Secondly, this celebration aimed at the formation of corporate identity and a sense of group solidarity within Korean American communities in terms of Christian faith, despite the inner diversity within Korean American churches including generational differences and interethnic relations. It makes Korean Americans successfully “assume an identity that is pluralist, multidimensional” while remaining rooted in its Korean American ethnic historical identification. By celebrating this diversity itself, this kind of ethnic ritual pursues a recognition and connection to American society which is presumed to be multiracial and multicultural.  

A major part of commemoration is to give visions and prospectus toward the future emphasizing the significant roles of Korean American Christians among Korean Americans as a community. This commemorative celebration suggests some common visions for Christian missions and stresses inevitable destinies of Korean Americans, transcending inner conflicts and ethnic ties within Korean American communities. This results in the construction of Korean American identity, promoting group solidarity.

Let me take two examples from photo collections to illustrate how the Centennial planners tried to make a historical connection between Christianity and modern Korean history, emphasizing how Christianity was closely engaged in the development of Korea. (showing picture) This photo collection is about the establishment of the Republic of Korea after independence from Japan in 1945. This collection shows that planners explicitly demonstrated their intention to connect Korean national history and Christianity, in the subtitle of this collection, which was “The Republic of Korea established based on Christian Democracy.” It implied that the Republic of Korea was starting as a Christian country which was not true. Under this title, this collection included the pictures of the worship services and Christian churches where Korean political leaders in the first government participated. Also they addressed political leaders by the titles which are used for Christian leaders in a Presbyterian Protestant Church, such as Mooksa (Reverend) and Jangno (Elders). 

Another photo example is the picture board under the title “Seungman Lee, The First President of the Republic of Korea.” Photo display committees put the picture of the English bible which Lee used, to emphasize his Christian background. There was an explanation beside the picture: “The bible which made Seungman Lee convert to become a Christian.” Also committees added the comment of how much Lee was actively involved in Christianity, saying “Seungman Lee led bible study groups even when he was in prison and evangelized over forty prisoners and that his bible study became the first

---

3 Rituals, in turn, form community boundaries based on religious connections that will supersede and transcend ethnic or biological kinship ties. (Anthony Buckley)
bible study in prison.”(photo) Sengman Lee was used as a symbolic figure establishing a close tie between Korean national history and Christianity.

Planners used narratives to honor the contribution of Korean Christian churches in the immigration history. In the official letter stating the purpose of this event, the Centennial committees clarified that their motivations and objectives for this celebration began with their desires to appreciate the contributions of Korean American churches in Korean immigration history: The letter says,

This year is a very historical one for all of us because it is the centennial of the Korean immigration to America and of the founding of the Korean American church. Our Christian Church has lived at the heart of the Korean American community and functioned as its center and the provider of comfort, courage and hope for its members and neighbors in times of hardship and crisis. Therefore, the Korean American community would not have survived without the leadership and service of its Christian Church."4

The emphasis of Christian backgrounds of the first Korean immigrants is a popular narrative. Rev. Lim, Dong sun said in his congratulatory message on the Centennial Celebration.

The history of Korean immigration started with Korean immigrant churches. When immigration opportunities opened to Koreans because the planters in Hawaii sought the laborers from abroad, Horace Allen, a missionary from The Presbyterian Church in USA, and Rev. Herbert Jones from Inchon Naeri Church played crucial roles in recruiting immigrants to Hawaii. With their help, the historic immigration history of Korean Americans started when 102 Koreans arrived in Hawaii. These first immigrants had worship services even on the ship and lived with focused on God after settling down in Hawaii and they never stopped worshiping God"5

These messages created the picture that American missionaries actively supported Korean immigration, especially Korean Christians and as a result, most Korean immigrants were active Christians. However, American missionaries discouraged Korean Christians from immigrating to America. American missionaries wanted Korean Christians to stay in Korea and to help their missionary work, rather than leave for America.6

Secondly, the generational reconciliation within Christianity is another major narrative Centennial participants used for the construction of Korean American solidarity. One of the important motivations of this celebration was the problem of the growing generational

4 Official Proposal Packet. Prospectus
conflicts between the first immigrant generation and the American born second generation within Korean American communities. Though the first Korean immigrants landed in Hawaii a hundred years ago, the current Korean American communities have been mostly established since the door opening to immigrants from all nations in the 1960’s in the United States. Over the last forty years, the American born second generations have grown to be adults, taking over the central roles in the Korean American communities. However, Korean immigration still continues, augmenting the number of first generation Koreans within the Korean American churches. This continuous generational tension and difference resulted in the exodus of the second generations from the immigrant ethnic churches, threatening the survival of Korean American ethnic churches. This generational tension became the main concern of Korean American church leaders and gave rise to debates over the construction of Korean American identities as a way to resolve the conflicts between two generations. In this sense, the Centennial Celebration emphasized the reconciliation narratives, by forming Korean American identities as the way to resolve the generational gaps.

Planners kept officially stressing the generational harmony among Korean Americans, promoting Korean American identity which unifies both generations. Planners warned the decrease of Korean connection among the second generations which would result in the disconnection from their parents, immigrant generations and suggested a spiritual solution to connect both generations to maintain Korean American solidarity. Planners said,

Our Roots originated in Korea, although we live in America. As time passes, our memory becomes faded and our children are apart from our generation. Our identity as Korean Americans must be reaffirmed as emotional and spiritual solidarity between parents and children is strengthened. The connection must grow between them as long as our community continues to expand.\(^7\)

The planners stressed generational harmony to the second generation participants. The English version of the invitation which mainly targeted English speaking generations displayed these planners’ intentions. They promoted the participation of the second generations in the Centennial Celebration for achieving the reconciliation between the two different generations. In addition, planners emphasized the central roles of the second generations for the future, saying “you will be the ones to carry the torch for the next 100 years to come.” Here is the English version of the invitation letter:

“We invite you to attend on November 9, 2003 at 5 PM, the Centennial Celebration, celebrating the 100th anniversary of Korean American immigration. It will be a time of transcending generation gaps, where grandfathers and grandsons can come together to celebrate the history of Korean immigration. We promise that it will be an inspiring and commemorative event. As the next generation of Korean Americans, you will be the ones to carry the torch for the

\(^{7}\) The Official Project Paper presented by The Christian Herald USA No. 130. The Theme of the Event.
next 100 years to come, and be representatives in this country. Your presence needs to merge the generations together. We happily invite you to come and celebrate with us!" 

In this letter, “you” meant the English speaking second generations and “we” meant the organizing committees members who were mostly immigrant generations. Therefore, this letter demonstrates that this Centennial Celebration started with the concern of immigrant generations about the disconnection with their children’s generations and these narratives and concerns motivated the construction of Korean American identity through Christian religious celebration.

This search of the common ground for both generations within Christianity is shown in the sermon by Sam Park, during the Grand Festival. He warned about the division between the first and second generation of Korean Americans and said that the only solution was to follow Christian humility. He said, “There appears to be an ever growing divide between the 1st and 2nd and beyond generations. The division is not only one of language, but of culture, of philosophies, even ideals. Each side has become armed with various charges: the 2nd generation is disrespectful, they are so lazy, they are too proud; the 1st generation is old-fashioned, they are too political, they are too proud. Ah! Here we meet common ground, the common ground of pride in humanity. And this pride, as long as we remain in it, will bring down the curse of division that befell those at the Tower of Babel. Will we doom ourselves to the same fate? The Bible speaks of an even greater divide: the one between the Holy God and sinful humanity. God’s response to that crisis is to be seen at the cross of Jesus Christ. The humble obedience of Jesus Christ is not only the solution to that cosmic divide, but also is to be the solution to the microcosmic divisions found among us.” He urged the audience to repent before the Lord that we have not lived up to the example set by Christ. He said, “The path to reconciliation is paved with repentance, and repentance is impossible without grace. It is so in our relationship with God, it must be so in our relationship with each other. As we enter this time of prayer, let us remember the grace that was freely given to us by Christ, to make us well.”

Finally, as ways to project visions for the future for Korean Americans in promoting Korean American identity, they used narratives making historical connections between Korean immigration and America based on biblical explanations, emphasizing Korean Americans’ central roles in American societies as immigrants, by connecting their lives to America.

One of the rhetorical strategies to construct Korean American identity by connecting Korean American experience to America history is the parallel to the Puritan narrative which symbolizes the beginning of America, making a founding myth in America. One of the major photo collection boards was about the first arrival of Korean immigrants in Hawaii. There were four pictures displayed in this board. The one was a picture of the SS Gaelic, which was the first ship of Korean immigrants. (picture showing)

---

8 http://www.ksachurch100.com/event.htm
The picture of the first ship, SS Gaelic, that brought the first Korean Americans symbolized the inception of Korean American histories. The image of a ship is a popular image of the first immigrants in America. The SS Gaelic is the representative historic name in Korean immigration history and provides the motivation to make parallel explanation of Korean immigration with the Puritans who came to American by the Mayflower in the beginning of American history. This is shown vividly in the written text in this board.

The SS Gaelic, the first ship of Korean immigrants, arrived at Honolulu, Hawaii on January 13, 1903. The first 102 Korean immigrants started severe labors at Wailuku and Mokuleia sugar plant plantations in Oahu. In the same year, 1,113 Korean came to Hawaii on 16 ships and 3,434 more on the next year, 1904, on 33 ships. By July on 1905, 7,226 Korean immigrant ancestors had arrived in Hawaii which they called as a paradise in the Pacific and a dream country. The total included 2,659 who came on 1905. They opened a new frontier history just like 101 Puritans in Plymouth four hundreds years ago.

The promotion of American identity was also presented in the messages for projecting the future of Korean Americans. In this Centennial event, organizers and participants emphasized on the significant roles of Korean American Christians in Korea, America and the world as leading Christians. In this sense, this narrative legitimatizes the central roles of Korean Americans in American society, rather than staying in marginality as immigrants.

An example of promoting American identity using Christian narratives is a sermon by Rev. Lim Dong Sun during the Grand Festival. Pastor Lim Dong Sun gave his special sermon, titled A Message for the Immigrants. He cited biblical story in which God sent a message of comfort and hope to the Israelites through Prophet Jeremiah when Israelites suffered in foreign land as captives. Pastor Lim applied God’s message to Israelites to Korean immigrants in America. By providing biblical answer to how immigrants live in foreign lands, he suggested a role model for immigrants by maintaining Christian religious faith. His message emphasized the central role of Korean Americans in America.

In the bible story he cited, southern Judah was invaded by the northern Babylonians resulting in many deaths and much destruction. The remains were captured and enslaved in a foreign country. During their hard captivity, God sent a message of comfort of hope to the Israelites through the Prophet Jeremiah. In his sermon, Rev. Lim applied the message of Jeremiah toward Israelites who lived in foreign lands to the present situations and future of Korean immigrants. Through his sermon, Lim argued that Koreans are destined to immigrate to America and God has plans to make Korean immigrants central in the United States founded by immigrants. He said “America is the best country in the world for the Korean immigrants to come,” and “in America nowadays, it has fewer incidents of racial discrimination, and anyone who is willing to work hard can achieve their dreams. Therefore, it is important that Korean-Americans have a sense of ownership of this land and love this land. It would not do us good to return to Korea. The land of Korea is small, crowded, and lacks natural resources; it might even be said that it is
patriotic to live here in the United States.” He also said, “In fact, this land, the United States of America, is not the land of American Indians, nor of the whites, but of God. It is the land of dreamers from all over the world. Today, there are over 400 different nationalities living across the United States.”

He argued that Korean immigrants and descendents should have love for America as their home, by citing the bible scripture, “Build houses and settle down: plant garden and eat what they produce” (Jeremiah 29:5) Lim, said “Being brought as captives and treated as second class citizens, they were forced to work and live like animals on the threshold of society. And because of their miserable circumstances, they had no love for the land: therefore they had no desire to build houses nor plant gardens nor trees. But at that very moment, God told them to love the land, to build houses, and to love the land, to build houses, and to enjoy the fruit of their crops. As a human being, if you love where you live, that becomes your second homeland.”

He also encouraged interracial marriage as one way of loving the land they live. They suggested examples from the Bible and Korean respectable heroes. “The captive Israelites in Babylon did not want to marry the natives of that land. To them, the Babylonians were gentiles, ones who served idols, and enemies of their homeland: ‘how can we marry and establish relationships with them?’ they said, and had largely ignored them. But God told them to marry them to be fruitful and to multiply with them. To most Israelites, it was common for them to marry their own people. However, there are cases such as Joseph’s marriage to an Egyptian woman, Moses to a Medianite, Esther to a Persian, and Eunice, mother of Timothy, to a Greek.” He supported his positive idea about intermarriage by taking the case of Rev. Kyung Jik Han’s son. Pastor Kyung-Jik Han was one of the most prestigious and respectable Presbyterian pastors in Korean Christian history, who had served as a senior pastor in Youngnak Presbyterian church.

“In Korea, the son of Pastor Kyung-Jik Han had married an American woman, and based on this instance, it is not shameful to have international or transnational marriage.”

He also stressed the loyalty to America citing the Bible verse, “Also seek the peace and prosperity of the city to which I have carried you into exile. Pray to the Lord for it, because if it prospers, you too will prosper. (Jeremiah 29:7)” He criticized the Israelites saying that “The Israelites in Babylon did not contribute to the economics of the land. They ignored the country where they live, saying it is Land of enemy, land of gentiles, and they became uncooperative, and lived unproductive life. But God told them to be useful and productive to the land in which they live.”

However, he exemplified biblical people who provided the models as immigrants. “Many figures in the Bible made significant contributions even in foreign lands. Mordecai benefited Persia, while Daniel was a great asset to the kingdom of Babylon.” He suggested this Christian ideal of immigrant lives through his sermons. He concluded his sermon by suggesting the future mission as model immigrants here in America, by

---

keeping God’s words. “We ought to remember these words of God, and as we look towards next 100 year or 200 year anniversary, it is my hope and prayer that we may become model immigrants to other people and pioneers to our future generations.”

His sermon illustrated how Christian church leaders project the place of Korean Americans within America. Through celebrating the central roles of Christianity in Korean American past, present and future, church leaders elicited the concept that Korean Americans are destined to take over the central roles in American society as immigrants for the next century. As long as they devoted their lives and vision to Christianity, they are chosen as a central race in every place, including America. In addition, Korean American roles are even more crucial because America has been the central country within the whole world in the past one hundred years, and the immigrants in America will assume the roles in world missions.

Rev. Junghyun Oh, a senior pastor of Sarang church in Seoul and the former senior pastor of Sarang church in Orange County, proposed the central roles of Korean American churches within the world history as well as American society in his celebrating messages. He pointed to central roles of Korean American churches under the world evangelicalism:

“I congratulate you on the centennial year of Korean American churches which started with the first immigrants arriving in Hawaii 100 years ago. As the person who had served in Korean American church for over twenty years I have no doubt that Korean American church will take roles in leading world Evangelical mission.”

As the descendents of European immigrants in America prevented the decline of Christianity in Europe which had started in the mid 20th century, five-million eight-hundred thousand Korean immigrants spreading around 178 countries in the world, are expected to take their roles in world missions in the 21st century. Furthermore, among Korean immigrant churches in the world, Korean American churches are playing central roles in the mission. I expect Korean American churches not only to challenge the Korean churches which tend to stagnate but also to, through the burgeoning spiritual power, influence American churches which are losing their powers”

His message exemplified the narrative that Korean Americans should take over world missions for the future as America has performed during the twentieth century. His messages analyzed that European immigrants came to America to keep their Christian faith and emphasized American active world missionary work in the twentieth century by these European Americans. Then, he proclaimed that Korean American Christians’ roles for the next century, as the next generation succeeding in European Americans in America, in terms of Christian evangelical mission. This also shows that organizers tried to place Korean Americans in a central place in American society through being Christians.
The expectation of Korean Americans’ contribution both to Korea and America is the central concept of Korean American identity, through this Centennial event. The role of Korean American churches in Korean history is based on their nationalistic activities during Japanese occupation in the first half of twentieth century.

These conservative model minority rhetorical strategies point to the goal of ethnic celebration for the purpose of overcoming their marginal status and the insecurity of the disconnection both from Korea and America. This celebration achieved the adoption of model minority myth not by economic success, but by being true Christians. The appreciation of the past contribution of Korean immigrant churches to Korean history and the expectation of future roles of Korean Americans make bridge the gaps not so much between Korea and America, as between immigrant generations and American born generations within Korean Americans. In this identity formation process, Christian rhetoric and narrative have provided the legitimate and bound frameworks for Korean Americans. This centennial celebration illustrated this process in the forms of sermons, addresses, and exhibitions.
During this time in which Darwinism and the theory of evolution are constantly being contested and rejected, the Center for Human Origin and Cultural Diversity (CHOCD) in the University of Missouri, St. Louis successfully introduces this material to 3,000 participants a year. It is the only center of this kind in the United States. This paper will present the center’s innovative and non-confrontational techniques and their role in preparing teachers to serve a diverse student population.

The CHOCD was jointly created by the College of Education and the College of Arts and Sciences in 1996. Primarily designed to fill a gap in sixth grade social studies curriculum, additional programs were developed to familiarize pre-service teachers, college students and classroom teachers with the material. The center’s programs introduce participants to recent information on human origin and teach them about cultural diversity through the investigation of African cultures. CHOCD’s lab based programs combine experiential learning, current scientific knowledge and an across the content area approach with state of the art pedagogy. The center’s Human Origin and African Cultures labs present a model in which anthropological, biological and social science knowledge bases are merged to present the significance of human biological adaptation and the formation of diverse cultures.

Using a learning-to-learn model, (Mentkowski and Doherty 1984; Loacker and Mentkowski 1993) a team of faculty and students from both education and anthropology developed the Human Origin Lab (HOL) with four integrated, hands-on learning stations. Learning stations are stand-alone, theme-based, intensive investigations through which participants experience a particular aspect of human origin and diversity. The African Cultures Lab (ACL) was an obvious extension of the HOL in which participants learn that the African continent is the homeland of the human family. This lab was developed in a similar vein, including four integrated learning stations that are more activity-orientated than the HOL. The activities of ACL place a greater emphasis on body/kinesthetic, verbal linguistic and musical/rhythmic intelligences. In addition, the ACL is addressing a growing demand by the African American population, for credible information and instruction in relation to the continent of Africa.

For this presentation we will focus on the four HOL learning stations and its activities in relation to improving pre-service and classroom teachers’ comprehension of human origin and diversity concepts. The first HOL station introduces the human fossil record. In this location, participants examine fossil casts related to the development of modern humans and their gradual exodus from the continent of Africa. The Participants
place these casts into chronological order using clue cards, timelines and mapping. In the “Archaeological Dating and Functional Morphology” station, visitors are asked to analyze fossils and artifacts that come from the field. They are introduced to the concept of human universals, as well as analyze the relationships between teeth and diet to understand their functional connection. In the third station, “Human Skin Colour Variation”, they employ the scientific method of testing hypotheses. Participants investigate the role of melanin production in relation to the geographic distribution of early modern humans. Finally, in the “Geological Time Scale” station, participants use deductive reasoning to develop a timeline of continental formation and introduction of life forms.

Surveys and reflective writings are used to analyze and examine the effectiveness of the CHOCD approach. A pre-test and post-test evaluation is given to measure the participant’s content knowledge and attitudes about human origin theory and diversity. After experiencing the laboratory programs, the content knowledge of the participants increased significantly and their ideas about both biological and cultural diversity reflected an increase in tolerance. Reflective writings showed that participants suggested multiple instructional techniques that they would use for their own teaching.

Research maintains that knowledge of diversities is critical to improving the academic and social growth of diverse students (Darder 1993; Larson-Billings 1994; Sheets 1993). While professional development and teacher-credential programs often provide training and preparation in diversity awareness to help teachers improve services to children, these programs tend to isolate the diversity issues from the content area teaching. One of the major difficulties is the lack of multiculturalism and diversity integration into general pedagogy and experiential strategies, as found in the CHOCD programs. Further study is planned. We will follow participants through student teaching to determine if student teachers completing the CHOCD experience exhibit significantly better performance in terms of delivering the multicultural education instruction as compared to those who have not had this experience.

The Relationship Between Organizational Socialization and Organizational Cynicism

The Relationship Between Organizational Socialization and Organizational Cynicism

Abstract

The purpose of this study is to examine the relationship between organizational socialization and organizational cynicism. We hypothesize that organizational socialization is negatively related to organizational cynicism. Data were collected through questionnaire survey from 331 employees of international tourist hotels. Results show that the hypothesis is supported. Implication of this finding and suggestion for further research is discussed.

Keywords: organizational socialization, organizational cynicism.
The Relationship Between Organizational Socialization and Organizational Cynicism

Introduction

Cynicism is widespread among organization members (Dean, Brandes, & Dharwadkar, 1998). As organization struggles to remain competitive, organizational change efforts are often blocked by cynical managers (McNamara, 1999). Therefore, organizational cynicism should be an important study issue in this era. Although organizational cynicism has attracted initial attention, it is still a new and challenging research opportunity and a theoretical framework needs to be built (Dean, et al., 1998).

Andersson (1996) even used psychological contract to explain why organizational cynicism would be caused and noted that factors influencing cynicism could be divided into business environment characteristics, organizational characteristics, and job and role characteristics, which consist of harsh layoffs, high executive compensation, poor communication, limited voice expression, role ambiguity, and role conflict. The present study tends to explore organizational cynicism from organization members – the extent of employees’ organizational socialization. Thus, the purpose of this study is to examine the relationship between organizational cynicism and organizational socialization.

Literature Review and Hypothesis Development

Cynicism is cynic’s opinions or attitude of mind. Dean, et al. (1998) defined
organizational cynicism as an extremely negative attitude toward one’s employing
organization, including three dimensions: (1) a belief that the organization lacks integrity; (2)
negative affect toward the organization; and (3) tendencies to disparage and critical behaviors
toward the organization that are consistent with these beliefs and affect. Atwater, Waldman,
Atwater, and Cartier (2000) pointed out that employees with organizational cynicism would
believe there are serious problems in their organization, which couldn’t be solved due to
management level’s self-centeredness. These cynical employees hold apathetic attitude to
organizational efforts, and perhaps even sabotage.

In terms of organizational socialization, past studies showed that organizational
socialization could let employees behave in the way that the organization wants them to. For
example, the tactics of organizational socialization could raise employees’ job satisfaction,
organizational commitment and organizational identification, lower turnover intention, and
ehance the person-organization fit (Ashforth, Saks, & Lee, 1998; Cable and Parsons, 2001;
Louis, Posner, & Powell, 1983). Moreover, the extent of organizational socialization is
positively associated with career involvement and adaptability, and negatively associated
with job stress (Allen, McManus, & Russell, 1999; Chao, O’Leary-Kelly, Wolf, Klein, &
Gardner, 1994). On the other hand, past studies also showed that organizational socialization
could make employees generate negative attitude toward their organization. Van Maanen
(1975) demonstrated that police officers’ commitment and work motivation would decline
after the socialization process, which was attributed to police officers’ job characteristic. Van Maanen and Schein (1979) also illustrated that an experienced patrolman passively describe their job is of little importance. Van Maanen and Schein opined that these highly socialized patrolmen master their job, but they have lost their motivation and idealism. This gradual development of cynicism toward the organization’s proclaimed object is called inefficacious socialization (Van Maanen, 1976).

These controversial findings demonstrate that the relationship between organizational socialization and organizational cynicism needs to be further examined. Firstly, the studies of inefficacious socialization are based on the following assumption: employees with longer tenure are better socialized than those with less tenure. However, organization socialization is not only experienced by newcomers but also senior employees. Organizational socialization is the process of teaching, learning and changes, which is continuously experienced in one’s career (Fisher, 1986; Van Maanen and Schein, 1979). Chao, et al. (1994) highlighted that changes of job and environment could create new learning needs and resocialization. Those studies that use tenure to measure one’s extent of socialization would only result in the inferred outcomes. Therefore, employees with high extent of organizational socialization would tend to harbor low extent of organizational cynicism. The inefficacious socialization that causes cynicism also needs to be reexamined.

Secondly, organizational cynicism is not limited to a particular type of work; cynicism
certainly is observable in a wide range of occupations (Dean, et al., 1998). In addition to policemen, other research subjects of cynicism include management levels, union members, customer service staff and professionals from different industries (Abraham, 2000; Anderson and Bateman, 1997; Reichers, Wanous, & Austin, 1997). The relationship between organizational socialization and organizational cynicism shouldn’t be merely examined under the particular organizational culture or characteristics. We speculate that the extent of organizational socialization would affect organizational cynicism.

Accordingly, the following hypothesis was tested:

Hypothesis 1. The extent of organizational socialization is negatively associated with organizational cynicism; the higher the extent of organizational socialization, the lower the organizational cynicism.

Method

Sample and Procedure

The participants of this study were employees of Taiwan’s international tourist hotels that are registered with the Taiwan’s Tourism Bureau. After potential subjects were contacted by phone, 32 international hotels were willing to participate in the survey. Depending on the participants’ wishes, surveys were collected centrally in the respective offices before mailing back, individually delivered and mailed back through an enclosed self-addressed envelope, or directly collected by the researchers. In the end, 745 questionnaires were distributed and 331
were returned, representing a response rate of 44.4%. The demographic breakdown of the respondents is as follows: 198 were female (59.8 percent); 224 were either single or others (divorced or widowed, 67.7 percent); and the average age was 29.2 years.

**Measurement**

Existing, established scales were used in measuring all of the constructs. Also, Sekaren’s (2000) recommended process of back-translation was adopted to ensure the compatibility of Chinese scale contents with the original.

**Organizational socialization.** This study measured the extent of employees’ organizational socialization by the scale developed by Taormina (2004), which included 4 dimensions: (a) 5 items for training, \( \alpha = .87 \); (b) 5 items for understanding, \( \alpha = .76 \); (c) 5 items for co-worker support, \( \alpha = .80 \); and (d) 5 items for future prospects, \( \alpha = .83 \). A 5-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree) was adopted for all items.

**Organizational cynicism.** The scale developed by Vance, Brooks, and Tesluk (1995, as cited in Atwater, et al., 2000) was used, which measured the employees’ negative attitude toward their organizations, management levels and other organization members. This scale included 6 items. The tested \( \alpha \) was .76.

**Demographic variables.** Participants’ age, gender and marital status were measured in this study.
Results

Means, standard deviations and correlations for variables used in this study are listed in Table 1, which reported that the four dimensions of organizational socialization were significantly correlated with organizational cynicism \((p < .01)\). Hierarchical regression was used to test the hypothesis. Control variables, including age, gender and marital status were entered in Step 1. In Step 2, independent variables were entered – training, understanding, co-worker support and future prospects. The results of these analyses are presented in Table 2. As shown in Table 2, organizational socialization accounted for a significant amount of the variance in organizational cynicism beyond the control variables \(\left( R^2 = .290, p < .01 \right)\). As for the four dimensions of organizational socialization, training, understanding and co-worker support were significantly predictive of organizational cynicism. Moreover, standardized \(\beta\) coefficients of -.20, -.22 and -.16 indicated that the relationship between organizational socialization and organizational cynicism is negative. Thus, the hypothesis is supported.

Discussion

Past studies indicated that organizational cynicism is the outcome of inefficacious socialization. However, this concept implies that employees might not be socialized in their organization and omits employees’ identification to their organizations. In the definition of organizational socialization, the understanding of organizational goal and value is an important dimension. Through the empirical results of this study, we find that employees with higher extent of organizational socialization would harbor lower extent of organizational cynicism. This finding supports our observation: the cause of organizational cynicism is insufficient organizational socialization, not inefficacious socialization.

In the academic field, the research of organizational cynicism is still limited. The finding of this study would be beneficial for extending the theory and establishing the framework. In the practical field, organizational change is a trend of this era (Yousef, 2000). Dean, et al. (1998) pointed out that employees with organizational cynicism might obstruct the organizational growth and change and even laugh in secret for disobeying organizational rules. Therefore, the management level should pay close attention to this phenomenon and adopt organizational socialization tactics to prevent it.
In sum, this study tries to clarify the controversial relationship between socialization and cynicism. This effort not only extends the theory of socialization and cynicism, but also provides a practical way to reduce organizational cynicism, thus making contribution to theory and management.

Effective teacher preparation is becoming more challenging as today’s students and families become more complex in cultural and ethnic diversity, learning styles, beliefs, and mobility. The impact of technology on student responsiveness and its massive and instantaneous influence on community knowledge and opinions have also increased the challenges for educators. These challenges facing local districts and institutions of higher education have been intensified by the demands of federal pressures for schools to “leave no child behind.” Many teachers are complaining about renewed emphases on teaching to the test, rote learning, and using teaching “scripts” in response to these pressures. The frustration for many is that there is a counterpoint theme emerging from research that describes what it means to “teach for understanding” reflected in more learner-centered models.

It is not the purpose of this paper to debate the merits of rote learning and other “disconnected information-based strategies.” Rather, the paper proposes a communication-based model for preparing today’s teachers that helps students integrate information and experience into meaningful constructs that emerge through continuous interactions. The paper brings together research and theory from three fields: (1) education research, specifically findings on preparing teachers for effective K-16 learner-centered instruction; (2) brain research and its implications for learning for understanding; and (3) findings on human communication, specifically tested concepts and models from the fields of interpersonal, organizational, family, and mass communication. The author’s model integrates
research findings with her experiences culminating from forty years as a professor of communication, teacher educator, and Senior Education Researcher with the U.S. Department of Education (recently retired).

For more than two decades, federal initiatives and innovations aimed at improving student achievement have emphasized the importance of teaching effectiveness. There is ample evidence that investing in teachers to help them attain strong content and pedagogical knowledge may be the best use of scarce public education resources. While researchers cannot agree on an appropriate balance of content and pedagogy needed in teacher preparation programs, few would argue that both kinds of teacher knowledge are essential to student success. In fact, it is now widely accepted that pedagogical and content knowledge are not discrete areas of preparation, but must be well-integrated if teachers are to meet the needs of individual learners and the nationwide goal of “leaving no child behind.”

However, effectively integrating pedagogical and content knowledge is not yet understood in all content areas in the context of impact on student learning. In addition, we are only beginning to accumulate knowledge on ways of grounding teacher learning in emerging findings from brain research. These findings will be described in the context of the central premise of this paper:

Teaching and learning are enacted through communication processes that are continuous, systemic, and transactional in nature. In the process of teaching and learning for understanding, communicators adjust their messages based on shifting perceptions of self, of one another, and of concepts of “the world as they know it”.

Findings from brain research support the idea that learning occurs when it is grounded in learners’ experiences. For example, a report from the National Research Council (1999) demonstrates:

Students come . . . with preconceptions about how the world works. If their initial understanding is not engaged, they may fail to grasp the new concepts and information that are taught, or they may learn them for purposes of a test but revert to their preconceptions outside the classroom.
Applications of the foregoing principle are reflected in well-organized and well-linked learning experiences in real-world contexts, both inside and outside the classroom. Such “contextual” learning strategies are often labeled “experiential,” “problem-based,” “learner-centered,” “community-based,” “service learning,” etc. Well-constructed contextual learning experiences are conceived as part of a model grounded in the following tenets:

1. Teaching and learning occur primarily through verbal and nonverbal communicative behaviors among teachers and students;
2. Effective learning depends in large part on the teacher’s success in structuring messages and experiences that build upon knowledge of related student constructs;
3. Knowledge of student constructs is based upon teachers’ accurate analyses of students’ prior learning related to concepts to be taught;
4. Prior learning derives from students’ broader culture, language, schooling, and specific family, work and individual experiences;
5. Teaching for understanding involves teachers’ abilities to communicate and adjust individualized messages (in learning settings) to build upon students’ prior learning and produce new student knowledge.

The following hypotheses will be presented for future testing:

Teachers who master communication concepts and strategies focused on “teaching for understanding,” in comparison with those who learn only “traditional” teaching methods, demonstrate:

1. Higher student achievement outcomes;
2. Higher levels of efficacy, especially in the role of learning resource rather than as a “conveyor” of information
3. Greater interest and/or involvement in professional/collegial learning in contexts such as learning communities.

Strategies will be presented for testing these hypotheses through various kinds of research studies.

Abstract
The competence in English is necessary for all the success no matter you work in Taiwan or in the international arena. How to learn English effectively, especially using interactive multimedia tools, become more and more important.
A depth interview with the chief executive officer of Live ABC Interactive Corporation that successfully developed interactive multimedia tools to learn English and becomes one of the three biggest English learning groups in Taiwan will show us the benefits of using interactive multimedia tools to learn English in Taiwan.
A survey from the learners will also prove that the using interactive multimedia tools to learn English is the best way to learn English.
In recent years, a great deal of anthropological research has been dedicated to the study of “transnationalism” and transnational migration. One aspect of the equation that is as yet understudied, however, is the influence of the State. Both through its deliberate interventions and through the unintended outcomes of its policy-making activities, the State represents a meaningful actor in influencing the form taken by migration. My research seeks to address the political ecology of migration at both the local and the national level—and on both sides of the border—and how it impacts the three phases of migration: the decision to migrate, the migration event itself, and the period of settlement in the new home. My work will focus on Mecca, Thermal, and Oasis, three Mexican migrant receiving communities located in California’s Coachella Valley. Major research questions will include:

1) What sorts of State level influences contribute to the “push” factors leading to migration?
2) In what ways do State influences on both sides of the border mediate in the migratory process? and
3) How do particular State influences shape settlement decisions?

My research will be based in part on the assembly of a history of late twentieth-century Mexico and the United States—particularly with regard to migratory policy and influence—which will serve as a framework for the study as a whole. I will also use person-centered interviews to compile a reconstruction of the historical assembly of the communities from the beginnings of their status as a destination in the trans-border migrant flow—circa the mid-1960s—to present. Particularly, I will investigate this migration’s roots in specific sending communities in Mexico and the ongoing maintenance of ties to the points of origin as well as changes in these factors as families become more settled in the US across generations. I will further include an examination of the present-day political economy and the ways in which the towns are integrated, not only within each and between the three, but externally with the official and unofficial institutions of US society. If a substantial influence is exerted on the migratory process
by the local and state political ecology, an analysis of the settlement pattern of the California Colonias should reveal significant overlap with the timing of “push” events in the Mexican political ecology, as mediated by “transition” and “pull” factors. It is this aspect of transnationalism that my research will address.
Colombia and the United States: a Silent Connection?

Colombia and the United States: a Silent Connection?

Colombia has often been described as a country of contrast and even contradictions. These contrasts and contradictions can be seen in its geography, its people, its economy, but more so in its politics, both in the past and present. An enigma to many (Osterling, 1989) and an exceptional country to others (Dix, 1987), “Colombia may be the least attended to, by scholars and media in the United States, of all the countries in Latin America, with exception of the negative attention given to the drug traffic” (Dix, 1987, p. 1).

Although little is known about Colombia and Colombians in the USA, this study analyzes the longstanding relationship between these two countries. The discussion will begin with a portrayal of Colombia’s rich history and its struggles with internal and external forces as the nation continues to forge its own identity. It will continue with a summary of Colombia and the United States relations, the immigration patterns that Colombians have developed through the years, the emigrating factors, as well as an overall view of the reception of Colombians in the USA.

This discussion will be intertwined with the notion that although Colombia has been neglected by US scholars and there is not vast literature regarding Colombia or Colombians in the US, there has been a strong connection between the two countries dating back to the time the United States pledged to “protect” the Southern Hemisphere from European invasion.

The Republic of Colombia: A brief journey through its territory and history

Colombia has a population of 42,310,775, ranking third in Latin America only after Brazil, and Mexico. Colombia declared its independence from Spain on July 20, 1810. During the pre-colonization period, what is today known as Colombia was inhabited by indigenous peoples who were primarily hunters or nomadic farmers. The Chibchas were the largest indigenous group
in this region. Ethnic diversity in modern Colombia is a result of the mixture of indigenous peoples, Spanish colonists, and Africans. Today, based on language and customs, only about 1% of the people can be identified as fully indigenous. About 58% of the population is “mestizo,” 20% white, 14% mulattoes (i.e., mixed white and African blood), 4% black, and 3% mixed black-indigenous people (Bureau of Western, 2004). The primary language is Spanish and the predominant religion is Catholic.

In 1549, Santa Fe de Bogotá was the capital of Santa Marta, where the Spanish colonist settled. Up until 1810, when the citizens of this city formed the first representative council to challenge Spanish authority, Santa Fe de Bogotá was one of the principal administrative centers of the Spanish colonist in the New World. After its independence, The Republic of greater Colombia was formed in 1819, which included Venezuela, Ecuador and Panama, but the greater Colombia (Bolivar’s dream) broke-up in 1830, at which time what is today known as Colombia and Panama emerged as one country. The current name, Republica de Colombia (Republic of Colombia), was adopted in 1886 (Dix, 1987; Osterling, 1989, Bureau of Western, 2004). Also, the capital’s name “Santa Fe de Bogotá” was officially changed to “Bogotá” in August 2000 (Bureau of Western, 2004).

From a geographical perspective, Colombia has an advantageous position. It is the only country whose borders touch the Atlantic Ocean and the Caribbean Sea in the Northern part of South America, between Panama and Venezuela, and the Pacific Ocean, between Ecuador and Panama. Its climate is tropical along the coast and eastern plains and cooler in the snowy highlands, which are subject to volcanic eruptions, and its soil changes from flat coastal lowlands, to central highlands, high Andes Mountains and eastern lowland plains (Dix, 1987; Osterling, 1989; The World, 2004).
The country is divided into five semi-autonomous regions. Each region has its own social structure, subculture, distinguishable geographical patterns, flora, fauna, and relevant economic activities which have resulted in specific cultural, social, economical and political patterns (Osterling, 1989).

Colombia’s diverse climate and landscape allows the cultivation and production of a wide variety of crops to include: flowers, sugarcane, coconuts, bananas, plantains, rice, cotton, tobacco, cassava, coffee, and other vegetables, as well as a great number of tropical fruits, dairy products and poultry. It has been said by many that Colombia has been gifted with minerals and energy resources. Colombia has the largest coal reserves in Latin America, is second to Brazil in hydroelectric potential, and possesses considerable amounts of ferronickel, silver, gold, platinum, and emeralds (Backgrounds, 2004; Bureau of Western, 2004; Osterling, 1989; Dix, 1987).

Despite its natural riches, during the earlier part of the 20th century the discrepancies in the way of life between the social classes in Colombia began to grow at an alarming pace. Colombia, through most of its history, has lived under the feudalist system - a small group of families controlling the great majority of the wealth and the greatest percentage of its people living in conditions that would be considered by the US to be below the poverty level. By 1964, 5% of the population was controlling 32% of urban income, and these income disparities increased during the 1970’s (Dix, 1987; Sanchez, 2003). Presently, Colombia faces difficult economic turbulence, including high unemployment rates, a decrease in real wages and purchasing power, increased levels of poverty and extreme income disparities (Sanchez, 2003).

Educationally, Colombians have always enjoyed the reputation of being highly intellectual and speaking the best Spanish, outside of Spain. In the earlier part of the 20th century, Colombia was known as the “Athens of South America,” because of its prestigious universities and the overall high level of education of its citizens. Several Colombians have achieved world wide
recognition in different fields. Of particular interest is the story of a young college student who in the late 1940s was forming his experiences about the political situation and in narrating them, he became a Nobel Prize winner in literature. Gabriel Garcia-Marquez, in his masterpiece, *One Hundred Years of Solitude*, attempted to bring the world closer to a Colombia that is mythical yet real, and sometimes so real that it appears surreal.

From a political point of view, Colombia is one of Latin America's oldest and probably most stable functioning democracy, governed by a civilian president, elected every 4 years, without the possibility of reelection. For the most part, presidential and congressional elections take place without major significant disruptions, with political power transferred to the incoming political party, usually without problems (Bureau of Western, 2004; Osterling, 1989; Dix, 1987).

**History of US/Colombian Relations**

The relationship between Colombia and the United States is longstanding and dates back to 1822, when the US president, James Monroe, became one of the first to recognize Colombia as a new republic (Bennet, 1915; Bureau of Western, 2004). It became stronger when on December 2, 1823, in Monroe’s message to Congress, he informed “the powers of the world that the American continents were no longer open to European colonization, and that any effort to extend European political influence into the New World would be considered by the United States as dangerous to their peace and safety” in what is today consider the “Monroe Doctrine” (United State Government Facts, 2005, p.2; Monroe Doctrine, 2005; Bennet, 1915).

This relationship collapsed in 1903, when the US provoked the small territory that is today known as the country of Panama, which was at that time part of Colombia, to revolt against Colombia. The US warships blockaded Colombia to prevent the country from putting down the revolution, therefore assisting Panama to break away from the motherland and declaring its
independence, with the sole purpose of obtaining the rights for the development of the Panama Canal. As a result, the Panama Canal Zone became part of the US ((United State Government Facts, 2005, p.2; Monroe Doctrine, 2005; Osterling, 1989; Bennet, 1915). This conflict put Colombia at the forefront of the first major military divergence between two countries in the western hemisphere.

The Colombian government backed down from its initial offensive reaction not only because it realized that the military power of the U.S. was unquestionable, but also because it became apparent that this had been a job undertaken by people high up within the Colombian government in an attempt to achieve some sort of monetary gain (Bennet, 1915). This episode, in many aspects, marked the beginning of the down-fall of economic power of not only Colombia but of South America as a whole, and it solidified the U.S. as the main economic supremacy due to the fact that it now controlled all the cargo and the trade routes to the Americas (Osterling, 1989; Bennet, 1915).

This single event changed the course of history and in the public opinion the U.S. became the “giant of the North,” who was not only willing, but also able, to do whatever it took to prove its supremacy. Though not an official US law, the Monroe Doctrine continues to have an effect on US perspectives and relationships with other nations regarding hemispheric intervention. The United States continued to have considerable power over Colombia during the 20th century, but a complete analysis is beyond the scope of this report.

**Colombia’s political situation and its relationship to the US**

Although a stable democracy, Colombia's political history has included periods of extensive violent conflict. After its independence from Spain, Simon Bolivar was elected first president of the Republic of the Greater Colombia, and Francisco de Paula Santander, vice president. The Liberal and the Conservative political parties were established due to conflicts
between the followers of the two leaders as a result of their political visions. Since then, democracy and violence appear to have gone hand-in-hand, until today.

Throughout its history, the violence in the country has originated due to different factors, but especially due to disagreements of the liberal and the conservative political parties, the rivalry between members of these parties, and the attempts to eliminate each other by seeking revenge. Other factors include unequal distribution of wealth and agricultural land, the lack of unreliable government institutions, and the political leaders’ ambition to impose their political views, despite the cost (Osterling, 1989).

During the 1970’s and 1980’s Colombia began facing a cruel and violent war brought about by the production and trafficking of marijuana and cocaine. During the 1970s Colombia became one of the most important centers of marihuana and cocaine processing, production and distribution. Although the coca leaves and the shrubs, from which both drugs are extracted, existed in Colombia for centuries, it was not until the 1970s that drug refiners and traffickers were responsible for great violence in the country (Sanchez, 2003; Osterling, 1989; Dix, 1987). When the local drug producers and traffickers began exporting the drugs, the Colombian “mafia”, as the drug traffickers became known, established themselves as one of the most brutal international organizations that did not hesitate to use whatever means they thought necessary to achieve control and increase its economic power (Sanchez, 2003; Osterling, 1989).

A “narco state” within Colombia soon was created, as intimidation through murder of both government officials and private citizens became the norm. During the early 1980’s another development occurred in the violence stricken country. The narco traffickers began a relationship with the guerrilla organizations, in which the guerrillas would protect the drug traffickers from the government in exchange for a percentage of the profits. Drug traffickers were then able to
build an empire (Sanchez, 2003; Osterling, 1989) and there seemed to be no one able to control them.

The violence in the country also increased due to the presence of anti-insurgent groups of paramilitaries who established themselves as a way to protest the injustices caused by the guerrillas and the drug dealers. These groups had grown at an alarming rate and had become more brutal than the guerrillas themselves, challenging them for control of territory, the government’s ability to maintain command of the rural areas, as well as control over the illicit drug industry. Violence continues to be used as a means to obtain power and control and as a way of protesting the government’s policies, especially extradition (The World Factor, 2004).

According to the Bureau of Western Hemisphere Affairs (2004), there is no single explanation that can fully address the profound roots of Colombia’s present day problems. Some of the explanations include: “limited government presence in large areas of the interior, the expansion of illicit drug cultivation, endemic violence, and social inequalities” (p.4). As a way to confront these challenges in 1999 the past administration revealed a comprehensive strategy to deal with these problems called Plan Colombia. To assist in this endeavor, the United States pledged $1.3 billion in aid to Colombia (Backgrounds, 2004; Bureau of Western, 2004; Secretary of State, 2003; Bureau of Western Hemisphere Affairs, 2001; United States Institute of Peace Library, 1999).

Colombia’s present president, Alvaro Uribe, took office on August 7, 2002. On the 2003, Report to Congress on United States Policy towards Colombia and other Related Issues, the Secretary of State indicates that US policy towards Colombia supports the Colombian government’s efforts, as stated in the president’s strategic plan called Democratic Security and Defense Policy, which fits within the overall social, economic, and political goals of Plan Colombia. This plan includes “strengthening its democratic institutions, promoting respect for
human rights and the rule of law, intensifying counter-narcotics efforts, fostering socio-economic development, addressing immediate humanitarian needs, and ending the threats to democracy posed by narcotics trafficking and terrorism” (p. 4).

Colombia has maintained a close compliance record in order to receive the financial assistance to continue implementing Plan Colombia. This compliance included the extradition of the first Colombian in 1997, almost ten years after the last extradition, of a drug trafficker, to stand trial for offenses committed in the US. 146 persons have been extradited to the US from August 1998 to October 2003, mostly for drug related charges. Also, as part of the narcotic control program, Colombia is involved in aerial spraying of herbicide and manual eradication as part of a commitment to eradicate illicit drugs, interdiction of drug cargos and prevention of money laundering; the financial support from the United States continues (Backgrounds, 2004; Bureau of Western, 2004; Secretary of State, 2003; Bureau of Western Hemisphere Affairs, 2001; United States Institute of Peace Library, 1999).

Presently, there is disagreement as to whether Plan Colombia and the US intervention in Colombia are indeed benefiting the people of Colombia. Although the guerrilla activity is not as strong in the cities, they continue to take land away from the people in the countryside causing massive internal displacement. Furthermore, the allegations of violation of human rights continue to rise. According to the United Nations, Colombia has become the biggest humanitarian calamity of the Western Hemisphere (Canby, 2004). Despite the many problems, the Colombian government is trying to reform the nation’s political and legal system and include its citizens in the process.

**Colombia and the United States: a Silent Connection?**

The relationship between Colombia and the United States appears to be based primarily on the drug trafficking crisis that has affected Colombia since the 70s, and the US government’s
willingness to assist the Colombian government in eradicating this problem. But this aspect alone
goes beyond simple financial assistance, since it is a fact that 90% of the cocaine entering the US
comes from Colombia and that this country is also a considerable source of heroin. Therefore,
Colombia’s drug problem has extended to the United States and has permeated the mainstream
society to the point that there were 50,000 drug-related deaths in the United States in the year
2000 and the US’s economy lost $160 billion during the same year due to illicit drugs (Secretary
of State, 2003).

Furthermore, United States has been impacted by the violence in Colombia, given that
Colombia’s terrorist groups have kidnapped 51 North American citizens since 1992, and have
killed 10 (US Department of State, 2003). The drug phenomena, the violence in Colombia and its
repercussions in the American society, as well as the US government role in Colombia, is also
beyond the scope of this study, but it is indeed a topic of importance in understanding the silent
connection between these two countries.

The fact that Colombia has been neglected by scholars in the USA and that the country is
mention primarily when discussing the negative effects of the drug traffic (Dix, 1987), may
indicate that there is a narrow relationship between the two countries. Contrary to this notion,
there are many other reasons that connect them. For example, there were approximately 50,000
US citizens living in Colombia in 2002 and there are about 250 North American businesses
operating in Colombia since Colombia is a free market with major commercial and investment
ties to the United States (foreign investment has increased mainly due to the oil sector) (US
Department of State, 2003).

Additionally, many Colombians have achieved worldwide recognition in different areas,
and a major part of their careers and accomplishments have taken place in the United States. In
the internalization of Colombian music, Shakira, Carlos Vives, and Juanes have been awarded
Grammies on numerous occasions. Colombian musical groups are also known for their interpretation of tropical rhythms of “cumbia”, “salsa” and “merengue” in the numerous night clubs all over the US. In soccer, several players have made history playing not only for the Colombian national team, but also for the North American league, the most famous of them being Carlos Valderrama. In Formula 1, Juan Pablo Montoya, has received various trophies and ranks among the best in the world. In baseball, Edgar Rentaría is considered a star. In literature and art, both Gabriel Garcia Marquez and Fernando Botero have had their works displayed in several cities. While their names have become known among the Latin community in the US, and in each specific field, the name of their country has not remained outstanding in the mind of North Americans.

Another almost unspoken connection between the two countries is the immigration trend of Colombians to the USA. Although Colombians have been migrating to the US since the early 20th century, and the first wave of Colombian immigrants began to arrive around 1945, there are limited history books and references available concerning the Colombian immigrant. According to Guarnizo, Sanchez, & Roach (1999), "While Colombians constitute an important wave of immigrants; nonetheless they are an understudied ethnic group" (p.367).

The fact that they are an understudied group and that the name of the country is not outstanding in the minds of North Americans, may lead to the speculation that Colombians, as a minority, have selected to be silent. In exploring this notion, many factors need to be taken into account. On the one hand, it may be necessary to understand the essence of Colombians’ identity, the fact that in many cases Colombians see themselves as being different and in a lot of ways “superior” from most other groups of immigrants from South America and Latin America as a whole, the historical background of the country, as well as the present situation of the nation.
Most Colombians are described as fearless, entrepreneurs and risk takers. A consequence of this trait is that Colombians are dispersed throughout the US. “Colombians’ identity is tied to the extended family, close friends and associates, socioeconomic class and region of Colombia” (Collier and Gamarra, 2001, p.13). Their sense of superiority many times contributes to Colombians not being willing to be “followers” outside their work place, therefore attempts to establish a strong Colombian community across the United States have been unsuccessful.

Colombians desire to succeed as individuals is not necessary tied to their desire to succeed as a Colombian individual. They strive to be the best in their field, whatever it may be, but not necessarily the best Colombian in their field. Another factor that strongly contributes to the Colombian immigrant maintaining a low profile as a Colombian national in the United States is the traumatizing stigmatization that Colombians suffer as a result of the drug problem. For those not involved, it is humiliating and devastating to have to deal with the stigma. To those involved, more than dealing with how society views them, their fear of being killed has an effect not only on the person involved in the situation, but more so, on the relatives, especially the ones that remain in Colombia. As it can be seen in the movie Maria Full of Grace, once Maria crossed the line and became a “mula” (transported of cocaine), her whole family who lived in Colombia was in danger if she did not delivered the drugs in the US. Although the drug traffic from Colombia is not the focus of this study, the connection between both Colombia and the USA impacts citizens in both countries that have been affected by this crisis.

The connections between Colombia and the US are many, and the reasons why little is said about the relationship between these two countries may well stem from a vast array of possibilities. The list of speculations could be very extensive, but the reality of the Colombian immigrant in the USA forces us to look beyond speculations in order to understand their impact.
in the American society. The following session will provide an overview of the reasons for this emigration, the immigration patterns established by Colombians and how Colombians have been received in the United States.

