focus on messages, sermons, prospectus papers, and letters, by church leaders and community leaders, as well as photos displayed during the Centennial Celebration. These materials are predominantly written in Korean and English, making a multilingual approach essential in this presentation.

This Centennial Celebration was a religious event of Korean American Christians and took place predominantly in terms of the evangelical Christian vision toward Korean Americans. The Korean Christian leaders of Los Angeles proposed and sponsored this Centennial Celebration for the purpose of celebrating the centennial year of the Korean
American Protestant Church. This celebration became a good example of how Protestant leaders promoted Korean American identity through religious celebrations. The symbols and narratives in this centennial celebration event presented the process to establish what it meant to be Korean Americans in the United States. Through this centennial event, Korean Americans negotiate the tensions and conflicts within Korean American communities as well as in the relationship with American society, in terms of American evangelical Christianity, constructing the common group ethnic identity of Korean Americans.

The identity formation among immigrants shaping and maintaining ethnic communities have been critical issues in the United States. The studies of ethnic festivals and celebrations in ethnic identity formation are based on the perception that the meanings of ethnicity are constructed and change over time, depending on how identity has been created at specific historical moments, rather than that ethnicity is “something to be preserved or lost.” Based on this perception, ethnic identity is established through the process of identification at a particular moment to cope with historical realities. In ethnic identity studies, there is a body of work which deals with festivals and commemorative events as cases and scholars point out the significance of the studies of these events, in the sense that ethnic groups engage in the process of determining who can belong to which group and on what terms. And my research on the Centennial Celebration of Korean American Churches will illustrate the way that ethnic festivals and events contribute to the formation of ethnic identity, in a methodological sense.

In the examination of this Centennial Celebration of Korean American church, I will analyze this celebration from the following aspects. In this sense, I will present examples that will illustrate the identity formation of Korean Americans through commemorative events and festivals.

First of all, through this celebration, Korean American Christian religious leaders tried to make creative use of the Christian heritage from Korea, tracing the history of Korean immigration back to the beginning of Korean Protestantism influenced by American missionaries. Also they identified the history of Korean Christian churches with Korean American immigration history by honoring the contributions and central roles of Korean American ethnic churches in immigration history. That is, this celebration intended to show a historically close connection between Korean Christian history in the 20th century relating to American Christian missionaries and the constitution of Korean American

---

Duntley, Madeline. “Heritage, Ritual, and Translation; Seattle’s Japanese Presbyterian Church.”
communities with the help of Christian churches. The study of this celebration gives a persuasive explanation of the significance of the Korean American Protestant churches in Korean American immigration history.