**Colombians Emigration Patterns: Reasons for Leaving**

There are many and very varied reasons for Colombians to leave their country besides the political instability, the violence and the drug traffic. Colombians have a history of migrating. According to Sanchez (2003), during the 1930’s there were 1,233 permanent Colombian residents in the US, and by the 1940’s this number had reached 3,858. The nomadic spirit of the Colombian individual and the prevalent feeling of Colombians that the government was not looking out for their best interest lured them to search for a better way of life for them and their families. One of the themes most prevalent in the Colombian experience is that of family ties, the Colombian individual comes from a social system in which family supersedes everything. This overzealous devotion to family brings to the forefront the Colombian lack of social responsibility and social acumen, and the endless search for a better life for the family as a whole, disregarding the best interest of the nation (Collier and Gamarra, 2001).

Furthermore, the Colombian national personal relationship with his own sense of adventure, his own need or lack thereof, and, the country’s failing model of economic development were “push” factors that made migration a desired option. The U.S. with its economic prosperity after war world II, its well structured social norms and its perceived peace and tranquility became a “pull” for the Colombian national.

**Colombian Immigration to the USA**

Overall, the Colombian government estimates that 10%, close to 5 million Colombians presently reside outside of Colombia. According to the 2000 US Census, there are approximately
500,000 documented Colombian born immigrants residing in the USA, but the Colombian government estimates this number to be about 1 ½ million, between the documented and the undocumented. Colombians can be found all over the United States.

Colombians have established themselves primarily in Florida, New York, New Jersey, California, Texas, Massachusetts and Chicago, Illinois, but Colombian colonies can be found in small cities, as well as large cities, in every state of the United States. Although little attention has been given to some of these groups, they have settled and have become part of the mainstream society.

An example of this is the Colombian “colony” in a small town close to Lancaster County, Pennsylvania, composed primarily of middle to upper-middle class Caucasians and a large Amish community. Although isolated from the Latino world, several families established themselves there around 1974 because the textile factories were offering good paying jobs and a chance to obtain legal residency. This group of immigrants was well received, its members had the opportunity to continue their education, improve their economic situation, and bring their families from Colombia; in other words, pursue the American dream.

While there is a consensus in the literature available about the immigration patterns of Colombians to the USA unfolding in three waves, there is somewhat of a discrepancy regarding the exact periods and there is limited information as to the reasons that led to these patterns. Collier and Gamarra (2001), and the statistics available at Conexion Colombia, the Web site promoted by the Colombian government, list the periods to be from 1950 until the end of the 1970’s; late 1970’s until mid 1990’s and mid 1990’s until the present.

This investigation is organized using the three time periods of Colombian migration constructed by Sanchez (2003), in his thesis "Colombian Immigration to Queens, New York: The Transnational Re-imagining of Urban Political Space": 1945-1964; 1965-1989; and 1990-2000,
for purpose of this study, this period will be extended to the present, due to the fact that he links the time frames to the internal conditions that surrounded the Colombian migration, as well as with the United States’ immigration policies and the overall receiving context.

**Colombian Migration during 1945-1964: First Wave**

By the mid 1940’s Colombia’s political panorama was already delineated by the two political parties, the conservative and the liberal. Up to this time in the history of the nation the conservative party which had been controlled by the upper class, had ruled the people. But the country was beginning to awaken from the hold of the feudalist and the liberal party’s social and political views were beginning to gain force.

On April 9th 1949, the hope of the people was lost, when their leader, Jorge Eliecer Gaitan, was assassinated in Bogotá, giving birth to the period known in Colombia as “La Violencia”. Due to this civil war against those that had oppressed them and had benefited from an unfair economic system, the political violence was growing at an alarming rate and the “internal political instability was an important factor in facilitating out-migration” (Sanchez, 2003. p.57).

During this period, the Colombians who left were mainly urban-based professionals, well-trained technicians and service workers (Collier and Gamarra, 2001). Also, many of them were veterans of the Korean War who chose to repatriate to the U.S. after being granted resident status for having fought for the U.S. (Sanchez, 2003), and did not want to return to a nation in the midst of a civil war.

**Colombian Migration between 1965 and 1987: Second Wave**

The years between 1965 and 1987 were marked by changes in the immigration laws in the US and the deteriorating situation in Colombia, both politically, and economically. During these years Colombia was experiencing growing levels of internal political violence in the countryside, brought about by the civil unrest and the declaration of war from insurgent fronts becoming more
and more prevalent in the Colombian society. The weak political and economic state in the country was complicated by the fact that Colombia became a major exporter of marijuana, as well as a cocaine processor and distributor, during the 1970’s and the 1980’s (Dix, 1987; Osterling, 1989; Sanchez, 2003).

The drug traffic impacted the economy dramatically, distorted the economic system, and accelerated the levels of social decomposition, criminality, public and private corruption and general insecurity. Due to the high rate of unemployment and the informality of the labor market, drug trafficking became an alternative source of employment, and it also created a climate of national pessimism (Sanchez, 2003; Osterling, 1989).

During this period Colombia saw the emergent drug cartels from Medellin and Cali, violent responses to the idea of extradition of Colombians to the US, and the overwhelming number of assassinations of politicians, journalist, lawyers and judges. This condition created great discontent and gave space for the armed insurgent groups to surface as significant military and political actors (Sanchez, 2003; Pearce 1990; Osterling, 1989).

These internal conflicts brought about the exodus of young adults migrating to the USA that were later on joined by their families" (Collier and Gamarra, 2001). This new wave of Colombian immigrants, while not as highly educated as their counterpart from the first wave, also found favor in the eyes of their employers because of the generalized perception among employers that Colombians were highly qualified and disciplined workers, this in turn, facilitated their upward mobility in the work place (Sanchez, 2003).

"The Immigration Act of 1965" allowed every country a quota of 20,000 new immigrants to the U.S. per year (Collier and Gamarra, 2001). This act also had the added incentive of family unification as a secondary goal. The injection of new labor hands to the ever-growing need of the work force was the primary goal of said act. The passage of this Act made it possible for the
relatives of many Colombians to immigrate, therefore creating a great influx of Colombians and other Latin Americans as well. Colombian migration to the United States increased considerably between 1964 and 1989. Sanchez indicates that during the 1950’s, 18,048 Colombians legally entered the United States, but by the end of the 1960’s the number of documented Colombians had arrived at 72,028. Although the 1970s only registered 77,347, by the end of the 1980s the total number had reached 122,849 (Sanchez, 2003).

**Colombian Migration from 1990 to the present: Third Wave**

The 1990s saw an immense arrival of Colombians to the US, due to the co-national contacts available to the Colombian in the US, the intensification of the military and political crisis in the country and the growth of formal and informal labor markets. The level of fictitious inflation experienced was at an all time high; the real problem was the fact that this inflation was being driven by drug traffickers who had no regard nor respect for societal norms, rules, and regulations.

The social unrest in Colombia had reached alarming proportions both, in the political front and the drug trafficking phenomena had reached its zenith. The well-known saga of the Colombian drug crisis, the destruction of the Colombian economy, the disruption of the Colombian way of life, the way the Colombian population lived in fear of being the next person on the list to die, the subornation of the political system by the “narcos”, the violence against the authorities and all those who dared speak against them, etc. did its major damage in Colombia during these years.

The decade of the 1990s was marked not only by the rising of the internal/external political crisis, but also by an alarming linkage between drug traffickers and the guerrilla groups, especially the FARC. The violent and overpowering control this union had, forced the internal displacement of over two million Colombians and led to the migration of a high number of
middle and upper class individuals and families, especially to the U.S. The U.S. was their final
destination in most cases, not only because it was still the best place to migrate to in the world
but also because it was the number one destination for the majority of drugs coming out of
Colombia (Sanchez, 2003).

The drug trafficking became a very prosperous business for some Colombians in the
USA. For this reason, the new wave of Colombian immigrants who were not involved in the drug
trafficking business, found the American experience to be a great challenge, compared to what
their counterparts of the previous waves had enjoyed. Their arrival was received with a great deal
of skepticism, not only by the members of the established community, but also and perhaps more
damaging, by their own countrymen (Sanchez, 2003).

The high level of violence being experienced in the U.S. communities, known as the
major stronghold of the Colombian immigrants, made authorities in areas such as Miami, Florida,
and Queens, New York, adapt stringent measures to counter act these problems (Sanchez, 2003).
Most of these measures were discriminatory in nature because they tended to lump all members
of that ethnic group as guilty by association or by virtue of having been born in that country.

Glick-Schiller, Bash, and Szanton-Blac (1992), state that trans-nationalism addresses
how immigrants create and maintain multiple social relations that connect their societies of origin
and settlement, and many Colombians did not want to maintain any contact with Colombians
they did not know. They even feared the relationship with Colombians they knew but that
demonstrated nomadic characteristics. Jones-Correa states in his book titled The Marginalization
of the Latino Immigrant (1998), that the "characterization of the Colombian immigrants as drug
traffickers resulted in the deterioration of their way of life".

According to Sanchez and Gomez (2001), in 1999 alone 366,000 Colombians applied
for immigrant visas and this was only part of the story because undocumented migration is not
captured by official statistics. The exact number of Colombians in the US is difficult to accurately calculate, especially by the US Census. The fear of deportation of many undocumented immigrants led them to avoid the process of census enumeration.

Response to the Immigration Process

The Colombian immigrants’ primary support is usually established through the close knit circle of family members and countrymen, usually from the same region in their country. Colombians by in large adapt very well to the main stream society and are able to blend in the community, especially if they are white or light skin, which makes it easier for them to pass themselves as Caucasians.

In many parts of the USA, Colombians have been looked at as a group that has very marketable skills, are able to incorporate to the work force rather quickly and have very strong work ethics. Although there is no specific information of services received, it is estimated that Colombian families as a whole are unknown in the annals of Social Services agencies.

US Acceptance of the Colombian Immigrant:

Immigration to the U.S. for the first wave and the early part of the second wave was well received because of the enormous capacity of the economy to assimilate newcomers to the work force (Collier and Gamarra, 2001). This was a period of massive expansion and extreme economic well-being for the US. However, the readiness of the U.S. to accept the new waves of immigrants from Colombia has varied according to the need of the U.S. for the skills that those immigrants possessed at that specific time. Furthermore, the acceptance of the Colombian immigrant has depended to a great deal on the city they have arrived to, the economic situation at the time of arrival and the readiness for the receiving city to welcome Hispanic immigrants in general.
Colombian immigrants of the first wave enjoyed a very positive experience due to their educational level and their social sophistication. The immigrants from the first half of the second wave enjoyed the reputation of the immigrants from the first wave and were able to take advantage of their superior skill levels in order to blend quietly into the American society.

In contrast, the immigrant from the second half of the second wave found themselves being stigmatized by the new problem confronting the American society at that time, the drug crisis. For many Colombians this stigma became a big issue and in many cases it became the cornerstone of the Colombians increased reservation and hesitation to socially interact with others, especially with co-nationals that they did not know. The new wave of immigrants faces specific problems. The great numbers of third wave immigrants are professionals who are finding difficulties in obtaining licenses and work permits to continue their professional careers, despite the city where they arrived, their situation is precarious due to their undocumented status.

Conclusions

Although little has been said about Colombia and Colombians in the US, there is evidence that the relationship between these two countries is not subtle. The increasing numbers of Colombians in the US are creating economic, social and political impacts and are raising very important policy issues at all levels of the US government. The US government and the American society as a whole can not continue minimizing the connection that has existed between the two countries since Colombia’s independence, therefore, there are several implications for Human Services and the US government related to Colombian immigrants.

There is a great need to educate individuals, communities, and society as a whole about the field of drugs. The drug phenomenon needs to be addressed as a global problem and not only the problem of Colombians or a problem of Colombians settling in the USA. The impact that the drug problem has caused in the American society needs to be given special attention, both, from
the mental health perspective, as well as from the policy perspective since the government’s
effort to reduce drug consumption in the US has not been successful and there is no evidence that
the drug production in Colombia has been eradicated.

Furthermore, the fact that a particular drug is produced in a country, does not make all
citizens of that country drug dealers or drug traffickers, in as so much as being from Iraq, makes
all Iraqis terrorist. Therefore, it is important to educate the North American society about
Colombians while assisting Colombian immigrants understand and process the feelings created
by the national identity crisis created by their characterization as drug traffickers and trouble
makers. The reestablishing of their national identity will aid in their desire to openly become
contributing immigrants in the USA.

An analysis of US immigration policies also needs to take place in relation to
Colombians. Despite the fact that the US has a great interest in providing financial and military
assistance to Colombia due to the drug crisis, the US government denial to provide Temporary
Protective Status (TPS), or to grant Political Asylum to many Colombians who fear persecution,
could be seen as a form of institutional discrimination.

Although initially Colombians remained silent, today with the outset of the new
political climate in Colombia, with renewed faith in their government officials and with a better
understanding of the American culture, Colombian immigrants are vowing to be at the forefront

There is growing evidence that Colombians are looking for ways, not only to improve
their economic and legal status in the US, but in the process, become active in the community,
share their traditions and culture, participate in the political process, and achieve social and
economical benefits for Colombians, both in the U.S. and in their native country. Also,
Colombians all over the world have begun to develop ways to maintain communication through the rapid spread of technology.

“When Silence, Outbursts, and Disclosures Matter”: A Qualitative Approach to Examining Emotional Expressiveness in Marital Satisfaction

ABSTRACT

This “work-in-progress” study builds upon previous research quantitatively conducted by this author published in the area of emotional expressiveness and marital satisfaction. This research reflects another approach to examining emotional expressiveness in marriage through the gathering of qualitative interviews and analyses. At this writing, 21 couples have been interviewed and audio-taped in the privacy of their own homes. The couples were asked a series of open-ended questions pertaining to how they expressed their emotions and how these behaviors impacted their levels of satisfaction. The specific focus of this presentation addresses the “active interview” process and how the resulting themes of silence, outbursts, and disclosures were meaningful to the study.
“From Cucumbers to Pickles”: Reflections on Life Changing Events from Adolescents’ Points of View

ABSTRACT

Using a critical incident methodology approach 329 college aged students, over a period of three years, reflected in their own words on nodal events in their lives when their families of origin were able to “come together” and not able to “come together.” Participants in the study shared poignant examples of how these events fostered communication changes in their families and altered their identities during these times. A thematic analysis was conducted that outlined general categories and frequency of events that significantly impacted their lives during the period of adolescence.

Introduction

We, as human beings, construct our identities in multiple ways over multiple years. Perhaps, the most pivotal years in development occur before we leave our family of origin, when we transition away from our families at approximately 18 years of age. There is a preponderance of literature that attests to the many influential events and stressors that create challenging paths for children and adolescents (Mliam, Ritt-Olsen & Unger, 2004; Joseph, Williams, & Yule, 1993; Aldwin & Sutton, 1998; Erikson, 1968). During the time that individuals experience with their families growing up, there are undoubtedly certain events, and people, that impact them more than others—situational and relational changes that further shape our individual and collective identities forever. Events that are irreversible; experiences that, for better or worse, alter our personal paradigms. Although researchers have typically studied negative
outcomes of nodal events, there is hopefulness that evidence exists toward positive change occurring after the negative nodal events. Often labeled as stress related growth, (Park, Cohen, & Murch, 1996) changes occur such as heightened appreciation of life, marking new priorities, and improvements in family relationships.

This study further investigates the identification of nodal events, the impact of these nodal events on families, and will ultimately, describe the associating communication the families’ practices surrounding these events. Metaphorically speaking in this research study, this “change” is likened to a cucumber and pickle, in that, once a cucumber becomes a pickle, there is no chance of the pickle returning to its original state of being a cucumber. The effects of change alter the purity or natural state of the “cucumber;” hence there is no way of turning back to a purist state.

Method

In an effort to discern which events are more likely to evoke “pickle-like” changes in adolescents, this research study employed the critical incident methodology approach to *329 college-aged students, over a period of three years. Using a snowball sample originating from undergraduate students in a family communication course, each student was asked to identify a nodal event that helped their family come together and a nodal event where their family was unable to come together. Along with identifying two nodal events, each student was asked to identify communication behaviors that accompanied each event. Various demographics were asked of the subjects such as gender, current age, and their age at the time of the positive and negative nodal events. The subjects were given a questionnaire outlining the two questions and were asked to write down their responses on the questionnaire. Each student filled out a form, in confidentially, and recruited several other participants as well for the study. After collecting the data, and
performing open, axial, and vivo coding procedures, several interesting findings occurred. The citings of nodal events were then turned into frequency counts amongst the defined categories/themes. Although the study is a work-in-progress, the following paragraphs reflect what has been discovered, generally, thus far:

Results

The results of the study highlighted similar findings of other investigations. Specifically, in this study, subject subjects identified 40- non duplicated nodal events on their questionnaires. The individual categories were:

Grandparents’ illness/hospitalization/injury
Grandparents; death
Parent/sibling illness/hospitalization/injury
Parent/sibling death
Parents’ divorce
Parents’ separation
Family member death
Family member illness/hospitalization/injury
Substance abuse- parental/family member/sibling
Substance abuse- self
Family friend death
Relocation
Unemployment
Special Events-graduation, wedding, funeral etc.
Law breaking-parent/family member/sibling
Law breaking-self
Accidents-car, freak, etc.
Suicide-Family member
Suicide-Family friend
Finance Related-college tuition, work, will, inheritance
Pregnancy-sibling/family member
Pregnancy-self
Family Vacation
Pet Problems
Blended Family Issues
School Choices- high school or college
Parents’ Infidelity
Single Parent
Family Morals/standards/religion
Wrong boyfriend/girlfriend/sex
Holiday Gatherings
Seemingly Trivial
Armed Forces/ Deployment
Unresolved conflicts
None (subjects could not identify an event or time when the family did not come together or did come together)
Family Member’s Divorce
Self-illness/hospitalization/injury
Wrong boyfriend/girlfriend/sex- Family member

Domestic Violence/abuse/incest

Family Member Re-marriage

All but five of these categories fell into both categories of either positive or negative nodal events. The exceptions were “Parent Infidelity,” “Wrong choice of dating partner,” “Surprise discovery of sex activity”, “Domestic Violence/Incest,” and “Unresolved Conflict” were standing alone in the negative category.

The majority of those who specified the category of “wrong boyfriend/girlfriend” as negative were female.

Many aspects around educational choice, i.e. high school or college preference, caused many problems for the subjects (especially when it was considered the wrong choice) including economic conflicts and divorce.

Substance abuse was cited in both areas of positive and negative nodal events by the subjects. The positive side revolved predominately around the recovery and total family involvement in the rehabilitation. However, it was more often cited as a negative event that pulled family members apart.

Only two subjects claimed that their families could never come together; in contrast, 32 subjects claimed they could not remember a time when their families could not come together.
Following axial coding, the above-named 40 categories were condensed into eleven new categorical themes:

Health Issues (self of other) - illness, hospitalization, death
Unplanned Events (self or other) - broke arms, car, pregnancies etc.
Separation/ Divorce/ Parents’ Infidelity
Relocation/Employment/Military
Family Rituals/Specials Events: weddings, funeral, graduations, vacations, holidays
Substance Abuse/ Law breaking (self or other)
Domestic Violence/ abuse/incest/unresolved conflicts
Educational Issues - college, grades, school choice
Suicide
Moral/Religious Issues
None

Discussion

The four categories of events that were most often cited as nodal events during their childhood/teen years were: grandparents’ death, parents divorce, parent/sibling injury/hospitalization, and self injury. These four main categories parallel previous research that identified life stressors including the loss of a loved one (Yalom & Lieberman, 1991) and cancer related illness (Charles, Sellick, Montesanto, & Mohide, 1996). It appeared that the majority of the responses reflected incidents subjects had experienced within the past 5 years, i.e. grandparents death, problem pregnancy, divorce, or major illness. The exception is that several referred to relocation, unemployment, or
parents’ divorce when they were adolescents, generally around the ages of 11-12, which reflected a timeframe history of over 10 years.

Nearly fifty percent of the subjects identified a crisis of a negative nature, i.e. injury, illness or death, as their nodal event that resulted in their families’ ability to come together. Specifically-mentioned processes that helped create the positive climate were supportive/open communication, disclosure, and honesty. As predicted from earlier research (Tedeschi & Calhoun, 1996), in this study there were many positive changes that emerged from negative nodal events. Overall, the participants’ responses were encouraging to this researcher in that many of the negative nodal events were followed by family cohesion and growth, reflecting earlier research of family growth, resiliency and overcoming the grief (Oltjenbruns, 1991; Greeff & Human, 2004; Schoktraylor, Hayslip, Kaminisky, & York, 2003).

Typically, the written answers and explanations around communication behaviors that accompanied these events were scant in nature, definitely a limitation of this study; however, of those subjects who did respond and elaborate on this question, the one thing that was alarming was the devastating impact that the negative nodal events had on the family communication.

Although some cited nodal events that left gaps and glitches in family communication for many years, others cited nodal events that severed all communication between family members both immediate and extended. Specific ‘hard edge’ nodal events cited were arguments over grandparents’ wills and estates, divorces, unresolved conflicts, and domestic violence/abuse/incest occurrences which resulted in “no talking”. The severity of these communication blockages definitely needs more probing and further research, specifically one-on-one taped interviews.
In view of these findings, this study has broad theoretical scope in a sense that the results provide a framework for further examining the paradigm of punctuated equilibrium (Eldredge & Gould, 1972). In this paradigm, typically applied to organizations and work teams, the system is analyzed according to “an alternation of stasis and sudden appearance-long periods of inertia, punctuated by concentrated revolutionary periods of quantum change” (Gersick, 1988, p.62). This concept of punctuated equilibrium could be further applied in the next phase of this research, utilizing narrative data gathered in the qualitative interviews. Participants’ responses could be examined within this theoretical framework to determine specifically how families managed to attain and maintain, through communication practices, their equilibrium following nodal events.

In conclusion, this preliminary report provides insight as to which events are nodal and impactful during adolescence, as perceived by college-aged subjects. Further analysis of this data will include statistical comparisons on gender reporting of nodal events, specific frequency counts, and narrative accounts that support each of the noted eleven themes. It is this author’s opinion that information regarding life-changing events in one’s family of origin and how communication patterns are ultimately affected by these events is worthy of continuing investigation.

ABSTRACT

A Qualitative Analysis of Single Parent Family Literature: A Paradox of Illusions

This paper is a qualitative analysis of scholarly peer-reviewed literature on single parent families published during 1993-2004. It examines targeted publications from numerous library databases spanning such disciplines as communication, sociology, marriage and the family, psychology, economics, criminology, and health. Three specific research questions include: 1) What major aspects of single parent families have been scholarly investigated within the past 12 years?; 2) What is the overall portrayal of the single parent family in this published literature?; and 3) What are the implications of these findings for family communication scholarship?

The extensive library search yielded a total of 588 non-duplicated entries. Performing a content analysis resulted in seven overall categories with associated themes: Structure and Roles; Demographics; Economics; Adjustment; Assessment; Risk; and Nutrition and Health. Following the analysis of the literature, a discussion occurs on the paradox of illusions embedded in the current literature- alternatives, truth and change, and its implications for family communication researchers.
A Qualitative Analysis of Single Parent Family Literature: A Paradox of Illusions

It is a well-known fact that single parent families are a prevalent family form in contemporary society. According to the U.S. Census Bureau’s report entitled “America’s Families and Living Arrangements: March 2000,” more than 20 out of 72 million children or 28%, now live in single-parent households. This statistic has increased since 1990 with 25% being single parent households; and, since 1980, with 18% being single parent households. (U.S. Census Bureau, 2000).

Children's living arrangements

![Pie chart showing 72% in single-parent households and 28% with both parents or other.]

U.S. Census Bureau, 2000.

Although the prevalence of single parent families has long been recognized, the knowledge base of the intricate workings and dynamics keenly relevant to this family form may not be as well understood. Unless there has been direct involvement with a single parent family via living arrangements or intimate association, one’s epistemological beliefs --- or the way one comes to know the world of single parent families (Smith, 1988) are, most likely, derived through the acquisition and synthesis of published works.

Although substantive research on single parent families exists, we, as family communication
scholars, believe it is imperative to investigate the published studies, collectively, and consider how these findings may impact single parent family identification. The reality that these families have been examined by researchers in numerous fields advances claim that this family form is far from invisible and has accrued status toward investigative credibility. Additionally, one could contend that these publications serve to affirm the single parent family, pronouncing its value and place in contemporary society; however, after careful review, much of the literature on single parent families may be construed as counter-arguments to this idealistic and hopeful image. Published titles such as “The Effects of Recent Parental Divorce on Their Children’s Consumption of Marijuana and Cocaine” (Jeynes et al, 2001) and “Family Experience in Pre-Adolescence and the Development of Male Delinquency,” (Coughlin, et al, 1999) hint that much of the literature highlights the many adversities intrinsic to this family form.

According to the activist voice of Paterson, author of “Unbroken Homes: Single Parent Mothers Tell Their Stories,” (2000) single parent families are wrongfully stereotyped as one generic class of people who are unfairly stigmatized by the research. She writes,

“Much damage has been done by sloppy, value-laden or poorly applied research using demographic data... Single parents, particularly single-mother headed homes are often the target of oppressive reports on “deviance factors” by those who use aggregate data. Readers of studies that quote census data need to be reminded that large numbers of people and statistical measures of central tendency do not provide an accurate picture of any single individual member who is counted in those data.” p.2)
In an effort to better understand how single parent families have been depicted in scholarly literature and how this may impact single parent family identification, this project uses thematic analysis to summarize existing literature, followed by a discussion on resulting paradoxical issues, and implications for family communication scholars. Specifically, the research questions are:

RQ 1: What major aspects of single parent families have been scholarly investigated within the past 12 years?

RQ 2: What is the overall portrayal of the single parent family in this published literature?

RQ 3: What are the implications of these findings for family communication scholarship?

METHOD

The methodology selected for this project was called “analytic description,” which refers to the “identification of recurrent patterns or themes and attempting to construct a cohesive representation of the data (Warren & Karner, 2005, p.190). The identified themes are then related to theoretical, conceptual, or applied concerns within the data, yielding interpretations as to what the messages or words within the documents convey. Th analytic description process is closely aligned with thematic analysis -- one of the five types of units studied within content analysis (Krippendorf, 1980) where “topics contained within messages” are examined (Frey et al, 2000, p.241) While analytic description has been used to study many disciplines, primarily sociology, its qualitative orientation presents an ideal framework for studying the ever-changing characteristics and dynamics of families. Given that the single parent family system is in a state of flux and often presented as a family in transition,
it is incumbent upon researchers to periodically complement the findings published in individual studies by analyzing the full spectrum of those findings of studies over time. Therefore, a synthesized analytic description can be an incisive tool for studying family systems as it is able to capture the total research landscape, while simultaneously, identifying dense pockets of information and significant voids within the research. Although, analytic description, like other qualitative methodologies, is limited to reporting the “here-and now” and does not speculate on causation (Warren & Karner, 2005), this does not preclude the innovative application of the findings this approach may yield. Its strength and credibility, combined with its allowance for qualitative flexibility, makes it an excellent choice for studying families.

After framing the research questions, this project examined the titles, abstracts, and contents of articles about single parent families published in scholarly peer-reviewed journals during the years of 1993-2004. The literature was searched using the key words “single parent families” in the following electronic databases: Ebsco Host; Academic Search Premier; Sociological Abstracts; OVID; and the Expanded Academic Index. The CD ROM CommSearch and copies of Communication Abstracts (targeted communication references) were also consulted. The resources covered many disciplines including communication, sociology, marriage and the family, sociology, psychology, economics, criminology, and health. The reference sections of all entries were scrutinized for related citations and cross-checked for duplications. In total, 588 journal publications were discovered. A complete listing of all titles is found in the reference section of this paper. Following a thorough reading and review of each article’s title, abstract, and contents, both open and axial coding procedures were conducted (Strauss & Corbin, 1998). The data was marked and labeled, resulting in seven overall categories and associated
themes within each category.

RESULTS:

A systematic review of the titles, abstracts resulted in the naming of seven overall themes: 1) Structure and Roles; 2) Demographics; 3) Economics; 4) Adjustment; 5) Assessment; 6) Risk; and 7) Nutrition and Health.

In the first category of structure and roles, 73 entries addressed various components of the single parents’ family configuration and associated tasks of its members. Various subcategories...
encompassed specific information on military single parent families; time, power, and control issues; family uniformity; parental role involvement; gender issues; sibling relationships; daughter relationships. Selected titles included: “Trends in Single Parenting in the US Army” (Schumm et al, 1996); “The Effects of Family Characteristics and Time Use on Teenagers’ Household Labor” (Gager et al, 1999); and “Changes in Women’s Roles: Impact on Social Policy Implications for the Mental Health of Women and Children” (Aube et al, 2000).

The second category featured articles centered on demographics with 103 journal entries. Such topics as cohabitation and paternity issues were addressed, as well as specific articles about minority groups, migrant working families, and single parent families in Pakistan, Spain, and Portugal. Selected titles included: “Bastard Boom: One third of babies born to unwed” (Flynn, 2001); “Factors Affecting the Relation Between Parental Education as Well as Occupation and Problem Behavior in Dutch 5 to 6 yr. Old Children” (Kalff, 2001); and “Reading and Writing Ability and Dropout in the Swedish Upper Secondary School” (Fischerbein, 2000).

The third category was economics with 103 journal entries. The majority of these articles addressed poverty and welfare concerns in single parent families including social policy and employment-related issues. Selected titles included: “The Role of the Economy and Welfare Policies in Shaping Welfare Caseloads: The California Experience” (Albert, 2000); “Expenditures on Children by Families, 1997” (Lino, 1998); and “The Dissolution of Joint Living Arrangements Among Single Parents and Children: Does Welfare Make a Difference?” (Brandon, 2001).

The fourth category addressed adjustment issues within single parent families. A total of 82
journal entries focused on topics affecting the well-being of these families including social competence, mobility factors, external support systems (grandparents, foster parents, Big Brother, organizations, 4H, etc.), social networking, and self-help literature. Selected titles included: “Involvement of Single Parent Families and Stepfamilies in 4H” (Ganong, 1993); “Structural Boundaries of Single Parent Families and Children’s Adjustment” (Rosenberg, 2001); and “Family Relations, Parenting Practices, the Availability of Male Family Members, and the Single Parent” (Florsheim, 1998).

The fifth category was assessment yielding 105 articles. The literature in this category featured evaluative data in single parent families regarding such topics as sibling behavior outcomes, children’s achievements, lifestyle ratings, effects of change, effects of childhood family background on marital quality and perceived stability. Selected titles included: “Stability of Family Interaction from Ages 6-18” (Loeber, 2000); “When Children Have Two Fathers: Effects of Relationships with Stepfathers and Non-Custodial Fathers on Adolescent Outcomes” (White, 2001); and “Quality of Life and Well-Being of Single Parent Families” (Ihinger-Tallman, 1994).

The sixth category of single parent family research discussed risk with 93 journal articles. Topics such as substance abuse, sexual practices, criminal behavior, deviance, and other external influences were covered. Selected titles included: “Homeless Female-Headed Families: Relationships at Risk” (Steinboc, 1994); ‘Family Environment and Adolescent Sexual Debut in Alternative Household Structures” (Michael, 2001); and “The Effects of Single Mother Families and Non-Resident Fathers on Delinquency and Substance Abuse” (Thomas, 1996).

The seventh and final category of single parent research discussed issues surrounding nutrition
and health with 29 articles. Topics such as mortality, diets, food programs, special need populations, diabetes, and clinical problems were addressed in the context of single parent families. Selected titles included: “Adults with Intellectual Disability in Long Term Respite Care: A Qualitative Study” (Chan, 2001); “Resiliency in Single and Dual Parent Families with Special Needs Children” (McNurten, 1996) and “The Relationship between Asthma Severity, Family Functioning and Health Related Quality of Life of Children with Asthma” (Sawyer, 2000).

**DISCUSSION**

**To render intelligible** this review of single parent family literature and its seven categorical findings and themes, we turn to researchers who have drawn on the notion of “paradox” to explain contrasts in world views and human behavior, especially in the fields of psychology and mental health.

To quote Dr. Paul Watzlawick in his seminal work, *The Language of Change* (1978):

> “Paradox is the Achilles heel of our logical, analytical, rational world view. It is the point at which the seemingly all-embracing division of reality into pairs of opposites, especially into the Aristotelian dichotomy of true and false, breaks down and reveals itself as inadequate” (p.99).

To end the paradox, Watzlawick recommends taking a *both-and* perspective that addresses both the needs and difficulties surrounding the phenomenon, as well as the strengths and successes that may not, at first-glance, be apparent within the phenomenon.

Further, paradox is defined as “A seemingly contradictory statement that may nonetheless be true.” (American Heritage Dictionary of the English Language, 2000); and “paradox is made possible by
dissociating dissociations so that the apparent and the real become so interchangeable that one cannot be
discerned from the other (Foucault, 1977, p. 8.)

Imbedded in the notion of paradox is a synonymous term called “illusion of alternatives”– a
pattern based on a forced choice between two alternatives. First coined by Weakland and Jackson in
their early studies on schizophrenic family interaction (1958), this term refers to one’s actual choice being
illusory, as neither alternative is practically possible nor totally accurate. The person trapped in this
illusion is, therefore, “damned if he does and damned if he doesn’t” (Watzlawick, p. 109).

After a review of the literature on single parent families, we find compelling justification
for three paradoxical illusions surrounding alternatives, truth and change. The vast majority of
the published scholarly work on single parent families between the years 1993-2004 portrayed this
family form as being in a heightened state of jeopardy and vulnerability; the collective research
overwhelmingly presents single parent households as familial units that experience multiple challenges and
risks, almost insurmountable, that ranged from economics to mortality. The thematic analysis of the
research suggests two polarities: 1) that a single parent family is in a state of transition defined by much
turmoil; and 2) that the most viable way to become a more operative single parent family is to alter the
family form in such a way that it doesn’t exist. These findings are paradoxically entrenched as the
families’ needs and difficulties are presented; yet the strengths and successes of these families remain
obscure, if not illusive. Researchers may find themselves in an odd predicament: How can one acquire
complete knowledge about the single parent family from published research when the research does not
reflect the “both-and” aspects of inquiry? Using Watzlawick’s words, the researcher is, in essence,
“damned if he does and damned if he doesn’t.” In parallel, the information system citing the selected research has paradoxically disempowered this family form by raising our awareness of their difficulties and vulnerabilities, while silencing their strengths and successes. This is not to say that the majority of published articles on single parent families within the past twelve years is to be minimized or dismissed; quite the contrary as the published research provides rich insight into the complexity and fragility of single parent families. However, more scholarly research needs to be conducted and published to provide a more accurate and total picture of this family form including both its weaknesses and strengths, challenges and successes, and guidelines for empowering these diversified families.

A second paradoxical illusion is the notion of truth - - or what fiction or non-fiction is represented within the literature on single parent families. In Foss’s summarization of Foucault’s “governing rules of discourse,” the first category of rules centers on what is being talked about and how that topic governs objects of discourse. Within this category are “more rules that silence certain dimensions of experience simply by not recognizing them as objects of discourse.” (Foss, Foss & Trapp, 2002, p.348.) For example, while numerous publications on single parent families exist, few focus on the presumed oppositional truths that single parent families, just like other families, can at times be fully functioning, non-problematic, and/or empowering systems. As researchers, we question the exhaustive depiction evidenced in this meta-analysis and its perceptual accuracy of single parent families. How is one to know if this compilation of studies represents the primary issues faced by single parent families? Or, have these studies been published due to other quizzical factors such as statistical significance, subjects’ availability, supportive funding, special interest features, or editorial preferences? These provocative questions
coincide with Foucault’s second category of rules concerning who is allowed to speak and write in our environment. Such a rule plays a major role in determining who has dominant voice and who remains silent. While there is an assumed credibility in authorship within all juried publications, i.e. selective credentials and the blind-review process, nevertheless, in the spirit of Foucault, it is prudent to foster some suspicion around the emanation and display of the published “truths” which digitally portray the single parent family reality. Paradoxically, what is collectively printed about these families constitutes the truth as we know it; yet, what is not printed - the unreported and unavailable scripts, could account for more truth in single parent families that what is printed. Of course, this speculation can only be confirmed with additional research.

The third paradoxical illusion gleaned from this thematic analysis focuses on change. According to Watzlawick, “change occurs when certain perceptions or other experiences can no longer be integrated into a person’s world image (or even directly contradict it) and thus requires an at least partial change of the image” (p.128). Moreover, Foucault addresses the difficulty of implementing change when the dominant discourse is firmly in place:

“One cannot speak of anything at any time, it is not easy to say something new; It is not enough for us to open our eyes, to pay attention; or to be aware, for new objects suddenly to light up and emerge out of the ground.....It must not be attached to some obstacle whose power appears to be, exclusively, to blind, to hinder, to prevent discovery, to conceal the purity of the evidence or the obstinacy of the things themselves; the object does not await in limbo, the order that will free it and enable it to become embodied in a visible prolix objectivity; it does not pre-exist itself held back by some obstacle at the first edges of light.” (p. 832 in Brummett, 2000.)

As these philosophies on change are processed, we note that both Foucault and Watzlawick recognize the import that discourse has on the conception of change, as well as
its enactment. It appears that the challenge of change, or at least a “partial change of the image,” directly correlates to the intensity of the dominant voice. The “louder” the voice or discourse, the more difficult for change to occur. As discovered in the meta-analysis, the dominant voice within these collective articles reflects a general theme of adversity and turmoil within single parent families. Herein lies an interesting paradox: On the one hand, the image of the single parent family system appears amenable to change due to its inherent adaptability and adjustment expectations; while, on the other hand, change in this system appears impossible due to the dominant debilitating voice of the literature that represents it. These opposing tensions create an illusive “choice- making boundary” between change and non-change for the single parent family. Furthermore, the actual permeability of this boundary, or likelihood of perceptual change, may fluctuate depending on: 1) the person’s “world image” of the single parent family; 2) the person’s willingness to consider how that “world image” was constructed; and 3) the person’s cognizance of the degree of influence from the dominant voice of the single parent family literature. These sequential steps require deliberate and critical thought, which, unfortunately, may be overlooked by many persons “doing” or “studying” single parent families, thus thwarting opportunities for a changed image of this family form.

What implications then, does this single parent family thematic analysis, resulting in a paradoxical illusions of alternatives, truth, and change, have on family communication scholars? Perhaps a starting point would be to examine the thematic analysis from a
communication lens. When searching the databases combining key terms of “single parent families”, along with the term “communication”, only seven articles appeared. These articles were published in the following journals: Journal of Intellectual and Developmental Disability, Journal of Adolescent Research, Journal of Adolescence, Journal of Communication Inquiry, Qualitative Inquiry, Family Relations, and the Journal of Applied Communication Research, and Journal of Marriage and the Family. Also, when researching Communication Abstracts, only three articles on single parent families surfaced.

It is highly disconcerting that only a few studies on single parent families have been studied from a communication perspective and published in mainstream communication journals. It would appear that family communication scholars have much to offer this understudied topic. New or enhanced communication investigations within this family system could include such topics as dialectical management, hierarchical issues, rhetorical strategies, conflict management, dialogic sensitivities, power balances, etc.

As family communication scholar Dixson argues, it is necessary to examine single
parent families in ways that we look at other families; . . .

“look for strengths and weaknesses and there may even be some things about single parent families which are stronger than intact families...quite often children are more mature, they are more responsible and they have a closer relationship with their parent than do intact families” (2000, p. 333).

By examining the communication patterns of single parent families, we are in a unique position to investigate rich areas of study, publish our findings, and present a more complete, and potentially, more favorable image of this prevalent family form.

A limitation of this study was the associated challenge of defining key terms related to single parent families. We found the research to be scattered amongst other key terms such as divorce, blended families, unwed pregnancies, cohabitation, etc. Because of the many confounding influences associated with single parent families, we decided to simplify the search by confining the key term to single parent families. Another limitation associated with this thematic analysis was the availability of databases used. While we felt confident with the representation of the databases selected, our findings were limited to the information available on those particular venues. Additionally, we excluded unpublished theses, dissertations, books, and Internet web sites, all of which could have impacted the overall categorical findings.

In conclusion, should census trends remain consistent, it will only be a few years until one-third of all children live in single parent families (2000, Census Report). Given this prominence and need for image repair, a critical future direction calls for
more communication-based investigations of single parent families that could strengthen the overall image of this family in print and beyond. Along with Hale and Dillard (1991), we know that “meta-analytic studies are valuable sources for understanding the results acquired from numerous studies and for setting the agenda for what now needs to be done” (p.71). Perhaps an increase in scholarly inquiry and eventual publication will end the perpetuation of this paradox of illusions embedded in the current literature, and ultimately, yield a more balanced and representative body of knowledge on this diversified family form in the future.

Empire, or Cyborg Governance: divining systemic power

Abstract

The web of post-modern power appears nomadic, elusive and always elsewhere. Like our online presences, it has no obvious boundaries and appears as spirit-like, a magic life haunting the net and the world. We cannot act upon it, and the traditional modes of protest, such as occupying the streets or a building, are no longer effective. Becoming cyborg means being controlled through this dispersed location of control. Responsibility is distributed while the impact of power focused. Power is seemingly emptied out of a place so that power can become total, as in Guantanamo Bay, where people are kept under U.S. restriction while outside the presence of that country’s laws. Government becomes liminal. “Liminal identities are neither here nor there, they are betwixt and between the positions assigned by law, custom and ceremonial” to quote Victor Turner. This liminality in the government and the corporation’s case, or in the systems case, allows it to govern strongly almost without resistance.

Antonio Negri’s term ‘Empire’ is perhaps unfortunate, for Empire implies an Emperor. Hence I use the term ‘cyborg-governance’ to refer to this confluence, without implicitly diluting its physiognomy of being systemic, of having distributed responsibility, and of appearing elsewhere with no apparent origin. Empire creates multitude and multitude creates the Empire of distributed power. Here the term ‘multitude’ implies the fall of the singularity which is empire, when it itself makes up part of its systemic distributed dynamics – no overthrow or freedom, need arise from this participation.

Introduction

This paper, you are warned, is political and subjective; but it is also, I hope, sociological, even if extremely incomplete1, and at least points somewhere different to what is already known. I am going to suggest that the organisation of power relations in the ‘North’ has changed significantly since the 1960s, from being participatory within the State, to being distributed throughout a (world) system. This is not only linked with what seems like a real increase in the ratio of power which can be attributed to the corporate sector, but also confusion, as power also always seems elsewhere – possibly even to those who appear powerful.

Domination must not be confused with control. Analytically power not only seems liminal but the more powerful use liminality to increase their power, whether deliberately or not. As a result, the social order seems to become more magical and can only be divined rather than

1 It is the second instalment of three conference essays (in the original sense of the word) attempting to explore the nature of power in the contemporary world. I hope that later versions will be more completely documented. For the First see Marshall (forthcoming).
perceived. This power can be also linked to cyborg imagery, and the cyborg becomes a metaphor for systemic helplessness rather than, as often argued, for liberation.

**The Growth and Decline of the Modern Nation State**

We may characterise the ‘Modern Period’ in terms of the growing inclusion of the State\(^2\). During the 19\(^{th}\) Century, and for the first 75 or so years of the 20\(^{th}\) Century, those represented, or able to participate, moved from males of property and the correct religion, to males of less property, males of other religions, women, younger people and so on. Rotten boroughs were destroyed and electorates shifted to the industrial towns. This increase in participation was fairly much marked by riots; disruption; unionisation; strikes; increased regulation of factory work, workers conditions and wages; increasing distribution of education; the beginning of social security and attempts to prevent destitution rather than punish the destitute and so on. Much of the time, conservative and labour forces allied against ‘liberal’ capitalism and its perceived destruction of values, obligation, and living conditions. The struggle seems to have taken longer in the US than in the UK, but nevertheless by the end of the Great Depression Keynesian economics had been embraced and established the radical idea of trickle up economics in which prosperity was induced by giving the poorer sections of the workforce more income, instead of the more traditional and repeatedly failed idea of increasing general wealth by making sure the wealthy have more income.

To some extent, the ‘middle classes’ came to exist because they filled positions within State and business bureaucracies. They were required to be educated, and to fill a position between the owners of capital, or those with government authority, and those supposed to obey. Thus they acted as something of a communication channel, and referee. Valuation of expertise (‘the white collar’) which distinguished them from workers, helped overwhelm loyalty to a particular workplace in favour of professional evaluation i.e. that of other equals with similar concerns. This was the beginning of the ‘knowledge worker’.

The sixties saw the peak of this process, with increased participation of supposed minorities, ethnic groups, gays, even those defined as criminal, and possibly the citizens of other countries through NGOs and International bodies. War in Vietnam had been shut down

\(^2\) Fuller arguments and documentation can be found in Marshall (2000: Appendix 1 section II).
partially by incompetence, partially by a dedicated enemy, and partially by protest participation and international action. This increase in participation could be seen as threatening. For example, Samuel Huntingdon wrote:

The 1960s witnessed a dramatic renewal of the democratic spirit in America. The predominant trends of that decade involved the challenging of the authority of established political, social, and economic institutions, increased popular participation in and control over those institutions, a reaction against the concentration of power in the executive branch of the federal government and in favor of the reassertion of the power of Congress and of state and local government, renewed commitment to the idea of equality on the part of intellectuals and other elites, the emergence of the ‘public interest’ lobbying groups, increased concern for the rights of and provisions of opportunities for minorities and women to participate in the polity and economy, and a pervasive criticism of those who possessed or were even thought to possess excessive power or wealth (1975: 59-60).

Previously passive or unorganized groups in the population now embarked on concerted efforts to establish their claims to opportunities, positions, rewards, and privileges, which they had not considered themselves entitled to before (ibid: 61-62).

Huntington goes on to argue that these events, which he calls ‘the democratic distemper’ or an ‘excess of democracy’ were problematic for good government, for governmental authority (on behalf of elites), and for American military hegemony (ibid: 105-6, 113). To some extent we might see this reaction as a foreshadowing of what I will call ‘cyborg governance’. Huntington’s oracle suggested that power no longer lurked in quite the right places and that the change threatened boundaries and control. He argued that it needed to be cut back firstly by a focus on economic issues (ibid: 84-5) and encouraging voter apathy (ibid: 114).

The 70s and onwards saw the, largely corporate, foundation of Right Wing, pro-capitalist ‘think-tanks’ in both Britain and the US (Ricci 1993), whose mission was to restore the appeal of free-market economics. This seems to have been done by associating the distrust of government, which arose during the Sixties and the Nixon years, with a free market agenda of ‘looking after oneself’, and cutting back on State intrusion. Sometimes the implementation of these policies seems to have been carried out by not informing people of political intentions. In the early 1990s, Peter Costello, the current right wing Australian Treasurer, when asked on the ABC election night broadcast why his party had lost a supposedly unlosable election,

---

3 “In the 1990s conservative intellectuals, bereft of a social base continue to exist as a group only because of subsidies from foundations and corporations” (Lind 1997: 7).
replied along the lines of “we told the people what we would do”. In the same vein free market enthusiasts Milton and Rose Friedman cheerfully approved of a Canadian politician’s refusal to inform the electorate of his plans to cut the civil service by 25%, and abolish many government programmes (1984: 6).

Whether intentionally or not, as the 20th Century came to a close, access to the State has been rolled-back, participation of the less powerful has been diminished, income is no longer redistributed to the poorer sections of the nation, education is no longer free and is in crisis, and the tax burden has shifted from the corporate sector to wage earners. This family of events would imply that the corporate sector has become the dominant sector of Western English Speaking Countries.

Yet this has not clearly resulted in the appearance of a definite ruling class with recognisable members, and institutionalised control.

**Post-modern Power**

Without implying complete agreement, the following statement, from Castells, summarizes some of the taken for granted background of this essay

> Capitalism itself has undergone a process of profound restructuring, characterised by greater flexibility in management; decentralization and networking of firms...; considerable empowering of capital *vis-a-vis* labour...; increasing individualization and diversification of working relationships; massive incorporation of women into the paid labour force, usually under discriminatory conditions; intervention of the state to deregulate markets selectively, and to undo the welfare state...; stepped up global economic competition.

> [T]here has also been an accentuation of uneven development [not only between economies, but within them].

> Social movements tend to be fragmented, localistic, single-issue oriented and ephemeral... people tend to regroup around primary identities: religious, ethnic, territorial, national... the search for identity, collective or individual, ascribed or constructed, becomes the fundamental source of social meaning (Castells 2000: 1-3)
We might summarise Castells’ position by claiming that Capital is now nomadic and flexible, able to strike where it will, and not easily locatable – whereas the majority of people are comparatively fixed and subject to these raids and movements. Capital lives in the “space of flows”, and people in the “space of places” (2000: 408-9, 442ff).

To put it another way, the web of post-modern power appears nomadic, elusive and always elsewhere. Because of this appearance, responsibility, and location of power is never clear, even to those who use it.

In academic and official writings we may note the often reported tendency of the term governance to refer to some kind of abstraction rather than to intended action, and to something ‘new’. The official portal to the EU web site defines governance in terms of the ‘post modern form of economic and political organisations’ (Europa 2004). Rhodes suggests that the term implies ‘a new process of governing; or a changed condition of ordered rule; or the new method by which society is governed’ (1996: 652). The term often seems to imply the importation of corporate managerial models, competition, profitability and so on into public life (ibid: 654-5). Stoker draws attention to a general agreement that “governance refers to the development of governing styles in which boundaries between and within public and private sectors have become blurred” (1998: 17). It is usually tied up with the ideas of ‘deregulating’ markets and barriers to foreign investment, or in other words surrendering the participatory State to corporate desire.

As part of this syndrome, we note the increasing way that Politicians blame events elsewhere for results in their own State. Thus ordinary wages decline due to foreign competition and the ease of exporting jobs elsewhere through information technology, while executive salaries increase due to the same international competition for the ‘best people’. Responsibility can be put upon the impersonal market, as if the market was not influenced by human decisions, and as if the market was not a political, but a natural, force. But although the market seems to demand policies which favour particular distributions of wealth, perhaps referring to it, also expresses the sense that even those at the top of the corporate sector have of not being in control.

See Lapham on a Davos meeting (1998), and Garten’s collection of interviews with global CEOs (2001).
The powerful seem mobile, able to be transferred elsewhere with ease, again largely through information technology. The original idea of which was to extend command and control. Power has no fixed base. Corporations are motile when compared to States, even when the States are necessary to impose the laws that make corporations and business possible, and to suppress worker dissent. The ability of corporations to engage in ‘transfer pricing’ whereby they take their profits outside of national domains, though incur costs within national domains, means that traditional ways of raising tax from corporations do not work. Similarly corporations can get States to compete for the lowest tax rates on their activities, or even subsidies. The tax burden is shifted on to those smaller companies or wage earners who cannot shift their incomes off-shore. As a result the revenues of Nation States may decline, and proposed regulation of corporations (such as the suggestion of curbs to pollution), or tightening of taxation can be greeted with threats of corporate flight.

As a result it is often hard to hold corporations responsible, as with the escape of the Union Carbide company management from any obligations over the ongoing Bhopal disaster. Union Carbide is now bought out by Dow Chemicals who deny any responsibility or obligation (Moro & Lapierre 2003: 385-6). Governments in Australia, and I imagine elsewhere, use privacy agreements and commercial confidentiality to prevent people from discovering the precise nature of their agreements with the corporate sector and the precise degree of taxpayer money involved, and even if cheaper contracts were available. It also seems hard to hold any particular person in charge of a corporation responsible for the actions of that corporation. This lack of responsibility does not always work, as seems to be being shown by the increased number of executives facing trial for fraud, although sometimes the responsibility seems strained, as in the recent James Hardie case in Australia. In this case a corporation essentially made profit through poisoning their workers with asbestos. When this

5 In a somewhat polemical discussion of transfer pricing Zepezauer & Naiman claim that “Of the US-based transnationals with assets over $100 million, 37% paid no US federal taxes at all in 1991, and the average tax rate for those that did pay was just 1% of gross receipts... Foreign based transnationals did even better. 71% of them paid no US income tax on their operations in this country” (1996: 70).

6 As Republican Newt Gingrich argued global competition meant even the US has to “change taxes, litigation and regulation to make America a more desirable place to build the next factory, open the next laboratory...” (1995: 65).
was discovered they transferred ownership of most of their assets overseas, while leaving some money with a foundation in Australia to deal with people suffering asbestosis and mesothelioma. This foundation did not have anywhere near the money needed to deal with the cases which were going to arise. The company came to court and the Managing Director who set up the process was dismissed, after a huge payout to him.

Sometimes it seems that responsibility is avoided through share holding, in that decisions are supposedly the responsibility of the shareholders, most of whom have little idea as to what is going on. It often seems to be alleged that ‘the people’ own the corporations through their pension funds, but not only do ‘the people’ have no control over these corporations, they have little control over how their money is invested in the first place. It would not be surprising if this supposed ownership was used to further diffuse corporate responsibility and to argue that we cannot have control over environmental issues, or whatever, because it may affect ‘your’ investments, and leave you penniless in your old age, and this is ‘your’ fault.

This condition of power being elsewhere is demonstrated clearly in elections where the people, rather than participating directly, are offered a choice of a bundle of things, many of which may be unmentioned, or largely undiscussed. For example, the current Australian government after winning the last election claims a mandate for its industrial relations package, which had almost no discussion, and has not in any sense been approved by the electorate. As well, both mainstream parties seem extremely similar in their policies and wary of who will campaign against them. They may well fear what will happen to them if they don’t toe an undefined line set by imaginary markets, more than they embrace what they are doing.

However, it is wrong to imply that the State, or the corporate sector, has all the power and its paths of ‘deceit’ always work. We can see the confusion produced in the current US Administration by the refusal of evidence to portray things as it thinks they are. Thus, anyone, who read independent newspapers could have been better informed about the extent of Iraq’s Weapons of Mass Destruction (largely due to leaks from intelligence agencies not wanting to be blamed for false results) than it seems the British, American and Australian governments were through their intelligence assessment offices. Wearing combat fatigues and claiming that major combat operations are over does not mean that the death rate among US troops will not increase, and resistance become harder to deal with. Photographs
‘escaped’ from Abu Graib, even if the prisoners could not. Attempting to suppress the increase in terrorist attacks in a report draws attention to the figures. Stacking supposedly popular ‘town hall’ meetings to support social security ‘reform’ (and there is a whole body of ideology in the use of that term) seems to increase resistance. It might well be the case that the problem for the people running Enron, and HIH in Australia, was that they thought they understood how things worked.

Those outside the process tend to think that there is some vast conspiracy going on, because they assume that people in power can control things (that dominance equals control), and thus are engaged in dark unspoken plots. We might think that right wing media commentators who fill the media with denunciations of its left wing nature, are either suffering from delusions (precisely who do they think owns and controls the media, who are they being paid by?), or they are incipient totalitarians who want to engineer a condition in which they only read stories which agree with their opinions. However, it is possible that they too are expressing the feeling that somehow, they don’t have power either, that somehow it escapes them and resides in another place, or that things are really out of control. It is going beyond the evidence to suggest that even those who appear powerful, may not feel that power is elsewhere.

**Physiognomy, Magic and Presence**

In a way power is like our online presences. It cannot be assumed to be only present or absent, it has no obvious boundaries and appears as spirit-like; a magic life haunting the net and the world, intangible but buried in materia. It is what I have called ‘asent’ (Marshall 2000: Chapter 6 and passim).

As a result of this ambiguity of presence, power can only be divined, from landmarks, from general layout, from the visible surfaces. In that sense, dealing with power becomes a Physiognomy, a divination from appearance. Divination might even be defined as “modes of communication developed to bridge realms that are intimately related yet distinguishable — the realm of ordinary or ‘visible’ experience and the realm of unseen powers” (Pemberton nd: part 6). That is not to say that a divination cannot be an incipient science. Physiognomy is related to weather forecasting and medical diagnosis. Paracelsian Oswald Croll writes: “For every disease… and its medicine, are of one physiognomony, chiromancy and anatomy”
(1669). The problem of divination increases when the inferences are less connected to actions, or the results of actions get buried in complexity. Anthropologically, the divination systems most written about function as ways of detecting the source of evil, or of evaluating others and the roles they play in society. For example speaking of Ndembu Divination Turner writes that “Divination seeks to uncover the private malignity that is infecting the public body” (1975: 16). It comes about when the situation is beyond normal means, or we wish to check that our actions will succeed. Divination is not free of politics, or attempts to negotiate a way of life amid multiple possibilities and potential catastrophes. We attempt to live within the possibilities of power, and perhaps attempt to divine was has prevented our control of the situation. In the west divining power may well be a part of the social process that leads to separation, and political polarisation, as we attempt to eliminate the truth expressed by the other.

Physiognomy is based on the idea that the soul shapes the face, that the appearance reveals the inner, or that the world can speak to us if we are knowledgable. However, we might also see it as a more conventional form of divination in which a collection of random, noticed events, are used to tell us something about what is hidden. To some extent that is what anyone in the global system must do. It may be precise where power impacts them, but to tell where other power is, or even to tell what the power is (as it may be being denied) requires the collection of random events which we then impose into a theory. But it is not the system itself that we portray, and in this situation we cannot. A fragmentary pattern gets taken for a whole. It seems, if we take them seriously, that people cannot tell their own place in that system. Or perhaps it is simply that we expect too much to arise from power, that we don’t have power unless we control the situation completely – which is impossible.

Thus it is hard to act upon the system of power. Traditional modes of protest, such as occupying the streets or a building, are no longer effective, and neither is the Internet. Critical Art Ensemble point out it is actually the elite who can make use of cyberspace to make:

a diffuse power field without location, and a fixed sight machine appearing as spectacle... hostility from the oppressed is rechannelled into the bureaucracy which misdirects antagonism away from the nomadic power field. The retreat into invisibility of non location prevents [definition]... of a site of resistance... No longer needing to take a defensive posture is the nomad’s greatest strength (1994: 15-6).
Sterling’s book *The Great Hacker Crackdown* (1994) demonstrates that hackers were nowhere near as motile. They tended to be arrested in their bedrooms.

Divination tends to mean that it is not just that finding rules which becomes difficult, but that reading disintegrates in the face of too much meaning, or too much urge to live within what we have divined. Texts may appear to have clues which reinforce what we have already determined to give sense to our sense lack of control or understanding. It seems to become impossible to interpret people according to their intention, and I’m not implying that this essay is immune to that – if it was then the situation would be different.

Any exemplary case will be controversial, so it means that special effort has to be placed in the reader making the divination. Let us take the recent case of academic Ward Churchill, although many others could be found. Churchill seems, as far as I can see, to have argued in the rather strong language which is favoured nowadays, that you cannot simply extract the history of US action from people’s resistance to it, no matter how criminal the form that resistance takes. His position was distorted (as far as I can see) and his livelihood threatened largely as a result of media activities. The distortion seemed to be of a form which only aimed at destruction rather than at dialogue. Partly because of the issue was raised of taking responsibility. It appeared impossible to answer a call for people to take responsibility for the consequences of the actions of people they classified themselves with. That responsibility always has to be elsewhere.

We might say that Churchill was used to divine the problems of the war on terror, and then to allocate responsibility for its difficulty onto him. To some, it appears that he was an example of the locus of the power that is endangering the US. The actual power differential is only shown indirectly by the difficulties he seems to face in transmitting his own view in a way that can be read.

A related example in Australia occurred when the immigration minister, Amanda Vanstone, argued that people should not protest against the prolonged imprisonment of refugees, as it raised the hopes of refugees and would cause unnecessary pain. Shortly after the attorney general Philip Ruddock (with his Amnesty International badge prominently displayed) argued
that lawyers who attempted to represent those refugees able to get to court would be held responsible for the failure of their cases, because they were clogging up the courts. This was despite the fact that most appeals to a court were successful, and if they took longer it was because the Department of immigration kept challenging them. Yet again responsibility is differed onto a divined other. It is not us who lock people up without trial that are cruel but the people who protest against it, or attempt to end it.  

Responsibility is distributed while the impact of power focused on whom ever it is affecting or confining. It seems common for power to be seemingly emptied out of a place so that the power of the emptying body can increase. An example is Guantanamo Bay, where people are kept under U.S. restriction while outside the presence of that country’s laws, or outside international laws. The result is that there is a war against terror but those detained in this war are not prisoners of war. This may be disputed in courts, but it is a technique which seems to sit easy with the dynamics of distributed power. The Australian Government after claiming that it is being blackmailed by refugees (ie is relatively powerless), then proceeds to excise parts of Australia from immigration law, in order to be able to imprison refugees without them having access to Australian courts and then to confine them in foreign countries, away from refugee advocates. In these cases power is increased by officially being deleted, but the fact that government’s have to do this also shows how they fear things will pass out of their control.

In this condition it is not really the refugees who become liminal (they are confined to a very specific place, under specific regulations, and very much outside), it is the government which becomes liminal. “Liminal identities are neither here nor there, they are betwixt and between the positions assigned by law, custom and ceremonial” (Turner 1969: 95). It, however, seems that this liminality is not being used to build any communitas in a communitarian sense, but it does attempt to deal with the disappearance, or increased vagueness, of marked hierarchy, clear rules, precise locations of power and responsibility. Unlike Turner’s liminal states it is not “giving recognition to an essential and generic human bond” but trying to overcome that

---

7 Far too much has been written about this incident but the wiki article is probably as good a place as any to start. http://en.wikipedia.org/wiki/Ward_Churchill
recognition or break bonds which may be recognised, but which are too threatening. It is truly a rite of anti-structure, a fight against, or a flight from, a briefly recognised complicity. If it does create community then it usually does so against some other, rather than through risking participation, because participation may even further destabilise the tentativeness, or legitimation, of the power, and increase the sense of resistance or dispersion. In this case there is another which has to be suppressed to bring the promised world which does not escape. In some ways it is like the workers paradise that justified Stalinist oppression. Except that the liminal image is not that clear.

As a liminal player, the use of power is again always shifting, becoming something of a dark unsettling trickster figure, it further takes on characteristics of the magical, the numinous and the unclear.

**Negri, Empire and Cyborg Governance**

In their recent books Negri and Hardt use the term ‘Empire’ to describe this kind of distributed governance, and they contrast it to what they call Multitude. Negri defines Empire as “the transfer of sovereignty of nation-states to a higher entity”, but not to a World Nation, or to an existent nation like the United States (Negri 2004: 59). It is “a network power” (Hardt & Negri 2004: xii), even though a country may have temporary dominance. Empire is produced by the networks of capitalism and NGOs transcending any particular country and linked together by information technology. They claim, as is argued by many people, that information technology is the basis for these transformations.

The term Empire is unfortunate in many ways. Firstly Empire implies an Emperor, and a dominant State which contradicts its assumption that there is no such Emperor or State. Secondly its singularity implies a level of deliberate co-ordination, rather than what seem to be levels of confusion and conflict. Co-ordination may only arise because of the temporary ease of reinforcing particular pathways. However this ease, may, as is often the case in complex systems change the way the system operates. If the system seeks homeostasis, that homeostasis could be reached through the elimination of parts of the system. Complex systems can almost always escape us.
Hardt and Negri imply that the informational economy will free liberation movements of the necessity of becoming organised in hierarchies, or of having to impose order after the chaos of revolution (2004: 68-78.) and thus revolutionary freedom will finally be possible.

Here, the Multitude replaces ‘The People’. Hardt and Negri argue that “The People” were fundamental to modernism in establishing authority and legitimating violence. The People were posed against the [aristocratic] state, but in fact always legitimated the authority of an elite (2004: 79). The idea of the People “reduces... social differences into one identity” (2004: 99). The multitude is composed of singularities, but is not a mob, crowd or mass, as these easily collapse into an “indifferent whole”. The Multitude acts “not on identity or unity... but on what it has in common” it can be the rule of everyone by everyone (2004: 100). The multitude is singularities which act in common (2004: 105). The multitude is defined as all those who labour and produce under capital, and it is asserted that the differences which divide labour no longer exist (Hardt & Negri 2004: 107).

This reduces the organising principle of categories to similarities, rather than accepting that members of categories can be linked by different commonalities, which would make the idea of Multitude stronger. However, the prime problem with their method of categorisation is that it ignores the ways that members of the multitude could differ or come into conflict. In some ways the term imposes uniformities on the World which do not exist, and obliterates differing and incommunicable cultures. We can see this apparent incommunicability and hostility within the Multitude of our own Western societies, which may even have been increased by information technology, without having to assume that conflictual differences will not exist within the complexity of the World.

There is little evidence that the differences which divided labour no longer exist. It would appear that some labour movements have been coopted by the corporate classes in the US (Frank 2004) – again the problems with divination, and in the last election in Australia where timber workers supported the government against forest conservation. Active snobberies might divide the multitude – such as the “aspirational” classes the leader of the Australian Labour Party Mark Latham separated from the worthless poor, not to mention race and gender divisions. Finally, if Multitude is linked in information technologies, ignoring the vast parts of the world which are not, then they may well be divided by work based knowledges which are not widely distributed, and which do not allow much in the way of intercommunication.
However, it is also possible that ‘level organisations’, through information technology can also extend the reach of the centre. The Bureaucracies separating the periphery from the centre, allow that periphery some degree of escape, things could be adapted to local conditions and local loyalties, because the centre could never see, and rarely would directly. What was done did not have to fit in with a computer program. Furthermore even if power is decentered and distributed, this does not necessarily mean that the system is likely to become democratic. If power is experienced as elsewhere then it probably cannot. That the networks interact and thus communicate, as say ants do automatically, gives no need for these communications to be meaningful, or to allow us to find commonality as is suggested (Hardt & Negri 2004: xiii, xv). The interaction of groups which then polarise or separate is also communication and can result from networks. This interaction may also continue to produce what they have in common, such as separation, hatred etc. Communication and connection is not an unrelieved good always bringing harmony, or construction.

Negri and Hardt do recognise that in the present this transformation does not necessarily liberate the worker. Contracting makes labour and income more precarious. The distinction between work and non-work is being blurred in favour of work, and in ‘emotional work’ our personal ‘private’ lives and being also become work (2004: 66, 111). Workers have to become flexible, ie fit in with the demands of capital (2004: 112). The rhythms of work become governed by ‘Just-in time’ production (Hardt & Negri 2000: 290), with its casual employment routines. Given that these transformations do not seem to be liberatory, then there is no necessity to see this economy as potentially democratic. Others, for example Galbraith, see the increased penetration of the state public sector by the corporate sector and hence co-opted by members of that sector (2004: 47-51), and also see small business in decline: “For the small retailer, Wal-Mart awaits. For the family farm, there are the massive grain and fruit enterprise and the modern large-scale meat producer” (ibid: 37). In this view the power of self provision, of self determination is destroyed and replaced with dependent employment. The worker no longer has their own responsibilities, it is the corporation which allows or shapes what is possible.

Networked communication can be paradoxical communication. Incessant ‘communication’ can be a way that alternate paths are suppressed (Hardt & Negri 2000: 347). The format, as much as broadcast media, suppresses exchange. Dean suggests that this communication no
longer forms as a way of building connection through exchange but acts as an economic form – yet another way of alienation (Dean 2004: 273). Hence everyone feels separated from the modes of communication.

Messages do not exist to elicit a communicative response, but are broadcast to produce a behavioural response. Their meaning is the response engendered. This is the power of communication devoid of anything else. In the world wide web and the blog format, this has been embraced as the main way to communicate. Messages become subsumed as isolate propaganda, the appropriateness of most of which is determined by the mainstream media bringing responses forth which it largely ignores. As Dean points out “the more opinions or comments that are out there, the less of an impact any given one might make” (2004: 274).

Within, this domain of saturated non-messages it is always possible to find a conspiracy, and some of them may even be real.

I use the term ‘cyborg-governance’ to refer to this confluence of distributed power and information systems, without implicitly diluting its physiognomy of being systemic, or resembling a cybernetic system, of having distributed responsibility, and of appearing elsewhere with no apparent origin.

Cyborg governance implies that the environment (and that includes our own lives, for lives cannot be separated from the system they emerge within), is permeated with machinery and the demands of human will, its subversions, and the possibility of unexpected transformations.

In this view, becoming cyborg means being controlled through this dispersed location of control. This is contrary to the usual liberatory view of the cyborg. The idea of cyborg governance is intended to imply the dangers of cyborg theory

**Against Cyborg Liberation**
The idea of the cyborg as a metaphor for liberation originates with Donna Haraway, but as I have suggested in my other essay at this conference, the cyborg myth has its own directions and pointers which might steer in another direction. The power might reside with the myth rather than with the intention of the tellers.
Haraway argues that the cyborg, can be a model for re-imagining liberation.

In the traditions of “Western” science and politics... the relation between organism and machine has been a border war. The stakes in the border war have been the territories of production, reproduction, and imagination (1989: 150).

It could easily be argued that the border wars have been fought and won, by the dominant groups extending the machine into the regulation of, or incorporation of, the subordinate. Thus it is largely working people who have rebelled against the extension of the machine, and the regulation of their lives by machine – because it is they who become fodder for a machine programmed elsewhere with no regard for their lives. Hence, perhaps the general class based (‘knowledge worker’) contempt for Luddites, who have doubts about the machines. The original Luddites where attempting to defend their livelihoods and their way of life and were crushed quite brutally by the owners of automation (Sale 1995). What contemporary Luddites observe is that the complexities of their lives are invisible to the program (Brown 1977: 66-7, 161-4, 171-2). If this is accepted, then the cyborg could be thought of as an extension of industrial power into the human realm – a way of making work total, rather than undermining spurious unities. If people object then they can always be reprogrammed. However there is little doubt that some of these machines can also be seen as ways of extending certain people’s power into the world as well, of extending their boundaries – it is not equitable, and does not respect difference, least of all that difference which would be apart from the extension of machine and work.

It is easy to imagine a world in which machines colonise humans, making them cyborg in the name of authority. Hierarchical patriarchal discourse may tend to assert the inferiority of humans to machines and thus assert human subordination, especially humans of a particular class/race/gender. Cyborgs can have hierarchies and that is part of our imagining of them. Dr. Who’s Cybermen think of themselves as superior, but they seem a grotesque diminution to lesser humans. Not all transformations of the body might be beneficial (whatever one’s criterion of beneficial might be).

Thus although Haraway might suggest that cyborgs have no dependency (1989:151), seeing them as extensions of power transforms them. Cyborgs must depend on machines and servicing, probably machines they cannot make, even while these machines may be elsewhere or under the control of others. In this sense the Cyborg epitomises the syndrome of
distributed power always appearing elsewhere, and of direct input being difficult to impossible. Cyborgs are embedded in systems which may have programs of which they may be unaware. Any independence here is hidden. In some senses this realisation of dependence might be useful, if it helped prevent people thinking they were self made rather than emerge nt within a society and a world and needed to cooperate. But it seems unlikely that if the dependence of is not recognised in the foundational document it will not be recognised elsewhere.

People can recognise that the extension of the cyborg could lead to “the final imposition of a grid of control on the planet” (1989: 154) – computers are heavily involved in the control of work and in the command structures of corporation and military, and yet come to ignore this in fantasies of transcendence. If power is elsewhere, perhaps it can appear nowhere.

Attempting to avoid being seduced by organic wholeness through theoretical fragmentation may confuse the act of attempting to become a whole, with the uses of wholes, as systems, in theory – a strong part of cybernetics and hence of real cyborgs. Fragmentation embraces the modernist or masculinist (if you wish), trend of breaking things into independent parts, without bothering to see how they might interact in complex systemic ways. Thus it becomes acceptable to introduce or appropriate species (rabbits, cane toads, gamba grass) as fragments without thinking of the wider systemic consequences. It is because such systems are so complex that minor changes in a certain place can have huge effects. If we claim everything is fragmentary, then we ignore the potential for system crash or for system transformation. We also loose the main ecological objection to genetic modification – that systems are complex, not immediately predictable and not containable – an objection which has nothing to do with maintaining genetic purity, as Haraway implies (1997: 60-2).

Despite claims of cyborgs being unspecist, mechanic control of animals does not seem particularly unspecist. If we build robotic animals will we come to treat animals as Robots? If machines are used to “lift” humans “out of” the environment, then humans become even more (conceptually) separated from others. Cyborg theory blends with the fantasies of capitalism about taming the earth and controlling it, about independence from our environment, or of finding that other species are irrelevant as we can grow/invent what we want and need. We can leave this poisoned world behind us for cyborg bliss.
The cyborg’s, posthuman connection with militarism and fordism (warfare and total
capitalism; patriarchal violence and transcendence or destruction of the “natural world” etc.)
does not seem to be something which can be ignored (‘the cyborg has no origin story in the
Western sense’ (Haraway 1989: 150)) or dismissed by naming this descent ‘illegitimate’
(1989: 151). Later, Haraway seems to argue that the cyborg can be kept distinct from the
android or robot by the choice of narratives employed, but this seems unlikely and contradicts
claims of border flexibility or vagueness (Haraway & Goodeve 2000: 127-29). As an
example we might note that Schwarzenegger’s character in Terminator 2 seems to come up in
most discussions of cyborgs, when technically the character is not a cyborg – it is a robot or
android. If nothing else this shows the ambiguity of boundaries and the ease with which the
mechanic overrides the human in narrative. Narratives and myths have their own dynamic,
and their own connotations, which may escape our attempts at flexibility – and is that
flexibility not also demanded from us by our workplaces?

This also might imply, as suggested above, that cyborgisation is often not driven by people
embracing it, but by it being inflicted upon them, perhaps as an unintended consequence of
transnational corporation and military control and communication. However it is possible
that both infliction and embrace might be true – the boundary is not clear, certain or fixed.

However, it seems likely that the ‘hybrid’ composed of Dupont and University research
departments retains more of the inclination of the corporation than of the campus. Its genetic
engineering becomes not an exploration of strange boundaries but acts as a way of extending
copyright regimes, and totalising corporate ownership of the new cyborg nature (Haraway
1997: 90-7). As when corporations allow their genetically modified crops to escape into the
fields of farmers who don’t want to use them and then sue for theft or breach of copyright.

Seeing relatively oppressed groups as active, resistant and not powerless, does not require us
to transform either them or ourselves into cyborgs, and Haraway later admitted that including
third world women working in electronics factories within the “we” of the cyborg was
problematic (1991: 12). There is, at the least, a status difference between a consumerist
cyborg and the enforced cyborg, as well as a difference in what they are able to do. Despite
the intention to avoid narratives of wholeness, the cyborg is often treated as if one, even
though rent with status and class differences.
Haraway continues that:

Cyborg politics is the struggle for language and the struggle against perfect communication, against the one code that translates all meaning perfectly, the central dogma of phallogocentrism. That is why cyborg politics insist on noise and advocate pollution, rejoicing in the illegitimate fusions of animal and machine. .... (1989: 176).

‘Noise’ in this circumstance is ambiguous, but ultimately means apparently random signals. Noise which constructs or disrupts, might well be lost without effect, circumvented by the tendency of distributed systems to bypass damage. The noise which stops us from thinking, and the pollution which stops us from breathing or eating, might already be provided for us at overwhelming volumes by those who already dominate.

There is nothing radical in noise. There is no reason “Phallogocentrism” cannot use unclarity for its advantage. Vagueness is part of the way transnational corporations or the military seek to avoid regulation, to shift profit away from the place of origin, to destroy public participation in public life, or to make their workforce more vulnerable. Or again, perhaps the contradictions, which others call lies, are actually responses to situations which are out of control, or which resist divination.

The political establishment has used cyborg theory: promoting social justice and democracy through internet connections and “open” communication rather than through participation in the State; the abolition of race and gender as problems by ignoring them (as supposedly occurs online); supposedly “safe warfare” through cyborgs, machines and overwhelming technological dominance; denying that there is a whole we might call society; destroying unions in the name of individual freedom; using lack of history and memory; pastiche of messages; declaring inequality arises from individual difference so on.

To repeat, power seems in a liminal position, it can move almost wherever it wants without obstruction and transform in myriads of different ways, even if it cannot achieve dominance because of the complexity of the whole. They almost cannot be touched, or acted on, by anything. Contradictions and ‘logical reality’ disappear in the world ‘they’ create.

The idea of the cyborg ignores what we might call the sandpile problem. One grain of sand is not a ‘heap’ but 100,000 grains might be, and the boundary is never going to be clear. To use
a cyborg cliché: imagine you have a human, you keep adding machinery and subtracting flesh, at what point does it stop being human? How many fragmented cells makes a human? This is the nature of many categories. Putting in a hybrid third merely allows the poles to separate while pretending to overcome them. Categories usually have some kind of bounding, and such boundaries become a way of conception. They will always appear somewhere.

It is the way of categories that a category which seems a disrupter of other categories sometimes becomes subservient to them, apparently privileging one side. Perhaps we should ask what this apparent privileging allows the privileging of elsewhere, and what kind of dominance it is part of. We might even suggest that such disposals of the body suggest, not that the old forms of authority are disposed of, but that they are intensified. In any case we cannot choose the histories of words, nor exactly what their connotations will be. In the same way as Haraway suggests that criticism of genetic modification is haunted by racism (1997: 60-2) so her own cyborg is haunted by totalising techno-capitalism.

In a slightly more pessimistic turn Cecil Helman suggests that the (cyborg) body of artificial parts like “Frankenstein’s monster” symbolises a type of society which is an assemblage of disparate parts animated by science and electricity, but with the brain of a criminal and, we might add, “out of control” (1992: 24). It certainly seems the case, that to our mythic imaginations the danger of machines taking over, is more pronounced than that of us becoming one with them in an empowering sense.

**Cyborg governance and the Multitude**

We cannot separate distributed cyborg governance from itself in the way that Negri separates Empire and Multitude. Empire creates multitude and multitude creates the Empire of distributed power. Certainly we may be able to divine where the balance of power seems to lie, but this does not give us a binary of capitalists and everyone else, it gives us a more fragmented world, split into local and global particularisms, and which may separate as much through information technology as they might cooperate. It may well be that this distributed governance results from the systemic limits of participatory government under the old State. To destroy the symmetry of cyborg governance and cyborgs we might want to introduce at least a third term, an X, to cover those who escape, without assuming they are the same either.
Cyborg governance and cyborgs are both symptomatic of the same thing. One does not have to be in opposition to the other, even though we might say that the system is on a destructive bent and will take its cyborgs with it, if they are not careful. The cyborg is within the system, and given life by it, as such it is directed by the system. It makes up part of its systemic distributed dynamics – no overthrow or freedom, need arise from this participation.

Indeed while industrial capitalism depended on the existence of a class which possessed relatively little capital, so information capitalism may require the creation of a class with relatively little ‘knowledge’ and relatively little recognised ‘creativity’.

**Conclusion**

This is an essay in sociology not politics, even if it is political, so there is no need for a triumphant or cautionary conclusion. What can be presented is only a divination, and a very incomplete one at that.

It is not possible to engage in fantasies of restoring the participatory state, or to hope that becoming cyborg is a way to freedom, or that the Multitude are independent of the system of which they are a part.

It is useful to recognise that the system appears to be magical, and that cargo cult is not a way forward. However, the system may not be under the control of the elites who pretend that it is theirs. One of the characteristics of cyborg governance is that the opposition seems everywhere, or mystically powerful, when the resistances may be systemic and simply escape control. The pretence of elites is also an act of magic, a magic which works to some extent by evacuating power to increase it, but magic subverts itself, evacuation could possible become real, and distracts from the real networks of power of which they participate. It may be possible to find gaps within this power, places in which the system is not so well set up, not making everyone cyborg. At these places of interstitial power, it may be possible to act – for good or for ill – to set up a tipping point which brings it all down. But there is no guarantee that will be an improvement. If the system falls, so might the world.

Politics requires caution, when the ripples of a stone in a pond might create a tidal wave.

Ambiguities of Gender: beyond the placid cyborg

Abstract

Gender functions as a category reference to the body, linked to both constructions of intimacy and privacy, and in opposition to itself. It, like any other form of presence online, is bound up with uncertainties and suspensions. It produces paradoxes because it is often exaggerated in order to generate the sexual tensions which build gendered intimacies and a sense of mutual presence and reference, while at the same time these exaggerations are also recognised and negotiated as deletions of presence, or even as betrayal. Online being is neither fully present or absent, but oscillatory, what I have called ‘asent’. In this situation, demands for authenticity, usually tied to the offline body, override acceptance of multiplicity. It is argued that the model of the cyborg does not transcend gender, rather it hybridises and presents a model of gendered unity which is subservient to the system of machines and caught between destruction and repair. It is suggested that it is more profitable, and truer to online experience, to conduct a politics of online gender by observing these tensions rather than smoothing them over.

Introduction

This paper originates in my, now over 10 years, fieldwork online, primarily in the Mailing List Cybermind. Anecdotes, surveys and statistics can be found in other papers listed in the Bibliography. This paper is primarily a theoretical summary of results as they apply to gender, and the comments refer primarily to middle class, white, Western English speaking internet groups. We cannot assume that everything which seems like an effect of the technology is not a cultural effect and will automatically apply across cultures.

Living online, for these Western English speaking subjects, is embedded within relations which currently appear to be paradoxical, ambiguous or contradictory. Sometimes these paradoxes appear to result from the medium, and the way communication is structured, and sometimes they seem to result from paradoxes and ambiguities ported in from the offline world. Gender, seems to be not only important for the way people conduct and organise their online lives, but is also embedded within these paradoxes and ambiguities. Often, it is claimed that online gender should both be analysed, and politically motivated, through the ‘posthuman’ figure of the cyborg; a semi-futuristic hybrid between human and machine,

---

1 As always thanks goes to the members of the List who have not only patiently engaged with these various projects but have contributed to them - particularly the List owner Alan Sondheim who has been engaged in productively theorising the internet for a long time. It is of the nature of such work that it is hard to disentangle what emerges from myself and what emerges from other List members. However, the inaccuracies always remain mine.
which is also supposedly ‘post gendered’. It is suggested here, and in my other essay for this conference, that the cyborg myth, as actually present in the West, is more in keeping with the project of techno-capitalism than of revolt, and that it is both more fruitful and true to online experience to examine the paradoxes around online presence and gender, than to suppress them via this metaphor.

**Paradoxes of Presence**

Online gender is embroiled in paradoxes. The most obvious one is that the importance of gender in online communication is often denied, while at the same time, people devote considerable effort trying to work out the gender of others and apparently being worried that the gender of others might not be the same as portrayed online (Marshall 2003).

Before discussing gender specifically it is useful to explore the fundamental ambiguities affecting a person’s perception of their online presence and the presence of others. Online being is continually suspended between presence and absence, and within ambiguities of confirmation. I have coined the term ‘asence’ to denote these states of suspension of recognition, closure and ‘being’ (Marshall 2000: chap 6 and passim).

Online closure is problematic. Email communication, for example, tends to end in silence, when participants have no more to say, or when email gets lost – which seems, in my experience, to happen quite regularly. In comparison, offline conversation usually terminates with all participants knowing that messages have been received or acknowledged, even if only with grunts, gestures or farewells, and you can expect to have a fairly good idea of how things have gone – there is a more complete sense of closure.

There are problems with presence. In offline societies it is also generally possible to tell whether a person is present or not. Online a person may be neither entirely present or entirely absent. Presence manifests only in those moments in which a person emits text or has that

---

2 Langa (2004) reports sending out bulk emails to people who had volunteered to respond to him, and suggested that up to 40% of emails could get lost. However, despite the reservations as to how this result might affect more normal personal emails, it is still suggestive of how spam filters, faulty systems and lack of response can affect personal communication. The experiment needs to be repeated before being dismissed.
text acknowledged. There is no marker of existence beyond the act of communication itself. Even with a text or graphic avatar, we cannot even be sure if the person is present when we are attempting to communicate. People on a MOO\(^3\) can just leave their terminal to go elsewhere without informing the other person, and it seems common to find that they may well be communicating with someone else at the same time – which can disrupt our sense of intimacy or attention.

Asence is emphasised by uncertainty about audience. List or Newsgroup members have little idea who is actually present or reading – most of their audience will never reveal itself. People may find that other people they would not want to read them, in this context (or any context), are present. People you think might be present may not be receiving mail. They may be off List for a few days without notification, or be skipping mail if busy. Messages to which you anticipate a response can go unnoticed. You may be engaged in conflict, or make a risky personal revelation, and those you expect to notice or give support do not, and thus you seem snubbed or absent and group “community” seems fragile (Marshall 2000, Chap.12 part.1: #IV.2).

Feedback is also often compromised. Generally, there is no certainty whether you have been received, or read, or of the nature of your reader’s reaction. In the asynchronous communication of a Mailing List, a person is not able to adjust what they are emitting according to an ongoing response. Due to this difficulty in adjusting communication as it proceeds, it is easy for text to be misinterpreted and meanings to diverge. In face to face communication we are constantly checking up, some times vocally and sometimes by body language or behaviour, in order to try and make sure that a message is being received correctly\(^4\).

\(^3\) I’m using the term MOO to refer to all derivatives and varieties of MUDs simply because I have more experience with them. A MOO can be defined as a way of communicating with others over the Internet which resembles an interconnected set of spaces set up on a single computer. People tend to construct and play ‘characters’ and are eventually able to build ‘rooms’ and ‘objects’ with properties. Communication tends to be synchronous and unarchived, so it is not usually possible to access conversations which occurred while you were not there.

\(^4\) To some extent this is why Plato famously objected to text as distorting (Phaedrus 275ff.). However with offline text the author may never face the consequences of misreading directly - they are in some ways more distanced than a person is in online communication,
On MOOs, text from various people can intertwine in unique manners on each individual’s screens, and it can be unclear precisely who is writing what, or exactly what others may read or be responding to. Lag can also disrupt the flow of response, and make it so that answers to old questions appear in response to newer questions.

As a result of these factors a person’s online presence is always drifting away. Status, without offline markers, has to be continually re-earned and re-presented as audience tends to shift. These unclarities could lead to anxiety, as most social being and sense of self depends upon the responses of others. In another context, Ruesch and Bateson, have suggested that people can feel helpless or insecure if they do not receive acknowledgment of their messages and write that ‘the individual feels paralysed if correction of erroneous interpretations is impossible’ (1987, 39-40). Asence is generally uncomfortable and people work to reduce it.

As shall be made clear asence, and the ways people attempt to reduce it, can contribute to an understanding of many online behaviours, from flame to netsex, and is intertwined with the way people use gender (Marshall 2004a).

If the idea of asence is correct then it is improbable that we will ever have any kind of simple co-presence online; it will always be fraught. Even if we had video connections (and these might be less asent), we still might be subject to interferences, delays and the suspicion that the image we perceive is simulated.

At the extreme the other person may even be some kind of program, or ‘bot’, as for example the famous Julia which was helped in its realism by online vaguenesses (Foner 1993). Foner writes that “the deliberate blurriness of the boundaries both enhances Julia’s effectiveness and makes her operation possible”.

Interestingly gender seemed important to the programmer’s concerns about how the bot should function. To make ‘her’ realistic, and to deal with people’s need for online gender Julia was programmed to guess people’s gender from their names, and was also programmed even though when they do, as in the case of Salman Rushdie, they may very well face real negation.
to strongly declare that ‘she’ is female. For example, she “appears to be premenstrual, or to mention her period in some way, about two days a month”. The real people online seem to treat her as a sexual being as a result. Foner remarks “A large percentage of Julia’s code deals with detecting and deflecting passes”. One given example of interaction features a man demanding that she take off her clothes. “Julia gets a lot of this kind of ‘attention’” Foner writes, and the most well known example of the bot in sustained interaction centres on a man’s persistent attempts to pick her up, which says something about gender and the way that it is used to resolve ambiguities and structure behaviour. Rather than give up, people try sex.

**Public and Private— gender, intimacy and property**

Another ambiguity which is important to online life and which is often used in asence reduction, is the division between ‘public’ and ‘private’. This division although treated as a polarised dyad in the West is more accurately a shifting matter of context. Often researchers will pronounce that online it is clear what is public and what is private and then seem surprised when other people define things differently. Meyrowitz (1985) has argued that new media/communication technologies often shift previously stable public and private divisions, and that it takes a while for new conventions to be worked out. It is also reasonable to assume that people may construct these divisions differently depending upon their social position and their aims.

This online unclarity reflects ambiguities in the divisions offline as well. For example, in the offline world people can dispute whether the actions of a private company dealing with the Government are of public concern, and thus open to criticism in the public domain, or whether it should it be protected by defamation laws and privacy agreements. Issues of power are fairly overtly involved here. Other ambiguities may be less overtly connected to power, but can be more paradoxical. Legal theorist James Boyle, among others, argues that under current information capitalism there are constant collisions between concepts of the public

---

5 This frequently seems a matter of debate on the Association of Internet Researchers Mailing List. Although the ‘Code of Ethics’ promulgated by the Association treats these issues carefully there always seem to be researchers who will claim that anything which can be found on the Web, or even sometimes in an open Mailing List, is in the public domain and should be quotable according to legal fair use provisions. Some appear to claim that if people who use the internet do not realise this then they are foolish, rather than that they are using a different criteria of public and private.
sphere of largely unconstrained and uncharged information exchange, and ideas of private intellectual property and copyright. It seems that a central contradiction of modern capitalism is that wide free, or easy, distribution is essential for the movement and development of knowledge, while constraint is necessary for profit.

Boyle claims that what he calls “the romantic notion of the author”, is central to the way the system works, as the author stands between these problematic public and private realms, “giving new ideas to the society at large and being granted in return a limited right of private property in the artefact he or she has created” (1996: xxii). Thus the border between public and private in the information capitalism appears liminal and shifting. The individualistic notion of the author is even used to give employers the right to strip the ownership implied by creation from their employees. The author is where the supposedly originary magics of creation flow into society as a whole, and where they are appropriated or claimed. These separates areas of public and private are deeply unclear, and in tension, while the construction of the author bridges between them, ‘authorising’ the constrained sellable information-product. A method of economic reproduction is grounded in these ambiguities.

This claim of authorship and origination acts to suppress any claims of sources and audience. As, it is impossible to not use the public domain of prior ideas and discoveries to create, this regime is in some senses paradoxical. It is neither obvious nor natural, and might completely stultify any kind of creativity.

The public/private distinction is not just important for property and space; but surfaces continually in the agitation for protection of privacy against the accumulation of digital records and ‘transparency’ of access; and in the political arguments over what people should be allowed to do in private as opposed what they can do in public. In some ways this can focus on the most influential virtual body we have, namely the almost invisible records compiled on us by corporations and governments which can affect how we are treated as much as our ‘real’ body does, and which is exploited in ‘identity theft’.

The public tends to mark the domain of politics and action and the private of intimacy. As such it is intertwined with our ideas of gender and of being oneself. The public tends to be
classified as male, artificial and open, and the private tends to be classified as female, genuine and ideally protected (Strathern 1990: 88-9)⁶.

Online it can seem that these ambiguities are more marked. In an email, for example, words written by one person can be overtly intertwined with another, the borders of property and authorship are markedly unclear – not just because people constantly confuse who is who, but because it shows that any innovation arises out of others. Although people complain that they might be being observed by invisible others they still behave as they normally might in private. Similarly, on lists the normally private can spill over into the List despite the relatively easy provision of invisible communication.

Furthermore, most of the life of an online group may not be public. The list can be surrounded by what Cybermind list owner Alan Sondheim calls the *aura* of personal communications and meetings in other online forums, and yet all one can perceive is the public, the offlist is completely hidden. Again in offline life much may be hidden but we may be able to observe that something is going on. Online group dynamics are not completely available for study, they are always gliding away into invisibility. They are subject to asence.

I remember one person on a Mailing List describing to me at length how their own off list interactions gave particular onlist messages ‘different’ and personal meanings. Public mail could contain ‘secret’ references to offlist correspondence. I was unsure how common this was, and whether it was a personal or social phenomena, but it seems reasonable to assume that offlist contact provides another context with which to read messages.

On a mailing list there are basically two forms of sociality; ‘on list’ and ‘off list’. If we take private/intimate and public/communal as divisions which come easily to us then it is worth investigating whether the traditional association of women with the private/intimate (or off-list sphere), and men with the public/communal or (on-list sphere) has any effect upon modes of exchange and performance.

---

⁶ What Strathern sees as the ‘infantile’ domestic, is more likely connected with a need to protect intimacy and gentleness. She appears to be polarizing, and making one side good and the other bad, rather than perceiving counterpositions, where sometimes one is ‘good’ and sometimes ‘bad’ depending on situation.
We can certainly read how the onlist sphere is constrained by gender, how in many places women are relatively silent in comparison to their numbers and that concerns posed by women are not followed up as much as they are by men. This does not seem to be the case everywhere (Cf Marshall 2000: Appendix I), but nevertheless it may imply that in many online groups women could well avoid the onlist, being more comfortable offlist – the offlist being apparently more intimate. It seems to be the case, from an admittedly small sample, that men can be more open offlist, than offline, when the other is female (Bennett 1998), which also stresses the importance of identifying gender. Anecdotal evidence in my own fieldwork suggests that most continuing offlist exchanges involve at least one woman, and that intimate exchanges will also tend to involve a woman. It is possible the intimacy value of ‘being a woman’ can be exaggerated online – this may be one of the things that contribute to harassment – men seeking inappropriate intimacy from ‘ideal women’ – but it may, in turn, mean that males, from these cultures, have a tendency to become less intimate with each other online. This conflation of women with intimacy and men with publicity, is one reason why it seems to cause more panic that a man may be impersonating a woman than the other way round – as it potentially betrays the intimate.

So, we can hypothesise that: a) public and private divisions can be shifting, ambiguous, and sometimes conflictual; b) the public life of the list may be embedded in a primarily female centred set of off-list exchanges; and that c) these exchanges do serve particular functions for women such as allowing expression and intimacy and comment on the onlist proceedings (this may also be the case for men); and hence d) they effect the group as whole. If this is correct- then we must be aware that ethnographies could simply be a study of male or ‘public’ behaviour passing itself off as the behaviour of a group.

**Gender: Paradoxes of Authenticity, Body and Intimacy**

Communication on the list was bound up in a degree of conflict or paradox, between demands for openness or authenticity, and the kinds of hiddeness which actually resulted.

Contrary to early expectations that online we could easily express multiple selves in some kind of postmodern manner (Turkle 1995: 178-180, 263-4; Reid 1994), there seems to be a
demand that we are to be ‘authentic’ (Marshall 2000: Chapter 7). What we present should be true to ourselves, we should not deceive or misdirect. We should be open and aboveboard, etc. It would be considered odd for me to write proposing something to any online group which I did not believe, even though this might be interesting. I might be derided as hypocritical at best. Observationally people seem to spend quite a lot of time and effort in trying to figure out the identities of others, and it seems that gender is one of the things that people are most eager to discover.

The closer and more intimate we are to someone, the more the relationship involves ‘trust’, then the more authentic it seems we should be. This is produces problems because authenticity is not just ‘as is’, it has to be recognised and conveyed, so it is surrounded by conventions, such as:

Convention No.1: Conventions undermine authenticity. We are caught in paradox almost immediately. In this society, as the relationship becomes important, ritual (particularly public ritual) tends to be discarded as inauthentic or contrived. Deuel suggests that pre-programmed MOO actions are used less, the more that netsex or the relationship becomes ‘real’ (1996: 140). The more emotional involvement increases and becomes private intimacy, the more authenticity becomes important and indications of direct typing are taken as transparency.

Convention no 2: strength of feeling denotes authenticity. Who believes someone who loves them ‘mildly’, or that this is really a good basis for relationship? However modes of coding emotion as being strong can also be decoded as anger, which can then pull people apart, and undermine the appearance of group harmony, rather than join them together.

Convention no 3: Emotions and body states, are irrational, underlying, largely uncontrollable and real. This allies with the second convention. It might be said to encapsulate the psychoanalytic theory of the id. In consequence, sexual behaviour, and sex, always displays something genuine about people. Continued mood can be important for the ways that people will interpret mails and interpret the ambience of the list as usually list mood is quite fragmented, strong moods like anger, or mourning, are easily over-generalised. Reports of body pain seem to be usually taken as genuine as well, but they are perhaps not as popular.

---

7 See in particular the work of Susan Herring listed in the Bibliography.
Convention no 4: Secrecy and unpleasantness equals truth. If you find something out about someone which was hidden you are more likely to believe it. This perception of truth increases with the unpleasantness of the discovery. Few Westerners seem to believe that anyone is troubled by underlying and secret niceness.

Convention no 5: On the Internet no one knows if you’re a god. Tales of betrayal and deceit abound. Therefore it becomes imperative to discover what is authentic about the others. The conventions appear to be that the more private (secret), and close to the offline world the communication then the more authentic it is. Thus a statement has the least effect online in public, more so offlist in private, more so via offline mechanisms such as telephone, and finally face to face. Even though, in reality these can be equally deceptive. You don’t know that the person you are meeting offline is, in fact, the same person you have conversed with online.

To some extent these conventions can gather around the idea of the practice of netsex (Marshall 2002). Netsex is supposedly revealing – because of its ‘rawnness’ and because people’s truth is supposedly anchored in their body. However it can be caught in different interpretations of public and private and whether it is a game or intimate. Discovering deceit about the other’s body undermines every other truth they may have communicated and body includes gender. Netsex is a marked and reiterative communication anchored in bodily response and continued mood. It can help restore closeness when people move into areas of mutual disinterest. It also reduces asence. It is not possible to simply be together online you must emit messages to mark your presence.

Sometimes this latter point can appear to be a good thing, as when one of my informants claimed that men actually speak with women on MOOs as opposed to at them offline, because they have to get her to respond to prove they are not talking to themselves.

Netsex and online gendered intimacy is also ranged with paradox. It is frequently alleged that you can express yourself as you are online, however to confirm this expression as authentic it has to go offline (into a still more genuine private), where you apparently cannot be who you are. Furthermore, people tend to use exaggerations, especially exaggerations of gendered discourse, in order to trigger sexuality, and these exaggerations can be perceived as deceits.
and set up problems of reality and authenticity: is your partner really as they described themselves in the moment of passion? So a mode of producing truth also becomes a mode of producing uncertainty.

Within this framework love seems to be a process of revelation, of exposing more of one’s truth to a trusted other. But what happens when all is said? Either the process ends and love ceases, or you continue but the other is tested – can they survive this uncovering, will they retreat? Online the responses needed to confirm, need to be strong, but it is not always clear what the response is. Are they still there? People constantly express some of these ambiguities – not only around whether their ideal net partner is of the gender they portray themselves, whether they are as they described themselves, but as to the effect of netsex itself, whether it is liberatory, whether netsex with a married person is adultery, whether netsex is destructive, and even whether netsex is more intense than ‘ordinary’ sex or just boring.

Emoticons tend to play a part in these bodily ambiguities, smileys are used to show when something is not hostile, or is ironic to diffuse wrath or offence. However, sometimes these emoticons are thought to indicate offence ironically. No response, or intent, is entirely certain. People can also gender themselves with emoticons or emotional statements, especially as women are believed to be more prone to indicate emotion.

Obviously we need to know whether different cultures find the need for different emoticons, or different visible punctuation.

At another level we can argue that gender itself becomes paradoxical or dislocating when it is treated as if it was an opposition (as in the formulation of ‘the opposite sex’) rather than a difference. Thus if we assume that women and men are logical opposites and thus that women are not-men, and vice versa, then we effectively delete the areas of commonality from our experience and leaving us incomplete. We are simply defining by negation and creating a gendered emptiness.

The value of online and offline bodies is not stable and changes with the context of comparison. Thus the offline body can be considered female when compared with the male spirit which is liberated online, while the offline body can be considered to be virile and masculine if compared with ineffective, or fantasy, bodies online (Marshall 2004b).
Paradoxes of Online Community

‘Community’ is not so much a ‘thing’, but a term with political and social import which carries ideals of legitimacy. It is, as a result, more interesting to look at how the term is used in a situation or among a group, than it is to try and identify its characteristics (Marshall 2000: Chapter 12 part 1).

On Cybermind, it seemed that a sense of what people called community was built up, partially at least, by the redundant off-topic mails which rendered the list more ‘personal’. In this case, expressing the personal was identified with the communal – as the personal is more ‘real’ by convention. However, the off-topic mails which built this sense of ‘community’ and ‘belonging’ could also drive people away by swamping mails dealing with the topic which they had joined the list for. Another problem which arose was that the more the personal ties between people become strong, then the more these ties will tend to go offlist, and thus remove the presence of posts which give presence to the list and its conviviality. In a way, the List itself can become asent through intimacy.

Increased levels of off topic and offlist mails could also make it hard for new members to understand the relationships between people, and the content of these messages could often require knowledge of previous encounters to interpret.

Thus a technique which generates feelings of closeness in a group, can make it hard to maintain levels of membership, especially given that people continually drop out. Nothing forces people to stay on, or be involved with, a group.

On the whole, a very small proportion of the group was responsible for most of the emails to the group. This has been true of every Mailing List I have been on, and is generally necessary. If even half of a List of 300 people post once a day, the List would become unreadable. There was also a constant tension between off stated desires for every list member to participate, and this need to keep the list traffic at a manageable level. High volume might indicate community and activity, but it would also lead to people skipping mails and missing much of what was going on, thus fragmenting people’s contact with the
group and diminishing their understanding of what was happening. It could also result in people leaving the list as they could not cope with the volume.

Attempts to build a space for ‘free and friendly discussion’ also increased the need for some kind of social control to remove obstacles and disruptions to this discussion. These attempts at control frequently resulted in flame wars, demonstrating unity between those on particular sides, increasing difference between those on opposing sides, and lowering the chance of free and friendly discussion which was supposedly the aim. People also tend to interpret what is aggressive behaviour or flaming differently (and this difference of interpretation can be gendered), and Lists can frequently be disrupted by arguments as to whether an argument is happening or not.

Flame wars tended to cluster around external world fractures (such as politics, gender, race, nationality and so on), which were used to interpret what was going on, or what people were writing. These interpretations did not always seem relevant to what people were trying to say. External world identity factors often overpowered any sense of identity as an Internet grouping – perhaps because it is hard to build up group identity as an Internet group by acting in relation to other such groups. To some extent it can be alleged that flame arises in many cases, not because of people’s anonymity or lack of responsibility, but because of absence. Flame guarantees a response and thus confirms that you exist and have presence and encourages exaggeration. Paradoxically such ‘exaggeration’ can lead to a greater sense of involvement at the same time as the bonds may be being destroyed. Such ‘war’ does not require that people are naturally aggressive, merely that the situation magnifies the possibility of such a response.

The sense of the group as ‘community’, with a ‘group style’, with a status or popularity hierarchy reflected in the visibility of persons, needs continual prestation, as it only exists in this prestation. An influx of new members can change the group identity, as they would not be aware of this identity or the ways it is maintained. They might post in unusual ways on different topics and great volume (inappropriate to their status as ‘newcomers’), and cause other more established members to leave or go no-mail.

**Summarising Gender and Ambiguity**
Gender functions as a category reference to the body, it is linked to both constructions of intimacy and privacy, and in opposition to itself.

It, like any other form of presence online, is asent and bound up with uncertainties and suspensions. Particular forms of unclear opposition which are important to online life and gender include the distinction between public and private, authenticity and deceit, and community and anomie.

Demands for authenticity, usually tied to the offline body, override acceptance of multiplicity, especially when it is necessary to show intimacy. Attempts to identify offline gender are common in these situation, but often fraught.

Attempts to resolve these binaries can produces paradoxes as when gendered characteristics are exaggerated to generate the sexual tensions which build gendered intimacies and a sense of mutual presence and reference, while these exaggerations are also recognised and negotiated as deletions of presence, or even as betrayal. Likewise the conventions used to indicate authenticity and truth also undermine it.

**Cyborgs**

Famously Donna Haraway has proposed that the model of the cyborg (“a cybernetic organism, a hybrid of machine and organism”) is a way of transcending gender writing:

The cyborg is a creature in a post-gender world; it has no truck with bisexuality, pre-oedipal symbiosis, unalienated labour, or other seductions to organic wholeness through a final appropriation of all the powers of the parts into a higher unity (1989: 150).

Why bisexuality, or not being influenced by the gender of your potential sex partners, is a seduction to wholeness is not explained.

My understanding is that Haraway wrote the original article as a polemic against mid-80s back to nature goddess feminism, and as such it was intended to show that humans have always been tool users and, in that sense, ‘unnatural’. However it has been transported out of that limited context and considered to have far wider, almost universal, implications. Balsamo
suggested that the “cyborg provides a framework for studying gender identity as it is technologically crafted simultaneously from the matter of material bodies and cultural fictions” (1996: 11), while an exuberant conference announcement which was posted to Cybermind declared that Haraway’s Manifesto:

interrogates and/or collapses the differences between the sentient and the non-sentient, the human and the non-human; it engages and undoes a wide range of binary oppositions from Cartesian dualism to culturally coded distinctions of gender, class, and race; and it exemplifies the breaching of boundaries and frontiers in social, ethical, legal and technological issues from disability to genetic engineering to computer privacy.

However, it is doubtful whether it quite fulfils these welcome aims. ‘Cyborg’ is not a value neutral term, it already has its ties and complexes. Myths, even ‘ironic’ ones, have their own directions, and those directions are part of the myth. Myths, and many other things, cannot entirely be disembedded or extracted from their defining social context, from within that social context.

Haraway writes that her essay is “an effort to contribute to socialist-feminist culture and theory in a postmodernist, non-naturalist mode and in the utopian tradition of imagining a world without gender, which is perhaps a world without genesis, but maybe also a world without end…” (151). However, a world without genesis may very well be a world without women, and may well presume a hidden unity for its generation. We all become machines, with the flesh simply a remnant of weakness. Davis-Floyd (1998) makes the point in some detail in her study of the increasing cyborgisation of birthing practices, which primarily function, whether intentionally or not, to give the medical establishment and hegemonic cultural forces more power, while alienating the woman giving birth.

Haraway argues that the cyborg, can be a model for re-imagining liberation.

In the traditions of “Western” science and politics...- the relation between organism and machine has been a border war. The stakes in the border war have been the territories of production, reproduction, and imagination (1989: 150).

In particular, the borders concerned are those between animal and human, human and machine, physical and non-physical and presumably male and female. The cyborg is held to challenge these divisions, without leading us to the ‘seductive’ desire for some kind of organic wholeness. As a result, by a never explained logic, nature ceases to be simply a resource appropriated by or incorporated into culture – perhaps because it is already
incorporated and there is no nature, tool, human distinction.

Yet it could be argued that the border wars have already been won by extending the rule of programs and human models into the world, and running work schedules according to ideals and theories rather than according to constantly gleaned ‘realities’, and indeed overriding those realities. This suggests that cyborgs do not necessarily transcend gender, in any way other than the way that males, in the West have always transcended gender, by relegating the female to nature, deleting it from the human and over riding it according to will and spirit. It may be that organic wholeness is actually a radical position, especially when it incorporates the ambiguities of actual life, and such an idea might suggest that human will cannot always be directly implemented via technology or effort without unforeseen consequences.

Further, statements such as:

Our best machines are made of sunshine; they are all light and clean because they are nothing but signals, electromagnetic waves, a section of a spectrum, and these machines are eminently portable, mobile ... Cyborgs are ether, quintessence (1989: 153),

suggest that cybermachines are already homes for disembodiment and etherealisation, and possibly enable a destruction of our bodies and their homes. This is not post gendered but a transcendence of gender via pure spirit. In this sense, cyborgs encourage the ideas of people like Moravec and the extopians in which the human is purely the mind or the spirit and we can overcome death by burying the body and copying our mind to a machine. The immortality claimed for such cyborgs also contradicts Haraway’s desire for positions of finitude and mortality (Haraway 1991: 16), showing that the cyborg is not inherently untranscendental. Kull’s post-Haraway cyborg theology also finds it easy to use cyborgs to discuss transcendence (2001, 2002), as does the film *The Matrix*.

The connection of the intellect with etherealisation is also suggested by Haraway’s admission that her cyborg has no disruptive unconscious. She explains this by her reluctance to embrace the totalising explanations of psychoanalysis (Haraway 1991: 9), as if that was the only theory of the unconscious, but it further shows the alienation of the flesh within the cyborg model, there is no room for ambiguity.

Haraway suggests that the cyborg might simultaneously enable the visioning of a system in which people “are not afraid of their joint kinship with animals and machines, not afraid of
permanently partial identities and contradictory standpoints” (Haraway 1989: 155). We might wonder if the cyborg, who has slain their ‘mere’ flesh (as per the mental immortalists), would inevitably see some kind of kinship with animals? Such an identity is only partial to the outsider who queries it, the insider with such an identity sees no diminuation. In an interview Ellen Ullman tells how she bought a little robotic cat:

it was advertised as having Artificial Intelligence and as having an ability to learn and respond to you…. And so I just left it on, and left it around the house and what bothered me was that after spending time with this very primitive robotic cat, I began to see my cat as just a set of robotic tricks. And I began to see her responses, which are really very complicated,… as a set of simple, programmed modules, and it really diminished her, and that’s what shocked me more than anything else, how would it change my thinking about a living creature (Ullman 2002).

In some ways this experience seems to be reductive of tensions and differences rather than leading to exploration of them.

The cyborg might, she claims, further destabilise the categories of class or gender, which have previously lead the political Left to fission into different identity movements – “Cyborg feminists have to argue that ‘we’ do not want any more natural matrix of unity and that no construction is whole” (Haraway 1989: 157). Cyborgs supposedly allow us to:

not think in terms of essential properties, but in terms of design, boundary constraints, rates of flows, systems logics, costs of lowering constraints…. no ‘natural’ architectures constrain system design (1989: 162).

Perhaps all this does is allow natural systems to be overridden by conscious will (as in conventional capitalism), creating a repressed which then sabotages what is supposedly determined.

Haraway famously argues that Cyborgs are post-gendered, but if gender is vital to “Western” self regulation and framing online, as argued before, then this seems improbable, and thus useless as a libratory tool. Portrayals of cyborgs on the Internet tend to be thoroughly gendered (DeVoss 2000). Silvio (1999) demonstrates that an apparently radical cyborg anime, also portrays control of female body by male spirit. Wilkerson writes:

from the standpoint of feminist bisexual identity… I contend that this [cyborg] myth evades the very issues of race and sexuality which it seems to be addressing’, and suggests that ‘it is vitally important to keep tensions of race and sexuality present rather than to blur the boundaries (1997: 164, 172).
If energy arises from opposition, then smoothing it out might lead to somnambulance.

In some ways the cyborg could be thought of as a surrender to boundaries broken by others – “becoming one with the borg”. Locating oneself in the ‘belly of the monster’ (Haraway 1991: 6) is also a good way to be digested and assimilated. Finally it seems that Haraway’s statement “the Subjects are cyborg, Nature is trickster” (1991) reintroduces a nature and culture, or self and world, divide – even if place for us has gone (‘geography is elsewhere’). Nature, or parts of nature, have regained their agency, as independent of humans and technology.

Those oppositions which the cyborg was to overcome have re-emerged within the attempt to find a third term combining both or acting as a bridge.

Exploring the way these category borders are used would seem more interesting than transcending them as hybrids, or by describing the current by models of a posited future. I hope a more modest word like asence which draws attention to the process of boundary uncertainty, of suspension and oscillation; that does not act as a bridging third; and which leaves the categories with the force that they have, is more useful than a hybrid like cyborg which already has its own drives, elisions and politics in place.

It certainly seems the case, that to our mythic imaginations the danger of machines taking over the machine/human counterposition, is more pronounced than that of us becoming one with them in an empowering sense. In particular the cyborg seems placid before the destruction of the natural world, and the incorporation of people as tools into information capitalism. It is placid before these events because these are the events which make cyborgisation possible. The Harawayan cyborg does not dispose of mythic directions, ignores the problems of systemic interaction, does not overcome conceptual polarities, does not provide a radical political strategy, and does not seem to portray the complexities of online, or cyborg, life and its varieties of interaction.

The model of the cyborg does not transcend gender, rather it hybridises and presents a model of gendered unity subservient to the system of machines caught between destruction and repair.
It is more profitable, and truer to online experience, to conduct a politics of online gender by observing these tensions than smoothing them over, or proclaiming they no longer exist.

Title:
A Structural Analysis of Medical Bureaucracies: What the Nurses Have to Say

Marcia Marx, Ph.D.

Abstract:

This research examines the structural dynamics of medical bureaucracies and more specifically explains how understanding organizational structure will provide insights into the problems faced in healthcare today. I will discuss the more traditional literature on organizations and then examine how a feminist analysis of medical bureaucracies will expand our knowledge of the problems in care giving organizations and help us to create more effective bureaucracies. I focus on the role of nurses in workplaces to provide empirical evidence of how structure impedes efficient functioning.
PURPOSE

Though the recent child decreases, on the scene of the education in Japan, which problem with school refusal becomes the past maximum. A problem at the school is pointed out as the location of the cause. It says that the class doesn't function successfully. By increasing, in individually depending compatible of the class person in charge, it isn't possible to be solved. The way of taking up a problem includes two tries. In the process of class management’s becoming difficult, it describes that various tries which the school does are a teacher by the time series. It analyzes an individual state mainly in the relation between the child and the teacher. It increases and it draws the personality of the class. The trend of the research moves from ? to ?. This change is the one to dig up the match of the teacher who is buried in the place of the practice from the attitude to have esteemed to make take up only the present situation as the problem and compose and to head for the restructuring of the common understanding.

In this research, it consulted the viewpoint of the school clinical psychology. It made that the capability forming by the teacher could be more independently achieved in the process of the research an aim. To realize it, it utilized an investigation activity by the expert from the outside at the school. The purpose of this activity was that the teacher notices that it does relation with the child and searched the growth of the teacher as the vocational person.

METHOD

The cooperator

The school which cooperated with the research is the public elementary school to have integrated five school into in 1995 in the city part and to have been born at it.
After establishment, it receives the specification of the studies and development school. It is the school which does a cutting-edge try to the problems of the modernistic education. It recruited a cooperator from the teacher at this school. It got three teachers who do 5 graders at the person in charge as the cooperator. As for them, to know a characteristic below by the observation of the class to make investigation before and behind back and forth was made.

The A teacher is the man teacher who continues a teacher over 16 years. Then, it takes the gathering duty of this teacher group. It is bighearted nature as the overall atmosphere. It thinks much of the guide of the whole class from the tutoring and it thinks much of child's growing in whole class atmosphere's changing.

The B teacher is the woman teacher who continues a teacher over 14 years. With the hope of the very person, it often takes charge of the amount grade. It speaks to the one child alone of the class and it thinks much of the tender concerning by the individual texture. Also, it is showing the posture to have judged personally, too, severely to up raise the child where to keep a rule is made.

The C teacher is the man teacher who continues a teacher over 3 years. Before becoming a teacher, it has the experiencing of work in the corporation. The story is trying to be made in the relation which is as near as possible for the children. 1/3 of the activity goal which the child wrote down gets "to insist on the sport" and only in the learning activity of the child, the effort to try to know a figure of doing that it is possible to see difficulty being can be guessed at. The C teacher notices a value for the overall activity to rise.

The way of the investigation

The way of the investigation which was used by this research is RCRT for the teacher which repeated revision for the school teacher. A procedure is composed of 4 steps below the most part.

1. The teacher extracts the child of his class in the order to imagine at the head.
2. It extracts the child of the affinity who doesn't go successfully respectively about several persons with the child with good affinity.
3. It creates and it shows 15 sets of sets of one set, three, of children to the teacher in order. The teacher chooses two which have the characteristic to resemble among three the thing comes out and shows the characteristic to be common. It increases and the degree of the opposition is described.
4. As for all child, it evaluates the degree of the characteristic according to the expression of ...
The time of the investigation

In this research, it implemented investigation with twice in the interval of the about half year to the same class. It implemented the 1st at the end of the grade of 3 graders. The 2nd was the summer vacation of 6 graders. During this research period, there was not a difference of the teacher and the child.

It did feedback interviewing and group discussion every each investigation and it made the recording data research material. The analysis and the feedback on information was shown in the profile data of the child by 15 expressions which were gotten as the investigation result. Next, it did the factor analysis the variable of which was an expression every class.

It computed a simple answer using the varimax rotation method after fixing the number of the dimensions and it put an expression in order every teacher. Next, it computed the factor point of the child and it showed the characteristic of the child in the figure.

The RESULT and CONSIDERING

The characteristic of the teacher

Here, it shows mainly the interviewing record of the feedback. A result by the factor analysis was shown in the attached list. In the interviewing scene, it discussed the key word which gathers those expressions up every factor with the teacher. The expression which contains an affirmative meaning in the table for the teacher was shown on the left side whereas the expression which contains a lot of negative meanings was shown in the right.

The case of the A teacher

The expression of the A teacher gathered mainly up by two groups in the case of the 1st implementation. If supposing that an expression is gathered, it became "quiet" vs. "jejune", "pleasant" vs. "silence". It is in the characteristic that these pairs don't always become an adversative like Japanese. It resulted in the structure which has an opposite meaning in the meaning space to have completed in the relation with the child of each teacher.

In the case of the A teacher, the figure of the child in case of the whole school life is roughly shown first. It was using specific expressions such as "the silence" repeatedly and the condition which receives the characteristic of the child was supposed not to
differentiate. It was telling the introspection to suggest the simplification of "... of
difficult really in it was difficult to become a word to extract the characteristic of the
child. " and its viewpoint to.

In the 2nd implementation result behind the half year, it was mainly gathered
up by three groups. " Being in shoes of the person and being thought of " vs. " making its
pace important ", " the effort can be made " vs. " jejune ", saying " becoming " " it seems
that it is a child " vs. " becoming pubescence ", the kind of the viewpoint increased. It is
the state to have been conscious in the pile with concrete relation with the child and to
have been thinking of the relation. The result appeared in the increase of the kind of the
viewpoint.

"After doing investigation in front, as for the child who did negative evaluation,
it was seeing slowly and carefully, it came and it thought that it does. It got to think of
the reason for the act, " Why was it so " which is in another back. It thinks that it was
changed from the condition which was gathering a viewpoint only around the actual
act. ... When finding that there is a reason, the feeling irritated often calms down. It is
possible to touch without becoming too emotional as the teacher. It thinks for the such
change to appear in the 2nd word use."

The case of the B teacher

The B teacher could gather the 1st expression to three. The B teacher could
gather the 1st expression to three. 15 expressions could be gathered to " the
independence " vs. " the behaving like the baby ", " being positive " vs. " the shade ", "
the responsibility " vs. " the spiritlessness ". The request how to want to have a child
grow up was very clear. There were many expressions " not to be " in the negative
expression and the B teacher made the height of the expectations to the child once more
what where many evaluative viewpoints occur in the fruit sense. Also, it reported a
change at the short time. The way of touching the child of the affinity who felt not good
changed.

It was a strange thing but behind the back of the investigation, it was changed
from the side of the child. Because I still changed, it thinks that the way of touching
from the child, too, will have changed. The posture that the strength of the influence to
investigation teacher himself is shown and that the B teacher tries to undertake a
change as his own happening was definite.

After the 2nd implementation, the B teacher told as follows. "Because it
understood its point of view in the investigation in front of this, it thought that it let's
attempt to see with the different eyes. It thinks for the way of putting on which the child
concerns consciously when it let's see with the different eyes to have been changed. On the other hand, it reconsidered the narrow of its point of view.

In this way, B teacher himself is the meaning to tell. The thing for which the introspection in the business that the daily life is busier simultaneously with the size of the effort of this teacher himself by the daily life in this talk is very difficult was supposed. It is easy for the reconsideration to reflect on it, being surplus to occur. The teacher needs the system building to guarantee the introspection which is useful for the practice while of this softening by.

The case of the C teacher
The C teacher gathered an expression to three about the 1st implementation. It was "activity" vs. "stillness", "quick on the uptake" vs. "slow", "burning" vs. "fragile". It attracted C teacher himself to the latter and of the whole it was moved. It is the fact that the image of that C teacher himself grows and the growth of the child overlaps in the teacher.

While seeing a figure, the C teacher told. "It is stillness, and it is but it has activity in. It is difficult to ascertain. The feeling becomes borrowing, saying not being because the child who is seeing extremely when seeing objectively is seeing only a side."

After the 2nd implementation, the C teacher told. "It knew that the existence of so-called class was very big for the growth of the child while discussing in the grade. It becomes big in teacher himself. When saying misunderstanding without fearing it, the class, too, was important to it but the recess time had weight. Now, it feels the importance of the experience which can release the idea to nourish the power to think of logically and order's XPOSs have stood. It is in the place of the class that it does it."

The change of the class view was linguistic-ized in this way.

The confirmation of the collaboration

It observed the state to share the information of the child each other among the teachers from the investigation interviewing. It was beforehand and as for the A teacher, the role of the elder brother and the share which can be compared to the family were causing the role, the C teacher of the mother about the role, the B teacher of the father of the grade. A communication by the viewpoint of each role was lively done beyond the frame of the class.

The remark of the A teacher
"The C teacher became a teacher, in 3, he began and took charge of the amount grade.
There was time to have thought that the truth must remark that it is various more. On the other hand, it sees from us and it has very good feelings. It invented when there would be to be it even if it entrusted. To nip never to do his bighearted in the bud, it was careful and it concerned.”

In this way, it admits each other each other as the individual among the teachers and the work which re-recognizes a mutual position was observed in the investigation. When expressing this in words and confirming it, the investigation played a big role. If there is not investigation, it seems that it is the place to be buried without being felt in the practice of the daily life. It seemed that it was useful for defining relation among the teachers by telling " that I of being this. can see so my viewpoint " before in the data which expresses the relation among children and teachers.

The C teacher: “It thinks that it pictures S and K more in this direction if being me.”

The B teacher: “It is so. It has been possible to be seen in this place by all means to, me. Why will the way of that it is possible to see be different from the C teacher? “

The C teacher: “Is to concern with the soccer related?”

The A teacher: “It is related to the nature of doing the favorite of the C teacher?”

Everywhere, it was seen and it thought that such exchange neutralized the leaning of the mutual point of view via the process of such a discussion.

Comparison between Teachers and Psychotherapists, on Each Viewpoint to Understand Infant Playing

Shimonuri Mayumi : Kyoto University of Education
Matsui Hitoshi : Kyoto University of Education

Abstract
Aims : The research objective is to make a comparison between nursery school’s teachers, psychotherapists and students on each viewpoint to understand the infant playing together. We used the ‘on-going method’ for investigating their processes grasping infants’ characteristics.

Method : We applied the way named ‘on-going method’. In practice, teachers, psychotherapists and students watched the videotapes that infants were playing in their infant school. They talked things that they were guessing on falling, while they fixed their eyes on.

Result : As a result, our data showed that the position and role as the specialist characterized their recognition, judgments and making relationships with infants. We expected to let the specialists know their own characteristics each other. These knowledge would be needed when the specialists in their different area work together.

Key Word
infant teacher psychotherapist collaboration on-going

Introduction
In Japan, school counselors have employed at junior high schools from 1995. It’s unusual for specialists except teachers to work in the field of education by then. Now school counselors’ employment spread over elementary schools, high schools and infant schools.

We think that it’s important for the specialists to know their characteristics and collaborate. Especially at infant schools, it’s needed for the specialists to know each viewpoint to understand the infant playing together.

Aims
The research objective is to make a comparison between infant school’s teachers, psychotherapists and students on each viewpoint to understand infants playing together. We used the ‘on-going method’ for investigating their processes grasping infants’ characteristics.

The ‘on-going method’ is adopted how to know the teacher’s recognition, judgments and making relationships with the children, while he/she is just teaching in the school. This method is purposeful to catch the teacher’s characteristics just now, not to catch them afterward. Ikuta(2002) used this method and researched about the difference how to recognize between the teacher and the professor, while they were watching the class of Japanese by their practice teacher.
In our research, the subject watched the videotapes that infants were playing in their nursery school. And they talked things that they were guessing on falling, while they fixed their eyes on.

**Method**

1. **Material and Subject**
   **Videotapes**
   We applied four videotapes that infants playing at their infant school in their daily life. We were named Videotape A, B, C and D. We edited A and B from training ones for infant school’s teachers, and C and D from ones that were filmed by us at the public infant schools. It took the subjects between three and a half minutes and five minutes to watch one videotape. The scene of A was to play with big blocks. B was to play with pretend scenarios. C was to play in the sand. And D was to play under a horizontal ladder. Each of the videotapes had the theme. The theme of A is to undergo a mental. The theme of B is to conflict with friends. The theme of C is to share pleasure with friends. The theme of D is to understand the infant from the position of each of the subjects.

   **Questionnaire**
   Whenever the subject watched one videotape, the subjects answered three questions and wrote them. Q1 ‘Please write the most impressed scene and the reason why you were impressed.’ Q2 ‘Please write things that you missed talking while you watched the videotape.’ Q3 ‘Please write the other information that you’ll want to know the infant, except for the videotapes.’

   **Interview**
   We interviewed the subjects, when they ended the last paper. Our question is ‘If the infant in the last Videotape D is playing in front of you, how do you make relationships with him?’

2. **Subject**
   The subjects were 10 infant school teachers, 10 psychotherapists of children and 10 teachers college students of fourth year.

2. **Practice**
   **Time for practice**
   The practice took from July to October, 2004.

   **Procedure**
   We practiced the individual interview. The procedure was as follows; (1) The subject watched the videotapes. He(She) talked anything he thought, felt and found, while he fixed his eyes on. We recorded all talking things. (We call this process ‘on-going’.) (2) As soon as he finished watching one videotape, he wrote in the paper to answer the questions. (3) He repeated (1) and (2) process, while he watched four videotapes. (4) Finally, he was interviewed about the infant of the last videotape. The practice took about one hour.

3. **Analysis**
   We analyzed talking things of ‘on-going’ and the Videotape D.

   We grouped talking things of ‘on-going’ by 12 categories and 45 subcategories. (Refer to
Next we made up them. And we picked up 'the subcategories of many talking things in same position'. Next we picked up 'the sub categories of many talking things by comparison with other positions'.

? We picked up `the terms' used frequently of `on -going'.

? We grouped the writing things about Q1 of Videotape D by five contents the subject wrote and four objects the infant worked on.

? We grouped the talking contents of the interview into six grades the subject made relationships with the infant and three grades how the subjects understood the infant.

### Result

We made up the number of `on-going` talking things. (Refer to Table2.)

The results of talking things of `on-going` were as follows. (Refer to Table3 and Table4.) The subcategories of many talking things of the Teachers were < Want to do > and < Have interest >. They were going to grasp the infant's aim of playing and interest in playing. The talking characteristic of them was < Estimate >. This was the important role of them. < Emotion/ Feeling >< Thought > showed the characteristic that they declared their thoughts shortly.

The subcategories of many talking things of the Psychotherapists were < Doing > and < Behavior >. The talking characteristic of them was < Reflect >. And the subcategories of few talking things were < Cause for behavior > and < Estimate >. They were talking as they watched and heard then, but they didn't talk their thoughts soon. And they were going to understand the present state of the infant.

The subcategories of many talking things of the Students were < Doing > < Behavior > < Situation >. These were the states of the infant that they were watching. They were speaking < Cheer > well to the infant, for example `Yoshi!' 'Ike!'. And they noticed the infant was in bad physical condition. Besides they were interested in < Making by the infant >. From the above fact, it came out that they were in favor the infant and acted with one heart and mind easily. Through < Notice or Understand another time >, we knew the Students' understanding processes about the infant.
Table 3 The Sub-category of Many Talking Things in Same Position’s Subjects

- **Condition A**: The number of talking things in same position’s subjects amounts to more than 5%
- **Condition B**: The number of talking persons in same position’s subjects amounts to more than 40%

*The boldface satisfies Condition A and Condition B.*

The results of the terms used frequently were as follows. (Refer to Table 5.)

The Teachers used frequently ᴰ? hard? , ᴰ? do one’s best? and ᴰ? oneself? . They estimated the attitude acting with positive and independently And they wished the infant would acquire such attitude in the future.

The Psychotherapists used frequently ᴰ? collect oneself/ come around? , ᴰ? have one’s way? and ᴰ? tell the playmate / be understood by the playmate? . They noticed the infant’s conflict and how to cope the problem. And they used ᴰ? role? and ᴰ? on purpose? , too. They noticed whether the infant has sociability. Then the characteristic terms of them were ᴰ? the world of oneself? and ᴰ? playing on one’s own? . They thought that playing alone had both a plus side and a minus side.

The Students used frequently ᴰ? alone? , ᴰ? on purpose? and ᴰ? cooperation? . These behaviors were easy for them to notice. And they wanted to know the meaning of these behaviors.

We grouped the contents writing Q1 about Videotape D into five contents; Remark/Question?, Characteristic of infants?, Thought?, Interpretation? and Consciousness of the problem?. Besides we grouped the objects the infant worked on into four objects; Thing?, Person and Thing?, Person? and Self through the thing?. The results were as follows. (Refer to Table6.)

**The Teachers** wrote about Thought? and Interpretation?. They were going to understand the infant as great. But they demanded the development better than now. **The Psychotherapists** continued having Consciousness of the problem?, while they were watching the infant. They often understood that the infant was facing Self through the thing.

The Students wrote in apt terms for their mind. They began to know about a developmental stage and Characteristic of infants.

We grouped the talking contents of the interview into six grades that the subject made relationships with the infant; Do nothing/Just look/Follow behind, Sit his side/Do his same thing, Make a relationship through the thing, Touch him, Speak to him/Play with him, Play with him actively/Praise him/Invite him other playing. Besides we grouped them into three grades that the subject understood the infant; He enjoys, He feels like doing, He is content, He doesn't enjoy, He is dull, He is content. The results were as follows. (Refer to Table7.)

**The Teachers** were the position to work on the infant. But they had the conflict between
working on and acceptance. They hoped that the infant was playing with friends more than playing alone.

The Psychotherapists were the position to accept as the infant really is. But they confirmed the infant’s reaction to their behavior. They thought that the infant was enjoying alone and keeping a distance to other persons.

The Students were doing for the infant. And they did trial and error. Thinking of them was similar to one of the Teachers.

Conclusion

We knew that all subjects would grasp a mental state of the infant and work on the infant who would be grown up and happy. On the other hand, our date showed that the position and role as the specialist characterized their recognition, judgment and making relationships with the infant.

Discussion

In Japan the people are ready for various specialists to work in the educational system. But they make little exchange of their information. In future it will increasingly need for the specialists to know their own characteristics each other.
We think that Teachers can take in away of thinking of Psychotherapists. We would like to express our views for two ways of thinking of Psychotherapists.

First it’s often difficult for Teachers to ‘accept as the infants really are’, because they hope that the infants act as one of the group and grow up along a developmental stage. So it’s important for Teachers to perceive the limit of their role and sometimes leave the infants to other specialists.

Next we think that Teachers will be able to change their viewpoint to understand infants, if they will have consciousness about ‘facing themselves’. And we mean that they will notice for themselves to be concerned in making the situation of the class. Consequently they will think that infants will also need the time of ‘facing themselves’, and can follow them.

We expect that psychotherapists will explain their particular ways of thinking to teachers, and they satisfy teachers that they would like to do.

At present the applications of Students in the field of education are going to expand gradually. When the specialists are working with students and beginners, they can remember what state of mind they were in at first, and they can confirm what to do they were experienced in the work.

These knowledge would be needed when various specialists will work together.

References
The Movie

The movie *Clueless*, released in 1995, targeted young girls and women from middle school and up (Lawrence, Rudin and Heckerling, 1995). This film greatly summarized the clothing choices of teenage girls in the mid 1990s. It appeals to the typical girl who has experienced or is experiencing the social pressures of high school. These pressures include the desire to be popular or “fit in,” which often means the desire or need to follow certain fashion trends.

The Character: “Ty”

Ty is the stereotypical, bumbling outcast who can only be saved from herself and her boring, socially inept life by a popular girl. Cher, the main character, sees Ty as a means of fulfilling her own warped sense of community service. Ty is the new girl at school and as such presents the possibility that Cher can better the world by making over one fashion disaster at a time. Over the course of the movie we watch Ty metamorphosize into something of a social butterfly, with still shaky wings. It is Ty’s struggle to find a compromise between her personality and her choice of dress that defines her character in the movie, *Clueless*. The
costumer designer, Mona May (Lawrence, et al., 1995), does an excellent job of portraying Ty’s transformation through the costumes chosen. In all Ty undergoes thirteen costume changes, each adding a dimension to Ty’s evolving character (Table 1).

**Analysis of Fashions Symbolizing Personality and Roles**

Ty’s costumes reflect changes in status within her role of high school student and friend. As we first see Ty (Table 1: Scene 1), she is wearing grungy, sloppy clothing, which the audience learns is congruent with her role as an outcast in her previous school. Ty’s baggy clothing and untidy hair show her carelessness towards her appearance, as well as her self-consciousness about her body. This becomes obvious in the makeover scene (Table 1: Scene 2) when Cher cuts a long top at the midriff causing Ty to hide her stomach while looking in the mirror (Lawrence, et al., 1995).

At first glance, Ty’s dress and appearance lead classmates and the audience to identify her as skateboarder or “slacker;” an underachiever who dress sloppy and is not part of the popular crowd at Beverly Hills High (Lawrence et al., 1995). It is over the course of the makeover that the audience learns how unsure Ty really is of herself. Also, her pre-makeover dress does not distinguish her gender, as she does not choose to adorn herself with feminine form-fitting fashions.

After the makeover Ty’s gender role is clearly defined through her dress and appearance, which mainly includes wearing short skirts and tight midriff tops. This dramatic change from unkempt and unfashionable to preppy and trendy, affect’s Ty’s confidence, and as a result the boys in school take an interest in dating her and the popular girls want to befriend her. Ty’s overnight popularity and rise in the social hierarchy in the school reflect changes in Ty’s roles.

Although Ty tries hard to develop a new personality to match her new look, she struggles from time to time. While she develops into a more confident and outgoing young woman, some aspects of her past are still visible. For instance, her tattoos continue to communicate a former aspect of her personality, and can be seen throughout the movie no matter what type of apparel
she wears. As the movie progresses the audience is aware of Ty’s struggle to find a balance between her pre- and post-makeover self.

**Analysis of Fashions and Nonverbal Communication**

Cher’s first impressions of Ty were made based on her adornment. Her dress communicated that, without Cher’s help and fashion advice, Ty would fall victim to the ridicule of her peers. This is evidenced by a student who commented that “[Ty] could be a farmer in those clothes” (Lawrence, et al., 1995). Cher and her friends stereotyped Ty as the aforementioned “slacker” simply based on the way she was dressed.

Ty’s character uses nonverbal communication to gauge how she is being viewed as her transformation progresses. Ty is even attracted to Travis, a popular boy, most likely because he is dressed similarly to her. Since perception is culturally conditioned, Ty had to conform to the liberal California style of dressing in order to make a good impression upon the rest of the school. The most universal dress item used for communication is hairstyle (Storm, 1987). Ty’s unkempt hair in scene 1 (Table 1) communicated her grungy lifestyle. Later, her styled hair depicts her affiliation with the popular crowd.

**Analysis of Fashions and Status and Social Class**

The outfit chosen by Ty on her first day at her new school portrays her as lower class and status. The comment about her looking like a farmer shows evidence of this (Lawrence, et al., 1995). After her makeover, however, Ty’s status immediately changes. Ty uses brand name clothing to show prestige (Storm, 1987). However, Ty tries to portray a higher status than which she appears to be comfortable. This is apparent when she is not sure of how to wear a sheer
button-down shirt at the frat party (Table 1: Scene 8). She asks Cher’s opinion and changes it several times, from tying it around her waist to wearing it as a headband in exasperation. Ty’s desire to change her status is relative to her desire to impress her new friends.

**Analysis of Fashions and Dress Congruence**

Before the makeover, Ty did not appear to be interested in her appearance or things such as shopping and socializing with her peers. Afterward, her change in adornment paralleled her need to match her personality to her new look, which is known as dress congruence (Storm, 1987). As stated earlier, Ty’s personality and actions follow her change in adornment. She aligns herself with the popular crowd through her new look and therefore has to act as they do, although uncharacteristic to her old self. She acts much more confident with her new dress choices. She takes on a snobby attitude with her crush, Travis, telling him to go sit with the rest of the slackers, and even turns on Cher, calling her “a virgin who can’t drive” (Lawrence, et al., 1995).

By the end of the movie, as Ty reaches a level of self-actualization, she develops her own style by combining her old and new looks. This is shown in the outfit she wears to Travis’ skateboarding competition (Table 1: Scene 12). Her pants look very similar to the brown baggy pants that she wore on her first day (Table 1: Scene 1), while her fitted striped top shows off her feminine figure. The audience can sense that Ty is coming into her own, feeling confident enough to be a little different from the crowd.
Conclusion

Although exaggerated, the movie Clueless provides an excellent example of how dress and adornment serve as cues to those around us. Careful attention was given to the development of the character, Ty. The film gives a larger than life view of high school cliques and the lengths to which teens will go to fit in.

References

On March 1, 1912, the Votes for Women Club held its organizing meeting in Grand Forks, North Dakota, as a chapter of the Votes for Women League of North Dakota. The Club’s stated objective was “To advance the industrial, legal, and educational rights of women, and to secure suffrage by appropriate state and national legislation.” The Club remained active until North Dakota Governor Frazier signed the Susan B. Anthony Federal Suffrage Amendment to the Constitution and its subsequent ratification. After two years of inactivity, the Votes for Women Club held its last meeting on December 29, 1919.

Two ledgers containing the hand written minutes for each meeting, the club’s constitution, and membership roster are currently held in the Elwyn B. Robinson Department of Special Collections in the Chester Fritz Library at the University of North Dakota in Grand Forks, North Dakota. For this project, I transcribe the ledgers and ask the questions, who were these women and men? What was their educational, economic, and professional status? I also examine how the organization evolved from a group of women who held teas, to a movement where debates and rallies drew hundreds of people, including men, who became members of the movement. Another aspect of the club that I examine, is the manner in which the organization was publicized through newspaper ads and articles, booths at country fairs, and literature distribution. In this paper, I attempt to reconstruct the movement, not just through a transcription of the ledgers, but by examining all available literature from the time, and by researching the lives of the individuals who were leaders and members of the movement. I believe this information can not only offer insight into how the women’s suffrage movement gained momentum during the early 1900s in small towns across the United States, but can offer insight into how women’s movements of today might be mobilized.
THE EU ACCESSION OF POLAND, CZECH REPUBLIC, SLOVENIA AND HUNGARY: THE PROBLEM OF FDI

Cristina Mocci, Giovanna Anselmi

ABSTRACT

This work analyses the role played by Foreign Direct Investments (FDI) in the development of four Central East European Countries (Czech Republic, Poland, Hungary and Slovenia) become new members of EU from the 1st of May 2004. Preliminary points of discussion are on one hand the initiatives undertaken by the EU to support the adhesion of CEECs to the “acquis communautaire” through the European Programs PHARE, ISPA, SAPARD and EU Financial Institutions (EBRD, EIB); on the other hand the national markets liberalisation process, the privatisation of productive sectors and the actions adopted by each country to attract FDI. Further than at macroeconomic level, the FDI role in the transition economies is considered in relation to the degree of presence of foreign firms, the overall firm productivity, the internationalisation of economies and the labour market. FDI outflows and inflows between Italy and the four mentioned countries are reported For the analysis the data provided by UNCTAD and by national institutions and/or by scientific publications are used. The UNCTAD short – medium term forecasts on FDI in the four considered countries are also included. In the conclusion the main socio-economic policy implications related to the FDI in transitional economies are synthetically discussed.

1. Introduction

After Berlin Walls shut down in the 1989, stronger relationships were established between EU and CEECs (Central and East Europe Countries) with particular attention to trade and economic and political cooperation. In 1989, to support financially and technically the economic transition, it was launched the PHARE Program (Poland and Hungary Action for the Reconstruction of the Economies), addressed at the beginning to Poland and Hungary and in the following extended to all others CEECs. From 1994 to 1996 ten CEECs requested to adhere to the EU and among them Poland, Hungary, Czech Republic, Slovenia. At the end of 2002, having these countries mostly met the 1993’ Copenaghen political and economic criteria, the “Accession Threaties” were signed and ratified on the 16th of April 2003 in Athens. From the 1st of January 2000 additional instruments were implemented, like SAPARD and ISPA, to help the new countries to improve their management skills and administrative capabilities in agreement to the Criteria of acquis communautaire and to the objectives of the Social and Economic Cohesion Policies. Financial Institutions, like EIB and EBRD, were also involved to support EU initiatives. With the EU enlargement positive effects are expected to speed up the new comers economic development. At least same of the new members, namely Poland, Hungary, Czech Republic and Slovenia, show a relevant capability to attract FDI.
due to the favorable conditions of the labor market, the incentives provided by national policies and the higher dimension of the markets. To encourage foreign investors important legal modifications have been adopted by National Governments in the fields of the liberalization of capital transfers, the protection of foreign investments, the equal conditions between local and foreign investors. These manifold actions consolidate the transition towards a market economy and enlarge the privatisation process carried out until now.

2. The transition to the market economy

In the east European countries the opening of the national economies was preceded by a period of inner privatisation directed to the local operators. Only later, when the lack of resources and knowledge, needed to operate in a competitive global context, emerged, the foreign investors were also involved in the privatisation and restructuring of the national economies. As consequence of these process, these countries are facing the same problems the EU is facing: the lack of labour market flexibility, the high level of taxation and the social welfare sustainability. To compete in the enlarged market, production costs have to stay low and the productivity must increase, with a high risk to push up the unemployment. In addition the EU budget regulations restrict more and more the margins of national development policies and the new members are obliged to contribute, from the beginning, to the financial budget of the EU.

In conclusion there are different ambivalent conditions on the one hand, characterized by the relevant difficulty to realize new socio-economic asset and a sustainable development, and on the other hand by the benefits expected from the adhesion to the EU (the shut down of barriers to the commerce and to the investments development, the free movements of goods and workers, the easier transfer of technological innovations, the partnership in european programs for research and development).

3. The privatisation process

Further the maximization of the selling price, the main objectives of the privatisations as seen by the government agencies have been the reduction of the firms bankruptcy risks, the fast economic growth and the integration of the national economies in the global context. For the managers of the privatized firms the main reasons to open the privatization process to the foreign investors were the long term development of the firms, to find new funding and expertise in marketing and management, to get new technologies and to introduce firms into the international markets.

The incidence of FDI in the privatisation process of the mentioned countries is reported in Tab. 3.1 a) and Tab. 3.1 b) for the period 1991-1999. Both in Czech Republic, in Poland and in Hungary the total FDI has rapidly grown from 1991 to 1995, with a share related to privatisation, respectively of the 100% in Czech Republic, of the 27% in Poland and of the 68% in Hungary in 1995. After 1995 FDI remained important for privatisation in Czech Republic (respectively 92% in 1996 and 80% in 1997). In Poland the highest share of FDI in privatisation was in 1992 (72%).

4. FDI role and national policies

International institutions define FDI as the creation of durable interests among subjects residents and operating in different economic national systems,
characterized by a relevant power of control of the foreign investors on the firms of the host country. So the investments are not characterized just for the financial profile, but become expression of entrepreneurial actions taken by Multinationals to create in foreign countries firms directly managed and financially controlled. Among the benefits expected from FDI, some are direct and immediate (on the balance of payments, on the balance of investments, on the employment growth). Others are indirect and referred to all the economy (Spillover Effects generally classified in Horizontal and Vertical Spillovers).

The Horizontal Spillover are due to relations and competition among the national firms and the foreign affiliates operating in the same production sector, they act through the training or retraining of the local manpower; the adoption of higher management standards, the stimulus to realize modern infrastructures and efficient communications systems.

The Vertical Spillovers are instead related to the productivity improvements achieved with transfer of knowledge from foreign producers to local suppliers (backward linkages) and to the firms utilising the semi-finished products of the Multinationals. The choice to open to FDI become effective in different times for the new EU members. As Hungary was the only country having strong previous relations with the rest of Europe and with the nearest countries, she was the main FDI beneficiary during the '90s. Poland, Czech Republic and Slovenia were more cautious in liberalizing their economies, due to discordant inner political orientations. More recently, the Czech Republic and Slovenia liberalized, and became much more attractive for FDI. Due to a more restrictive policy versus FDI Slovenia has still difficulties to reach permanently high level of foreign investments.

5. FDI statistics
The main statistics on FDI reported in the following, concern the size of stocks and flows of FDI and the impact at the firms level and on the labour market.

a) Size of stock and flows
The growing cumulative amount of FDI clearly shows the relevant role played by the FDI in the considered economies (Fig. 5.1). FDI stock in the Czech Republic has joined the 60% of the GDP; Hungary follows with 42%, Poland with 26% and Slovenia with 19%.

In Fig. 5.2 FDI stocks Inwards and Outwards are reported. Remarkable differences appear between the high level of the stocks generated by foreign investors in each country and the low stock levels generated by national investors abroad. FDI annual flows are reported in Fig. 5.3. Czech economy attracted about the 15% of the GDP in the 2002, about the 5.8% in the 2003 and 2004. In recent time Hungary presented a strong uncertainty in attracting FDI: as inflows have been about 1.5% of the GDP in 2002 and in the 2004, against a negative value in the 2003. Poland has reached a FDI inflows level of the 1.8% of the GDP in the 2002. More far appears to be Slovenia. FDI inflows are mostly directed to the secondary sector (36.8 - 42.5%) and to the tertiary sector (57.3 - 61.7%) of the national economies. Globally, in the years 1996-2000, the contribution of EU to the FDI in the considered countries has been dominant (70-85%). European countries who mostly invested in this area were Holland, Germany, Austria, Italy and France. Holland has been present especially in Poland, Czech Republic and Hungary, Austria operated mainly in Hungary and in...
Slovenia. Italy is more present in Poland, Slovenia and in Hungary, with a very low activity level in Czech Republic; France mainly directed his investments to Poland and Slovenia. Germany is the only country having permanent relations with all East European Countries considered.

Poland, Czech Republic, Hungary and Slovenia are limitedly present abroad with their FDI (1% of GDP) due to different factors: the lack of funds and of capability to operate in a free and competitive market, the firms small size and the reorientering of the economic flows from the CEECs to the EU. These investments abroad are due to competitive advantages in some economic sectors and to the exploitation of existing commercial relations.

b) Impact at firm level

Further the macroeconomic level, FDI impact has been relevant also at firm level in all the four considered countries.

The foreign firms have consolidated shares of the manufacturing sector, especially in Hungary where the share overcomes the 70% and play an important role in these countries both for turnover and productivity (added value/worker) (Fig. 5-4).

In Czech Republic foreign firms represented in the 2002, the 32% of the total number of firms in the country, produced the 48% of the output, gained the 46% of the profits and kept the 35% of the employment.

The average productivity in the manufacturing industries is increased in the period 1993-2001 relatively to the USA values, growing from 10% to 28% in Poland, from 15% to 27% in Czech Republic, from 16% to 34% in Hungary.

In Potential Purchasing Power values, the average the added value/worker in the year 2000 was equal to 46.3% in Poland, 62.7% in Czech Republic, 76.9% in Slovenia, 61.1% in Hungary.

The FDI contribution to the firms fixed capital composition (Tab. 5.1) was in the 2000 the 23% in Poland, the 35% in Czech Republic, the 15% in Hungary and the 4% in Slovenia (9% in 2001).

In 2000 the foreign affiliates operating in Poland were 4340, with a total asset value of about 45330 Mil EUR, a selling’s amount of 62 BIL US$, an average asset value of 10,44 Mil EUR, an asset value/employer of 69,9 KEUR and an average number of employers of 149,4. In Czech Republic, the foreign affiliates had in total, a selling’s amount of 45 BIL US$ of which 10 BIL US$ were exported. In Slovenia the 1617 foreign affiliates had a total asset value of 7229 Mil EUR, the asset/affiliate was 4,47 Mil EUR with a asset/employer value of 154,5 KEUR and 28,9 employers/affiliate. In Hungary were operating 26,645 affiliates with a total asset of 26981 Mil EUR, an asset/affiliate of 1,01 Mil EUR, an asset/employer of 44,5 KEUR and 22,8 employers/affiliate.

The concentration level of the production activities can be examined looking at distribution of selling volumes among the firms. In Poland the first five foreign affiliates weighted, in 2000, for 14,3% of the total, the first ten for the19,8%, the first fifteen for the 24%. In Czech Republic the first five foreign affiliates covered the 29% of the total, the first ten the 34,5%, the first fifteen the 38,4%. The corresponding figures were respectively 24,7% - 31,4% - 35,5% in Slovenia and 14,1% - 18,2% - 20,9% in Hungary.

c) The labour market

The intensive transformation, privatization and restructuring activities, carried out in CEECs, have produced deep and alarming changes in the labour market. Many local
firms submitted to privatisation process, reduced the staff to attract enough foreign investments. In 2003 the unemployment levels joined 19.8% in Poland, 7.8% in Czech Republic, 6% in Slovenia, 5.8% in Hungary. Employment levels are now relatively increased due to the recent Greenfield foreign investments. The trend of the labour cost per unit in manufacturing is reported in Fig.5.5. As shown, it strongly decreased in Poland after 1998 (-12% in 2002), while it has grown recently in the other considered countries (+13% in Czech Republic and in Hungary). In general social disparities are increased with the entry of the multinationals as foreign firms employ the most skilled manpower.

6. The main problems with FDI
Further the employment reduction a new problem rose more recently in the considered countries in relation to the high share of profits come back to the multinational motherfirms from the affiliates. The amount doubled in Czech Republic during the last two years. In Hungary it rose in 2000 25% relatively to the year before and in 2003 decreased to the levels of 2001. Globally the back profits going out for all the considered countries amount to 50% of the FDI annual flows. In addition to raising unemployment and to the back profits, other not least problems are related to FDI development. The integration with multinational nets leaded to a strong specialization of the local productions and to a limited attribution of decision capabilities to the local firms. Strategy decisions, in particular, were transferred to the “head quarters” of the multinationals and it become real the risk that reorganizations decided too far can affect economical efficiency of local firms. The national economic policies are coping with the risk to be exposed to sudden capital movements, unexpected job cut and heavy pressure of foreign lobbies. The presence of foreign firms is introducing important and new problems to economic policy. The main challenge for host countries is to try:
- to limit collateral negative consequences on the labour market and on the national economic system
- to maintain the long term benefits coming from FDI
- to keep the foreign investors on site in spite of raising labour costs
- to spur the foreign firms to reinvest FDI profits instead to send them back out.

7. Expected developments
In spite of the negative international economic trend that UNCTAD and several other national institutions have foreseen, Czech Republic, Hungary, Poland and Slovenia will maintain and strengthen their advantageous positions in attracting foreign investments. The FDI Confidence Index 2003 (A.T. Kearney), evaluating the attraction capabilities of different economic systems, attribute respectively the fourth, the thirteen and the seventeen position respectively to Poland, to Czech Republic and to Hungary.

The UNCTAD survey undertaken at world level with the IPAs (Investment Promotion Agency) of each country (158) about the future perspectives for the period 2004-2007, shows a strong degree of optimism versus FDI increase in the short (2004-2005) and in the mid-term (2006-2007). More than 90% of the IPAs in the European East countries believe in this perspective for the short term, the 80% for the mid-term.

As to the mode of admittance of FDI, in the short term, both greenfields (55%) and Mergers and Acquisitions (32%) are foreseen.
In the 2004-2005, the sectors attracting the most of FDI will be the Manufacturing Industries (electrical and electronic tools, others manufacturing, metallic and mineral products, motor-cars, machinery) and, in the tertiary sector, financial services, Information Communication Technology (ICT), education and health, building and transports. In the primary sector mining and oil activity mostly will attract FDI. Germany and USA are mentioned frequently as the main investors in the short term. To stimulate the process, all the mentioned countries introduced recently meaningful measures to attract and keep FDI, in the fields of taxation of firms and personal income, real estate and creation of technological development poles.

8. FDI and italian firms.
The Italian FDI abroad are still mostly due to the large size enterprises; however the contribution of SMEs to the international production is growth in the last decade from 4% to 17% of the total manpower of the Italian foreign affiliates. In the geographical distribution of the participation, similarly to what happened in the export trade, the share of the CEECs countries is increased with a concentration on some countries in the area.
The Tab. 8.1 reports the FDI flows from Italy to the four new members, that in the year 2000, rose to the 13,2% of the relative country total, and the flows to Italy, from the four countries, that were 3.8% of total.
The FDI trends follows the adverse conjuncture going down from 1996 to 2000 both for flows to Italy and to the four Countries. The Czech Republic only seems to reach a better condition for the outflows to Italy in 2000, being their FDI increased to 2.5%.

Conclusion
Privatisation and FDI have played a fundamental role in liberalization and restructuring process happened in the last fifteen years in the economies of CEECs. FDI stock as a percentage of GDP has reached 60% in Czech Republic, 42% in Hungary, 26% in Poland, 19% in Slovenia. In the Czech Republic the foreign affiliates represented in 2000 the 48% of the output, 46% of the profit and the 35% of the employment. In Hungary over the 70% of the total turnover in the manufacturing sector is due to the foreign firms. The overall contribution of the EU to the FDI of the mentioned countries is about 70÷85% of the total.
Such process of internationalisation of the economies has produced meaningful levels of unemployment that in 2003 reached 19,8% in Poland, 7,8% in Czech Republic, 6% in Slovenia, 5,8% in Hungary. Others specific problems emerged recently in connection to FDI, namely the increasing share of profit back to multinationals, that has reached the 50% of the total FDI annual flows, the sudden capital movements and the employment loss due to the economic decisions taken abroad by the multinational firms.
Thought these problems are difficult to manage and with the enlargement CEECs have assumed new obligations as to balance equilibrium, environmental policies, social security and EU financing, they have got also new channels for modernization and finding capitals for investments and strong advantages are expected from the economies internationalisation with FDI, both direct (on the payment balance, on the investments, on the employment) and indirect due to the Spillover Effects, spread out in all the economy.
The FDI confidence Index 2003, that evaluates the FDI attracting capabilities of different countries, ranks Poland, Czech Republic and Hungary respectively at the 4th, 13th, 17th place in the world and the Survey carried out by UNCTAD with 158

Abstract

Economic growth and social progress: The citizens’ perspective portrayed in a survey in Hong Kong*

Hong Kong’s economic growth in the last 20 years has been impressive in terms of its GDP and other economic indicators, despite the recent global economic downturn that affected almost all economies. The affordability theory and diswelfare propositions support that economic prosperity is likely to result in a higher degree of social development, shown notably in better and more social services. However, the social indicators depict a mixed if not contradictory situation: for instance, public spending on social welfare is increased drastically and yet the gini’s coefficient also jumped to an unprecedented high level. What do the ordinary citizens think? How do they evaluate the social development in Hong Kong in terms of/ in light of the social welfare development? This survey found that while the people of Hong Kong felt that the provision of social welfare was adequate, they failed to combat the rising social problems and meet mounting needs. This paper discusses the possible reasons behind their thinking and the implications for social policies.

Intrastate Conflict in the Developing World and Its Economic Stimuli

Economic motivations contribute to the occurrence of political conflicts in the developing world. The focus of this paper will be to illustrate the economic and developmental stimuli for political instability in developing countries. The discussion will: a) define the notion of political instability within a given nation, while distinguishing two unique but not necessarily exclusive conflict scenarios; b) explore the economic factors which contribute to each scenario; and, c) recommend policies intended to address these pejorative economic characteristics. Although the relationship between economic and security factors is reciprocal (that is, political instability contributes to poor economic conditions as logically as poor economic conditions contribute to political instability), this paper will focus on instances of political instability whose roots are economic in nature.

I. Political Instability

In order to properly address the developmental economic settings for political instability, it is first necessary to define what one means by the term political instability. Several economists have taken unique approaches to this discussion, each with its distinct conclusion as to the “problem” for which economic “solutions” are proposed. E. Wayne Nafziger speaks of “humanitarian emergencies” in developing nations, and the detrimental economic conditions which may bring them about.1 Frances Stewart concentrates on threats to “individual security,” or violent acts on an individual (in opposition to the idea of national security, for example). He also highlights state civil war as a serious conflict which frequently arises from economic

---

Susan Rice illustrates political instability in terms of the potential threat of a state to “international peace and security”; a politically unstable state could, potentially, instigate conflict with its neighbors, harbor terrorists, or support the proliferation of deadly weapons. For the purposes of this paper, however, the definition of political instability shall be confined to intrastate conflicts which trigger the failure of a state or a civil war. The state of a humanitarian emergency, as discussed by Nafziger, will also be included in this clarification, definitively indicating the emergence of a failed state. Despite the global security implications of a failed state, which include the threat of international terrorist support, weapons proliferation, or interstate war, it will be necessary to focus on conflicts within state borders in this paper, since the basis for conflict will be constructed within the realm of national economic policies and the supporting domestic social structures.

Two distinct scenarios will be discussed to represent possible inter-group conflicts which could escalate to an eventual civil war or failed state. In this way, conflict between citizen and state will be distinguished from conflict between citizen group and citizen group. While the motivations of both conflict scenarios differ, the foundations of each can be traced to economic shortcomings, whose repercussions with respect to the political instability of a developing nation are grave.

II. Economic Motivation for Conflict Between Citizen and State

A civil war or failed state can result from the discontent of a people with its government. This conflict scenario, between citizen and state, arises when a state fails to deliver socially acceptable economic benefits and social programs. This concept can be demonstrated as a rupture in the “social contract,” a proposition originally presented by Jean-Jacques Rousseau in The Social Contract; Rousseau stresses the implicit submission of the individual to the “general will” with the expectation of a governing body whose sole interest is that of its citizens: “Further, the Sovereign, being formed only of the individuals who compose it, neither has, nor can have, any interest contrary to theirs.” Frances Stewart elaborates:

[the social contract] derives from the view that social stability is implicitly premised on a social contract between the people and the government: according to this (hypothetical) contract, people accept state authority so long as the state delivers services and provides

---

reasonable economic conditions (employment and incomes). With economic stagnation or decline, and worsening state services, the social contract breaks down, and violence results.\textsuperscript{5}

The deterioration of the social contract is a pivotal crisis in citizen/state conflict, for as economic conditions which are not deemed “reasonable” persist, civilian compliance with state norms dissipates, the social contract dissolves, and violent conflict will ensue.

\textbf{A. Government Spending}

Mismanaged or poorly-directed government spending can negatively effect the state of the social contract. This trend is most commonly attributed to excessive military expenditure, which, while justified in many cases by the persistence of civil war or state conflict, can greatly detract from social programs, including spending toward health- and education-based initiatives. Nafziger and Auvinen notice the trend in relation to the occurrence of humanitarian emergency: “Military centrality, as indicated by the ratio of military expenditure to GNP, contributes to humanitarian emergencies through several alternative dynamics.”\textsuperscript{6}

Misplaced government funds weaken state institutions by diverting resources from special programs and investment; in the case of military expansion, the effect can be cumulative. In other words, military spending which forces cutbacks in social spending can enrage a population, sparking social unrest and forcing the ruling regime to reinforce the state military by increasing spending. This cycle can dangerously persist until public outrage explodes at the invisibility of social support and the blind focus of state spending on the military. In these scenarios, as Nafziger and Auvinen point out, “the regimes are afraid to cutback military spending.”\textsuperscript{7}

Many governments in developing nations are also hindered by ineffective means of taxation. A blatant inability to collect government income puts pressure on state budgets and prevents the government from providing even the most minimal functions. In Sierra Leone, Liberia, and Sudan, for example, the state has been unable to provide defense, law and order, public health, and economic stability to its citizens, all the most basic of state responsibilities.\textsuperscript{8} These conditions cripple the legitimacy of the government, erode the social contract, and can ultimately lead to conflict.

\textsuperscript{5} Stewart, Frances, p. 14
\textsuperscript{6} Nafziger, E. Wayne, and Auvinen, Juha. 2001. “Economic Development, Inequality, and Humanitarian Emergencies.” Kansas State University, University of Helsinki. Abstract. p. 16

\textsuperscript{8} Nafziger, p. 12.
B. Vertical Inequality

Vertical inequality surfaces when a ruling upper class enjoys significant financial and economic advantages over lower class citizens of the same nation. This ruling elite typically receives significantly greater incomes, which can be outwardly resented by the working lower class. In this instance, a small, privileged percentage of the population reaps financial and material benefits while the poor majority suffers. It is for this reason that many economists consider the measure of GDP per capita to be an inaccurate method for collecting economic data, as it fails to consider income inequalities. The prevalence of vertical inequality is above all a concern in developing nations, where typically, few individuals have access to political or financial power, a colonial legacy underlying many former European possessions.

In most instances, vertical inequality is exacerbated by corruption. With a predatory state in control, individual interests and political gain take precedence over social and national reinvestment. A ruling elite will seek to further distance itself from the working class by feeding its advantages: “Predatory rule involves a personalistic regime ruling through coercion, material inducement, and personality politics, tending to degrade institution foundations of the economy and the state. Elites extract immediate rents and transfers rather than providing incentives for economic growth.”

Corruption from government officials ultimately steals from the lower class individuals, undermines social programs intended to achieve social and economic equality, and delegitimizes the ruling government.

Stewart points out that “High (vertical) inequality might be associated with such a failure [of the social contract], unless accompanied by populist measures to compensate the deprived.” The myopic social sentiment of a ruling class serving its interest is in direct conflict with Rousseau’s initial assertion (see above), and remains an integral motivation for citizen/state conflict in place.

C. Economic Stagnation and Poverty

High poverty levels, which are affected by the level of national income, or GDP per capita, and the distribution of income, represented by vertical and horizontal inequalities, are direct results of inefficient economic practice. Slow economic growth, high inflation, and high unemployment are devastating factors of an economy suffering from economic stagnation. Decreased incomes for the working lower class, unemployment, and “relative deprivation”, or the “perception of social injustice from a discrepancy between goods and conditions

9 Nafziger and Auvinen, p.5.
10 It is important to note, however, that frequently, citizens from every echelon of a developing nation participate in corruption. Middle and lower class individuals can evade paying taxes, or partake in black market or other illegal moneymaking activities, for example.
[individuals] expect and those they can get or keep,"\(^{12}\) all discourage the majority of the population not part of the ruling elite.

Stagnation can be triggered by any combination of policy measures. Excessive government intervention in economic practices can hinder growth and economic efficiency while maintaining the elite’s control of national resources. However, high-pressure demands from the IMF, World Bank, and other international NGOs to fully liberalize developing economies can be equally damaging, as national industries can be subject to a direct disadvantage while competing with OECD countries. As developing countries are most often one-export economies, supported by a sole primary commodity market, they are extremely susceptible to price fluctuations and the advantages of mature industries in developed countries. Most developing nations’ regimes adhere too closely to either a neo-liberal or state control policy, and face dire consequences in terms of economic efficiency and income distribution. Institutions also play a role in the effectiveness of economic policy. Nafziger stresses the need for developing nations to establish “monetary and fiscal institutions; capital, land, and exchange markets; [and] a statistical system,”\(^{13}\) to reduce the risk of humanitarian emergencies. This institutional reform should include drastic regulatory reform which could bolster growth by encouraging foreign direct investment and domestic entrepreneurship.

The impoverished conditions which accompany economic stagnation threaten the political stability of a nation as a representation of the failure of the social contract. As Stewart highlights, “[along] with economic stagnation or decline, [...] the social contract breaks down, and violence results. Hence high (and rising) levels of poverty and a decline in state services would be expected to cause conflict.”\(^{14}\) In many developing countries, the state fails to provide its citizens with the efficient, productive economy, consistent employment, and effective, accessible institutions and social programs they expect to receive. In a scenario of this nature, the social contract between citizen and state dissolves, and what remains is civil war and intrastate conflict.

**III. Economic Motivation for Conflict Between Citizen Group and Citizen Group**

An alternative stimulus for political instability is intrastate conflict between groups of citizens. Along with the struggles between upper and lower class groups mentioned above (also known as vertical inequalities,) struggles between groups can also include divergent ethnic or racial groups, geographic regions, and religious groups. These horizontal inequalities, while at

---

\(^{12}\) Nafziger and Auvinen, p. 3.

\(^{13}\) Nafziger, p. 11.

\(^{14}\) Stewart, p. 14.
times coinciding with vertical inequalities, can be equally as disruptive in a civic society where a particular group deems itself to be in an exploited or minority position. Since every individual in a given state identifies himself or herself with various groups, distinct bipartisan fractures can result in the collapse of government programs or institutions, and even bring about civil war.

A. Horizontal Inequality

Inequality between particular social groups in developing countries, or horizontal inequality, can have severe consequences for political stability. In short, a group of citizens who earns less income, or owns less land than a particular group will be motivated to initiate conflict in the state. It may be particularly implicit in the social contract that the state provide equally beneficial services and opportunities to all citizens, and in this way, horizontal inequalities may be considered the responsibility of the government. However, these conflicts do not manifest themselves as citizen/state but as citizen/citizen conflict scenarios, since the resentment is reasonably directed toward the opposing group.

The most clear instances of inequality are economic. Most minority or disadvantaged groups are deprived of equal employment either in public or private sectors opportunities (Uganda, Malaysia, Fiji, i.e.), equal land ownership opportunity (Cambodia, El Salvador, Haiti, i.e.), equal foreign aid shares (Sudan, Rwanda, i.e.), or equal income (South Africa, Malaysia, i.e.)\(^{15}\). Many times, this inequality is representative of state policies aimed at protecting the interests of the ruling elite. In this way, horizontal and vertical inequalities overlap, in that certain ethnic or regional groups also occupy the most prominent political, military, or financial positions in a society. Nevertheless, underprivileged groups who experience inequality are strengthened by their common lot as socially neglected individuals and motivated to create change- and violently if necessary.

Other horizontal inequalities contribute to the discontent of the disadvantaged. The Inaccessibility of fair political representation (Burundi, Uganda, Bosnia, i.e.), health services (Burundi, i.e.), food and water supplies (N. Uganda, i.e.), educational opportunity (Rwanda, Haiti, South Africa, i.e.), and housing (Northern Ireland, i.e.) all promote intrastate conflict.\(^{16}\) As Nafziger claims, both economic and social factors play into the citizen/citizen conflict scenario: “Communal factors contributing to conflict include educational discrepancies, regional and ethnic employment differentials, interregional revenue allocation, and language discrimination.”\(^{17}\) Indeed, “Where some groups suffer economically, socially, or politically compared with other groups in society, leaders can use the resentments caused by the

\(^{15}\) Stewart, p. 13.
\(^{16}\) Stewart, p. 13.
\(^{17}\) Nafziger, p. 15.
deprivations experienced by many of the members of the group to mobilise support. Where political redress is not possible, they may resort to war.”

B. Group Motivation and Competition

As noted above, inequalities can spark groups, ethnic, racial, social, or otherwise, to take arms and attempt to attain that which they feel is not being provided for them. This juncture, when the interest of the state is overridden by the interest of the group to retract or reverse the advantageous circumstances established by the ruling group, critically threatens the level of security in a developing nation. The group association allows the individual to feel justified in his revolt for a just society, at the expense of political stability.

In nearly all developing nations, the largest economic group consists of the agricultural sector. At a heavy disadvantage in terms of income, opportunity, and standard of living, the poor, working class farmers have the potential to be the most influential group in the society of a developing state. In this way, violent conflict between groups is likely to emerge if the unjust conditions persist. Poverty can influence the attitude of the individual toward the state, as the social contract deteriorates (see above), but it can also direct a growing anger and resentment toward the ruling group, not as members of a corrupt or unjust government, but as individual representatives of a certain race, ethnic group, or geographic region, for example.

A scenario dominated by inequality is an ideal climate for group competition, especially for natural resources. If certain services, like educational and health programs, are at a premium, groups are forced to compete, sometimes violently if necessary, in order to claim a stake in the state system. This occurrence is solidified in the case of natural resources. Since developing countries primarily export primary goods (agricultural and mineral commodities), the possession of land and mineral resources becomes crucial to the acquisition of economic and political power. “The struggle for control over minerals and other natural resources are important sources of conflict,” according to Nafziger, as in the case of Congo-Kinshasa, where Mobutu monopolized and exploited the Congolese citizens through his strangling possession of national mineral wealth. Today, rebel groups, both within the Congo and from neighboring nations are competing and fighting for the abundant caches of cobalt, copper, diamonds, and uranium.

Competition and group motivation, caused by horizontal inequalities tacitly incurred by unjust government practices, can be a serious source of political instability, as economically disadvantaged groups express their dissatisfaction with a unified proclamation of violence toward advantaged groups.

---

18 Stewart, p. 12.
IV. Policy Recommendations

The following recommendations for policies are aimed at economic stabilization. The goals illustrated are not just economic growth or an increase in GDP per capita (goals most frequently stressed by the IMF), but include reducing unemployment, poverty, and income disparities, while ameliorating the quality of life in the nation. Development is not a solely economic factor, and its achievement should be considered in terms of the improvement in the daily life of a citizen and his protection, by the state, from the threat of political instability.

A. Planned Stabilization

Nafziger greatly emphasizes the need for “greater international support for domestically planned macroeconomic stabilization and structural adjustment,”20 and while this may refute the liberal policies stressed by the IMF and World Bank, planned stabilization is certainly the most effective recommendation to developing countries. The neo-classical model of development, which is supported by the IMF and other NGOs, can be extremely detrimental to a fragile, developing economy. The free market fails to benefit a developing nation with young industries, less skilled labor, and weaker infrastructure, rendering it susceptible to competition from mature, developed economies. Also, a policy of complete trade liberalization, as advocated by the IMF, leaves the state with few tools to handle economic stagnation or recession, an occurrence all too common in developing countries. And as Nafziger asserts, “Countries that failed to adjust were more vulnerable to an emergency. Non-adjustment can contribute to poverty, displacement, and humanitarian crises.”21 Therefore, economic stabilization could be achieved with the establishment of an effective, central government who can a) efficiently manage industrial and commercial investment, money supply, taxation, and interest rates; and, b) gradually privatize national industries as they become increasingly capable of sustaining productivity and growth in the free market.

B. Attraction of Foreign Investment

FDI (Foreign Direct Investment) is an integral component to economic development. Rostow’s Linear Stage Model of development emphasizes the role of investment in the efforts of

19 Nafziger and Auvinen, p. 13.
20 Nafziger, p. 4.
21 Nafziger, p. 4.
technological progress and the adjustment of the national economy from a traditional to a mature industry. Lewis also stresses investment in the modern sector of the economy to fuel the reallocation of labor to industry and spur growth in both the traditional and modern sectors. It is impossible, thus, to deny the importance of foreign investment to developed countries, as it is vital to the development of infrastructure, industrial technology, and supportive services in government.

However, as Nafziger shows, more than half of private capital flows to developing countries are loans; this shows the necessity of international institutions and OECD countries to create reasonable expectations in their loan stipulations and to be flexible with debt payments. Also, OECD nations’ willingness to write-off previously incurred debt would be a crucial component to developing countries’ recovery. It would be impossible for a developing nation to rehabilitate its economy or establish economic efficiency with a cloud of foreign debt hovering above.

Opportunity for FDI, nevertheless, is great at this time. The presence of multi-national corporations, or MNCs, makes access to foreign industry, labor, and capital very open. Regional associations have also helped to attract FDI from developed countries by unifying the interests and resources of neighboring countries. Increases in foreign investment in sub-Saharan Africa and Asia have benefited the economies of those nations attracting capital, though they only achieved this with tremendous structural reform.

**C. Institutional Reform**

As Nafziger points out, “stabilization and adjustment programs, foreign aid, and foreign investment are not likely to be effective in spurring a country’s economic development and reducing the risk of humanitarian emergencies if economic and political institutions are poorly developed [italics mine].” Regulations can reduce predatory acts from ruling elites and decrease complication in business transactions- both crucial components to attracting investment from a developed nation. An article in The Economist states that “an often-ignored fact is that poor countries frequently hurt themselves by strangling business with red tape.” These reforms can include developing an effective banking system, trustworthy legal establishments, land reform, and the allocation of certain resources, including investment and foreign aid; the development of efficient institutions in a developing country will lead to more investment, generate growth in industry, and stimulate the developing economy. In this way,

---

22 Nafziger, p. 10.
23 Nafziger, p. 11.
poverty may be reduced (although it is important to note that economic growth, measured in GDP growth, is at best minimally related to the reduction of poverty.)

D. Distribution of Growth and Income

Since economic growth does not necessarily translate to poverty reduction or equal socioeconomic distribution, growth must be directed to targeted, underprivileged groups in the societies of developing countries. Nafziger characterizes affirmative action-type initiatives which include “targeting programs for the poorest regions and communities and employment and educational preferences for disadvantaged communities.” He shows how “a number of countries, including India, use industrial incentives and subsidies to help economically backward regions and train business persons from underprivileged groups.” Both vertical and horizontal inequalities play a clear role in the emergence of the “failed state” and the disruption of political stability. Therefore, programs which would target disadvantaged groups with directed capital, educational opportunity programs, and land reform would be supremely beneficial. They can help close the gap between rich and poor by increasingly providing incentives to small business owners, improving the conditions for social mobility through education, and securing the property rights of all citizens.

E. Commitment of OECD Countries

The commitment of developed countries in these policy recommendations cannot be understated. There is a heavy dependence on the dedication of developing nations to support the top-to-bottom development of a developing nation. The community of OECD nations must be willing to accept the process of “planned stabilization” as an acceptable economic procedure. It must also be willing to commit considerable investment in developing industries, while resisting the urge to take capital earned and run (a growing phenomenon known as capital flight). The OECD community must also be willing to work with developing nations to reform structures and regulations, write-off debt owed from these nations, and support an increase in the developing nations’ export-led growth.

It is clear, unfortunately, that, as Susan Rice indicates, “The fundamental problem is simple to define but very difficult to correct: it is a lack of political will on the part of concerned governments- in both the developing and developed world- to tackle the problem seriously.”

\[25\] Nafziger, p. 15.
V. Conclusion

In a developing nation, intrastate conflict, or political instability, can surface from tension between the state and its citizens, or from tension between two opposing groups of citizens. The tension is typically, though not necessarily exclusively, economic in nature: state mismanagement, in terms of fiscal policy, institutional regulations, and internal corruption, can lead to economic stagnation and the contagious spread of poverty. Thus, inequalities, both vertical and horizontal, will emerge, generating animosity and sparking conflict. While this paper suggests several economic policy measures addressing the economic pitfalls in developing countries, they can only be executed with the full-fledged, long-term commitment of the G-8 Nations and the entire community of the developed world. For certain, however, the ultimate amelioration of economic conditions in a developing state will help to ensure political stabilization in each nation and improve the quality of life for every man, woman, and child in the developing world.

Abstract

The Systems of Care approach augments traditional mental health services by providing families and children a holistic mode of culturally competent interventions in a community setting. This paper is a descriptive study of a System of Care Program in Georgia entitled the Peachstate Wraparound Service Initiative (PWSI). The baseline data from a longitudinal study on families with severely emotionally disturbed children is analyzed. Sixty-nine caregivers with children ages 5-18 completed the Demographic Interview Questionnaire (DIQ), the Child Behavior Checklist (CBCL), and the Child and Adolescent Functioning Assessment Scale (CAFAS). Twenty-two children over age 11 completed the Youth Self Report (YSR). Caregivers reported more problems in psychological functioning on the CBCL than the youth reported on the YSR. The severity of the social and emotional problems of the children is indicated by the CAFAS. Results demonstrate moderate to severe behaviors in the areas of school, home and behavior with others. The subscales for moods/emotions and thinking reveal mild to moderate functioning in the children.
Districts of Hope: A Socio-Urban Account of Jeddah Slums, Saudi Arabia

Topic Area: Sustainable Development
Presentation Format: Paper Sessions

Abstract

For the last fifty years, the urban and social fabric of Jeddah, a major and most populated city in Saudi Arabia has been dominated by slums. It is estimated that the city consists of more than fifty slums scattered throughout the city. While many domestic and international urban planners and designers find it hard to comprehend the presence and continuous growth of these districts in the light of the tremendous efforts made by the government to improve the urban and social quality in Saudi Arabia, these slums seem far away from being controlled or at least redeveloped.

Based on a fieldwork, this paper analyses the history of Jeddah slums, their emergence, scale and classification. It also discusses measures taken by the relevant authority, namely Jeddah Municipality, to deal with these physically and socially deteriorated areas and the associated problems. Regardless of their decaying conditions, these districts are inhabited by families who are eager to and dreaming of the day when they could leave the slum to a better life/built environment.

The paper also focuses on al-Sabeel, a major slum in Jeddah, as a case study. This consists of an examination of the slum's current urban conditions such as land uses, building states, utilities, road network as well as economic and social circumstances of residents. Toward its end, the paper studies the obstacles faced by both Jeddah Municipality and the residents themselves to improve the urban and social conditions of the slum. The potentials this and other slums embody for development are also highlighted.

1. Introduction

Slums or squatter settlements are a major socio-urban feature of many cities around the world, especially developing countries. Saudi Arabia, an oil-rich country, is not an exception. The Saudi city of Jeddah has been suffering from presence of slums for decades.

Exploring the extent of the slum problem, this paper starts with a brief history of the urban development of the city. This is followed by a discussion of Jeddah slums from socio-economic and urban points of view with some focus on al-Sabeel, a major slum in Jeddah.

2. Evolution of Jeddah and its Urban Development

The history of Jeddah is linked with that of Mecca, which was a major trading center between Yemen in the south and Syria in the north before Islam. When trading activities in the inland city of Mecca increased, there was a need for a seaport on the Red Sea. That port was Jeddah, which is located 80 km west of Mecca.

In the 6th century, the Persians built a wall around Jeddah. Within that wall, the urban fabric formulated, reflecting local environmental, social, and economic aspects. As a result, the wall had various gates oriented toward major trade routes of that time. The northern gate faced Syria, the eastern Mecca, and the southern Yemen. That was in addition to the sea connection with the outside world on the west side. The gates had fundamentally influenced the city urban morphology and growth even after the
demolishing of the wall in 1947, when the city continued to grow toward the north, east and south (Fig. 1).

![Fig. 1. Rare pictures showing the historic wall around Jeddah before being demolished in 1947.](image)

As far as the urban growth before demolishing the wall, Jeddah grew beyond the wall in a half circular form. New districts appeared outside the wall but with strong physical connection with the city inside. Most of the population of these districts were of tribal background. They migrated to Jeddah for a better life and worked on fishing as well was commercial activities related to the port.

Climatically, the high temperature and humidity has greatly impacted the urban form of Jeddah. This explains the city compact urban fabric that featured attached buildings and narrow irregular streets. Certainly this form was in line with the traditional social system of that time, where social and family ties were extremely close. Above all, this form was of human scale and facilitated the circulation of that time.

In the 1930s and 40s, the growth of the districts outside Jeddah wall intensified. This reduced the spatial gaps between these districts and the city inside, thus the urban form became more circular. This was followed by some urban development during King Abdul Aziz, the founder of Saudi Arabia, who in 1949 ordered the construction of public water network in the city as well as an airport.

The well-known oil boom of the 1970s was associated with tremendous rapid urban development in Jeddah. As a result, the city grew haphazardly and slums started to appear.

2. Socio-Economic Aspects

Current Jeddah master plan reveals that the monthly income of 2% of the population is 501-1000 Saudi Riyals (USD 134-266) (1 USD = 3.75 Saudi Riyals) per family, 50.2% receive USD 267-533, and 28% receive USD 534-800/month. In general, it is estimated that the monthly salary of 25% of Jeddah population is less than USD 1,333. Another study states that any Saudi family consists of 7 members living in a large city such as Jeddah and its monthly income is less than USD 1,333, is living under poverty line. This means that 25% of Jeddah Saudi population is living in poverty. The other income groups are distributed as follows: 64.8% receive USD 1,333-2,660/month and 10.2% receive over USD 2,660/month.
It is worthy to mention here that 59.6% of Jeddah population are Saudis while 40.39% are non-Saudis. 60% of the Saudis have an income from a job or employment. This means that 40% of the city Saudi inhabitants are unemployed.

As far as the non-Saudi population of Jeddah, 60% of them have a monthly income of less than USD 1,067 SR.

The income of more than 50% of the inhabitants of Jeddah slum areas such as the central district is less than USD 1,067 [1]. Again, this indicates that more than 50% of slum residents are living under poverty line.

3. Jeddah Slums

There is no doubt that the rapidly growing slums of Jeddah severely impact the urban and social fabric of the city. This is in addition to security, health, economic and environmental problems these slums create. Indeed, the presence of these slums has already deteriorated the image of the city, which is considered the main seaport of Saudi Arabia and gate to the holy cities of Mecca and Medina. The government has spent large sums for Jeddah’s infrastructure and urban development and prosperity.

In order to reach a solution for the problems associated with the presence of slums of Jeddah, below analyses these areas in terms of the reasons of their emergence, growth as well as location.

3.1 Classification of Slums

Jeddah slums vary in location, size, and urban characteristics. Yet, they can be categorized according to their location as following:

1. Infernal slums: They are the old slums that developed immediately outside the city wall, adjacent to the historic part of Jeddah, in middle of the last century.

2. External slums: They are mainly located beyond the highway or ring road on the east side of Jeddah (Fig. 2). This highway was supposed to be the limit of Jeddah urban growth toward the east in the 1980s. It connects Jeddah international airport with Mecca passing along the city on the east. The slums of that part are scattered between the desert and mountain areas far away from the city center.

3. Slums between the ring road and the city center.

3.2 Reasons for the Emergence of Jeddah Slums

During the last 5 years, Jeddah has been adding two slum areas every year. According to 2004 statistics, Jeddah consists of 52 slums of a total area of 66,329 km² (Fig. 3). They represent pernicious spots to the city, which is supposed to be of a vital importance to the government, society and Muslims around the world, being a major entrance to the holy cities.

The reasons for the emergence of these slums are as follows:

1. The city wall: The presence of the wall around Jeddah in the past restricted the city growth. This has led to creation of districts, such as al-Sabeel, al-Hindaweyah, and al-Sahaifah, randomly grew outside the wall. After the demolishing of the wall in the middle of the last century, these districts became an extension of old Jeddah and at the
same time slums since they were built with poor construction materials and techniques and without any planning.

2. The growth of the city without a master plan: Before 1963, when the first master plan was set up for Jeddah, the city expanded toward north and east. This has generated some slums along the growth paths.

3. Absence of fund: The master plan set up in 1963 comprised development proposals that demanded funds to execute. Nonetheless, the absence of such fund worsened the physical conditions of the city by allowing more slum growth and appearance. Jeddah Municipality had an essential role for this dilemma as it concentrated its efforts in maintaining new suburbs in the north on the account of the rest of the city.

4. Time gap between master plans: The period from 1963 and 1978, when the first and second master plans were developed, was wide enough to allow the city to expand without any building ordinances or/and planning policies. Again, more slums emanated in various parts of the city.

5. Large scale immigration: During the last 40 years, the city population has tremendously increased due to migration. The oil boom of the 1970s was associated with mega-scale projects in major Saudi cities such as Jeddah. Accordingly, workers from all over the world came to Jeddah to participate in the development process of that time. In 1978 the city population reached one million inhabitants, 47% of them were Saudis and 53% non-Saudis. Residents of surrounding villages and small cities immigrated to Jeddah in immense scales for better life and economic reasons. This has
increased the population number and in turn s the demand for low-cost housing. This has also led to more growth and appearance of new slums.

6. Large increase in property prices: The high raise of prices or rentals of residential properties in Jeddah has forced Saudi and non-Saudi families to look for cheaper or illegal means to acquire lots. As a result, dwellings in various slums attracted those families. This also resulted in the emergence of new slums beyond the city urban growth limit.

7. Previous lifestyle: Some Saudi families who migrated from rural areas to Jeddah used to live in large lands instead of small apartments. The new and different lifestyle experienced in Jeddah has driven them to unlawfully acquire properties in desert areas east of the city, which they use as a second home during the weekend or holidays. Such norm has induced gradual appearance of new slums in the desert and mountain areas where land is cheap or with no value and naturally beautiful and healthy.

8. Absence of police power: The elimination of the growing attitude of illegally acquiring public lands by citizens requires the use of police power. Unfortunately, the Municipality of Jeddah, which is responsible for the protection of such lands and assuring the application of building regulations, lacks such power. This in turn has encouraged the growth of slums throughout the city.

9. Delay in dealing with slum problems: The rapid growth of slums in Jeddah, faced with financial limitation and absence of serious solutions from the Municipality side, has turned the slums into a permanent problem, whose solution has become out of control.

3.3 Authoritarian Measures to Address Slum Problems

Despite the Municipality negligence and slowness in facing the rapid emergence and growth of slums, there have been some efforts made by this authority to tackle slum issues. These efforts are as follows:

1. Detailed plans of action areas of some slums prepared by the Municipality in 1993. These plans were set up despite the shortage of technical manpower and experience the Municipality has been suffering from for years. They proposed some minor physical modifications in street width, function and direction of the slums in order to integrate them with the rest of the city and disclose their compact urban form.

2. Establishing an administration responsible for dealing with slum matters on daily bases. The major task of this new administration, which is called "Administration of Slum Affairs", is to set up strategic proposals for slums problems.

3. Assigning private consultant firms to set up detail maps of the existing urban and socio-economic conditions of some slums. Two slum areas have been dealt with in this regard so far. However, these maps are merely a survey of urban, social and economic conditions of the slums. They do not provide any recommendations or solutions.

4. Proposing to higher authority (Ministry of Rural and Municipal Affairs and Emirate of Mecca Region) budget needed to deal with the deteriorating urban situation of some slums.
5. Seeking professional assistance from urban planning faculty members of King Abdul Aziz University, Jeddah.

4. Al-Sabeel District

One of the largest, oldest and most populated slums in Jeddah is al-Sabeel. Its location in the heart of the city makes al-Sabeel as important as the historic area of Jeddah. Below is an analysis of the urban and social aspect of the slum.

4.1 Urban Issues

4.1.1 Location

Al-Sabeel is located in the center of the city of Jeddah. Though it is a slum, al-Sabeel is one of the most important areas of the city due to the commercial activities that surround and penetrate its boundaries (Figs. 4 and 5).

The buildings of Al-Sabeel are old and physically in bad conditions, and the population density rate is considered the highest in Jeddah. While the road network is functionally inadequate, the rate of building occupancy is extremely high.

Fig. 4. Location of al-Sabeel Fig. 5. Al-Sabeel master plan

4.1.2 Land uses

The gross area of al-Sabeel is 75.8 hectares, and the land use varies from purely commercial (31.44%) to residential mixed with commercial (17.91%). Commercial buildings concentrate on the major roads of the district (Table 1). Regardless of the compact urban form of al-Sabeel, which is the highest built up area in Jeddah, there are vacant lands scattered throughout the district. They represent 2.38% of al-Sabeel.

4.1.3 Building characteristics

Al-Sabeel building conditions differ according to their age. 69.5% of the buildings were built more than 25 years ago; therefore, they are physically in extreme deteriorating conditions (Figs. 6-8). Only 5.83% of al-Sabeel buildings are in reasonable conditions.

4.1.4 Facilities

Al-Sabeel seriously suffers from shortage of facilities such as education, health, administration/municipal and recreation. Currently, the facilities provided cover only 1.96% of the district.

This shortage is faced with high rate of population (5,0715 inhabitants), which is serviced by only one primary school and another elementary for male students. The case of females is even worse. There is only one primary school and another for religious studies for females. The rate of schools in al-Sabeel, either for male or female students, is way below planning standards.

As far as health facilities, the population of al-Sabeel is provided with a small clinic. Nonetheless, religious services, such as mosques, are considered in proportion with population number although they are not well distributed according to planning principles to evenly cover the entire district.

4.1.5 Street network

Al-Sabeel is contained within roads that form a ring around the area. Some of these roads, such as King Khalid in the southeast, are considered major traffic spines of Jeddah. It should be noted here that while these roads benefit the city as they link different parts with each other, they have no impact on traffic circulation inside the district, where streets have emerged as needed and without any planning standards (Fig. 11). The district streets vary in width and volume of traffic, and with a total length of 36.5 km. 67% of them are not paved or covered with asphalt. And of course they lack sidewalks, illumination and parking spaces (Fig. 12).
Studies by Jeddah Municipality reveal that current street network of al-Sabeel is incapable of handling the district need of traffic circulation and totally unsafe. The major roads are extremely congested during the day.

Fig. 11. Al-Sabeel road network. Notice the irregular and compact urban fabric, which resembles that of most of traditional Islamic cities.

Fig. 12. Unpaved streets of various configurations in al-Sabeel

4.2 Social Issues

The total population of Al-Sabeel is 5,0715 inhabitants with a density of 669 person/hectare. This exceptionally high rate of density is reflected in the number of dwelling occupants. It is estimated that the average occupancy per house is 5,63 persons.

A socio-economic study, also conducted by the Municipality, explores that only 36.5% of Al-Sabeel residents are employed (Fig. 13). The number of Saudi
householders there is 58% and non-Saudis is 35%. The average monthly income of residents of a dwelling is USD 754 [2].

4.3 Major Obstacles for Socio-Urban Development

According to Jeddah Municipality, there are many factors making any socio-urban development of al-Sabeel difficult.

1. The high population density of the district.
2. The presence of around 70% of district buildings that are in very deteriorating physical conditions.
3. The existence of high-rise buildings (around 23%) mostly built with reinforced concrete.
4. The urban compactness the district features.

Regardless of these factors, there is still an opportunity to improve the urban and social conditions of al-Sabeel and other slums in Jeddah. This opportunity is based on the observation the author made during surveying Jeddah slums, including al-Sabeel. The author noticed the great willingness of residents to improve the environment of their slums and living by any means. This explains the hope these residents have: to leave the slum as soon as possible. The author believes that Jeddah Municipality or any relevant authority should work or set up plans on the ground of that hope. The plans should consist of programs that would teach residents how to improve the physical conditions of their dwellings themselves. Such programs have succeeded in slums in Asia and South America where residents renewed their house using simple materials and techniques the municipal authority taught them (Fig. 14). Moreover, Jeddah Municipality should capitalize on the free time residents have due to their unemployment. It could build small training schools/classes or turn a few dwellings into workshops where dwellers could learn handcrafts or artwork and produce products to higher income groups of Jeddah. This way the residents will generate an income that would allow them to attain a better life, thus their hope/dream, but without leaving the slum.

5. Summary and Conclusions

Jeddah slums are a serious issue that is threatening the urban and social life of the city. These slums have emerged due to various factors, and with time, they have grown to a scale beyond control. Despite the efforts Jeddah Municipality have been making to tackle the city slum problems, they are still far a way form the level of the urban and social crisis of the slums. Al-Sabeel, a major slum area in Jeddah, experiences deteriorating physical conditions and a high rate of inhabitants who are either living in poverty or unemployed.

Nonetheless, the conditions of al-Sabeel and other slums in Jeddah could improve if relevant authorities empowered the residents by educating them new and practical means of sustainable living.
Fig. 13. Though it is rare, homelessness has been noticed in al-Sabeel.

Vitamin A deficiency is one of the leading causes of blindness among Filipino children. Vitamin A deficiency is still considered a public health problem among preschoolers and pregnant and lactating women. Research and development funded by the Peanut Collaborative Research Support Project (USAID) was previously conducted to develop a process to reliably fortify peanut butter with Vitamin A. In 1999, the first industry collaborator agreed to adopt the technology and subsequently began marketing it throughout stores in the Philippines. This research assesses the impact of the introduction of vitamin A fortified peanut butter on consumers.

The specific objectives of the study were to: (1) estimate the current impacts of the fortified peanut butter on the consumers in the relevant market areas; (2) compare the knowledge, purchase, and use of vitamin A fortified peanut butter in low and middle income groups for enhancing planning for future impacts; (3) estimate the consumption of peanut butter with vitamin A among children to determine impacts on the most vulnerable age groups; and (4) examine family patterns of consumption of vitamin A fortified peanut butter.

The results are based on an analysis of data collected in a stratified random sample of middle and low income households in Cebu, Laguna, Tarlac, and 10 Metro Manila urban barangays (communities). A total of 176 middle-income households and 185 low-income households participated in the survey. Only households that purchase peanut products and have children were included. Over 90 percent of the households consume peanut butter, by far the most commonly consumed peanut product.

Over 40 percent of the households buy peanut butter at least once a month. The vitamin A fortified brand is purchased by about 20 percent of households (17 percent of middle income households and 23 percent of low income households), making it the second largest selling peanut butter. Among persons 2 to 20 years of age, 76 percent eat at least one-half tablespoon of peanut butter per week. About 15 percent of children in the sample are estimated to be consuming at least one-half tablespoon per week of the vitamin A fortified peanut butter. For children 2 to 6, one-half a tablespoon is 25% of the RDA. Roughly 17 percent of the children 2 to 6 receive at least this amount per week or more.

The results suggest that the potential for increasing the intake of vitamin A through peanut butter fortification is substantial. Since peanut butter is by far the number one choice among peanut products and that the survey respondents indicated a strong willingness to purchase the fortified peanut butter, considerable gains could be made though effective education and advertising. Providing Filipinos with this source of vitamin A will help diminish deficiencies and its debilitating effects. However, aggressive marketing and a more extensive vitamin A information dissemination campaign on the part of the government is needed.
Sleepless in the Sceptered Isle:
English Protestantism, Anomie, Disenchantment,
and Religious Suicides During the Reign of Henry VIII

Gil Richard Musolf

ABSTRACT

Research explores the behavioral effects of anomie (religious disunity) and disenchantment (decline of magic through sacramental deritualization) in the reign of Henry VIII: did the loss of religious unity and the magical rituals, sacraments, and enchantments that enhanced Tudor subjects’ chance for salvation lead to anomie, that is, a suicidogenic social structure that induced despair and religious suicides? The first part of my project involves reviewing quantitative data from other researchers to assess the evidence and reliability of suicide rates. The second (and future) part of my research involves a primary analysis of archives from the London Public Record Office to obtain evidence of religious suicides. Such research might shed light on the prevention of violence—and other social problems—in contemporary societies undergoing political conversion from below and interventionist institutional and cultural change from above, such as nation building, democratization, or the transition from communism to capitalism.

STATEMENT OF THE PROBLEM

Emilé Durkheim is a foundational sociologist; his key concept is anomie, explored in his three major works, The Division of Labor in Society (1893/1964), Suicide (1897/1951) and The Elementary Forms of Religious Life (1912/1995). Anomie is a social fact external to and coercive of the individual, explained by other social facts. Anomie is a property of the social order which exerts a force upon the individual so that he or she may define his or her life as not worth living. Integration, social solidarity, and regulation are aspects of anomie. Integration is the degree to which the collective consciousness is shared—
values, norms, beliefs, and ideas—and possess coercive power; in this function integration either attaches citizens to society or, in its absence (anomie), provokes deviance. Anomie is disunity plus deviance. Social solidarity is our feeling of unity (a “we-feeling”), our sense of belonging, that we are all members of society, a community, a neighborhood, etc. Moral regulation refers to the potency of external constraint; when moral regulation declines external constraint dissipates, since they are essentially synonymous. These three constituent aspects of anomie are not distinct but overlap; empirical data supports the argument that all three are inextricably related to each other, that is, they each entail the other (Pope 1975). Not sharing in society’s collective consciousness entails a lack of belonging and feckless social control. To put it positively, the more we share in, identify with, society’s collective consciousness, the more we feel we belong (a “we-feeling”), and the more likely we are to follow the rules. Integration, social solidarity, and moral regulation are highly dependent on rituals that reconstitute the values and norms that socially reproduce a we-feeling and external constraint. Durkheim’s theory predicts that when anomie is present—normative disunity combined with a loss of social control and moral regulation—suicide rates will rise. Suicide is a social fact; its patterns illuminate the effect of social forces. Though suicide is always an individual act, its trajectory can tell us much about the power of cultural and institutional change upon a population (MacDonald and Murphy 1993). The data traditionally used to measure the extent of anomie are officially adjudicated suicides from coroners’ inquests. But problems with corners’ inquests and official suicide statistics abound (Douglas 1967; MacDonald and Murphy 1993). Thus, qualitative data that illuminates the mentality, the subjectivity, of individuals who kill themselves is invaluable to complement the crudeness and inaccuracy of official statistics.

Max Weber also is a foundational sociologist; his key concern was the rationalization and
disenchantment of the modern world that began with the rise of Protestantism, expounded in *The Protestant Ethic and the Spirit of Capitalism* (1933), his most famous work. Disenchantment is the process of eliminating mystery, magic, miracle, and superstition from institutions and everyday practices. The disenchantment that arises from the elimination of magic and enchantment within Catholic ritual and ceremony engenders individualism and “a feeling of unprecedented inner loneliness of the single individual” (Weber 1993: 104).

[It] is with the lonely individualism of the Protestant faith that the process of disenchantment begins in earnest. Divorced from his priests and the Church, with its elaborate hierarchy that served to explain the most minute details of everyday life within the sacred precepts of revealed doctrine, Western man fell back upon . . . painful and ‘inhumane’ individualism (Greisman 1976: 496).

As Weber argues:

[Protestants] even rejected all signs of religious ceremony at the grave and buried [their] nearest and dearest without song or ritual in order that no superstition, no trust in the effects of magical and sacramental forces on salvation, should creep in. There was not only no magical means of attaining the grace of God . . . but no means whatever (105). This, the complete elimination of salvation through the Church and the sacraments . . . was what formed the absolutely decisive difference from Catholicism (104).

Profound cultural and behavioral effects can be inferred from disenchantment. “Carried to an extreme, [disenchantment] turn[s] life into a tale which, whether told by an idiot or not, would certainly signify nothing, having been evacuated of meaning” (Schneider 1993: xiii). “[T]he two dimensions of
disenchantment—intellectualization and rationalization—have rendered social life essentially meaningless. . . .

(Greisman 1976: 498), helped to create a barren and repressive world” (500). Two behavioral effects which can be hypothesized are despair and an increase in religious suicides, the former is unmeasurable, the latter can be empirically measured by officially adjudicated suicides from coroners’ inquests. If suicide rates go up during a period of religious disunity, then that provides some evidence that religious disunity causes suicide. However, it does not tell us why any individual committed suicide. Evidence that any particular suicide was a religious suicide, committed, for example, because of apostasy and despair, requires qualitative evidence, such as a suicide note.

Debunking rituals as superstition and magic unworthy of human veneration—disenchantment—leads to a falling off of such rituals, which detaches people from the moral values that provide integration, solidarity, and regulation. Deritualization through the decline of magical, mysterious, superstitious, and miracle-inducing rituals and practices, such as evangelical antisacramentalism, is a paradigmatic instance of disenchantment.

Thus, anomie typifies a social structure waning in integration, social solidarity, and regulation, which can be induced by disenchantment. Fundamental sociological research suggests examining the behavioral effects of both anomie and disenchantment during an historical period when they were pervasive.

A period of history when religious disunity and disenchantment compounded together more profoundly than at any other time in European history was during the rise of Protestantism and the Reformation. One country where religious disunity and disenchantment was profoundly contentious and resistance prevalent was England. Henry VIII in one fell swoop known as the Act of Supremacy (1534) (though other previous and future acts and injunctions were important) dramatically transformed religious
allegiance, ritual practice, and Tudor governance. Wherever there is repression there is resistance (Foucault 1979). The English Reformation was not just an “act of state”, but resisted by “struggles between state and people as well as struggles between Catholics and Protestants” (Haigh 1993: 18). Resistance and reflection rather than embracement (such as in Germany) can bring doubt, confusion, and anomie. The vast majority of the population “sat bewildered in pews or befuddled in alehouses; [additionally, there were] those who grumbled as well as those who greeted . . ., the Reformations came out of the clashes between them” (16). Both anomie and disenchantment can make life seem meaningless, confused, and, in a deeply religious culture, induce apostasy, despair, and suicide. Thus, the research project centers on the possible rise in suicide rates attributable to anomie induced by state-sanctioned disenchantment and popular resistance during the English Reformation that began in the 1520s in the reign of King Henry VIII (r. 1509-47). It is a quintessential period and place to test the behavioral effects of Durkheim’s theory of anomie and Weber’s historical process of disenchantment, that is, the extent of social, cultural, and behavioral aftermath from, on the one hand, evangelical conversion from below and state-enforced institutional and cultural antipapism from above and, on the other hand, resistance to changes in doctrine and practice in defense of “traditional piety” (Duffy 1992). Did suicide rates increase and is there evidence of religious suicides as a consequence of the contentious elimination of long-standing beliefs and rituals?

Giddens (1965: 5) argues that a “suicidogenic social structure” has both anomic and egoistic effects, both of which produce “high rates of suicide”. Historians on the English Reformation have been suggestive that a suicidogenic social structure—apostasy and despair—led individuals to commit suicide. The cause of suicide, according to contemporary theologians, was despair, the opposite of Christian hope. “The worst desolation was not poverty or the recourse it led to—begging, prostitution, and crime—but the mental
desolation of despair” (Brigden 2000: 83). Brigden suggests a link between religious disunity, despair, and suicide: “[I]n May 1532 there were fourteen suicides in London, by hanging or drowning, at the time that a traumatic assault on the liberties of the Church caused Thomas More to resign his office” (83). Concurring, MacDonald and Murphy (1993: 39) argue that nothing was more strongly emphasized in Reformation England than the “links between apostasy, despair, and suicide. Renunciation of religious truth in favour of false doctrine leads to diabolical temptations to despair and self-murder.” Thus one supposition might be that as one became an apostate to the Pope and the Church of Rome, yet was confused over or unconvinced of evangelical answers, despair set in and suicide became an option. The loss of moral certainty, salvation expectations, and afterlife assurances were disintegrative to religious unity and conducive to despair and religious suicide. Another supposition is that Protestantism’s moral deregulation embodied in its espousal of liberty of conscience, justification by grace through faith alone, the priesthood of all believers, and one’s freedom to contemplate Scripture, salvation, and the afterlife on one’s own, combined with the renunciation of sacramental rituals—disenchantment—led to a decline in social cohesiveness (integration, social solidarity, and regulation) and the increased likelihood of religious suicides. As Anthony Giddens (1971: 85) has argued: “Protestantism is the religious forerunner and primary source of modern moral individualism . . . .” Protestantism engendered anomie and disenchantment, both leading to atomization.

The Tudor theology was that the Devil instigated apostasy and despair, goaded one on to suicide, and even provided the instruments of self-destruction. In fact, the Tudor logic was “Satan, apostasy, despair, and suicide . . . .” (MacDonald and Murphy 1993: 40). Rival theologians argued that the wrong theological beliefs caused suicide. Certainly Protestant and Catholic theologians hammering away at the
laity’s psyche that their religion held the proper road to salvation and that the other one led to damnation could cause the type of moral confusion—apostasy and despair—indicative of anomie. Suicide was used as a social weapon in such propaganda. “Both Protestant and Catholic writers capitalized on . . . suicides . . . [as they] strove to prove that the creeds they hated were doctrines of desperation[; that] the antagonistic faith drove its members to a state of despair, the psychological equivalent of apostasy, and to suicide” (43). As Stephen Greenblatt (2004: 94) has stated:

[F]or those who believed that the fate of their eternal souls depended upon the precise form of worship—and that, after all, is what the strong claims were about—the shifts in official belief and regulated practice must have been excruciating. Local communities were ruptured, friendships were broken, families were torn asunder—parents against children, wives against husbands—and inner lives tormented with pity and fear.

Self-examination over the uncertainty of external means to salvation produced the tormented conscience, the guilt, dread, doubt, and despair (Anfechtungen)—the demons Martin Luther wrestled with—which caused his apostasy and unrelieved torment until he supplanted what he called the theology of glory with the theology of the cross (Marty 2004: 40). Historians have argued that many suffered despair, malaise, and angst; some of those committed religious suicide.

QUANTITATIVE DATA

The English are obsessive record keepers, and their records on suicides prove no exception.

A new law regulating the pay and performance of coroners was passed in 1487 that made them responsible for holding inquests on every violent or suspicious death that occurred in their jurisdictions. This statute was fine-tuned by a writ in 1509 and a second statute in
1510, and a regular procedure for returning inquisitions to the court of King’s Bench and recording their verdicts was established (MacDonald and Murphy 1993: 24). To ensure compliance with the law, they were required to return copies of the inquisitions at the semi-annual meetings of the assizes in their counties. The clerk of the assize subsequently forwarded them to the court of King’s Bench, where they were reviewed and enrolled (26). Because there are so many inquisitions in the King’s Bench series, and they are cross-referenced in the controlment rolls, it should be possible in theory to reconstruct an accurate yearly count of the suicides reported to the central government (360).

What is research without problems? To begin with, was a death suicide is enshrouded in intrigue.

Suicide was a terrible crime in Tudor and early Stuart England. Self-killing was a species of murder, a felony in criminal law and a desperate sin in the eyes of the church. Suicides were tried posthumously by a coroner’s jury, and if they were convicted as self-murderers, they and their heirs were savagely punished. Their moveable goods, including tools, household items, money, debts owed to them, and even leases on the land that they had worked were forfeited to the crown or to the holder of a royal patent who possessed the right to such windfall in a particular place. The suicide of an adult male could reduce his survivors to pauperism. Self-murderers were denied Christian burials; their bodies were interred profanely with a macabre ceremony prescribe by popular custom. The night following the inquest, officials of the parish, the churchwardens and their helpers, carried the corpse to a crossroads and threw it naked into a pit. A wooden stake was hammered through the body pinioning it in the grave, and the hole was filled in. No prayers for the dead were repeated; the minister did not attend (MacDonald and Murphy 1993: 15).

“For these reasons, evidence of suicide must often have been covered up” (Brigden 2000: 83).

A second problem is the idiosyncracy of coroners and coroners’ juries; a death to one might be a self-murder to another. However, administrative procedures were in place by 1487 and “fine-tuned” in 1509 and 1510 to standardize adjudication (MacDonald and Murphy 1993: 24). A third problem is that adjudication was susceptible to pressure from the crown seeking financial gain: “really rich men—usually
merchants—were occasionally convicted of self-murder” (27). Politics, a dead person’s status, ecclesiastical intervention, coroner competency, jury diligence, and who knows what, may have intervened in judgments. A fourth problem is, do complete records survive? and the thoroughness of the records available; absent or impaired records in one or two crucial years vitiate theoretical generalizations. A fifth problem is non compos mentis verdicts, which cannot be included to support any social theory. However, between 1485 and 1660 “fewer than 2 per cent [of suicides] were excused as persons non compos mentis” (16). Only felo de se, a felon of himself, verdicts will count, which, of course, included women. A sixth problem is ascertaining who the coroners were and when they changed office. A seventh problem is that the most important jurisdiction, London, will be missing. “Coroners in many cities and towns, such as London, Norwich, and Bristol, were not required to return their inquisitions to the court, and they did not normally do so” (360).

With all of these problems, the data can only be considered weak, impaired, and crude. Conclusions will be suggestive. A trenchant critique of relying solely on suicide rates has been stated. “Sociologists opposed to the ‘positivism’ of Durkheim and his students have long insisted that official statistics are bogus because the classification of suicidal death is a complex social process that results in verdicts more dependent on the attitudes of officials and procedures that they use than on what really happened” (Macdonald and Murphy 1993: 4). As a longtime proponent of humanistic/hermeneutical sociology, I agree with much of that. Yet I have always argued that an adequate sociology incorporate both structure and agency. Unless one is ready to abandon the concept of social structure and social facts/social forces (indeed sociology!), arguments about the effect of large-scale social forces must necessarily be inferred from behavioral data. Social facts are an ontological assumption of sociologists.
Epistemologically, sociologists argue they “know” this through data that warrants such an assumption, suicide rates being the paradigmatic example. In fact, only a page later MacDonald and Murphy (5) state that social forces affecting attitudes on and punishment of suicide were in play: “The intensification of hostility to self-killing in the sixteenth and early seventeenth centuries was the result of the Tudor revolutions in government and religion—the rise of the modern state and the Protestant reformation.” Thus whatever the population’s attitude, especially the local coroner’s and the coroner’s jury, if the hostility to and punishment of suicide intensified and rates rose nevertheless (but whether they did or not is arguable), it must mean something—maybe that more people were committing suicide, and maybe they were in response to anomie and disenchantment; in this case, brought on by Tudor wars of governance and ecclesiastical ideology.

Assessing Tudor subjects’ mentalité, arriving at verstehen, is risky business. What it must have been like for Tudor subjects living through a spiritual crisis can only be gleaned from evidence such as letters, diaries, and pamphlets. But the vast majority of the population was illiterate. And for both the literate and illiterate, the 1534 Act of Treason “made it treasonable to call the King a heretic, a schismatic, a tyrant, an infidel or a usurper” (Brigden 2000: 120), “giv[ing] the King alarming new powers over conscience” (163). One way to indirectly tap into Tudor subjects’ historical mentalité to achieve verstehen is by following Durkheim, to infer that anomie exists by behavior, an increase in suicide rates. There’s the rub, since aggregate data cannot be used to explain individual cases; to do so commits the ecologicial fallacy. Other evidence of anomie and disenchantment is necessary to contextualize and complement such rates, especially evidence that England’s social structure was anomic, that it did experience a decline in social cohesiveness. This evidence exists through historians’ interpretations of the English Reformation. Also, salvation wars between Catholicism and Protestantism is, ipso facto, a crisis in the collective conscience, a
deterioration in social order. In fact, the Pilgrimage of Grace (1536), the most severe threat to the Tudor reign, was launched by a huge segment of the population opposed to the downslope of Catholicism. Personal narratives and suicide notes of self-murderers that demonstrate aspects of anomie (decay in integration, solidarity, and regulation) and apostasy would provide powerful qualitative support to the argument of a suicidogenic social structure. Aspiring to complementarity between quantitative and qualitative data, linkages between macrosociological and microsociological explanations, relationships between the public issue of a suicidogenic social structure and the private trouble of a self-murder, and connections between the history of a Tudor crisis and the biography of its victims, are goals. Achieving them is a horse of a different color.

Suicide rates are obtainable solely from coroners’ reports and problems with those reports have been noted, but the coroner’s report is the unit of analysis. Any biographical or personal information, for example, letters, diaries, suicide notes, etc., if attainable, will also be a unit of analysis. The research is longitudinal. Pre-Reformation rates have to be compared to rates after the onset of the Reformation. What were per capita suicide rates before the onset of the English Reformation during the early decades of Henry VIII’s reign, 1509-1530, and what were they from then until the end of his reign, 1530-1547? If anomie existed, then per capita suicide rates should have gone up during the 1530s, after numerous policies such as (though not limited to) the Acts of Annates, Restraint of Appeals, Act of Supremacy, Act of Treason, the Oath of Succession, the break with Rome, the stands on conscience by Fisher, More, Barton, and others, and the marriage to and subsequent beheading of Anne Boleyn.

Quantitative data and tables from other researchers to be provided at the conference.

Abstract

There is frequent reference to the term “context” or its variants such as “contextual”, “contextually”, “contextualizing”, and “contextualization” in both speech and written communication. This reference is usually made in a variety of phrases such as “…in this context…”, “…in the context of economics…”, “…it depends on the context…”, “…in the historical context…”, “…in the international context…”, “…in the context of war…”, “…in the classroom context…”, “…taken out of context…”, etc., etc, ad nauseam.

The frequent reference to context or its variants tells us that knowledge of context is more important in human communication than knowledge of words per se. It also reminds us that words have no universal meaning. The meaning of a word is defined by the context in which it is used. Since there are different contexts, this means that words have multiple meanings. As used here, context refers to background information and meanings underlying verbal and nonverbal messages or physical acts, which a speaker or author provides in order to achieve communication efficiency and effectiveness.

Despite the frequent reference to context in speech and written communication, the literature review revealed no systematic study of the character and value of context. What kind of background information does a speaker or author need to provide in order for the listener or reader to understand clearly and to decode accurately the information and meanings embedded in verbal and nonverbal messages or physical acts? What kind of background information and meanings does the context provide that words alone do not? What is the nature of interface between natural language and context? This cross-sectional study explores answers to these and related questions with a content analysis of the uses of the term “context” or its variants in textbooks required in various college courses during fall 2000 semester. The quantitative data were analyzed via SPSS (11.5) for Windows and the qualitative data were analyzed via WinMax Pro 98: Software for Qualitative Data Analysis for Windows.

This paper will report: (1) the frequency of uses of context or its variants in textbooks of various college courses, and in academic domains (arts/humanities, behavioral/social sciences, and natural/physical sciences), (2) the structural interface between natural language and context, and (3) the specific critical thinking skills needed for uncovering information and meanings embedded in verbal and nonverbal messages or physical acts. The paper’s thesis is that context is a language on its own with its own grammar and that knowledge of the elements of this grammar is essential for efficient and effective speech and written communication.
Title of the Submission: An Evaluation of the Student Teaching Program of Selected Universities and Colleges: Basis for a Model Teaching Program

Topic area of the submission: Education

Presentation Format: Poster Session

Name of the Author: Prof. Elena Edna C. Nagtalon

Department: Bachelor of Elementary Education

Fax Number: +63- 77- 7714143

ABSTRACT

An attempt to evaluate the Student Teaching Program of selected universities and colleges in order to come up with a Model Student Teaching Program is the main concern of the research.

Specifically, it tries to answer the following questions:

1. What is the status of the Student Teaching Program of selected universities and colleges:
A. Philosophy of the program

B. Program objectives

C. Program content

II. General Performance of Student Teachers

III. General Performance of Teacher Training Instructors and Cooperating Teachers

IV. Program Efficiency

2. What are the strongest and weakest aspects of the program?

3. What best practices can be deduced from the existing program of said universities and colleges?

4. What model Student Teaching Program can be proposed?

The researcher will administer the Questionnaire to Evaluate the Student Teaching Program (QESTP) developed by Aribuabo (1992) to different respondent groups, namely: student teachers, teacher training instructors, cooperating teachers and principals, and college professors who are handling professional education courses. All of the respondents shall be randomly sampled. Triangulation will be done to selected samples. Data gathered will be tabulated and statistically treated using percentages. From the data gathered, a Model Student Teaching Program shall be proposed to improve the weaknesses of the existing program and to strengthen those aspects where the program is strongest in order to ensure quality pre-service education among would-be teachers.
Abstract:

The purpose of this paper is to conduct a comparative analysis of the development of securities markets in Asian Economies. This study focuses on nine Asian economies; Korea, Taiwan, Hong Kong, Singapore, Malaysia, Thailand, Indonesia, the Philippines, and China.

Securities markets in the nine Asian economies are relatively young as compared with those of the U.S. and the U.K. Among them, the Hong Kong Securities Market is the oldest and was established in 1891. In 1990, the youngest market was founded in China. Other markets were set up from the late 1920s to the early 1960s. The informal exchange, however, started far before the establishment of the stock exchanges.

From the history of these markets in nine Asian economies, the author points out four common features. First, many market systems were affected by experiences of the colonial era. In the early period of stock exchanges in these economies, colonists were the first people to exchange their shares and decided the rules and regulations for stock trading. Second, most governments of the nine economies took the initiative to facilitate the “formal” securities markets, including trading systems, settlement systems, legal institutions, rules and regulations, etc. Before setting up the official markets, governments maintained a “laissez-faire” approach. These governments however, started to recognize the significance of the securities markets
in order to achieve economic development. The third feature is that these markets have developed rapidly since the late 1980s. With economic development, the securities markets of these nine economies attracted a large amount of funds from abroad, further facilitating the functioning of the markets. The last feature was that most markets have been severely affected by the currency crisis in 1997. Because this crisis spread out to neighboring countries, they experienced sudden outflows of foreign capital. This had a great impact on stock prices.
Factors Affecting Utilization and Satisfaction With Recreation Opportunities at Ohio State Parks

Ted L. Napier, Ph.D.
Professor of Environmental Policy
The Ohio State University

Mailing address: 2120 Fyffe Road Columbus, Ohio 43210. Telephone number: 614-292-2706. E-mail address: napier.2@osu.edu.

Funding for the study that made this paper possible was provided by a grant from the Division of Parks and Recreation of the Ohio Department of Natural Resources and by a grant provided by the Research Enhancement Grants Program of the Ohio Agricultural Research and Development Center of The Ohio State University. The positions advanced in the study are solely those of the author and do not represent official positions of the funding agencies.
Abstract

Data were collected from a sample of Ohio residents to assess characteristics of visitors to Ohio State Parks during the 2004 recreation year. Satisfaction with specific recreation facilities and services made available at Ohio State Parks were also examined. The theoretical perspective used to guide the investigation was developed from selected components of social learning and opportunity theories. A structured questionnaire was mailed to 2,485 randomly selected Ohio residents during the late fall and early winter of 2004. A total of 980 questionnaires were returned which constitutes a response rate of about 39.4 percent. Of those returned, 737 questionnaires contained sufficient data to be used for statistical modeling. Study findings revealed that approximately 42.1 percent of study respondents had visited Ohio State Parks during the 2004 recreation year and that a large majority of the visitors perceived the parks favorably. Visitors to Ohio State Parks reported visiting the parks about six times during the 2004 recreation year and visiting approximately two parks during the recreation year. Discriminate analysis was employed as a means of identifying characteristics of respondents who visited Ohio State Parks during the 2004 recreation year. The theoretical model developed using socio-demographic variables and measures of structural barriers to predict visitor status was shown to have some utility for predicting visitation at Ohio State Parks. Several factors assessing the quality of facilities and services provided at the parks and all of the socio-demographic factors included in the statistical model were shown to be significant in terms of correctly classifying respondents into visitor and non-visitor categories. Approximately 70.6 percent of the respondents were correctly classified using the predictive model. Multiple linear regression modeling was used to examine factors affecting satisfaction with the State Park visited most often. The independent variables included in the regression modeling were shown to have limited utility for explaining variability in satisfaction scores. Study findings are discussed in the context of future program planning within the Ohio State Parks system.
Introduction

Assessment of satisfaction with consumer products has been an important component of marketing strategies for decades within the United States. It is widely recognized that manufacturers must monitor levels of satisfaction with their products to remain competitive in the marketplace. Market research makes it possible for producers to modify goods and services to be more congruent with the desires and preferences of client groups. Millions of dollars are allocated each year to ascertain how consumers perceive specific goods and services and study findings are employed to adjust marketing strategies and to modify products.

Public providers of outdoor recreation opportunities have also recognized the need to monitor satisfaction with recreation opportunities made available to the recreating public and to assess preferences of client populations (Anderson and Blahna, 1996; Bright, 2000; Jacobson, 2001; Napier, 1981). Such research provides resource managers with information for modifying recreational opportunities to better satisfy the perceived needs of client populations and to devise marketing approaches that will appeal to a broad range of clients.

The purpose of this paper is to present the findings from a state-wide study of Ohio residents that was designed to examine satisfaction with outdoor recreational opportunities provided by the Ohio State Parks system. Statistical models are presented that were developed to predict participation visitation at Ohio State Parks and to identify factors that are useful for predicting levels of satisfaction with various aspects of the Ohio State Park visited most frequently. The findings are discussed in the context of future outdoor recreation planning and development within the state.

Outdoor Recreation Satisfaction and Participation
Many factors have been shown to be significantly related with outdoor recreation participation and with satisfaction with recreational opportunities provided (Anderson and Blahna, 1996; Arnold and Shinew, 1998; Devine and McGovern, 2001; Lee and Scott, 2001; Tian-Cole, et al. 2002; More and Stevens, 2000; Napier, 1981; Raymore and Scott, 1998; Shelby and Heberlein, 1986; Stewart and Cole, 2001). Existing research indicates that satisfaction with recreational opportunities varies by a number of personal characteristics and by host of site-specific factors.

Personal characteristics such as age, health status, disposable income, number of children living at home, and location of residence have been demonstrated to affect satisfaction with recreational opportunities provided and with participation in specific outdoor recreational activities. Such findings are consistent with theoretical arguments advanced by proponents of “personal community theory” who assert that individuals must possess characteristics that facilitate accessing outdoor recreation opportunities (Napier and Maurer, 1981). The theory suggests that certain characteristics make it easier for individuals to participate in outdoor recreation activities while others impede participation.

Increasing age can impede participation in outdoor recreation activities because older citizens often are not able to effectively use recreational facilities and services that are often designed for younger people. Older people should articulate their lack of participation in outdoor recreation sites by being less satisfied with public outdoor recreation facilities that are not designed to accommodate the needs of older consumers. Inability to participate in outdoor recreation activities at recreation sites designed for younger people due to age should be reflected in higher levels of dissatisfaction with outdoor recreation facilities and services provided.

Health status can impede outdoor recreation participation because people who are physically
challenged cannot access outdoor recreation facilities and services that are designed for physically active people. If specifically designed recreation facilities for the physically challenged are not provided, then participation will be significantly constrained for individuals who lack requisite health status to participate. Inability to participate due to health status should be reflected in higher levels of dissatisfaction with outdoor recreation facilities and services provided.

Access to disposable income is often a requisite factor to participation in outdoor recreation activities. Most public outdoor recreation facilities and practically all private recreation facilities are financed by user fees. If an individual wishes to use a recreation facility that requires payment of a user fee, the person must have access to disposable income. Unfortunately, a rather large percentage of people within the US does not have access to sufficient economic resources to pay for access to outdoor recreation facilities that require payment of user fees and are excluded from participation. Inability to participate in outdoor recreation activities due to user fees should be reflected in higher levels of dissatisfaction with outdoor recreation facilities and services provided.

Children living at home can influence participation in outdoor recreation activities because most parents wish to provide their children with learning experiences and one means of doing so is via outdoor recreation outings as a family. While adults may place higher priority on more sedate indoor activities when making decisions about their personal leisure activities, the presence of children in the household can act as a motivator for the family to engage in more vigorous outdoor recreation activities because most outdoor recreation facilities are designed for enactment of active recreation activities. The presence of children in the household should be reflected in higher levels of participation in outdoor recreation participation and subsequently higher levels of satisfaction with outdoor recreation facilities
and services provided.

Location of residence can affect outdoor recreation participation because living in more densely populated areas will encourage parents to take their children to outdoor recreation sites for the learning experiences that can only be achieved in rural environments. Children can learn skills in rural outdoor recreation settings that they cannot learn in urban environments. Children cannot experience natural environmental settings in densely populated urban environments and parents should be motivated to take their children to outdoor recreation sites so their children can access new outdoor educational experiences. Urban location of residence should be reflected in higher levels of satisfaction with rural outdoor recreation facilities and services provided.

Other factors that can affect level of satisfaction and participation in outdoor recreation activities are characteristics of the recreational facility and the services provided. Social learning theory (Bandura, 1977) argues that human beings learn from experience and develop perceptions about phenomenon encountered in their physical and social environments in the context of those experiences. If the learning experiences at the outdoor recreation sites have produced positive consequences, then people will develop favorable orientations toward the outdoor recreation sites being assessed. Social learning theory argues that individuals tend to repeat behaviors that have generated benefits for them and avoid situations that they believe will generate negative consequences for them.

In the context of outdoor recreation participation and satisfaction, people will participate in outdoor recreation activities when the facilities and services being made available to them satisfy their perceived needs and preferences. Therefore, characteristics of outdoor recreation facilities that individuals perceive to be relevant to their recreation needs will be significantly related with participation
and level of satisfaction with facilities and services provided. Factors that make outdoor recreation experiences more rewarding will be significantly related with participation and satisfaction with outdoor recreation facilities and services provided.

In sum, the theoretical model basically argues that personal characteristics of the outdoor recreation participant and characteristics of the recreation facility and the services provided at the site will be significantly related to levels of satisfaction with outdoor recreation opportunities provided and will be significantly related with frequency of participation at the recreation site.

**Research Methods**

*Data collection:* Data were collected from a sample of Ohio residents during the late fall of 2004 using a mail questionnaire to assess the merits of the theoretical perspective outlined above. A systematic random sample of 2,485 Ohio residents was drawn by a professional sampling firm in the early fall of 2004. The lists of names and addresses maintained by the sampling firm are the most comprehensive source for developing random samples that exists within the state.

A questionnaire was mailed in mid-November to the selected sample. A cover letter explaining the purpose of the study and a self-addressed and stamped return envelop were included with each questionnaire. Approximately three weeks later a second questionnaire was mailed to non-respondents with a revised cover letter asking them to participate in the study. A third mailing was posted to non-respondents three weeks following the second mailing.

A total of 980 questionnaires were returned using these methodologies which constitutes a response rate of approximately 39.4 percent which is considered to be average when using a mailed questionnaire to collect data from general populations. Of the questionnaires returned, 737 were
sufficiently completed to be used for statistical analyses.

*Measurement of study variables:* The questionnaire used to collect study data was developed to accomplish the following objectives: to assess location and frequency of visitation at Ohio State Parks, measure satisfaction with facilities and services at the park visited most often, to examine barriers and facilitators of State Park visitation, and to collect socio-demographic characteristics of study participants. Variables included on the questionnaire that are examined in this manuscript were measured as follows:

**Visitation at Ohio State Parks** was measured by asking respondents to indicate the number of State Parks they had visited during the 2004 recreation and the total number of times they had visited them. Respondents were also asked to indicate the anticipated number of times they would visit Ohio State Parks during the 2005 recreation year. The values entered for these questions were used in the statistical analysis.

**Level of park satisfaction** was measured by asking visitors to Ohio State Parks to report their level of satisfaction with six characteristics of the park visited most often. The characteristics assessed were as follows: cleanliness, appearance, employee helpfulness, condition of buildings, safety and security, and programs and activities. The Likert-type responses (Edwards, 1957; Nunnally, 1978) to the satisfaction scale items were as follows: excellent (weighted 5), good (weighted 4), average (weighted 3), poor (weighted 2), and very poor (weighted 1). The weighting values for each respondent were analyzed using item analysis to determine if the items were sufficiently inter-correlated to justify combining the weighting values for all items into a single variable. Item analysis produced an alpha coefficient of reliability of 0.87 (Cronbach, 1951) which indicates the items are highly intercorrelated. An alpha
coefficient of this magnitude indicates the weighting values can legitimately be summed to form a composite measure of satisfaction with the Ohio State Park visited most often. The weighting values for the six satisfaction items were summed to form a composite measure of satisfaction and the computed value was used in the statistical analysis.

Time and distance to Ohio State Parks was measured by asking respondents to indicate the time in minutes and the distance in miles required to travel to the Ohio State Park they visit most often. The values entered for these two variables were used in the statistical analysis.

Facilitators of park visitation was measured by asking all study respondents to assess factors that could encourage them to visit Ohio State Parks in the future. Respondents were provided a list of 14 things that could affect park visitation. Factors evaluated were as follows: quality of park facilities, relevance of park programs, user fees, access to park information, crowding, park safety, helpfulness of park employees, quality of food service, children education programs, programs for physically challenged, access for physically challenged, rental equipment, entertainment for children, and adult education programs. Respondents were asked to check all of the factors that would encourage them to visit Ohio State Parks more often in the future. All factors checked by respondents received a value of 1 and all factors not selected received a 0. The weighting values were used in the statistical analysis.

Socio-demographic characteristics were measured by asking study respondents to provide information about themselves and their family. Information was collected for age, number of children living at home, location of residence and monetary expenditures per trip to state parks during the 2004 recreation year. Age of the respondent was measured using four categories which were as follows: under 18 (weighted 1), 18-34 (weighted 2), 35-60 (weighted 3), and over 60 (weighted 4). Number of children living at
home was measured as the number of children living at home below the age of 18. The possible range of children was from none (0) to five or more (5). Location of residence was measured using 7 categories of community size. The categories used are as follows: rural farm, rural non-farm, village (<2,500 people), small town (2,500 - 10,000), small city (10,001-50,000), city (50,001 - 250,000), and large city (> 250,000). Weighting values of 1 through 7 were used to represent the categories with rural farm receiving a value of 1 and large city a value of 7. Total expenditures for park visits was measured by asking respondents to indicate the amount of money usually spent on five categories of purchases per recreation trips to Ohio State Parks during the 2004 recreation year. The values submitted for each of the different types of purchases were summed and multiplied by the total number of trips to Ohio State Parks during the 2004 recreation year. The product of the calculation was used in the statistical modeling.

Statistical analysis: Study data were examined using frequency distributions, means, and standard deviations to assess general trends within the data set. Discriminant analysis was used to compare characteristics of visitors and non-visitors to Ohio State Parks for the purpose of identifying variables that could differentiate park visitors from non-visitors. Multiple linear regression modeling was used to examine the utility of the theoretical model developed to guide the investigation of satisfaction with the State Park visited most often. Means substitution was used for missing data which has been shown to be the best method for salvaging cases when the number of observations is high, the intercorrelations are low and the amount of missing data is very low (Donner, 1982). All of these conditions were satisfied in the data set.

Study Findings
Of the 737 useable questionnaires returned by the study sample, a total of 310 reported they had visited Ohio State Parks during the 2004 recreation year which indicates that approximately 42.1 percent of the study respondents had visited Ohio State Parks during the past recreation year. This value is probably a good estimate of participation in the state because it replicates findings from previous research conducted in Ohio. The previous study reported that approximately 42 percent of respondents had visited an Ohio State Park during the recreation year assessed (Carr and Chang, 2000).

Respondents were requested to provide basic socio-demo information about themselves and their families. Characteristics of the study sample are presented in Table 1 and show respondents are mature adults with relatively few children living at home. A large percentage of respondents lived in cities.

(Table 1 here)

Respondents were asked to provide information about visitation to Ohio State Parks during the 2004 recreation year. Of the 310 respondents who indicated they had visited Ohio State Parks during the 2004 recreation year, a large majority provided detailed information about their park visits. These data are presented in Table 2 and show that visitors to Ohio State Parks visited about 2.1 parks during the 2004 recreation year and that they visited the parks a total of 6.5 times. Respondents also indicated they would maintain basically the same level of participation during the 2005 recreation year.

Respondents who reported visiting Ohio State Parks reported they traveled about 36.2 miles to the State Park visited most often and that it took them about 46.8 minutes of travel time to reach the park. They also reported using Ohio State Parks for about 23 years. This means that park visitors
have considerable personal knowledge about Ohio State Parks.

Data collected about expenditures during visits to Ohio State Parks revealed that the average respondent spent about $599.17 to visit the parks during the 2004 recreation season. The expenditure per household data indicate that visitation of Ohio residents to Ohio State Parks generated an estimated 1.1 billion dollars in recreation spending in Ohio during the 2004 recreation year.

(Table 2 here)

Level of satisfaction with the Ohio State Park visited most often is presented in Table 3 and show that respondents who reported visiting State Parks were satisfied with services and facilities provided at the State Park visited most often. Findings revealed that respondents were most satisfied with the appearance of the State Park followed closely by cleanliness and safety and security. Respondents reported the lowest level of satisfaction with programs and activities provided at the State Park visited most often. However, a mean value of 3.6 indicates a relatively high level of satisfaction with the programs and activities provided.

(Table 3 here)

Respondents were requested to indicate what would encourage them to visit Ohio State Parks more often in the future. A total of 14 options were provided to respondents and they were requested to select all of the options that would encourage increased visitation in the future. The findings are presented in Table 4 and reveal considerable differences for visitor and non-visitor respondents.

*Improved facilities at parks, lower user fees, access to information, programs for children, and entertainment for children* were the facilitators chosen most often by respondents who reported visiting Ohio State Parks. *Facilities for physically challenged, programs for physically*
challenged, and availability of rental equipment were seldom selected by respondents who indicated they had visited Ohio State Parks.

*Access to information, lower user fees, and improved facilities at parks* were most frequently selected by the non-visitor group, however, the percentage of respondents selecting these options was much lower than the visitor group.

(Table 4 here)

The sample was divided into visitor and non-visitor groups to assess the merits of the theoretical perspective used to predict factors that would differentiate visitors to Ohio State Parks from non-visitors. The findings are presented in Table 5.

The findings demonstrate that the factors included in the discriminant analysis were significant in differentiating visitors from non-visitors. The findings show that 14 predictive variables were significant at the 0.02 level in differentiating visitors from non-visitors. All of the socio-demographic factors were significant at the 0.01 level while 11 of the 14 facilitators to greater participation at the parks were shown to be significant beyond the 0.02 level.

A canonical correlation is a measure of strength of association in discriminant analysis and the square of the value is an approximation of the variance explained by the predictive variables. The square of the canonical correlation of 0.44 is 0.194 which means the model is fair in terms of predicting visitor and non-visitor status using cross-sectional data. The statistical model was shown to correctly classify 70.6 percent of the respondents into appropriate categories which is considered good.

(Table 5 here)

Linear regression analysis was used to assess the merits of the theoretical perspective used to
guide the investigation focused on satisfaction with the Ohio State Park visited most often during the 2004 recreation season. The summed scale scores for measures of satisfaction with park visited most often was selected as the dependent variable and 10 variables hypothesized to affect satisfaction were included in the modeling to predict variability in satisfaction scale scores. The findings are presented below in standardized regression coefficient form. Significant coefficients are identified with an asterisk.

\[ Y = -0.170X_1^* + 0.158X_2^* + 0.153X_3^* - 0.137X_4^* - 0.130X_5^* + 0.067X_6 - 0.057X_7 \\
- 0.037X_8 - 0.019X_9 - 0.009X_{10} \]

\[ Y = \text{Level of satisfaction with park visited most often} \]
\[ X_1 = \text{Improve facilities at park} \]
\[ X_2 = \text{Access to information about parks} \]
\[ X_3 = \text{Location of residence} \]
\[ X_4 = \text{Programs for physically challenged} \]
\[ X_5 = \text{Increased safety patrols} \]
\[ X_6 = \text{Age} \]
\[ X_7 = \text{Lower user fees} \]
\[ X_8 = \text{Outdoor education programs for children} \]
\[ X_9 = \text{Number of children living at home} \]
\[ X_{10} = \text{Total dollar expenditure during 2004 park visits} \]

Regression findings revealed that five independent variables were significant at the 0.05 level in reducing the unexplained variance in satisfaction with the state park visited most often during the 2004 recreation season. Only one of the socio-demographic factors was shown to be significant in the regression model. Respondents who reported living in more urban areas tended to be more satisfied with the park visited most often. Individuals who indicated that better services in terms of improved facilities, increased safety patrols and programs for physically challenged people would increase participation tended to be less satisfied. Individuals who perceived a need for more information about State Parks tended to be more satisfied.
The squared coefficient of determination for the computed regression model was 0.097 which means that only 9.7 percent of the variance was explained by the predictive variables included in the model. While the amount of explained variance was very low, the observed significant relationships were consistent with research expectations.

**Conclusions**

Research findings basically supported the theoretical perspective used to guide the investigation about factors influencing visitation at Ohio State Parks. Discriminant analysis revealed that predictive variables chosen for investigation were fairly good for correctly classifying respondents into visitor and non-visitor groups.

Examination of the mean values for the visitor and non-visitor groups (Table 5) reveals that the visitor group is consistently higher on park related concerns than non-visitors. Improvements in park characteristics such as improved facilities, better programs and food service, lower user fees, and improved safety will probably have greater impact on the visitor group than the non-visitor group. This suggests that barriers to visitation of non-visitors is probably not related to services and facilities available at the parks.

Study findings strongly indicate that respondents were satisfied with the services and facilities made available to them at Ohio State Parks visited most often during the 2004 recreation season. The mean scale score for satisfaction with State Park visited most often was 23.3 which indicates a very positive perception of services and facilities provided at the park visited most often. Unfortunately, the findings are much less supportive of the theoretical perspective used to guide the investigation of satisfaction with the Ohio State Park visited most often during the 2004 recreation year. While
directions of the significant relationships observed within the regression model were consistent with research expectations, the magnitude of the explained variance indicates the statistical model is poor for predictive purposes. The failure to identify socio-demographic factors that predict satisfaction with services and facilities at the State Park visited most often suggests that visitors from all socio-economic groups perceive the managers of the parka as providing good quality services and facilities to the recreating public.

Perception of One’s Own Prestige and Social Development, with Particular Reference to the Developing Countries

Taysir Nashif
United Nations
31 Barry Way
Hamilton, NJ 08619, USA
tnnashif@aol.com

Introduction

In the activities of society, the objective and subjective factors are blended in a number of social concepts, such as stability, order and satisfaction. Though it is impossible to fully separate the objective and the subjective factors in such concepts, it is nevertheless possible to recognize, to a certain degree, the existence of such factors.

To achieve progress in the scientific, cultural, political and economic fields, it is necessary to recognize and take into account the objective factors in such concepts. Failure to do so is a major reason for a country’s social – including political, cultural and economic – underdevelopment.

Perception of one’s own prestige is based on objective factors – such as type of occupation, wealth, ownership of property and level of income – and subjective factors – such as family affiliation and place of birth.

Perception of one’s own prestige (social status) is a source of psychological gratification and a motivation to strive to retain such perceived prestige.

Often, a contradiction arises between the requirements of the subjective and the objective factors. To overcome social underdevelopment, one has to give priority to the requirements of the objective factors over those of the subjective factors in his (and “his” applies to the feminine gender) perception of one’s own prestige. Not to do so would inhibit social advancement. But the individual tends to regard the giving of such a priority as an infringement on his sense of prestige.

It is assumed in this paper that the subjective factors override the objective factor of professional specialized occupation in one’s behavior, contributing to the perpetuation of social underdevelopment from which peoples are suffering, particularly in the developing countries.
The paper sets as its goal to discuss the dynamic concept of the perception of one’s own prestige which, as mentioned above, consists of subjective and objective factors in a social-psychological setting. Examples will be drawn from the social realities of the developing countries involving the estrangement or contradiction between the requirements of the subjective and objective factors, thereby affecting the social setting.

In the activities of society, objective and subjective factors are blended in at least a number of social concepts, such as stability, order, honor, dignity and satisfaction. An objective factor is one that the nature of the subject requires to be accommodated or taken into account. A subjective factor is one that is not organically related to the objective factor. Though it is impossible to fully separate these two factors, it is still possible, to a certain extent, to identify them. The lower is one’s educational and intellectual level and the less developed is his sense of fairness, the more difficult it is, on average, to separate the subjective from the objective factors in one’s own sense of prestige.

Prestige is related to the exercise of influence. Sociologists and political scientists have made attempts to classify or isolate those who exercise influence. These may be seen in relation to some classification of structures of influence. One classification is that of wealth, power, status and prestige. Functionally and structurally, with the exception of wealth, it is difficult to distinguish between these concepts. These four dimensions, at the least, need to be considered in defining class. Thus, stratification systems rank people in more than one dimension. Remarking on the relation between ‘class’ and ‘status,’ Max Weber wrote, “with some oversimplification, one might … say that ‘classes’ are stratified according to their relations to the production and acquisition of goods; whereas ‘status groups’ are stratified according to the principles of their consumption of goods as represented by special ‘styles of life’.” (1)

Students of society differ regarding the degree of influence that prestige exerts. Gustave Le Bon wrote, “whether it be ideas or men, has in the main enforced its authority by means of that irresistible force expressed by the word ‘prestige’ … Prestige in reality is a sort of domination exercised on our mind by an individual, a work, or an idea …” (2) Le Bon remarked that
prestige “… can be worn away … by being subjected to discussion … From the moment prestige is called in question it ceases to be prestige. The gods and men who have kept their prestige for long have never tolerated discussion. For the crowd to admire, it must be kept at a distance.” (3)

Perception of one’s own prestige is based on objective factors – such as educational specialization, type of occupation, ownership of property and level of income – and subjective factors – such as respect for the elderly, reverence for one who is or believed to be descendant from a family, class or place of birth which is respected, the ascription of extraordinary actions to certain persons, and other cultural symbols. In some societies, belonging to a particular religion or race is a source of prestige; in other societies, birth into a celebrated family or attendance at a certain school is a source of prestige. (4)

There are two types of prestige with both objective and subjective factors: a prestige that people ascribe to a certain person or view as enjoyed by a certain person; and perception of one’s own prestige. The degree of prestige people attach to an occupation is heavily influenced by the education required for the job or the authority it offers its holder, as well as by income. (5)

Because of the intrinsic difference of perception, one’s own perception of prestige differs from that of others. In nearly all cases, however, some common ground exists; in other words, some subjective and objective factors of prestige are shared by both a person’s own perception and others’ perceptions of that prestige. In this paper, the focus is placed on the way one perceives his own prestige.

Lack of distinction, insufficient distinction or indifference to this distinction between the subjective and objective factors is one of the major reasons for the scientific, political, cultural and economic underdevelopment of peoples in all continents, particularly in the developing countries. For advance in the scientific, cultural and economic fields to be achieved, distinction between the objective and subjective factors needs to be recognized and taken into account, and objective factors need to be accommodated in policy formulation and implementation.

A perception of one’s own prestige is a source of gratification for one who has this perception. John Adams has remarked that, “… The rewards … in this life, are esteem and admiration of others – the punishments are neglect and contempt – nor may anyone imagine that these are not as real as the others. The desire of the esteem of others is as real as a want of nature as hunger – and the neglect and contempt of the world as severe a pain, as the gout or stone.” (6) This self-perception is a source of psychological
gratification, because it gratifies one’s ego. Prestige does not only gratify individual ego; it also buttresses power. It turns power into authority.

Because prestige is a tool to generate and exercise social, economic and political influence, one who holds prestige attaches great importance to it. Because prestige is important in the acquisition of power, the exercise of influence and authority and psychological gratification, a person with prestige always tries to keep, protect and promote it. The higher is the prestige the greater is the likelihood of one’s enjoyment of it and one’s determination to protect and enhance it.

In reality, the subjective factors often dominate, or have the upper hand over, the objective factors in one’s perception of prestige. This domination is one of the main reasons for the underdevelopment from which many developing peoples are suffering in the social, economic, scientific and cultural fields. Development is a process of change which involves, but is not limited to, a greater degree of specialization, functional differentiation, experimentation, and more realistic and objective readings of situations. Objective factors in one’s perception of one’s own prestige are of relevance to the achievement of development. Moreover, these objective factors are of relevance for the removal of the manifestations of underdevelopment, such as lack of functional differentiation and of specialization.

Objective and subjective factors differ in the extent of their presence in, or proportion to, one’s self-perception of prestige. This extent depends on such factors as the extent of one’s educational level, one’s professional and occupational level, one’s upbringing regarding the values placed on democracy or on totalitarian and patriarchal systems, and the extent of one’s respect for scientific approach.

In cases of contradiction, as usually happens between the subjective and objective factors in the perception of one’s own prestige, one has a tendency to accommodate the subjective factors and pays less attention to the objective factors. A person regards giving priority to the objective factors over the subjective factors as an encroachment on his prestige if his perception of his prestige depends on the subjective rather than the objective factors.

The overall effects of the contradiction between the two factors depend on the extent of their presence in one’s perception of one’s own prestige. The following is an example of that contradiction drawn from the field of development. Social and economic development requires the availability of a considerable degree of people’s participation in the process of development; this is unavoidable. However, one who holds the reins of authority – be he a governor, minister, mayor, chief of tribe, head of village,
police officer, army commander or university president – may take, proceeding from his desire to keep his prestige which consists, as mentioned above, of subjective as well as objective factors, a hesitant, cautious, indifferent, reluctant or hostile stand towards the idea of popular participation. He may think, depending on his social and educational background, that such participation is inconsistent with his exercise of authority, which constitutes, in his own view and the views of others, one of the strong bases of his prestige. It is obvious that this stand would be a major reason for preventing or delaying development.

One factor for educational, scientific, economic and technological progress is knowledge, which is an instrument of control. It is obvious that taking account of subjective factors in one’s perception of one’s own prestige is not conducive to the acquisition of knowledge; rather, knowledge is acquired through taking account of the objective factors.

As already mentioned, it is impossible to separate the subjective and objective factors in one’s perception of one’s own prestige. It is, however, possible to achieve a certain degree of separation. The stronger is the objective factors in the objective-subjective combination, the less difficult it is to acquire knowledge and vice versa.

ABSTRACT

This paper presents a qualitative study concerning Pacific Islander students with physical disabilities in education at an orthopedic hospital in Honolulu, Hawaii. This study included nine in-depth interviews. Of these nine interviews, four were of hospital classroom teachers and five were of other staff members including two social workers, one orthopedic therapist, one nurse, and a former nurse who now works in telemedicine. At this hospital children are flown in from areas in Polynesia, Melanesia, and Micronesia for stays as long as one year with the average being about 22 days. While children are patients at this hospital they are required to attend the hospital classroom. It is argued in this paper that children with physical disabilities are challenged in four ways: they are experiencing multiple dislocating factors such as transitions and adjustment to a new environment, cultural changes, physical challenges, and different educational experiences. The study revealed that all four factors were possible reasons for low academic achievement. However, it was also noted that due to the nature of one’s disability and culture, academics may not play a role in one’s success or failure. Achievement of any kind pointed towards the idea of having a disability, but not being disabled as defined by informants.
ABSTRACT

This paper presents a qualitative study concerning Marshallese students with physical disabilities in education in Hawaii. This study includes ethnographic in-depth interviews of ten Marshallese with disabilities, ten interviews of Marshallese without disabilities who have experienced a U.S. education, ten interviews of professionals in the community, ten 1-2 observations of 3 Marshallese families, one year of unobtrusive observations in the Honolulu and Kona Marshallese communities, and a year’s gathering of local news artifacts. It is argued that due to military testing in the Marshalls by the U.S. government in the 1950’s and 1960’s led to a higher percentage of disabilities in this population, resulting in migration to the U.S. for better healthcare and education. It is argued that community history, migration, culture, and disability leads to marginalization and affects one’s education in the U.S. Theories from the research will be used to create practical applications for the classroom and will be later discussed.
Case Study/Report on Issues Related to Teaching:

Preparing Indigenous Teachers for Alaska Schools (PITAS)
Preparing Indigenous Teachers for Alaska Schools

Program Abstract

PITAS. Alaska Natives represent less than five percent of the educators in the state, yet Alaska Native students make up nearly twenty-five percent of the student body. In order to address the scarcity of indigenous teachers in Alaska, the Preparing Indigenous Teachers for Alaska Schools (PITAS) program was created at the University of Alaska Southeast (UAS) in 2000.

Goal. The primary goal of the PITAS program is to increase the number of Alaska Native teachers in Alaska Schools by increasing the participation of Alaska Native students in teacher education programs at UAS by 100%.

High School Component. Currently, there are fifteen PITAS Mentor Teachers recruiting future Native teachers in twelve communities throughout Southeast Alaska and the Lower Kuskokwim School District. The Mentor Teachers guide Native high school students through an independent study course that exposes students to the teaching profession and helps prepare them for college.

Summer Institute. Entering freshmen are required to participate in a two-week summer bridge program that includes placement testing, college orientation courses, a Tlingit language and culture course, and group activities.

UAS Scholarship. Students who are admitted to the program receive a scholarship that generally covers tuition, fees, books, and room and board at UAS. Students must be enrolled full-time and maintain a minimum 2.5 GPA in order to remain eligible for the scholarship.

Mentorship. Upon entering UAS students are matched up with continuing students who assist them in their transition to college life. The mentoring groups meet regularly and frequently throughout the first year.

Foundations Course. All PITAS students are required to take a year-long course that is designed to build leadership skills and strengthen Native identity.

Cultural Infusion. The Cultural Infusion component of PITAS seeks to make UAS a culturally responsive institution by integrating Native culture into the curriculum. Last summer five UAS faculty/staff members participated in Alaska Native subsistence activities in the traditional village of Kake as part of the Cultural Infusion program. Thirteen members of the faculty/staff are signed up for the camp next summer.
**Degree Programs.** PITAS students receive their teaching certificates through participation in either the Bachelor of Arts in Education or the Masters of Arts in Teaching (MAT) programs at UAS. There are currently 31 undergraduate students and 6 MAT students in the PITAS program at UAS.

**Partnership.** PITAS is a U.S. Department of Education grant-funded program designed to increase the number of Alaska Native teachers in Southeast Alaska schools. Sealaska Heritage Institute, the Central Council of Tlingit and Haida Indian Tribes of Alaska, the Alaska Native Brotherhood, the Alaska Native Sisterhood, and School Districts from Southeast Alaska and the Lower Kuskokwim are partners in the project.

Hansen's Disease (HD) is an infection caused by the Mycobacterium leprae discovered by Hansen of Norway in 1873. This bacillus has the capacity to invade the skin and peripheral nerves. But the infectiousness of this bacillus is very weak, and it is very rare that the symptoms appear even if infected. The chemotherapeutic drugs as represented by Promin developed in 1943 have been found to cure the disease. (The social education committee of Japanese Hansen's Disease society)

In Japan, the national policy which segregated compulsorily the people diagnosed as HD to remote leprosaria began in 1907 and continued even after the cure method had been established. It was finally abolished in 1996. Most of the HD sanatorium residents were obliged to live a life in which freedom, such as movement, career choices, etc. were restricted over many years.

This research seeks to determine the influence of this kind of social isolation on the life-span development by examining the entire life of the HD sanatorium residents in Japan who have now reached old age. This report is the result of analyzing the autobiographies that the residents themselves wrote, and examining the meaning of family, marriage, and work for them. The reason these items were taken up at this time is that we assume focusing on the most important roles of lifetime leads to a better understanding of the interactions between the residents themselves and the social context* in which they were embedded.

Method

Subjects and Materials: Four autobiographies written by the H D sanatorium residents themselves (hereafter called Autobiography A-D, respectively) are the materials of the present study. The subjects are the authors, Y. Hirasawa (A), M. Kunimoto (B), H. Kagata (C), and A. Hirano (D).

Analytic procedure: The parts referring to “themselves” “family” “marriage” and “society and work” were extracted from the autobiographies. These items were put in chronological order for each author, then matched with the principal events in Japanese society or in areas around the sanatoriums (macro- or exo-system level*), the principal events inside the sanatoriums (mezzo-system level*), and the changes in human relations of the authors (micro-system level*). Thus, we made four chronologies of every subject’s (author’s) life history and examined the interactions between the subjects themselves and the social contexts in which they were embedded. The following are the results of analyzing these life histories. In the analysis, we refer to the records of the interviews with the subject (author) and other residents.

Results

Social isolation:
The segregation was far too strict. Going out was strictly prohibited after being placed, and all sanatoriums were managed so that self-sufficiency of food, clothing and shelter might be possible. Thus, these sanatoriums were a society closed off from the outer world. Between 1945 and the middle of the 1950s, such restrictions were severest. According to the autobiographies, the severest situation depicted around the time of the Pacific War seems to be as follows:

- Only exchange tickets could be used for money in the sanatoriums.
- Mail reaching the subjects in sanatoriums was opened and censored, even if from family.
- Meetings with outsiders were strictly monitored and recorded in writing by staff members present.
- Residents wore the same uniform, made like a Japanese yukata with cotton.
- Residents served as workers at the sanatoriums, providing care and nursing, and
laboring on pig and chicken farms.  
- The above situation was common to virtually all the sanatoriums. ……etc.

The present residents’ average age is in the upper seventies. Most were segregated around the time of the Pacific War about 60 years ago, when they were only teenagers. Thus, the severest period of social isolation coincided with their adolescence and early adult stages.

In Japan, at the end of the 1940s, medical treatment for Hansen's disease was provided, and the national policy continued even after that. However, social education activities began, which aimed at abolishing discrimination over HD, and the prohibition on going out was eased little by little. Thus, some residents aimed at life outside the sanatoriums and at social rehabilitation. But even on the outside, the residents could not return to their home country and had to hide their illness. Although the policy was abolished finally in 1996, they were already aged then, so social rehabilitation was very difficult. Thus, it can be said that their social isolation has continued over 50-60 years or more even until now.

**Autobiography A:**

“I was segregated to the Hansen's Disease sanatorium one day in my boyhood when my heart was full of hope. Since then I have been confined in a concentration camp called a sanatorium for most of life. I was forced to put on a uniform like a prisoner, going out was forbidden, and I was kept under strict surveillance. I became a human being permitted to live under the Leprosy Prevention Law.”

“It was often said that we could return to society for the first time, only when we died, our bodies were cremated and we became smoke.”

**Meaning of family:**

Many of the present residents were isolated around the time of the Pacific War. In Japan in those days, suffering from HD meant that not only they themselves but also their family and relatives underwent discrimination and persecution. Therefore, when diagnosed as HD, most of the patients were ordered to break off from their family and were segregated to the sanatoriums under the pretense that they had died, had changed to another school, their occupation had been changed, or they were missing. To meet with one's family was allowed in the sanatoriums, but the families who came for the meeting were actually very few. And the residents, on their part, did not make contact with their families either. Therefore, most residents have had little
communication with their families for 50 years or more until now. Moreover, many are using a false name in everyday life. However, to judge from the autobiographies, it was not because they ever hated their family but because they had a strong desire not to cause their family problems that they used the false names and did not contact them. Moreover, the attachment to their mothers and the memories of their hometown in childhood still gives them ongoing mental support.

**Autobiography A:** “I do not let my hometown be known or my real name because my family had to undergo indescribably severe persecution, and I'm very afraid that my very existence will have a bad influence on my family trying to live peacefully now. “

“It is because I'm encouraged by my mother's belief and her way of life that I can do my best, though I expose my handicapped body on television or in mass communications this way. However, I could not see my mother's last moment, could not attend her funeral, and still cannot go to visit her grave.”

**Autobiography B:** “If our families did not cut their ties with us, we patients broke off contact with our families by ourselves and tried to protect our families.”

**Autobiography C:** “When I came back to my hometown to speak on the issue of Hansen's Disease, I felt the depth of human empathy and the warmth of my hometown fully, and I am very glad from the bottom of my heart that I survived to live a long life.”

After legal rehabilitation in 1996, some of the residents resumed the exchange with their family or relatives, but most do not still communicate with them. They only went past or looked at their first home from a distance even when they went back to their hometown for the first time in decades. The reason is that a possibility that their family and relatives will be troubled cannot be denied and they do not want to remember discriminative treatment undergone once and so on. And many of the residents have used assumed name and hesitated to reveal real name. This is also out of the consideration that they must protect their family and relatives from discrimination even now.

**Meaning of marriage:**
In general, many residents married at the worst time in the Pacific War days. Because the cure method was not established yet, and food was so little then, patients could not expect to live a long time. We infer from the autobiographies and the interviews that subjects recognized marriage as an event to be experienced in a short lifetime, and that they married because they hoped their partner to attend their death rather than have a
long life together. In the sanatoriums of those days, there was a custom that a person with a slight illness would care for a seriously ill person, and they seemed to have been intensely interested in the person they entrusted to their care.

Generally, in Japan, marriage has the meaning of constituting the social base for expanding social activity further and enriching it, leaving offspring, etc. But for male residents including the autobiography writers, sterilization was forced upon them in marriage. And it was a matrimonial condition for both sexes to give up having a child. Moreover, the marriage for them meant keeping to an isolated life of working in the self-sufficient organization of sanatoriums rather than making a base for a new departure in society.

**Autobiography A:** “Getting married meant giving up social rehabilitation... If I had a strong desire to make a comeback to normal life, I would not marry in the sanatorium. Although my social rehabilitation was to go home for me, I gave it up.”

**Autobiography C:** “It is natural to human beings that those who desire marriage appeared because we had the same illness and gave much attention to caring for one another.”

“I will have no posterity because of the sterilization operation. Although I regarded it all as determined, when I got on the operating table, an infinite feeling of lonesomeness welled up inside me.”

As surveillance became loose little by little and social rehabilitation went into the view after 1950s, meaning of marriage mentioned above changed a lot. Residents who got married after then gained foothold for social rehabilitation like A. Hirano, the author of **Autobiography D.**

**Meaning of work:**

From personal communication with the author of **Autobiography B,** the residents were divided into three types in terms of the following social activities:

1. Activities of the residents' association: the management of the sanatorium, the movement for affirmative action, PR activities to enlighten people on HD, etc.
2. Artistic activities: writing an autobiography and poems (including Japanese-style poetry Tanka and Haiku), calligraphy painting, photography, and Bonsai (Japanese-style gardening), etc.
3. Religious activities: There were several meeting places for Christians, and
Buddhists. Funerals were an especially important event among daily religious practice.

Seemingly, the above activities might be like leisure activities, but the residents were forbidden to go out, so they had no occupation. Activities inside the sanatoriums included the meaning of work for them.

Generally, work implies means of self-realization, as well as interaction with others and society. We assume this could apply to the residents. Each of the activities had functions to bind the residents together or to express “themselves” to the outside world or leave something to posterity.

Some of the residents came out of the sanatoriums and found a successful occupation after 1950s. The author of Autobiography D is one of them. He had various jobs and finally established a company by himself. But many residents who hoped to work continued to live inside the sanatorium while holding an outside job. It is interesting that they succeeded in obtaining the cooperation of understanding people around the sanatoriums. Most of them, however, had no choice but to come back to the sanatorium because they could not find a hospital other than the sanatorium when the complications of HD became very severe.
Title: Migration, poverty, and HIV risk of infection: An application of social capital theory.

Abstract

The 2003 World Bank data on HIV/AIDS for Sub-Saharan indicate that 26.6 million people are living with HIV, including 3.2 million who became infected in the past twelve months. AIDS killed approximately 2.3 million people in the same year. This makes this region by far the worst affected by the HIV/AIDS epidemic. Current interventions are designed primarily after individual-based public health models. However, literature indicates that the root cause of HIV/AIDS in developing countries is poverty. This paper proposes a macro level conceptual model based for understanding the spread of disease by considering migration as an intervening factor. Migration, a by-product of Colonialism is a culturally accepted means of earning livelihood. However, migratory patterns and sexual interactions during the migration periods in combination amplify the risk of HIV viral transmission. An application of social capital theory is used to generate a framework for exploring how migration serves as a conduit for the disease. It specifically investigates male migrant laborers particularly in South African mines and argues that a migrant labor’s movement away from his village diminishes his social capital in terms of social networks, norms, and traditions. Further, individual coping and adaptation to the migratory lifestyle introduces new social networks, norms, and lifestyles that could prove to be conducive to the spread of the HIV virus. A leadership model approach aimed at building social capital among the male migrant workers is proposed as a macro level intervention.
The spread of disease in a particular society is influenced partly by the political, social, economic and cultural environments in which people live. According to Hunt (1996), there are several models that explain the HIV/AIDS patterns in Africa. The historical material model helps to explain AIDS related risk factors by the colonial past of Africa. For example, in sub-Saharan Africa “circular” or “oscillating” migration, which owes its origin to colonialism, is an integral part of the social norms. This phenomenon has been an important determinant and a contributing factor to the spread of disease. Typically, young men leave their rural homes in search of work in urban areas. There are also cases of forced migration, usually as a result of political conflict. In this new, unfamiliar environment, away from the cultural norms and village traditions, they may engage in sexual activity with high-risk women, thus exposing themselves to the virus. On their return they may carry with them the acquired virus and infect their rural partners (Lurie, 2000).

Literature identifies geographic mobility, migration and population displacement as significant risk factors to general well being. Several studies have shown that migrants are at a greater risk of HIV/AIDS along with other forms of STDs than non-migrants in the whole of Africa (Decosas et al., 1995; Jochelson et al., 1991, Lurie et al. 2000). Studies done in Uganda, South Africa, Botswana, Senegal among a few all point to a strong association between
migration and HIV (Decosas & Adrien, 1997, Pison et al., 1993). A study of male factory workers in Zimbabwe indicated that male migrant workers who have lived apart from their wives and have had several sexual partners were more likely to be HIV positive than their non-migrant counterparts (Mbizo et al., 1996).

All these studies arrive at the same conclusion that the social disruption, which characterizes migration, determines a migrant’s vulnerability to AIDS. Migration is predominantly a male institution in Sub-Saharan Africa. Typical camps for mine workers may provide accommodation for as many as 2000 young male migrant workers. In the rural environment where these men come from they are subject to very strict social controls and cultural norms of their villages. Social behavior is highly codified and privacy is an alien concept. However, in the camps this strict external control is suddenly loosened and is replaced by the culture of maleness. “Being male, young, at least temporarily single, and receiving your pay on the same day” (Decosas et al., 1995) are some of the causes that make this population vulnerable to the exposure to HIV/AIDS.

As stated by Doyal (1981) that in the case of male migrants disruption of the personal foundations attributed to family life often led to the disintegration of established marital and sexual patterns. Literature also point to a co-occurring phenomenon that is responsible for the rapid spread of the virus among the migrant workers. This is particularly true in the mining and plantation workers. On the weekend after the payday, a convoy of 30 to 40 sexworkers is
brought to these areas by the employers. Decosas et al. (1995) states that, “this incredible burst of sharing genital microflora is a powerful motor for the spread of HIV infection”. This phenomenon of frequenting sex-workers is not confined to miners and plantation workers only, but is true for any migrant worker.

Hunt (1996) presents a different theory on transmission of AIDS in Africa. He calls it the “truck transport theory” (pp. 1284) of transmission of AIDS. It argues that truckers in the process of frequenting prostitutes have transmitted the disease from community to community.

Other authors like Caldwell et.al (1989) have looked at cultural patterns, particularly with regard to sexuality and reproduction as an explanation for the AIDS epidemic in Africa. The primary focus of this discussion deals with migration as a conduit of transmission of HIV/AIDS, particularly in South Africa.

a. A history of migration in Southern Africa

Historically, the political and economic system of South Africa had been ordered around the migrant labor system and had been intimately linked to the structure and functioning of the system of apartheid. According to Zwi and Bachmayer (1990), both legal and illegal migrants were drawn to work in South African mines and farms from rural areas within South Africa and neighboring countries. Migration was both and integral and essential part of the way in which the government, with the support from industry (particularly mining), structured South African society that eventually culminated in the system of apartheid. During the early decades of the
20th Century, the apartheid movement was controlled with the aim to provide a continuous flow of cheap labor to agriculture, industry and commerce (Wilson, 1972).

Two laws were passed one in 1894 and the other in 1913 that formally established the migrant labor system. The Glen Grey Act of 1894 imposed a financial tax on black South Africans who were not primarily engaged in the monetary economy of then South Africa. This had the consequences intended by the policy makers in forcing a large number of Black South Africans to seek employment in the mines and other economic sectors to raise money to pay the tax. The Native Land Act of 1913, severely restricted black people’s access to land (even though the title of the Act relayed a different idea). This Act was enthusiastically supported by the mining companies who now could be assured of a constant supply of cheap labor. This Act was also supported by white farmers since this meant more land for them and cheap labor to work on those farms (Lurie, 1992, Davies, 1979).

The intended effect of both these laws was to have black South Africans ‘offer’ up cheap labor in primarily white owned businesses. By allowing them to live only temporarily in so-called ‘white’ areas, these laws ensured that black South Africans retained a rural base and did not settle permanently in their areas of employment. This rural base, however paltry, it might have been, allowed the industry to spread the myth that black workers had access to land and also allowed them to conveniently avoid any responsibility for the welfare of the workers. If a
worker was severely injured or too old or too sick to work, they were simply sent home (Palmer and Parsons, 1977).

The changing and dynamic nature of migration and how it became interwoven with the South African society can be best understood through the ways in which sources of rural livelihood in South Africa changed over the last century. Remittance of family members working in the urban areas gradually increased in importance and by the 1970s, only 10% of the total household income came from agriculture and the rest was accounted for by family members who worked as migrant workers.

b. **Social capital and health promotion**

Links between social capital and health have come into recent prominence through income inequality and health inequality literature. Kawachi and Kennedy (1997) had concluded in their research that income inequality led to a lack of investment in social capital which in turn led to increased mortality. Kawachi et. al. (1999) had indicated that a large gap between rich and poor can cause a breakdown in social cohesion which then transferred into higher mortality rates among the poor. Lynch and Kaplan (1997) maintained that income and other resource inequalities were indicators of other kinds of latent inequalities in the socio-political structures that might lead to health policies that adversely affect the poor. A study investigating the links between social capital, social support and health was conducted David J. Pevalin and David Rose. They measured social capital in terms of social participation, level of contact with friends,
extent of criminal activities in the neighborhood, and the level of attachment to neighbors. Social support was operationalized in terms of perceived support in times of need. Their study findings demonstrated that both social capital and social support had a positive effect on health of the individuals (www.renewal.net/Documents/Research/ Socialcapitalinvestigating.pdf – retrieved on 4/30/2004). Research conducted by Hawe and Shiell (2000) had identified factors that may influence the social capital value of community groups in relation to HIV prevention at the individual, group, and community levels. Campbell et.al. (2002) drew on Freire’s critical consciousness as a way of increasing social identity and social capital among a group of school children in South Africa and then using peer education as an HIV prevention strategy. Their obvious underlying theoretical assumption was the link between social capital and individual well-being.

This argument is based on the premise that migration leads to social disruption and that in turn increases the migrant’s vulnerability to AIDS.

I. **Theoretical Context**

The theoretical foundation used in this proposal is *Social Capital Theory*. As was noted earlier that there has been a current enthusiasm for the notion of social capital, particularly as it relates to promotion of health. Although social capital is a relatively recent addition to the social sciences, the term was coined by Hanifan as early as 1916 within the context of community involvement in a successful schooling system. Social capital refers to the
institutions, relationships, and norms that shape the quality and quantity of an individual’s social interactions. Social capital is not just the sum of the institutions, which underpin a society – it is the glue that holds the individual members of a society together (Serageldin, 1998).

The central tenet of social capital, namely that membership of a certain group confers benefits and obligations on individual, has its roots in both classical sociology and economics (Portes, 1998). The recent interest is social capital can be traced back to one of the three sources: Pierre Bourdieu, James Coleman and Robert Putnam. Although each of the authors provide a similar definition of social capital, there are significant differences in the meaning and implications that follow (Portes and Woolcock). This discussion is based on Putnam’s view.

According to Putnam, social capital represents the features of social life, networks, norms and trust. The Theory of Social Capital presumes that generally speaking the more an individual connects with other people, the more is the trust and vice versa (Putnam, 1995). According to Woolcock and Narayan (2000), the basic idea of social capital is that an individual’s family, friends and social networks constitute “an important asset, one that can be called on in a crisis, enjoyed for its own sake, and leveraged for material gains” (pp.226). The two important concepts in social capital theory are bonding and bridging. Bonding refers to strong intra-community ties with family, institutions, and networks within the community. Bridging on the other hand refers to extra-community networks (Woolcock, Narayan, 2000). According to Portes (1998), one way of synthesizing the growing body of work on social capital is to mean
that the concept will embody two components. One is a relational element within social organizations to which an individual belong and the other is the material element that relates to the resources that the individual has access to by the virtue of being a member. According to Woolcock (1998), there is a micro-level and a macro-level component to social capital. At the micro-level the concept refers to the extent to which an individual member is integrated into his/her social network. At a macro-level this refers to the synergy between groups of community networks and the interest of its populace.

From the above discussion it becomes apparent that social capital is not a homogeneous, bounded concept. It possesses relational, material and political aspects with their own effects on an individual or the community. It can take different forms for different individuals and community.

II d. HIV/AIDS and Prevention Programs

In the growing body of literature on HIV/AIDS among migrant men in Sub-Saharan Africa, heterosexual transmission has been identified as the primary means of the spread of the disease. Therefore, most of the intervention programs have been targeted at the sexual practices of individuals. Most of the programs fail to consider the context within which sexuality is negotiated (Joffe, 1996). HIV/AIDS needs to be dealt as a social and developmental issue and not a biomedical/individual (Campbell & Williams, 1999). Gillies et al.(1996) argue that the intervention programs have been informed by inappropriate social and psychological theories,
which assume that sexual behavior is guided by rational choices informed by health-related information. Evidence points to the contrary. Kippax and Crawford (1993) are of the view that sexuality is a far more complex phenomenon than what is acknowledged by current the prevention programs. It cannot be understood solely in terms of decontextualized and quantifiable individual behavior. Thus current research on prevention needs to be located within the context of societal, normative and cultural frameworks in order to identify individual risk and resiliency factors. Resiliency in this context refers to behaviors that counter exposure to HIV/AIDS risk.

The following case study provided by Campbell and Williams (1999) drives the point home regarding the importance of social capital within the context of risky behavior. The authors talk about a mineworker in the gold mines of Johannesburg. He comes from a rural district in Lesotho. He states that he misses his family and that single sex hotel life (where 90% of the workers live) provides very little social support. Away from the strict control of his parents and village norms and living an extremely high stress life of a miner, drinking and sex seem to be two of the most common diversionary activities that are easily available to him. Furthermore, the authors also allude to the strong association between alcohol and unprotected sex (Campbell and Williams, 1999).
This study while acknowledging the wealth of prevention work done so far at an individual level, attempts to explore a different dimension of prevention by looking at social capital as a possible factor in promoting resiliency.

**Building Social Capital through Leadership Mobilization**

The devastating impact of the HIV/AIDS pandemic throughout Africa mandates that intervention must occur at both the micro and macro levels. These interventions must be science or evidence-based and must also be culturally amenable to the target population. One model, the Leadership Mobilization Model, seeks to create a united front in the fight for public policy enforcement and reform where necessary, advocate for funding to combat the proliferation of the disease, and to increase education and knowledge, and to utilize power and resources within community organizations to advocate for the resources to slow the progression of the disease. This indigenous leadership model is based on the “Council of Elders” model of community reform. It includes leaders in the clergy, public policy, health promotion, medicine, and community based, non-governmental organizations. The goal of implementing such a model is to bring together individuals who are considered local leaders within the community and educate them about their role or potential role in the fight against HIV/AIDS transmission.

Core elements or activities of the Leadership Model include: (1) identifying, educating and mobilizing African community leadership; (2) facilitate collaborations with all community entities and explore collaborations with other non-traditional entities who also have a stake in
addressing the problem; and (3). Create action plans that respond to World Health Organization’s, The World Bank’s, and the CDC’s initiatives-increase identifying high-risk populations, increase testing, provide continuum of care for HIV positive individuals, and reduce the spread of HIV infection.

**Core Competences and Skills Needed to Implement the Model**

The Leadership Mobilization Model is predicated on a set of competencies and skills that necessary to implement this model. Leadership must possess several core competencies, which include the ability to work with African leaders, the ability to collaborate with and engage other leaders; the ability to understand the role and value of macro or structural intervention. Although the Leadership Mobilization Model is a macro level intervention, Leaders must also understand the role and value of individual behavioral interventions. Lastly, each organization should have a sound infrastructure.

The organizational skills necessary to accomplish the tasks of the Leadership Mobilization Model include the ability to facilitate collaborations, the ability to teach HIV prevention, the ability to conduct social marketing campaigns, the ability to develop and implement action plans and the ability to monitor, evaluate, and ensure quality, integrity, and accountability among leaders.
Components of the Leadership Mobilization Model

The formation of an Advisory Committee that will identify leaders is the primary component of the Leadership Mobilization Model. According to the model, leadership identification is an on-going task. The leaders must also be educated on HIV/AIDS and its impact on local communities, which is second component. Leaders will also be educated on the role of the leadership and the need for aligning or realigning resources to target the problem. Another educative area involves educating the leadership about the collective benefit of collaboration with other leaders and community stakeholders.

The third component is the development of action plans. This activity involves the development of action items identified by the council of leaders. Action plans are the result of prioritizing local community issues, selecting the three most important issues to act upon, and a strategy for implementing action items that includes roles and responsibilities of each leader. Leader will also reach consensus regarding the collaborations sought and the resources needed to accomplish each identified goal.

The last component of the LMM is monitoring or evaluation of progress. The leadership will be held accountable to produce regular evaluative reports concerning the implementation and impact of the action plans. Evaluation will assess the capacity of the leadership to effect changes at the macro level that translates into significant and sustainable changes how HIV/AIDS addressed in local communities.
Using the LMM within the South African Context:

A participatory approach would be utilized to maximize active involvement of all the stakeholders in program design, implementation and evaluation. The first step would be to pull together a management team of various stakeholders that would constitute the Circle of Elders and the Advisory Committee. The various stakeholders in this model would include representatives of the provincial and the national health departments, the gold mining industry, trade unions, academicians, donor representatives and the community-based action group (particularly the elders of the villages that supply the labor force). The community action group could include medical workers, traditional healers, social workers, teachers, religious groups.

The success of this group would depend upon their collaboration and cooperation in building social capital among the miners as a way to prevent risk of HIV exposure. It also depends on maximizing local community participation and representation through grassroots involvement, particularly through the Circle of Elders.

Such efforts at social capital building may face several obstacles. Educating the stakeholders on the advantages of social capital and the presence of conflicting ideologies may come up as an issue. Building social capital could be a lengthy and arduous process and results may not as immediate as behavioral interventions. It may become a challenge to keep the stakeholders excited about the project and have continued faith in it. This model of prevention is
far more complex that individual intervention. To help understand these complexities and respond to them, ongoing process of evaluation is imperative.

**Conclusion**

HIV/AIDS is currently one of the most devastating health conditions affecting the health of millions throughout the world. UNAIDS estimates that approximately 60 million people have been infected since the beginning of the epidemic and in 2001 alone an estimated 5 million would have acquired HIV infection. A significant proportion of these individuals reside in Sub Saharan Africa.

The health and social implications of HIV/AIDS on human development are extensive and have resulted in an expanded national and international effort to respond to the HIV/AIDS epidemic with increased funding and expansion of prevention, care and intervention activities. In South Africa activities have expanded and funding of HIV/AIDS has increased significantly from the 2001/2 to the 2002/3 financial year.

As the literature points out the connection between migration and HIV/AIDS has been explored extensively and it has been established to be an important determinant of the spread of the disease. However, most of the interventions designed have looked at behavioral modifications. This study is an attempt to supplement the existing prevention programs by exploring the importance of environment as laid out by the social capital paradigm.

Relationships Between Multiple Role Commitment, Psychological Well-Being, Managerial Skills and Performance of Thai University Administrators: An Application of Multi-Sample, Non-Recursive Structural Equation Model

Abstract

The purposes of this research were 1) to develop and to validate the non-recursive model displaying relationships between multiple role commitment, psychological well-being, managerial skills and performance of Thai university administrators, and 2) to test the invariance of the proposed non-recursive model across groups of administrators with different gender, age, educational levels and fields. The related documents, consisting of nine textbooks and more than twenty research and academic articles in social, behavioral, management sciences, and research methodology were thoroughly studied, analyzed and synthesized. The proposed model was developed employing the evidences from related documents and examined by the committee of seven academic experts. The sample of this study were 350 heads of department, randomly selected from the Faculties of Education, Arts, Anthropology, Medicine, Medical technology, and Nursing from eight government universities, purposively selected from the population. The three questionnaires were distributed to 350 department heads, or equivalent, 22 Deans, and 700 staffs by the researchers. The obtained data were edited, cleaned, and saved for analysis. Both the validation of the measurement model and the non-recursive structural model were performed using LISREL. Multiple group strategy was employed to test the invariance of the proposed model across groups of administrators with different gender, age, educational levels and fields. The developed non-recursive model displaying relationships between key variables, as presented in this research is being on the process of empirical validation. It was anticipated that the research results would be of great advantages to the universities executive management.

Background

The topic of multiple roles and their outcomes had attracted much attention of academics from many areas. The effects of multiple roles on person remained controversial. It was unclear whether the effects were beneficial or detrimental (Robinson & Swanson, 2002). Some research findings found that the interaction between work and family roles was a source of stress for many men and women (Simon, 1995). On the contrary, several researchers reported that multiple roles led to an increase of psychological functioning and work
effectiveness (Gottlieb, 1997; Marks & MacDermid, 1996; Robinson & Swanson, 2002; Ruderman et al., 2002). The mixed evidences from those research indicated that the balance involvement between multiple roles and their outcomes varied on several factors, including individual characteristics. Hence, the relationships between multiple roles and their outcomes needed to be investigated for deeper understanding, especially the relationships between multiple role commitment, psychological well-being, managerial skills and performance. This research was an initiation aiming to clarify the true relationships between these variables, to develop, and to validate the relationship model employing multi-sample, non-recursive structural equation model.

**Purposes**

The purposes of this research were:

1) To develop and to validate the non-recursive model displaying relationships between multiple role commitment, psychological well-being, managerial skills and performance of Thai university administrators.

2) To test the invariance of the proposed non-recursive model across groups of administrators with different gender, age, educational levels and fields.

**Conceptual Model**

There were positive interrelationships between multiple role commitment, psychological well-being, and managerial skills (McCauley et al., 1994; Gottlieb, 1977; Robinson & Swanson, 2002; Ruderman et al., 2002; Maclean et al., 2003). However, Ruderman et al. (2002) was the only group of researchers who had attempted to investigate the recursive causal relationships and they suggested that further research were required to investigate the reciprocal relationships between these variables.

In this study, the researchers proposed the conceptual model based on the role accumulation theory, which focused on positive effects of multiple roles. This theory differed from the transactional model of stress, which provided the theoretical basis for both negative and positive outcomes of multiple roles (Seiber, 1974; Lazarus & Folkman, 1984; Ruderman et al., 2002). The role accumulation theory, focusing only on the positive synergistic effects of multiple roles, helped formulating better guidance for people to enhance psychological functioning (Ruderman et al., 2002). Traditionally, multiple roles was measured by counting the number of roles a person held. The role accumulation theorists disagreed with the traditional theorists. They focused on
affective commitment to roles and demonstrated that the role commitment was a better predictor as compared to the role occupancy (Ruderman et al., 2002). Following the role accumulation perspective, multiple role commitment was considered in terms of one’s interest in and willingness to commit to a given role. Its indicators consisted of marital, parental, homemaker, friendship, community, and occupational roles (Amatea, 1986; Ruderman et al., 2002). In this study, homemaker role was revised and transformed to parent care provider, and kinship roles in order to satisfy the Thai context of extended family (Santasombat, 1994; Sirisai, 1998).

In traditional perspective, a psychological well-being person was one with good mental health without psychological symptoms such as anxiety, depression, and distress. Ruff & Keyes (1995) proposed the new perspective of psychological well-being as a positive psychological characteristics of one’s growth and development. In this study, the six-indicator model of Ruff & Keyes (1995) and the three-indicator model of Ruderman et al. (2002) were combined to measure psychological well-being. These combined indicators were self-acceptance, purpose in life, environment mastery, personal growth, positive relation with others, autonomy, life satisfaction, and self-esteem.

Managerial skills were behaviors or activities demonstrated by a manager substantively contributed to the manager’s successful performance (Boyatzis, 1982; Whetten and Cameron, 1984; Anderson, 1997; Kakabadse, 1998 cited in Analoui et al., 2000). In this study, the three-indicator model of Analoui (1995) and the two-indicator model of Ruderman et al. (2002) were combined to measure managerial skills. These combined indicators were task-related skills, people–related skills, and self-related and analytical skills.

Differing from the model of Ruderman et al. (2002), the managerial skills was not the final outcome of the relationship model in this study. Since Shipper & Davy (2002) proposed that managerial skills had strong effect on managerial performance. The final outcome of the model, managerial performance, was the accomplishment of predetermined objectives through behaviors or activities demonstrated by the administrator. In this study, managerial performance was measured by production measure and judgmental measure (Shipper & Davy, 2002; Berry, 1998)

In order to complete the relationship model, the researchers, therefore, inserted managerial performance as the dependent variable. Moreover, differences in gender, age, educational levels, and fields, which were human attributes were taken into consideration as a control variable in the model (Simon, 1995; Arkin, 1995; Ruderman et al., 2002). Finally, the drafted non-recursive relationships between multiple role commitment, psychological well-being, managerial skills and performance was developed as displayed in Figure 1.
From the above non-recursive relationship model displaying as LISREL model, the researchers proposed the reciprocal relationships between multiple role commitment, psychological well-being, managerial skills and performance. This proposed reciprocal model was next proposed to be invariance across the group of people with different control variables: gender, age, educational levels, and fields.

In this study, the proposed model was validated empirically using the administrators of Thai government universities. It was anticipated that the research results would be of great advantages to the universities executive management.

Method

Population and Sample

The population of this study were all the Department Heads, or equivalent, of the government universities in Bangkok Metropolitan Areas, Thailand. Since there were 25 parameters to be estimated in the proposed LISREL model. The sample size required for this study was 250 subjects, based on the ratio of 10 subjects to 1 parameters as stated by Hair et al., (1998). The sample consisted of 350 heads of department, randomly selected from the Faculties of Education, Arts, Anthropology, Medicine, Medical Technology, and Nursing from eight government universities, purposively selected from the population.

Research Instruments

The research instruments consisted of three questionnaires. One for the department head, and the rest for the Dean and the staffs, respectively. The first part of the questionnaire for the department head was a checklist measuring personal data. The second part was 5-level rating scale measuring multiple role commitment. The third part was 5-level rating scale measuring psychological well-being. The fourth part was 5-level rating scale measuring managerial skills. The questionnaire for the Dean were 5-level rating scale measuring the department head’s managerial skills and performance. The questionnaire for the staff was 5-level rating scale measuring the department head’s managerial skills. These instruments were constructed with some modifications from the questionnaires developed by Ruderman et al. (2002) and Shipper & Davy (2002). All instruments were tried out and validated for reliability, content validity, and construct validity.
Data Collection and Analysis

The questionnaires were distributed to 350 department heads, or equivalent, 22 Deans, and 700 staffs by the researchers. Data from the questionnaires were edited, cleaned, and saved for analysis. Firstly, the statistical assumptions were examined, descriptive statistics, and mean comparison were employed using SPSS for windows. Secondly, both the validation of the measurement model and the non-recursive structural model were performed using LISREL. Finally, multiple group strategy was employed to test the invariance of the proposed model across groups of administrators with different gender, age, educational levels and fields.

Conclusion

The conceptualization of the developed non-recursive model displaying relationships between multiple role commitment, psychological well-being, managerial skills and performance, as presented in this research is being on the process of empirical validation. The research findings will be critical in 1) extending the multidisciplinary knowledge, which can be used for further studies, 2) serving as a guidance for administrators regarding the balance of work and family domains, 3) making up the policy and practices in various departments and organizations, and 4) extending the practice of data analysis using advanced statistical analysis.

ABSTRACT

The overwhelming majority of Muslims in Thailand reside in the five southern provinces of Songkhla, Satun, Pattani, Yala and Narathiwat. The current unrest in the Deep South – Pattani, Yala and Narathiwat - has been viewed by some politico-security experts as an outburst of jihadist terrorism. Prime Minister Thaksin Shinawatra is of the view that this uprising can be dealt with firmly in much the same way as was done by the Thai security forces during the 1980s when Bangkok was confronted by the Muslim separatist movement PULO – Pattani United Liberation Organization. But in doing so, the Thaksin administration has failed to take into consideration the political, economic, social and cultural complexities of the Thai Muslim populace and dealing with the situation in an aggressive manner may lead to further tension and more serious conflict between the center and the periphery. Yet, despite arguments as well as documented evidence to the contrary, the Thai Muslim “extremists” and/or “separatists” always have been blamed by the government authorities in Bangkok for creating trouble in the region and being the sole source of all the sectarian turmoil.

Since January 2004 a spate of almost continuous violent incidents have been visited upon the local people of Thailand’s Deep South. Martial law which has provided the Thai military with the legal right to search homes and to detain suspects without charge has been imposed on the three southernmost provinces: Narathiwat and Yala (which border Malaysia) as well as Pattani. Furthermore, the forceful and visible suppression of Thai Muslim “rebels” both on 28 April and on 25 October has given the impression of a veritable downward spiral of disintegrating stability and rising insecurity. Thai Muslim community leaders have warned that these actions undertaken by the Thaksin administration will drive away future tourism and will reduce foreign investment inflows to the area. And, in addition, the repressive measures employed by the Thai security forces can only heighten a sense of alienation on the part of Muslim youth and lead to their recruitment by hard-core insurgents.

Yet these episodes of unrest are being identified by the Thaksin administration as a manifestation of the separatist tendencies among Muslims in the Deep South. In all, over 400 people, both Buddhists and Muslims, are estimated to have lost their lives in southern Thailand since January 2004. The violence gripping the southern Thai provinces has added fuel to the fire, in that the situation has gone to the extent that a rift now appears to be opening between Bangkok and Kuala Lumpur.

When examining the difficulties of Thailand’s Deep South where Muslim insurgency seems to be currently on the rise, many questions and concerns come to mind. Still, this is not the first time Bangkok has had to deal with such “separatist” violence in the southern region, but why has it recently resurfaced and why has it become more vicious and seemingly better-coordinated than ever before? Is this just a festering of a historical grievance? What are the objectives of the insurrection – independence, autonomy, reunification, equal rights? Will Bangkok be able to neuter effectively the insurgents as it has done in the past? And finally, what are the potential implications that this expanding insurgent movement have in affecting Thai foreign relations within ASEAN as well as the country’s image throughout the world?

The article will answer the above questions by first probing the history of the region, the roots of the contemporary insurgency and the reaction of the Muslim population in Thailand’s Deep South to the war of attrition gripping the community. Furthermore, there will be a survey of the public statements and policy actions of PM Thaksin Shinawatra towards and whether or not the Thaksin administration perceives the struggle in the South as an important front in the US-led global war against jihadist terrorism. Also to be explored will be the effects that the recent violence has had upon the internal security of Thailand and how it is affecting Thai foreign policy, particularly vis-à-vis Malaysia. It is vital in addressing these different facets of the problem in the Deep South in order to draw up some substantial conclusions as to how Bangkok has approached this domestic crisis and what may be the real aspirations of southern Thai Muslims.
Not Without Our Children: The Collaborative Continuity Approach to Language Instruction

Not Without Our Children: The Collaborative Continuity Approach to Language Instruction

Summative Abstract

That children have a natural affinity for language acquisition--however many languages they are exposed to--is indisputable. How they come to have this unique linguistic forte is, however, less understood. Few studies, if any, examine how children acquire a second language in non-classroom, naturalistic settings, and how children can and do facilitate subsequent language acquisition (i.e., second and foreign language acquisition). This presentation will draw attention to is the unique talent or propensity for language instruction--complementing their awe-inspiring language learning ability--that children exhibit in their interactions with their siblings, with their bi- and monolingual peers and playmates, and with adults with whom they feel at ease. It is this unique instructional potential the child possesses that constitutes the basis for the instructional approach advocated.

This paper draws attention to the value of the comprehensible input that children provide in both child-child and adult-child interactions. The focus is on how children, particularly bilingual children, serve--spontaneously--as effective language facilitators outside the classroom, and as valuable community language resources or sociolinguists in different contexts of situation. Children are shown to serve as language and literacy educators in multiple capacities and senses, and the value of this finding in the design of cross-age community language and literacy programs is outlined. The collaborative continuity approach advocated can easily be utilized in other disciplines including the social sciences.

Representative data will be cited, illustrative of the multiple roles children adopt (as translators, mediators, literacy liaisons or language and culture brokers) in interactions with adults and their peers. The central premise is that children have the potential to be effective language facilitators to their peers and the adults they frequently interact with, and should, therefore, be included and actively involved in community-wide language instructional efforts. The primary purpose is to argue in favor of a child-facilitated approach to second language and literacy development. This paper should help language and literacy instructors, parents, and program administrators, in particular, to recognize the depth of knowledge that can be gleaned from our children. Educators are provided with recommendations on how to effectively utilize an untapped-yet-vital source of "comprehensible input" in community literacy settings--including after-school ESL or language enhancement programs--as well as in the regular classroom.
Introduction: An Overview

An ABC news report from March 30, 2004 (aired at 6:40 p.m. EST) followed the story of an orphanage in Afghanistan where the Head, Sarina, came up with an innovative and workable solution for her unstaffed English classes. When she could not locate enough adult English teachers, she put older (bilingual) children, aged nine to 16, who were fluent in both Arabic and English, in front of the classroom. While Peter Jennings did not discuss the effects of this instructional approach on the adults involved, nor the impact of the teaching experience on the children’s linguistic, cognitive, and social skills, the benefits of this cross-age collaboration (for both groups) were apparent.

As far-fetched as it might sound, children are some of the best language facilitators we have available. Why? For several reasons, not the least of which is the fact that they possess some of the most important instructional qualities and, in many immigrant homes, are often called upon to use these skills to ensure their families’ (day-to-day) survival (see Stockwell 1999). First, they speak from personal experience, so they are the stories they tell, and second, they are naturally creative and spontaneous, as evidenced by their ability to engage in pretend play (see Engel 1999). Most importantly, they are perhaps the best judges of their own sociolinguistic needs, and of their instructional abilities and limitations. The stories children tell are/can mean valuable lessons learned. A child's ability to pretend and to role play multiple roles even in solo play sessions is noteworthy.

Children have been serving as language brokers or liaisons for a long time, and yet—quite surprisingly and almost ironically—the vital language and social services they have been providing have received little to no attention (see Santiago 1999, Stockwell 2000, Orellana 2001). Language facilitation is not the sole area in which children’s instructional capabilities is evident. It is, therefore, time to give credit where it is due—long overdue, in fact—and to both celebrate and utilize the unique language-instructional skills our children possess and share with all of us.

All over the world, children and young adults—who usually have a technological edge—have been instructing their parents and/or other adults on ‘current’ technologies. If we can accept technology-related assistance-cum-instruction (e.g. how to burn a CD, set up an e-mail account, create graphs and import clip art or create a Web page), why should we resist or be opposed to language assistance from our children?

It appears to be the case that, just as there's a child in(side) most of us, waiting to be informed and entertained, inside almost every naturally curious child resides a teacher—waiting to be heard—via elicitation or an invitation to recount a valuable life experience.

The result? Language and literacy acquisition through our children, and since language and culture are inextricably linked, learning distinctive features of one or more cultures is inevitable. Pre-school and elementary school teachers are perhaps in the best position to assess the value of this approach; they could, for instance, test out the outcomes
periodically by asking student facilitators (empowered as a consequence) to observe and share the reactions of their parents to the information they impart.

In general, research examining how children acquire linguistic and cultural artifacts from other children, and how bilingual children serve as natural language teachers and mediators or interpreters in child-child and in adult-child interactions is limited. Geneticists (those like Noam Chomsky, who believe that children are genetically predisposed to language) speak of input-driven language acquisition and learning, yet children are generally ‘placed’ at the receiving end. The goal of this paper is to argue in favor of child-facilitated instruction and learning, specifically in the area of language and literacy. In essence, the focus is on how children and youth can help teach others--children, adolescents, and adults--a second language/culture in naturalistic settings, thereby bridging growing generational, (sub)cultural, linguistic, disciplinary and other divides. As such, I will illustrate how children--particularly bilingual children--adopt multiple roles, as cultural and language transmitters in their interactions with monolingual adults and children. I will also present arguments in favor of the proposed collaborative continuity approach. The basic idea behind it is to encourage cross-age and cross-cultural collaboration in various venues (including the classroom) and to attempt to ensure a cross-over effect for this philosophy of instruction and learning—in short, sustainability beyond the classroom. This can be done through periodic ethnographic monitoring (via journaling, observations, visits, participants recordings, and the like). The collaborative continuity approach is applicable to practically any discipline including the social sciences.

To date, the child’s language and literacy-instructional ability has not been directly researched although a few isolated and incidental examples have been cited in passing, hinting at the value of this as-yet-untapped skill. The next section summarizes the relevant literature.

**Our Growing ESL Population and Attendant Linguistic Needs**

Currently, immigrants, Hispanics, in particular, make up the fastest growing segment of our population (see Rumbaut, 1998, Fulignii 2001, Lee 2003). The burgeoning pre-K-12 English as a Second Language (ESL) student population in U.S. schools demands immediate English language and literacy attention, given that language and literacy are at the core of all disciplines, constituting the (very) medium/means through which all subject matter content is presented. This is especially visible in the social sciences which, in some ways/can be conceptualized as being located / broadly speaking, lie at the confluence of language and culture, broadly defined. The demand for foreign language training is also at an all-time high. The U.S. Dept of Homeland Security has established an Interagency Language Roundtable and designated 2004-2005 “The year of languages in the federal government”suggesting that language is recognized by our government as intelligence, even though many of our government designated “foreign languages,” such as Spanish, are not really foreign to U.S. territory as far as domain(s) and extent of use.

Hinting at the relative failure of foreign language teaching and, by extension, learning in the U.S., Bialystok and Hakuta (1994: 2) note that “Even in the United States, home of
world-class monolinguals, a surprisingly large proportion of High school students have taken courses in a foreign lang; of course they pretty much remain singletons, but at least it is not for lack of opportunity”(see also Bialystok 2001: 9). With the exception of Spanish, which can no longer be considered a “foreign language” in the U.S. (so Spanish-instructional venues need to reflect this in their terminology), some might argue that opportunities for FLA, particularly outside the classroom are limited. The lang. instructional-learning approach advocated here should benefit this group, as well. In short, we have reached a point where pragmatic and effective lang.-and-literacy instructional pedagogies are desperately needed at all levels and in practically every domain. In short, the demographic and (re)settlement realities of our present-day society (Quintero and Rummel 2003) dictate the need for immediate, concerted, and innovative responses to community-wide demands for what is referred to here as subsequent language and literacy acquisition (SLA), including heritage, “foreign,” and second language enhancement. Yet, given the acute shortage of trained ESL and literacy instructors in practically every State, and the importance of adult (including parental) language and literacy in creating an educated citizenry for this Super Power/our nation in this new century, while simultaneously ensuring the academic success of our children (which research shows it to be contingent upon), we must start at the grassroots’ level, targeting entire families and communities, not just children. Hence the collaborative continuity pedagogy advocated here, which is applicable to (practically) any subject/content area. The recent national educational recommendation that seeks to make all parents of minority language students literate, and to familiarize ESL parents with mainstream literacy practices (see Weinstein-Shr and Quintero 1995, CAL 2000, Chang 2001, Hurley and Tinajero 2001, among others), so that they can be more directly involved in the education of their children constitutes yet another favorable reason. This measure is viewed as both a remedy and a long-term educational solution. It is seen as a vital first step in reducing the high (school) dropout rates of many language minority students, and it is also designed to ensure the sustained educational success of ELLs, by bridging the cultures of the home and the school.

Researchers are increasingly reporting on the growing generational, cultural, and linguistic divides visible in our soc., particularly in our immigrant ESL communities—between ESL children and their parents and other adult family and community members, on the one hand, and parents and institutions, on the other. Not only is the pedagogy proposed here designed to minimize, if not eliminate the lostalgia (for lack of a better term) countless ESL children and adults face (almost daily) by bringing them together /helping them engage in a fruitful and equitably empowering exchange, it should/will help fix/increase the ESL child’s chances for acad. Success (primary benefactors of parental involvement) as well as/and the instructors’ and administrators understanding of the cultural background, and the lang and literacy practices and expectations of the family and community to which the child belongs (secondary benefactors), while simultaneously ensuring that the ESL parent and comm. Member gains vital/valuable lang and cultural info. In the process—from both the children and the adults involved in this tiered/cyclic /. This symbiotic circle of simultaneous learning and instruction—where everyone will get to be the first soldier ant—should be fulfilling for all participants.

While it is true that immigrants have always been part of the American mosaic—bringing with them a variety of languages and cultures, for the first time ever, multilingualism and multiliterate
practices are no longer restricted to particular areas or cultural and linguistic groups. As such, the pre-K-12 content instructor might be at an instructional loss, not knowing how best to meet the ling. needs of the large #s of minority lang. speakers that now populate our classrooms. Hence, we need to assist all instructors (pre-K through college level and beyond) on how to effectively reach out and connect with ESL students and their families. First, we need to be able to identify student-specific sociolinguistic needs, so that we can help cater to these through/by way of suitable instructional approaches and materials. (By the same token) We also have an obligation to be aware of (national) language standards, including ESL and content standards, so that we can work (toward) them simultaneously/in tandem. We must remember that lang. minorities, often referred to as LEP or ESL individuals, can serve as valuable language and literacy resources and community partners for the benefit of all, through cross-age and cross-cultural pairings and groupings. This way, both our younger and older generations can be bridged and can benefit from what essentially becomes a bidirectional exchange.

Background Literature

One of the best examples of the child’s sophisticated language skills is, in fact that of an eight-year-old trilingual (English-Italian-French-speaking) girl, BS, whose artful ability to translate in a culturally appropriate manner an overtly negative sentence that her father directs her to translate is cited in Harris and Sherwood (1978: 157), and reproduced below:

Father (to BS): Digli che e un imbecile! (Tell him he’s a nitwit)
BS to 3rd party: My father won’t accept your offer
Father (angrily in Italian): Why didn’t you tell him what I told you?

This simple exchange is quite revealing of power relations, culture, personality, and more. It is noteworthy that BS’s father uses an imperative, indicative of both his greater power and age, as well as what might easily be perceived as anger but in actuality is none other than culturally acceptable “hard bargaining” (Harris and Sherwood 1978: 157) commonly employed in Italy. In contrast, BS’s rendition is non-confrontational and strategic, reflective of her flawless cultural adaptability. She could just as easily have directly translated her father’s statement (i.e., “You are an idiot”) or employed a reported speech version (i.e., “My father says . . .”) which would, of course, have absolved her of any blame. BS’s decision to avert any negativity in the interaction and prevent the potential of a similar negative response from her listener—at the risk of bearing the brunt of her father’s anger—is both admirable and commendable. Apparently, this is not the first time she has softened “his outburst” (Harris and Sherwood 1978: 157).

Some of the earliest evidence of child translation/children as born translators comes from the linguist H. Leopold’s (1939-1949) records of his daughters’ bilingualism, now a classic in the field of early bilingualism. Leopold (1949) observes of his three-and-a-half daughter HL, for instance, that “she usually translates my messages to her mother into English without effort; but sometimes she delivers them in their German wording” (27). He records that, at four years, four months to four years, five months, “She is so used to translating automatically in English that she pays as much attention to the meaning as to the form” (162).

Child translation is also observed but not directly studied in Swain (1972), Swain, Naiman, and Dumas (1974), Paivio, Clark and Lambert (1979), Harris (1980), Harley (1986), and Hakuta (1988). Harris (1977) is one of the few studies that highlights the value of natural
translation. Harris (1980) illustrates how a child as young as three translates spontaneously—without prompting.

Perhaps the only study to date to empirically examine infant and child translation is Harris and Sherwood (1978). These researchers hypothesize that “the basic ability to translate is an innate verbal skill” (155). If this is indeed the case, as they amply illustrate, it makes even more sense to employ the language-facilitative skills children and young adults naturally possess in our lang. and literacy instructional efforts. In short, their finding has considerable value for lang. and literacy instruction. However, unlike in the ethnographic study outlined here, only translations from European languages are examined. Furthermore, the data they present are largely descriptive, and the instructional-learning impact of child translation is neither conjectured nor investigated. And the applicability/value of their findings to lang. instruction are not considered.

Saville-Troike (1982) and Hakuta (1988) also highlight the bilingual child's cognitive sophistication, as does Bialystok (1988) who illustrates how bilingualism yields heightened linguistic awareness in children. It is very likely that children develop this greater (meta)ling. awareness and simultaneously experience cognitive growth in the course of translation and precisely as a result of such engagements, yet this idea has neither been raised/considered nor researched to date.

Johnson (1988) proposes that ESL children are much more likely to master English when placed in knowledge disseminators roles in meaningfully designed information-gap interactions. She recommends pairing ESL children with their more fluent native-speaker classmates, so that they "develop a native-like control of that language" (250). Arguably, apart from being a nebulous construct, “native-like control” is now a questionable construct (see Paikeday 1986, Davies 2003), given that non-native speakers far outnumber “native speakers” (see Kachru 1992) with immediate/direct implications for language instruction and learning. Moreover, the other side—the monolingual side—also stands to gain from such pairings, which Johnson (1988) overlooks. Rather than assuming beforehand that pairing or grouping (newcomer) ESL students with monoling. English spkrs/students would unduly burden or slow down the latter’s learning, we should encourage such pairings in different subject areas (including literature/lang. arts, reading, world history/social studies, art, and math) and let the data determine the feasibility. Possible and likely benefits for participants include:

- enhanced awareness of the structure and meaning(s) of their primary language
- exposure to the sound system, vocabulary, structure and discourse features of another lang.
- advanced social and prag. Skills, including how to negotiate & get along in diverse settings (i.e., cross-cultural and cross-linguistic skills)

Blakeley’s (1997) study on the English Language Fellows program established at the University of Rhode Island is esp. relevant/deserves mention in this regard/at this point, even though his focus is on adults—college students. While he, too, is fixated on the “native speaker” construct and recommends pairing and grouping “specially trained native speaking undergraduates” with “at-risk” (289) ESL classmates, the student content-language facilitators’ reports presented in this study illustrate the multiple benefits—to the “fellows,” as well, as they are called, of serving as ESL language aides and content clarifiers. First, their grades, like their ESL classmates’ improved
dramatically (far more visibly, in fact). Through her participation in what is essentially a peer-tutoring program, Rebecca, whose reports constitute the primary focus develops advanced social-interactional and critical thinking skills, as evidenced by her ability to pull Y out of her shell and by her linguistic discoveries and instructional creativity/instructionally creative and instructive sessions with D and Y, as well as through her continuous self-questioning, which Blakeley (1997) observes is characteristic of the 48 fellows under focus at the time. Moreover, Rebecca, is made acutely aware of the structure of English, specifically sounds that are not found in Japanese and Cambodian, and vocabulary items (including idioms, so frequently employed in American English). When D, one her ESL classmates misread “independent from” as “dependent on” on a/in a multiple choice quiz item, she writes, “Tomorrow [while taking the quiz] I think they will take their time and look at every word (so will I, by the way)” [emphasis added]. Not surprisingly, she earns a 100% on the quiz. Second, any preconceived notions, prejudices or covert blinders fellows-to-be might have had against ESL individuals were eliminated as a consequence of this cross-cultural exchange. Blakeley (1997) cites the case of Murray who, until then, had been oblivious to an Indian volleyball player as is shocked at his discovery that “dark-skinned” individuals, like his Indian volleyball teammate, had been totally invisible to him. “How could I not have seen the guy before?” he is quoted saying. Such findings will likely be replicated at all levels, including pre-K-12. In fact, the positive outcomes are likely to be amplified at this level given that . . . are especially/particularly when we consider how impressionable infants and children/young minds are/not confined to/not unique to the tertiary level. What they propose is both pragmatic (directly relevant to students’ curricular needs) and motivational—enhancing their desire to advance their English proficiency while offering them a workable opportunity to co-construct knowledge, negotiate/est and strengthen social ties and excel (in both lang. and content).

In Harding & Riley (1999), at least 50% of the case studies mention that the children served as natural translators and interpreters in their everyday interactions. Moreover, the fact that the children almost always employed the dominant language for comm... amongst themselves further (of the(ir) immediate environment) The example of two-and-a-half-year-old Matthias “sitting solemnly between his two sets of grandparents, ‘translating, without any trace of difficulty and embarrassment’ (88) in the (case study 3) is exemplary/one such example/a case in point, and is shared with great aplomb (with the researchers) by his parents, suggesting that his natural simultaneous translation talent surprised them and (simultaneously/clearly earned/garnered their admiration). What stands out are the facility with which he was able to switch back and forth, and his uninhibited personality, both considered highly influential factors in SLA theory. We learn that his grandparents on both sides of the family are monolingual. Evidence of the child’s language-instructional potential is also evident in the second case study they cite, where a Turkish-Eng.-spkg child’s parents credit his peers for his biling. Proficiency. In the researchers’ words, “He’s a good example of the fact that a child’s own social life with his peer groups determines the development of both his languages” (86). Although the source of the English Kanem’s nanny “was learning” (86) is not identified (interviews with the nanny, the parents and Kanem would, of course, have been beneficial in exploring this), it is very likely that he facilitated her SLA. One of the shortcomings of the research reported in this text is that the case studies provided are brief,
impressionistic, classist (all but one parent has a college degree), and purely descriptive and largely parental accounts/assessments of children’s bilingualism, including many misconceptions and questionable ideas (see Pandey forthcoming for details).

Like H and R (1999), the case studies Schecter and Bayley (2002) and Orellana (199, 2001) cite contain examples of bilingual ESL children serving as language and literacy facilitators in multiple capacities (in a majority of homes), primarily as homework assistants to their siblings or as literacy liaisons to their parents and other adults.

It is this instructional potential that we must keep in mind. As Bruffee (1993) rightly observes of peer-tutors, one of their great potentials is their power to function as “agents of institutional change” (81) and “to change the interests, goals, values, assumptions, and practices of teachers and students alike” (82). Arguably, the outcomes are similar when children and young adults are empowered in child-adult dyads. It is noteworthy that children’s instructional skills are neither confined to the playground nor to role-play situations. It is also worth mention that children as young as four have been known to role play and, more specifically, to play “teacher-teacher.” Countless children the world over spontaneously adopt/ funct. in multiple predominantly adult roles or are ‘drafted’ and successfully perform lang. funct. associated with specialized and more adult-like lang. These functions range from everyday negotiations such as taking messages (a task or speech act that involves excellent listening and speaking skills as well as reading and writing skills), to communicating messages or correspondence sent by school administration, and participating in a gamut/variety of service encounters, including translating between bank tellers, physicians, nurses and other adults on the one hand, and adult family members on the other, as well as paraphrasing, interpreting and translating between instructors and peers within the school context. Many autobiographical accounts by bilinguals, such as Amy Tan, Esmeralda Santiago, Oscar Hijelos and others (see Andalzua 1990) contain numerous examples. In her eye-opening piece titled “Mother Tongue,” for instance, Amy Tan recalls the discrimination her mother suffered (throughout her childhood) on account of her Chinese accent. Unwilling to look past her so-called “Broken English,” which Tan describes as “impeccable” and illustrates to be richly flavored, Tan notes that “people in department stores, at banks, and at restaurants did not take her seriously, did not give her good service, pretended not to understand her, or even acted as if they did not hear her” (1990: 5). These same people reacted very positively when Tan spoke for her mother, as she often did in (most) formal situations. Hijelos’ story, recounted in his edited collection of poetry, Cool Salsa, is similar.

Arguments in Favor of the Collaborative Continuity Pedagogy

The child’s linguistic capabilities are indisputable. Some arguments in favor of a child’s language genius, the basis for the proposed pedagogy, include:

i). Inexplicable Sources and the Poverty of Adult Stimulus

Children’s linguistic creativity is remarkable, nay astounding. I was in an elevator with a six-to-seven-year-old and her father who stood in one corner and another adult in the other. When the doors opened on the fifth floor, the single adult got out and I heard the child turn to her father and ask,” Daddy, is He a SHE or is SHE a HE?”
Children say and write things they have never heard, least of all from adults. A perfect example is the novel utterance, “I hate you!” (The Human Language Series). Phonetic spelling is another. Parents can usually think of/give you/cite lots of examples. My six-year-old niece was writing a story when I called home the other day, so I asked her to tell me what it was about. Impressed (with her story/at her imagination), I asked her, “Where did you get your imagination?” “At Walmart,” she replied with a serious tone. “How much did you pay for yours?” I continued. “Five dollars.” “How come?” I proceeded to ask? “Because they said I already have a large one.” Vukelich, Christie and Enz (2002) cite the following example:

A restless Hannah is standing next to her mother in the dance studio, eating a piece of chocolate. . . . [S]he runs her finger over the raised letters imprinted on the candy. “What does this say?” . . . “HER-SHEY, it says HER-SHEY.” In a Very puzzled voice, with a perplexed look, Hannah repeats “Her-she” several times. Then she asks, Mommy, is this a girl candy bar?”

As a new mother, I often catch myself recalling my verbalized interactions with my baby, or rather, the kind of language I employ with her when we’re alone, or when the only other person in the room is her father. I find that my language with her tends to be very simplified, consisting mostly of greetings such as “Hi” and “How are you?” which I tend to repeat throughout the day and sometimes within the hour (as though she were amnesic!) The good news is that, to the best of my knowledge, she has not let anyone know what form our conversations take, and by the time she gets ready to have a real conversation, she’ll have forgotten how pidgin-like my language was. Until then, in those special moments that I get to share with her, I can continue to say practically anything to her, content that I’m providing her with language (so that she can begin to recognize its sounds and cadences). If children learn simply by imitating adults, specifically their parents and/or caregivers, I should be worried that my six-month-old will grow up speaking telegraphese and using primarily canned utterances that would sound absurd to non-family members. I can only imagine my embarrassment if my daughter were to talk to me the way I talk to her. In short, the language stimulus we provide our children is often rudimentary and non-representative of the linguistic range and breadth we are expected to produce. Moreover, children say things they have never heard, least of all from adults. A perfect example is the novel utterance, “I hate you!” (The Human Language Video Series). Parents can usually share lots of examples. My six-year-old niece was writing a story when I called home the other day, so I asked her to tell me what it was about. Impressed (with her story/at her imagination), I asked her, “Where did you get your imagination?” “At Walmart,” she replied. “How much did you pay for yours?” I continued. “Five dollars.” “How come?” I proceeded to ask? “Because they said I already have a large one.” Vukelich, Christie and Enz (2002) cite the following example:

A restless Hannah is standing next to her mother in the dance studio, eating a piece of chocolate. . . . [S]he runs her finger over the raised letters imprinted on the candy. “What does this say?” . . . “HER-SHEY, it says HER-SHEY.” In a Very puzzled voice, with a perplexed look, Hannah repeats “Her-she” several times. Then she asks, Mommy, is this a girl candy bar?”

Along these lines, how, for instance, do we explain the language-readiness of children born to deaf parents, as well as that of deaf children (proficient in sign language) born to hearing parents? The American Sign Language (ASL) of Simon, the deaf nine-year old boy whose language was carefully studied by two psycholinguists, is a stellar example of the latter (see Singleton and Newport 1999; also cited in Pinker 1994). Simon exhibited complete mastery of ASL, including its complex verb
inflections, yet the ASL stimulus Simon received from his parents was clearly impoverished. His parents, also deaf, did not learn ASL until their teen years, after the onset of the conjectured “sensitive period” (see Flege 1996), the period during which language acquisition researchers point at various obstacles in the way of target language mastery, so they failed to attain the level of fluency that Simon, by virtue of his age and other factors, attained. The absence or poverty of language input is also evident in the case of children of Pidgin speakers who often end up speaking a much more complex and elaborate language, termed a Creole (Bickerton, 1999, Romaine 1996). Moreover, unlike their parents, for whom the Pidgin serves as merely a lingua franca, the Creole that evolves with children plays a larger role—that of mother tongue.

ii). Creolization:
Initiated by children, creolization is one of the strongest arguments in favor of a child’s linguistic abilities. When a pidgin is adopted by children as their mother tongue, it is said to become a Creole (see Bickerton 1999). As such, Creoles are child-created languages, a monumental feat. In Calvin and Bickerton (2000), Bickerton observes that:

Creole languages come into existence when parents who speak a structureless early-stage pidgin pass it on to their children. The children change that pidgin, in a single generation, into a full-fledged language. If they were seeking structure in the pidgin, they wouldn’t find any—they impose structure from within their own minds. (33)

In this case, the pidgin—however telegraphic—constitutes “comprehensible input,” a necessary ingredient in the child’s journey of ling. discovery and creation. Bickerton provides evidence (see B 1975) of children’s ling. creativity from Hawaiian Creole, and credits children who were raised on the island in the 1890s for its genesis. The only language or comprehensible input the children could have heard would have been the pidgin that their parents and other adult Island residents spoke, so children were instrumental in its evolution and use. Even children as young as four can be linguistically innovative. Idioma de Signos Nicaraguense (ISN) is a case in point. This language is believed to have been developed through the peer interactions of deaf Nicaraguan children like Mayela, aged four, and her younger schoolmates whose sole input was “the pidgin signing of the older children” (see Pinker 1994: 36). Linguist Stephen Pinker (1994) notes that “ISN is very expressive. . . . The children use it in jokes, poems, narratives, and life histories, and it is coming to serve as the glue that holds the community together” (37).

iii). Acquisition vs. Learning: the Child’s Worry-Free Language Path
Why is it that children can potentially acquire any number of languages they are consistently exposed to? This potential is in and of itself a strong case for the child’s natural language aptitude (see Chomsky 1995; Pinker 1994) which linguist Noam Chomsky (1965, 1995) views as an innate and universal tendency. The success of early/infant bilingualism or what Harding and Riley (1999) refer to as “the most common and successful types of bilingualism” (40) is a case in point. Granted, just because someone is fluent in X does not necessarily mean that they will be good at teaching X or in facilitating its acquisition. Nonetheless, the ethnographic evidence presented in the next section strongly suggests that children and young adults can be effective language and literacy facilitators, particularly in guided instructional contexts.

iv). Children as Language Catalysts:
It is a known fact that children tend to rapidly acquire the primary lang(s) of those with whom they frequently/closely interact with closely. We often refer to the outcome of this formidable child-child multiple-language-sharing by way of the verb “pick up” (even if it is incremental—i.e., primarily in the form of words or expressions), suggestive of the ease with which this ling. transmission occurs/transpires, yet empirical studies of the role of child comprehensible input in first lang. (L1) acquisition and in subsequent lang acquisition (SLA) are lacking. This hypoth is certainly worth testing.

It is conceivable, for instance, that children who have siblings and/or relatives with whom they frequently interact learn the language or languages known to these children much faster than they would if they did not interact so frequently with other children, and certainly far more rapidly than adults exposed to similar indivs in a comparable amount of time. In other words, comprehensible input from children might actually be more palpable and palatable to this category of learners. Numerous examples abound, many of which have not been reported. In the ethnographic research conducted in conjunction with the present study, the Egyptian mother of a nine-year old boy who was born and raised in America expressed her surprise and puzzlement at how her three-year old, Atim, acquired English. “I wonder how he learn English” she explained quizzically, “because we always speak in Arabic, and we watch mostly Arabic TV.” “From me. He listened to me!” volunteered his older brother, Behrooz, smiling confidently while Atim nodded shyly.

While some of these arguments overlap, the fact remains that the linguistic credibility and capability of children is, for the most part, unchallenged. Whether we choose to ignore it, overlook it, acknowledge it or to capitalize on it for our community-wide language and literacy efforts is an open question. Let’s face it; we tend to underestimate children’s abilities, including their language proficiency. Arguably, the language of children unafflicted by language-altering conditions such as aphasia and autism, aged five and on is no less complete, meaningful--and, if we insist on using a grid, native-speaker-like--with one possible exception, namely, that children show evidence of continuous and more evident language advancement, particularly as regards vocabulary growth. The truth is that children, like adults, do vary in their language and literacy abilities and skills, but, for the most part, their language development, including SLA, is instinctive, and therefore, guaranteed.

**Ethnographic Data**

As it is both time-consuming and hard to demonstrate ongoing language acquisition or learning, longitudinal and ethnographic studies of second language learning in naturalistic settings were considered necessary and suitable. However, space constraints only allow for the presentation of a few demonstrative data segments, outlined below. In the three cited here, from three separate studies, children were observed to artfully perform the role of second language and literacy facilitators. The data (video-taped) were transcribed using a basic conversational analysis notation system first employed by Sacks and Schegloff (1974) which looks at patterns of turn taking as indicative of nature and level of engagement.

The data were collected over a minimum of six months; and involve interactions involving different age groups, cultural and linguistic backgrounds, and social settings. In the first two examples, from Study A, the child participants under focus were from two
families, one a Palestinian Arabic-as-first-language-speaking family of seven (five children, ranging in age from one to seven), and the other a monolingual American English-speaking family of four (a girl, Laura, aged five, her 17-year-old brother and her parents). The interactions between the children in both families were carefully observed and randomly recorded and video-taped, as were the interactions between the children and the adults in different contexts.

The findings from Study A corroborated in Study B, embarked upon for primarily comparative purposes, as the data were drawn from two families with the similar ethnolinguistic backgrounds--another bilingual Palestinian family of six (four children and two parents) and their American neighbors (two monolingual, English-speaking American families).

The participants in the third study, Study C include three generations of a Cuban-American household, including an L1 Castilian-speaking grandmother who, at the time of the present study, was learning ESL in a naturalistic setting; an early bilingual Spanish-English speaking mother, and a bilingual five-year-old only child whose primary language is English (see Pandey, forthcoming for details).

Excerpt 1: How to Pronounce “r” in Arabic

Context: Laura and her mother, Gloria, are having dinner. Laura has refused to eat the pork her mother tried to serve her because she has just learned from her Palestinian friends that it is "haraam" (i.e., unclean).

1. M : Hey Laura! Do you remember when you were telling me about “Haraam”? About “Haraam”... You said it was never WHAT to eat cake?
   [pause: L looks puzzled]
   You said it’s never “Haraam” to eat cake. Can you tell me. . .

2. L : What you’re supposed to do is /rrr/, VIBRATE your tongue.

3. M : Vibrate your tongue. Where?

4. L : /h_raam/ In the. . .[gesturing] in the middle of the word.

5. M : In the middle of the word. But where in your mouth?
   [L tries to demonstrate] Just tell me.

6. L : On the top [L utters the word again, as though to doublecheck]

In this exchange, Laura attempts to teach Gloria how to pronounce the Arabic trill (/r/) correctly, and in context. Because of the close ties between mother and daughter (her only daughter), and the fact that the mother is so proud of her daughter and pays so much attention to every word she says, their role relations are contextually non-hierarchic.
In explaining how to make the word-medial /r/ sound in "haraam," like an instructor determined to accomplish her goal, Laura aims straight for the target sound, as evidenced by her choice of the definitive structure "What you're supposed to do is . . . ." It is almost as though she will accept nothing less than the "proper" or target sound, hence her use of the agentless passive structure, and the strong participial form "supposed." She could easily have used a milder modal such as "You could . . ." or "You might want to/try to . . ." or "They expect you to . . ." but she sounds more like an expert and much more serious when she employs the agentless passive. By using this structure, she deflects attention away from the native Arabic speakers. Her role as instructor and phonologist is only strengthened when she employs the (jargon) verb "vibrate" in her attempt to ease the articulation of this target sound for her mother. Yet Laura does not employ the simple imperative form "Vibrate your tongue"; she tones it down to a more indirect, palatable form accompanied by an equally advisory tone. Her instructions are very accurate and not at all patronizing. It is interesting that the role relations between mother and daughter are clearly non-hierarchic in this exchange, and indicative of a strong instructional symbiosis of sorts. With Gloria's assistance, Laura is able to shift roles from that of daughter (on the listening end) to that of reliable language instructor, Her mother complies by adopting the role of an enthusiastic student. And yet this is not a role play scenario. Such role reversals are common in this household, and possibly in some others, as well.

In excerpt (2), when her 'student' asks her "Where?" Laura responds with even more specific instruction(s): " . . . in the middle of the word." Prodded further with the genuine inquiry "But where in your mouth?" she responds with equally precise articulatory advice "On the top," and the interrogator, her mother, begins to practice this sound much more successfully. As is the nature of conversation, it is a two-way negotiation, and this exchange is no exception. How could Laura's instructions be viewed as anything other than instructional discourse? Excerpt (2) is another illustrative example of the child (as) as excellent conversation (and listening partner) plus second language facilitator.

Excerpt B: How to pronounce Arabic /kh/ (a pharyngeal phoneme/sound)

Context: In a follow-up conversation, Gloria asks Laura to teach her how to pronounce another Arabic sound.

<p>| | |</p>

In turn 2, in teacher-mode, Laura supplies a word containing the target phoneme /kh/ that is not found in English and, without waiting to be asked how it is produced, employs the obligatory model "need to" in an equally assertive and explanatory directive "You need to do this." She does not stop at this. She follows up with a mimed articulation of the target sound, once in isolation, and once again in context—in the word in which she first used it. It is noteworthy that
five-year-old Laura has not been trained, so we can only imagine what her instructions might look like if she is (formally or informally) trained. Her mother's natural, student-like reaction is to imitate the non-verbal and verbal instruction her daughter has provided her (by request).

While Laura's mother intentionally adopts the role of a student in both (1) and (2), (something adults rarely do except with other adults), these excerpts clearly illustrate the child's natural gift for teaching. A question worth asking is "Who could Laura have learned these un-English sounds and words from?" The answer need not be debated.

What the following data item makes clear is that monolingual children who have bilingual friends stand to learn a lot--especially sociolinguistically--and could begin to function naturally as cross-cultural liaisons, and communicators of cultural artifacts from the other culture(s) they are exposed to through their bilingual/bicultural friends. It is note-worthy that adults, too, can benefit substantially from the linguistic enrichment (primarily phonological, lexical, and sociolinguistic) the child instructor provides. In excerpt (3), for instance, Herman patiently assists his Uncle with pronunciation and vocabulary.

Excerpt 3: Mr. Singh and his 7-year-old Nephew, Herman

Context: An elicitation lesson on body parts initiated by the adult who works 10-hour shifts, even on weekends, which leaves him no time for formal English instruction. New words he learned in that session and as a result of it include: shoulder (the /sh/ sound in particular), thumb, ear vs. hair, eardrum, tummy, belly, and nose (the /z/ sound in particular, which this Punjabi and Hindi speaking ESL adult, Mr. Singh, had difficulty pronouncing, and which he was pronouncing as /j/ in the classic first language transfer mode).

Mr. S: [Pointing at his shoulder and asking in Punjabi] A ko ki bote? (i.e., What do you call this?)
H: Shoulder
Mr. S: Kya? (i.e., What?) Solder?
H: Na. SHol-der (Stressing the initial /sh/ sound and articulating each syllable carefully)
Mr. S: Solder?
H: SHoulder (stressing the phoneme /sh/). /s/ nahi (i.e., not /s/). Sh! Sh!
Mr. S: (Eyeing H carefully as he attempts to repeat the target sound) S . . . sh . . . [H nods] Shoul-der.
H: (Still not satisfied and noting the need for more comprehensible input) Sh. Sh. Shoulder. SHOLE-DER.
Mr. S: (Imitating/Repeating after him) S, shoulder.
H: [Nodding vigorously] Hunji (i.e., Yes Sir).

The suffix {-ji} is a honorific particle in Punjabi and it is noteworthy that Herman uses it when he addresses his elder. It has now been borrowed into many north Indian languages, including Hindi, Kashmiri, and Urdu. Elicitation excerpts such as this one suggest that children can be overtly drafted into language and literacy learning efforts, and that they can instruct us on more than just structural features (i.e., social, pragmatic features that are culturally based, as well). This example also suggests that behaviorism may have a place when adults are the learners and children their facilitators.

Implications and Directions for Future Research
Separatist language and literacy instructional-learning practices are all too common in our society and, not surprisingly, continue to persist. Examples include adult versus child second language and foreign language classes. Yet, if the success of our children in American and Canadian schools is contingent upon the strength of home-community and school ties (Edwards 2004), then such exclusionary practices must be revisited and modified to make way for a truly inclusive pedagogy, particularly in communities with high volumes of immigration, where such setups might be more feasible.

We must remember that our theories of language acquisition derive from observations of children for whom this phenomenon is second nature. From a linguistic standpoint, we would do well to gain insights into more than the language structure—into the sociolinguistic and pragmatic dimension(s) of child language use, as the ways in which children use lang. to establish and affirm relationships with indivs.who differ in age, gender, ethnicity and other sociciolung indices, or how they negotiate identities in their day to day lives, particularly immigrant children, can be of great benefit in the construction of not merely models of language attrition, bilingualism and much more, but also in the design and testing of appropriate language instructional and learning pedagogy/approaches.

At a time when families are experiencing even greater divisive forces at work in the form of growing cultural and ling. divides btw. Parents and (g)children and grandchildren, age-separatist instructional-learning practices which are the norm in the United States, as in many other parts of the world, might not be as feasible and appropriate. In other words, a more inclusive pedagogy might be worth a try, particularly in community center and other community-based lang. and literacy devt/enhancement sites/venues.

**Findings and Implications**

For all the subjects, contact with English was observed to be greater with one parent, notably their fathers. Fathers were observed to play a smaller role in these children's socialization (process). In families where the oldest child had assimilated toward the L2 (English) culture, and rejected the L1 language-culture (Carlos is a prime example), biculturalism was a less noticeable feature in the speech-language of all the children over 2.5 years old. This preference for the dominant language is likely to re-appear in the siblings, particularly when they start going to school in a less cosmopolitan setting.

In some homes, older siblings can make it easier or harder for the younger ones to learn and retain the L1. Bilingual children whose acculturation has yielded bilingualism and biculturalism were observed to serve as efficient acculturators to their monolingual friends, their younger siblings, and to (monolingual) adults. Children from homes where a language other than English is the primary language who have older siblings, were observed to master English (and possibly even their L1s) faster, as they have two or three facilitators.

Implications of these findings include pedagogical (for teachers, educators/decision-makers/curriculum designers), linguistic (i.e., how to ensure smoother, faster and more effective language acquisition or naturalistic bilingual competence), and social-pragmatic (for monolinguals who have any kind of contact with bilingual children).
Concluding Remarks

Children, particularly bilingual (bicultural children) are natural born teachers and some of the best language facilitators we have at our disposal, and we would be remiss to overlook them/their vast untapped linguistic potential. All children have the potential to be facilitators to their peers and the adults with whom they interact. The data gathered in the present study also suggest that bilingual children in America and other English-dominant and English-favoring nations have an (informational) advantage, particularly if they can successfully cope with the pressure to conform to the monolingual, English-only majority.

Abstract:

**MODELS OF EMPOWERMENT VS. MODELS OF DISEMPowerMENT: AN ANALYSIS OF A LINGUISTIC AWARENESS TRAINING PROGRAM IN RURAL AMERICA**

Anjali Pandey, Salisbury University  
Project Director: ACE Program  
expandey@salisbury.edu

This proposal reports on findings of the ACE conceptual model, a pedagogical model designed to train content-area teachers (K-12) on effective language teaching principles for newcomer, immigrant students in over 15 different schools in seven different geographical counties on the rural Eastern Atlantic Seaboard of the United States—areas exhibiting some of the fastest growing immigrant populations. The study spans the findings of 24 months of the program. Operating on the premise that in the 21st century particularly in isolated rural counties, expertise in teaching English as a second language to newcomer populations cannot justifiably achieved via workshop models which give a peppering of “the best practices” to content-area teachers with no formal linguistic training, the ACE conceptual model strives for range, breadth and depth in linguistic awareness via a specially designed Copernican model of education. In this block educational system, course content on language awareness is designed to increase professional awareness of language teaching in the triple domains of knowledge, efficiency and expertise. In the ACE model, content is delivered in longer blocks of time than conventionally sequenced classes permitting for more intense continuous study and the eventual creation of a flexible expert. Via a series of 11 carefully designed and methodically sequenced graduate-level courses held at accessible times over a period of nine months the model provides a long-term, high-incentive model in which linguistic awareness of language form, acquisition, culture, bilingualism, reading, writing, methodology, assessment, materials design and program development empower and instigate teachers to implement praxis that ensure that all children, mainstream and newcomer, have access to high-quality education. This model of education is based on an additive rather replacement teacher workforce model and has several implications for new governmental mandates in the United States such as the *No child Left Behind Act* of 2001.
A GEOGRAPHIC ANALYSIS OF UNITED STATES CASUALTIES DURING THE FIRST TWO YEARS OF OPERATION IRAQI FREEDOM

Operation Iraqi Freedom was launched on 20 March 2003 to dispose Iraqi President Saddam Hussein, who was believed to be harboring weapons of mass destruction. Since the start of the campaign over 1400 United States soldiers have lost their lives due to both combat and non-combat related injuries. This study focuses on the United States for both combat and non-combat casualties during the first two years of the Iraq war. State and county residence data, as well as home military installation data will be gathered to provide insight into areas of the United States that have been most affected by the toils of the Iraq war. It is hypothesized that the areas of the United States that have the lower per capita income will have the higher casualty rate, due to opportunities the military provides. We will use information collected from the Department of Defense and Census Bureau to determine if there is a correlation between county of residence and key demographic data. This study hopes to provide a glimpse into the areas that have been hardest hit by the war, both in the residence and the military home of the service men and women.
1. ABSTRACT

Ice jams are caused by the initial freeze-up or break-up of ice on river channels during the winter months. This process occurs most frequently in northern portions of North America and Eurasia, although they have also formed in the southern United States in places like Hunt, Arizona, and Rainbow, Texas. As water bodies begin to freeze or break-up, water from the upper reaches continue to flow, causing these water bodies to carry broken chunks of ice downstream. Ice jams can severely impact the ecosystems and are known to cause extensive morphological changes to the channels and human-made structures.

The processes that constitute ice jams are well studied, but not completely understood. The lack of information gathered on ice jams, is a concern to communities along water bodies. The expanding urban growth and population along river systems is also a concern due to the construction on floodplains, which are at a greater risk of
flooding. This study will review some of the impacts that ice jams have had on humans along river systems in North America. More so, we will focus on the dangers that humans face from this phenomenon. We expect to find that although human-made structures can provide safety to these river communities, the failure of these structures can cause significantly more damage.

2. INTRODUCTION

During the winter months, rivers in the northern portions of the United States and throughout Canada have a phenomenon occurring, which is known as “ice jams”. Ice jams are a process that is caused by the initial freeze-up of various water bodies or the initial break-up period associated with the spring thaw. This in turn causes the frozen water bodies to swell, carrying broken chunks of ice downstream. An ice jam typically occurs where a water body experiences a noticeable change in slope, usually from a steep to milder grade. A surface-water profile changes significantly over a long distance, causing the surface-water levels to increase upstream of an ice jam, which then floods nearby neighborhoods and low-lying communities. In Canada, for example, ice jams have caused significant damage to low lying areas and shoreline properties.

Ice jams are a consistent problem in cold regions, and cause difficulties with river navigation on rivers such as the St. Lawrence and the Mississippi (Vincent et al., 2004). According to Gerard et al. (1995), during a five-year period from 1983 to 1987, roughly 35 percent of all flooding was caused by ice jam events. Early literature reviews that have been done in the past that have contain great amounts of historical information in regards to river ice; however, the data is often scattered and these literature reviews do not document many of the recent data that has been collected in the last few decades (White,
The U.S. Army Corps of Engineers (USACE) Cold Regions Research & Engineering Laboratory (CRREL) possesses an ice jam clearinghouse, (Fig. 1) (CRREL, 2004), which has all documented ice jams recorded. The ice jams recorded in the ice jam clearinghouse have a heavy reliance with the U.S. Geological Survey and is by no means an accurate historical record of ice jams (White, 1999).

Due to the lack of information gathered on ice jams, this is a growing concern to regions in the north. With a growing population and extending urban growth closer to river systems, problems with flooding due to ice jams have been more widely documented. However, not all areas are being built-up. Much of the ice jams occur in areas that are heavily isolated, such as areas near federal parks and grasslands.

The formation of ice jam formation is little understood, although they are of interest to researchers in many scientific disciplines. However, the sedimentation of a river can be heavily scoured by ice jams, making it easier for a geologist to understand the friction causing the scouring. Because of the complexity of the processes and parameters involved, researchers are studying ice jams at centers such as the National Water Research Institute in Canada, the Hydrologic Engineering Center in California, and the Cold Regions Research Engineering Laboratory in New Hampshire, the latter two being branches of the USACE.
Ice jam impacts humans and their settlements in numerous ways. There are the obvious, such as destroying buildings and structures (i.e. bridges) or costs of mitigation, as well as obscure ways, such as making travel difficult or impacting food production (Fig. 2 and 3). Ice jam impacts on humans and their settlements are important because millions of dollars are spent annually to combat this problem and this problem could be better solved by taking preventative measure prior to development (Beltaos, 1995). The purpose of this paper is to examine case studies where ice jams have impacted humans, in addition to look at the future of ice jam impacts on the human race. From Table 1, one can see that 42 states and one district have had a recorded ice jam event. Gleaming from the total

3. CASE STUDIES

Ice jams and its processes have been well researched. This is aided by the plethora of data that is collected every year on this phenomenon. A study by Andres (1995) on the Peace River in Alberta, Canada focused on the freeze-up processes and ice jam on a large river with hydroelectric capabilities. The Peace River begins high in the Canadian Rockies of British Columbia, and flows northeast through Alberta, finally entering the Slave River. This study primary focuses on the narrow study area near the town of Peace River, where the ice jams have caused much damage in the past. Ice jams have caused damage to some of the building located along the river, as well as to river structures, such as bridges and dams. The ice cover produced on this river is very thick and possesses a significant flow underneath it (Andres, 1995).
Another example of damages caused by ice jams was in Allagash, Maine, located near the Canadian border on the St. John River (Fig. 3). In the early winter of 1990, unseasonable weather resulted in a breakup type ice jam, which then refroze, resulting in a layer of ice over 30 feet thick (FEMA, 2004). By early April, the ice had begun to release, resulting in the destruction of a 211 foot bridge, a 740 foot bridge, and causing damage to more than 30 homes (FEMA, 2004). The destruction of the two bridges created a detour in excess of 100 miles. The results of this ice jam led agencies involved with the reconstruction effort to develop and build new bridges that can prevent future damages (Wuebben et al., 1995).

![Figure 3. Bridge and Road Section Destroyed by Ice Jam. Source: Wuebben et al., 1995.](image)

The previous examples of ice jam damages that have impacted humans and their settlements are just two if the numerous times that ice jams have inflicted damage. There have been attempts in recent years to gain a grasp on controlling damages that result from this phenomenon. However, as with any type of river control, nothing is 100 percent. Ice jams will continue to be a threat to humans as long as humans live and work near river
channels. The next section will deal with the future of ice jams, as well as some future means of control the damages.

4. FUTURE OF ICE JAMS IMPACTS ON HUMANS

As the human race continues to grow in numbers, the areas along will be continue to be prone to development. Traditionally, some of the most fertile land has been found along river channels. Civilizations were built in areas where there was convenient access to the fertile plains for food production. With this development came an increase risk to flooding and associated catastrophes. The same could be said for not only today, but also for the future. There is and will continue to be an increased demand for highly valuable land. People need places to live, work, and land for food production. This is leading towards construction in areas were there high risks to natural hazards. Some cities are controlling construction in these higher risk areas, by placing parks and greenways in the land immediately adjacent to the river channels. These provide a means of reducing some damage to structures in the vicinity to the rivers.

Another area is that of climatic influences on ice jams. The future is uncertain, and there has been much debate regarding the existence of global warming. Ice jams will continue to be an issue whether global warming exists or not. The debate is whether global warming influences the magnitude and frequency of events. There is a study currently underway to look at climatic effects on ice jam events. The results of that study will provide insight to what the future of ice jams may hold.

The final area that needs to be addressed are means to avoid ice jams influences on humans, or at least curb some of the negative affects. One simple means of addressing the problems with ice jams would be to halt construction near rivers and let nature take its
However, that option is unrealistic in today’s society. The key is going to be in developing and perfecting mitigation techniques to lessen the damage caused by ice jams.

5. CONCLUSIONS

This study looked at the impacts of ice jams on humans and their settlements in North America. Based on the research presented in this paper, it is clear to see that ice jams can and do occur in most of northern portions of the continent. The research conducted could provide a benefit to community planners, state and federal disaster management officials, as well as other natural hazard researchers in order to aid in gaining a grasp on this phenomena.

Ice jams are important phenomena not only due to the initial damage that they cause, but also in the long term effects, such as urban planning issues. There have been numerous efforts to reduce the areas along river channels to increase the amount of housing that can be provided, as well as to reduce the amount of damage from flooding. However, it has also been documented that human influences on the rivers, such as dike and levees lead to an increase in velocity of the water. Whether or not these changes to the rivers impact the frequency and magnitude of ice jams is still to be determined. It is important for city planners and engineers to keep ice jams in mind when they constructing protection systems, bridges, and new communities.

The work presented in this paper could also benefit future studies by providing a baseline in which future work could focus on more explicit areas in this topic area. Future work that is currently underway is related to examining ice jam events along the Red River of the North in North Dakota, and how these events are related to not only climatic variables, but also river channel modifications. Another future study current being
planned is focused on how human modifications, such as dikes and levees influences the frequency and magnitude of ice jam events. In closing, there is a vast quantity of work still to be undertaken in this area and this phenomenon is not fully understood; however, with studies such as this one and the others being planned the knowledge base in this topic will continue to grow.

6. ACKNOWLEDGEMENTS

The authors would like to thank the University of North Dakota Department of Geography, The Graduate School and Office of Research and Program Development for their support of this research.

7. BIBLIOGRAPHY

This paper presents an economics model for understanding media change in China, highlighting finance, ownership, market structure and government regulations as important causal variables. It argues that marketization of China’s media industry is producing a basket of information and entertainment goods that are reflective of consumer demand, advertisers’ interests, increasing private investment, more opportunities for industry participation and the creation of new media legislation. It also suggests that the new media environment will not automatically produce democratization, which is partly dependent on context-specific factors. The paper employs a number of analytic techniques in reaching its conclusions – television program placement analysis, website content study and film import examination.
The Chinese media environment has changed dramatically over the past twenty years - foreign satellite television broadcasters now have landing rights in China, Chinese people are able to watch Hollywood films in cinemas, official Chinese Communist Party newspapers have fallen out of favor, lively radio talk shows are heard over the airwaves, real-time coverage of events, such as the Iraq War, is happening, a new openness about social problems, such as corruption, is noticeable, transmedia mergers are occurring, media conglomerates are forming, foreigners are being given more investment opportunities in areas such as pay television, publications distribution, renovation of cinemas, and film and television program production, and more competition is arising amongst Chinese companies in areas such as foreign film distribution and digital television. Along with these changes, Chinese people have more communications technologies at their disposal - mobile phones, facsimile machines, text messaging services, and desktop publishing.

At the same time, a number of restrictions exist - content censorship regulations, curbs on the Internet, a taboo on direct criticism of most high-level government officials. For those who stray beyond the permissible, intimidation, arrest and imprisonment are possibilities. In such an environment, self-censorship becomes a widespread practice.

Theories abound to explain the Chinese media environment - state corporatism, regulated marketization, praetorianism, self-liberalization. “State corporatism” refers to “media commercialization with the endorsement of the state.”

---

marketization” to party control over the media through a licensing system and
other mechanisms while marketization is occurring, 2 “praetorianism” to the
“cacophonous and unstructured circulation of communications messages,” 3 and
“self-liberalization” to the “unintended consequences of economic reform” as a
country transitions from communism to an authoritarian regime. 4 All of these
theories have in common the notion of change, the idea that China is a transition
state somewhere along the road to a market economy from a planned one. The
bifurcated notion of the transition is also captured in other descriptions found in
the literature, or among scholars, such as “rehabilitated bureaucratic-authoritarian
regime;” 5 post-communist, authoritarian, transitional society” 6 and “capitalist
dictatorship.” 7

The purpose of this paper is to explain the factors that account for the change
in China’s media environment. The explanation that I give is one largely based
on economic considerations. These considerations are drawn from the literature on
media economics, which has blossomed in recent years. 8 Among the notions I

---

7 I owe this term to Professor Mike Thies of the University of California, Los Angeles. The term was used in an interrogative context in relation to China.
employ are market structure, dual product market and theory of the firm. Special
attention is paid to identifying who the media actors are, what motivates them
and what institutional environment they operate in.

The argument of this paper is that media marketization in China (broadly
construed) is ushering in a new media environment where the basket of media
products manufactured is different than that which would be produced in a pre-
marketized or non-marketized environment. This may seem obviously true, but it
needs to be demonstrated that media content in China has changed, and that this
change is linked to changes in explanatory variables.

This paper is essentially a case study. As such, its findings do not directly
apply to other countries, and some may feel that the findings regarding China
itself are on shaky ground. But insofar as the principles of media economics
apply to other countries as well - as I believe they do - the model I present may
have universal applicability. One attraction of the model is that it allows unique
features of each country to be taken into consideration. To actually do this
properly, however, requires an international team of scholars examining how
marketization is playing out in other transitional - and democratic, industrialized -
countries. This is a small first step in such a project.

The method I employ in this study involves a number of different techniques -
television program placement analysis, website content analysis, newspaper
advertising and circulation data review and film import information examination.
Where possible, I make comparisons over time, seeing how the marketizing Chinese media environment differs from a non-marketized one, often described through a propaganda model.

The structure of this paper will be as follows: in the next section, I will present a model for understanding media change; then, in the following section, I will apply it to China to see what changes have actually occurred; then I will see how changes in the explanatory variables are related to changes in Chinese news content; then I will look at how all of this is related to the broader question of democratization. Finally, I will end with a few suggestions for future research.

**Understanding Media Environments**

In analyzing media environments, there are four questions that one needs to ask - who pays for the media output?, who owns the corporation?, how concentrated is the industry?, and what are the regulations and policies the government has created? The issues these questions address can be subsumed under four different headings: finance, ownership, industrial structure and regulatory framework and policies. These factors are, I maintain, the primary determinants of media content in a given country or particular media sector. It may be, however, that there are other factors that have causal significance. For example, it may not be enough to look simply at government regulations and policies, it may also be necessary to see how vigorously they are implemented or enforced or even if they are enforceable. The creation of new technologies may also have significance in understanding how media environments develop. Another point is that there may be overlap between these four different primary factors.
Why a particular media industry has a certain structural configuration, for example, would seem to be linked to the types and amounts of ownership permitted within the industry. For analytical purposes, however, I keep these factors separate. Where necessary, I attempt to make connections.

The first factor is finance. This refers to how resources are acquired for the operation of the business. Among the possibilities are: government or political party subsidies, charitable contributions from individuals or institutions, and revenues generated through market activities. In a system with government finance, one might expect that media organizations would be kept on a short leash. As Wilbur Schramm wrote about the former Soviet Union, “Mass communications are used instrumentally - that is, as an instrument of the state and the Party.” It is possible, however, that other configurations could develop. In a market-based system, or one where markets provide incentives for action, media organizations are motivated by two different factors - consumer demand and advertising revenue. On the one side, media companies, be they television broadcasters, radio stations, newspapers, or magazines, have to provide products attractive to their audiences, which might mean flashy entertainment or more business news. On the other, they have to meet the needs of advertisers. The two markets are linked in that advertisers want access to large audiences. As Alan B. Albarran has written, “Greater demand for media content enables companies to charge higher prices for their advertising. Likewise, a drop in audience ratings, reader circulation or other

---

10 The dual product market description is less applicable to the film, music and book publishing industries, which are more heavily dependent on the consumer market.
media usage will trigger a decline in advertising revenues.”

The impact of advertisers on program production may be felt in a number of ways. Media companies might be hesitant or unwilling to supply products that offend their sponsors or they might be encouraged to supply products that generate interest in their sponsors’ businesses, e.g. an increase in health-related news along with a proliferation of drug-related advertisements on television. Another concern of market-oriented media companies is costs. This could affect things such as the number of correspondents posted overseas, decisions about whether to create news products for local markets or to distribute uniform products nationwide, and even what sources of information to use. All of this is nicely summed up by John H. McManus who writes:

To the extent that the business goal of maximizing profit dominates, the foregoing analysis suggests that rational news departments should compete with each other to offer the least expensive mix of content that protects the interests of sponsors and investors while garnering the largest audience advertisers will pay to reach. What becomes news then depends on cost-benefit analysis of each stage of production.

It may be, however, that as companies sever financial ties from the state for working capital and other requirements in countries making the transition to a market economy that the profit motive and greater financial independence have a liberating effect, enabling a wider diversity of content, even if that content may not be what is needed to usher in a democratic society. This issue I will return to later.

The second factor is ownership. Media corporations may be government owned

or privately owned. Government-owned media companies have been characteristic of communist countries while privately-owned media companies have been characteristic of capitalist ones. Privately-owned media companies may be independent, family-run operations or they may have their shares listed on the stock market. Managers of stock market listed companies often face pressures to produce short-term profits and maximize shareholder value, objectives which have implications for the types of business strategies they pursue. Another type of media organization that exists is the public service monopoly, an organization such as the BBC that has autonomy from the government and exists to rectify cases of market failure. Another important distinction is between domestic investment and foreign investment. Allowing foreign companies or individuals to invest in a country’s media assets can have an impact on the media products that are manufactured and the way they are produced. The host country may seek foreign investment because of the deeper level of production and managerial expertise that is attached to it.

The third factor is industry structure. By “industry structure,” I am referring to the level of concentration in a particular media industry. Is the structure one of perfect competition, oligopoly, monopolistic competition, or monopoly? It is hard to say which structure is most characteristic of a capitalist society. As Ben H. Bagdikian has pointed out, the level of concentration in the U.S. media industry is very high, with five major companies dominating the landscape - Time Warner,

---

13 For more on different media types, or “regulatory forms,” see Monroe E. Price and Peter Krug, “The Enabling Environment For Free and Independent Media,” Sponsored by United States Agency for International Development, Center for Democracy and Governance, Prepared by Programme in Comparative Media Law & Policy, Oxford University, December 1, 2000, 7-8.
Walt Disney Company, News Corp., Viacom and Bertelsmann. In the first edition of his classic book, *The Media Monopoly*, published in 1983, Bagdikian identified 50 major corporations as controlling the major media industries in the U.S. Perhaps what is important in the case of countries moving away from state domination of their media industries is that companies, at least in the initial stages of market reform, have more opportunities to participate in the media industry. Over time, however, a variety of industry configurations can emerge, as we shall see in the case of China. The issue of media concentration is important because of the implications it may have for media pluralism. One group of people argues that media concentration reduces pluralism by excluding or under-representing some political viewpoints, suppressing innovative products, preventing newcomers from easily entering the industry and promoting duplicative content. Others see the issue as less clear cut, or think that media concentration can actually increase pluralism, in part because of the economies of scale and increased efficiency associated with size, and the impact this has on product development. As one writer concludes from the “growing empirical literature,” “increased concentration can in some markets lead to more diversity since sellers in a concentrated market may offer products aimed at attracting additional customers to the market rather than aimed at stealing customers from already

---

offered varieties.” 19 Another points to the “surprising number of facts and opinions that are critical of the dominant corporate structure” as evidence that media pluralism is still alive and well in the U.S. 20 Doyle argues that pluralism is not only the result of the number of producers of media goods but other factors such as the size and wealth of the market and the management of resources. 21 Another aspect of concentration that could have an impact on media content pertains to the types of mergers that are permitted, three types of which can be identified - horizontal, vertical and diagonal. 22 A horizontal merger is between firms of the same type, a vertical merger between companies at different stages in the production chain and a diagonal merger between companies of different types. The issue of cross-ownership has been an issue of major public policy discussion, an indication of its significance. 23

The final factor concerns government regulation and policy. The laws, notices, administrative decisions, policy directives and other statements by government officials all have a major impact on the type of media environment that arises. In the United States, for example, the Telecommunications Act of 1996, which aims to promote competition in various media and telecommunications industries, and the Federal Communication Commissions’ cross-ownership rule change, which loosens ownership restrictions on broadcasters, are both factors affecting media

---

21 Doyle, Media Ownership, 14-26.
22 See Doyle’s Media Economics (22-23) for a clear discussion of these differences, along with an assessment of the advantages of each strategy (25-37).
activity. From the standpoint of countries making the transition to market economies, perhaps the important thing here, at least in the case of China, is simply the fact that legislation is being created to enable a more predictable, orderly and stable environment in which media activities can be conducted, or that laws are being eased to allow companies to do things that formerly they were prohibited from doing. It may well be the case that the new legislation in China, of which there has been much in recent years, represents an effort by the government to maintain control. Rather than being a case of new “rule of law,” it is more a case of “rule by law.” This is an important issue I will return to.

From these four factors, a definition of a marketizing media environment emerges. A marketizing media environment is one in which companies are motivated by profit generation, private money is increasing, barriers to entry are declining, at least in the initial stage of reform, and new regulations are being enacted, many of which may be more liberal than past regulations. The claim of this paper is that China’s media environment is changing largely because of the advent of marketization. Stated otherwise, marketization is producing a different basket of media products in China that is more attuned to consumer demand, is geared toward satisfying advertisers’ needs, is influenced by private money and is reflective of changes in media industry structure and liberalization of government regulations. If this hypothesis is true, it would follow that the basket of media products today, and the general nature of the media industry in China, would be

different than it was during the pre-reform period. To determine to what extent this is true, and to what extent marketization as I have defined it has actually occurred, I now turn to an examination of China.

The Growth of Marketization

In order to understand the new system of media economics in China, it is necessary to say something about the old system. Under the old system, which existed from around 1949 to 1978, the media were completely funded by the state, save for a brief period in the early 1950s. Media organizations were evaluated not on the basis on how much money they made, but rather how much social benefit they produced. Advertising, which had experienced its golden years during the 1930s, and saw some usage into the early years of the People’s Republic, fell on hard times, generally unnecessary with only limited market competition and harshly criticized during the Cultural Revolution (when it was used for political purposes). Ownership of media assets was by the state, though some private newspapers and radio stations briefly existed before closing in the early 1950s. Foreigners were basically kept out of the industry.

Commercialization began in earnest in the late 1970s/early 1980s, possibly gaining steam over the past decade. One measure of commercialization in the media industry is advertising expenditure. As Table 1 shows, Chinese advertising industry spending has grown dramatically over the past decade. As an indication

28 Zhao, *Media, Market and Democracy in China*, 16.
of how important the Chinese industry has become (it is now one of the five largest in the world), the International Advertising Association held its 2004 world congress in Beijing in September. To take advantage of the new opportunities, companies are now setting up shop, or enlarging operations, on the Chinese mainland: Nielsen Media Research, for example, said last year that it intended to expand its television audience measurement service in China.

To get a better idea of how marketization is playing out in China, I turn now to program placement information of China Central Television (CCTV).

This information shows that all or most of the top-ranked programs in 1997, 1998, 1999, 2000 and 2001 on CCTV-1 were broadcast during prime time, when advertising rates were highest. (See Table 2 for data on the five-year period and Table 3 for information on 2001).

It might be argued that the reason prime time programs have the highest ratings is because they are broadcast in prime time. Evidence suggests the reality is more complicated. It is quite clear that CCTV is learning to play the ratings game, juggling schedules, canceling programs, adding new ones, and revamping formats to generate large revenues. Examples abound. On December 2, 2000,

---

31 I define “prime time” as the period from 19:00 to 20:54. At 20:55, advertising rates go down for all broadcast length categories of advertisements. At 20:01 (in 2001, for example), the rate of a 5 second, ten second and fifteen second commercial on CCTV-1 (40,000, 56,000 and 70,000 RMB, respectively) is lower than that for a 15 second commercial broadcast at 19:52 (90,000 RMB), but the rate for a 20 second or 25 second commercial is higher at 95,000 RMB and 110,000 RMB, respectively. It therefore seems sensible to denote the end of prime time as 20:54. By “top ranked” programs, I am referring to the 30 programs with the highest viewer rates for each year. It is hard to give systematic data on programming changes based on ratings information from the five-year period because some programs are one-day programs which means, by definition, they won’t appear the following year, even if they are part of a series that will. It is also the case that episodes of a drama series may not appear in a prime time slot - or any slot - in a subsequent year not because the series was
CCTV increased the broadcast time of a news investigation program on CCTV-1 from 30 minutes per episode to 40 minutes, and aired the program two times per week - on Saturdays at 9:15 p.m. and on Thursdays at 4:20 p.m. In 2001, when the program won an award and ranked as the 21st most popular for one of its episodes on contraband in Xiamen, a third broadcast slot was added - 6:20 p.m on Sunday. CCTV also changed the Saturday broadcast time to 8:06 p.m, when advertising rates were higher than 9:15 p.m. Another program fared less well. “Between the Cities,” a humor-oriented sports program following a European format that began airing on October 30, 1998, was canceled in less than a year. The program had been broadcast every other Friday on CCTV-5 at 9:30 p.m for ninety minutes. Another program to disappear - this one from CCTV-3’s lineup - was Chat. The program had suffered declining ratings for several years. Friends was also taken off the air, in July 2002, only to reappear after changes had been made. Other programs that underwent changes were Daily Cuisine and Zong Yi Da Guan, both of which had lost viewers. Strong evidence that the company is playing the ratings game also comes from things that the company itself has said. In a company memo, CCTV notes that it “took some measures to strengthen its influential position in the rating market,”

_canceled but simply because it only had a fixed number of episodes, as is typical of drama series in at least some Asian countries. It is also hard, in some cases, to know if a top-ranking program in prime time has been deliberately placed there because of past performance or whether it is a new program that has had an initial success. We can note that staple shows, such as Network News, Spotlight Interview and Science and Technology Survey, which have been among the top-rated programs during the five-year period, remain in prime time broadcast slots._

citing the giving of awards to best program hosts and hostesses, the elimination of worst programs and the encouragement of competition between producers as examples. 38 CCTV President Zhao Huayong is also said to have commented, “that, with the exception of the news, any programming failing to bring advertising dollars to support itself is liable to be axed.” 39 One new activity that proved to be a commercial boon was the live coverage of the Iraq War. CCTV’s commercial income is said to have increased by 30% in March, 2003 compared to the year-earlier period as ratings on CCTV-4 skyrocketed. 40 A desire to increase advertising revenue has also been one of the reasons CCTV has set up a 24-hour Mandarin language television news service.

Another area where change is occurring is ownership. The Chinese media are typically described as “state-owned,” and this, for the most part, is true. But around the edges, and, in some cases, at the very core of what is happening, major changes are occurring that are having a dramatic impact on the media environment. These changes can be summed up under three different headings - stock market listings, foreign investment, and content provision. I consider each in turn.

The first area is stock market listings. Privatization of media assets has been very slow to come to China, but in some areas, it is a major form of funds procurement, and it is becoming increasingly acceptable. One group of companies with private investors are Internet service providers. China.com, Sina.com, Sohu.com and Netease.com are all listed on the U.S. Nasdaq. Highly popular newspaper *Beijing Youth Daily* is also eyeing a stock market listing for its business operations, as is newspaper media giant Guangzhou Daily Group. Even CCTV is experimenting with spin-offs of non-broadcasting parts of its business. Going beyond this - publicly listing editorial operations - is still not permitted for newspapers, magazines or broadcasters. A second way private money is entering the Chinese media industry is through foreign investment. Foreigners are allowed to invest in book, magazine and newspaper retail distribution and various aspects of the film industry, such as production, technology, film screening and cinema renovation. They have also been given the green light to invest in pay television. In general, the movement is towards liberalization of foreign investment regulations. A third way in which private money is entering the industry is
through various contractual arrangements. These arrangements, which Zhao describes as a “surrogate for private ownership,” have effected a number of media sectors, including publishing and radio. In the publishing area, Pei writes, that “The private entrepreneurs capitalized on the new arrangements by taking over virtually all the functions of the publishing houses, becoming, in effect, *de facto*, though unlicensed publishers. They found authors, translators, or even pirated materials, and negotiated a nominal cooperative arrangement with publishing houses, paying a fixed fee or a share of proceeds for the use of government-issued book numbers or magazine identification numbers…” Foreigners have also gotten into the act, through magazine consulting and copyright transfer agreements and through “consulting arrangements” in the radio broadcasting industry.

The structure of the Chinese media industry is also changing. With the introduction of reforms, many more companies have entered the media industry. This has been especially pronounced in the print media sector, as Table 4 shows.

Periodically, companies have been driven to closure as the new commercial imperatives take their toll. One event that drove a number of publications out of business was the end of mandatory subscriptions for villages to party and government-run publications. 

Linear growth has not been apparent in the television and radio industries. While the number of radio and television companies initially grew, as Table 5 reveals, it then fell back. The number of film production studios also has declined in recent years. One explanation comes from Pei, who was writing before the peak:

The explanation for this striking difference between the print media and the electronic and screen media was the varying degree of penetration by market forces in these sectors. The most prominent contrast between the print media and the electronic and screen media lay in the relatively high entry barrier for the latter. Generally speaking, entry barriers to potential competitors consist of three elements: initial capital requirements, technological threshold and licensing procedures.

Another thing that has happened in China’s media industry in recent years that has caused consolidation is the formation of media groups. These groups, listed in Table 6, represent an attempt by the government to grow media giants that can take on conglomerates from overseas in the WTO era. They are also are part of an effort by the Chinese government to attempt to retain control over the media industry.

46 Another group is China Publishing Group, the country’s biggest in the publishing field.
It is not entirely clear what impact the conglomerate structure will have on media content. To the extent that these organizations benefit from economies of scale (there is also evidence that they end up subsidizing weaker members in the group), they would have more resources for financing new content, of which there is said to be a shortage in China today from domestic sources. It could also be that competition between similar companies within the same group reduces product differentiation, as one writer suggests.\(^{47}\) Still another possibility is that the conglomerates could end up less independent in their viewpoint than would be the case under a more decentralized media structure. Although the following comment does not apply directly to China, it may suggest the type of situation that could develop: “In country after country [in Asia], new media barons have allied with business, industrial, political, and military powers; instead of expressing different perspectives and acting as a watchdog of the government, they lend continued support to power brokers and the status quo by promoting and protecting vested interests.”\(^{48}\) This is an area in need of systematic study.\(^{49}\)

One final issue to touch on is mergers and acquisitions. This is an area where

---

\(^{49}\) There has been very little written about this important topic. One of the few pieces is by Zhao, “From Commercialization to Conglomeration.”
a great deal has happened in recent years, with a major restructuring of the Chinese media industry. Expansion strategies employed have fallen into each of the three categories mentioned earlier - horizontal, vertical and diagonal. The creation of media conglomerates has led to a combining of media assets of companies of the same type, and in some instances, where a market need has been identified, new subsidiary units have been set up. An example of this is Xinhua News Agency’s creation of Xinhua Financial Network, a dedicated business news provider set up with foreign investment.\(^{50}\) Vertical expansion has also occurred. An example of this would be newspapers setting up their own distribution networks in order to bypass the postal system. Diagonal expansion has also happened. Examples of this would be Guangzhou Daily Group becoming involved in real estate\(^{51}\) and Hunan TV & Broadcast Co. putting a variety of media under one roof.\(^{52}\) Interest in cross-media expansion has increased in recent years as government officials have expressed support for such activity and as technological trends have made such behavior seem more logical. The impact of different expansion strategies on media content is again not entirely clear. There could be synergies from mergers between companies of the same type, though a stronger company merging with a weaker company may simply harm the stronger company. Companies may also benefit from cost savings and greater efficiencies as is often seen in the case of mergers. Companies may also overdiversify, going into areas in which they are poorly equipped. An example would be Hunan

Media and Entertainment Group, which suffered losses from new business expansion after earlier gains. Some of these outcomes could boost media content as more resources would be available to produce it; others could have the opposite effect. In so far as media conglomerates remain state property, and operate under the watchful eye of party officials and regulatory agencies, limits may be placed on how independent they can become.

Government regulation and policy is another major determinant of a country’s media environment. In regards to marketization, what matters in China is simply the fact that legislation is being created for the operation of a more predictable, orderly and transparent media industry. As one document puts it, “The rule of law concept contains certain tenets that are essential components of an enabling environment for the development of effective, independent media, regardless of the substantive legal norms adopted in a legal system and regardless of the specific institutional structure within which those rules exist.” The content of law, however, does count, and here the trend in most Chinese media sectors is in the direction of liberalization. To take one example, a rash of new film industry regulations - Interim Provisions on Approval of Projects for Screenplays (or Their Synopses) for Shooting and Censorship of Films, Provisions on Administration of Chinese-Foreign Cooperation in Film Production, Interim Provisions on Qualifications for Access to Business of Production, Distribution and Projection of Films, and Interim Provisions on Foreign-Funded Cinemas - all point to a more liberal media environment. There is, however, also a “non-marketization” aspect

of government regulation in which laws are used simply as a tool of control. One writer refers to the “public security orientation” of Chinese law, while another writes: “Laws and regulations are enacted explicitly to achieve the policy objectives of the regime.” China’s media environment, then, is subjected to two types of forces, a marketizing one and a non-marketizing one. This has given rise to the notion of China as being “between the party line and the bottom line.” At times, these forces may move in opposite directions, creating various “contradictions, tensions and ambiguities.” Here, I simply wish to register my recognition of the importance of government as a force for producing media outcomes. This paper focuses of the role of marketization in producing change, but a fuller analysis would also include an important role for the Chinese state, not only as an agent of economic reform, but also as an agent blocking the development of a more free and independent press.

Consequences

In the introduction of this paper, I mentioned a number of ways in which the Chinese media environment, and the images and ideas to which Chinese people are exposed, is changing. These changes have been affecting media programming, freedom for reporters and the specific media that people are accessing for their information and entertainment needs. In this section, I will look at some of these

58 Zhao, Media, Market and Democracy in China.
59 Ibid., 2.
changes more systematically, presenting data that shows that China is in fact evolving away from a “propaganda state” towards a more liberal media environment. To be sure, there are still propaganda elements in the state-owned media, but the symbolic environment to which Chinese people are exposed is considerably broader than that during the pre-marketization period.

An indication that the Chinese media environment is changing comes from Freedom House’s freedom of the press survey. In its 2004 survey, which covered 2003, China scored an “80,” the same level as the previous four years but an improvement over its score of “89” for 1993, the first year for which Freedom House began publishing specific numerical scores. The reason for the improvement was a greater degree of information coming into the country, helped by the Internet, the ability of reporters to report on a wider range of issues, such as local corruption, and the inclusion of Hong Kong in its China score. (In the Freedom House Survey, “100 indicates the least amount of press freedom, “0” the most. A score of 0-30 gives a country a “free” status, 31-60, a “partly free” status, and 61-100, a “not free” status. Scores are determined by examining the legal environment, the political environment and the economic environment of the media. The economic environment includes such things as the structure and concentration of ownership and activities by the state in regard to advertising and subsidies.) The Freedom House survey is sometimes criticized for understating the amount of press freedom in China. That makes it all the more impressive that

---

evidence of change is contained in the survey.

Content Analysis To get an idea of what kinds of stories are appearing in the Chinese press, I did a content analysis of four Chinese media English-language websites for the month of June 2004. The websites were those of People’s Daily, the Chinese Communist Party’s newspaper; China Daily, a state-owned newspaper; Xinhua News Agency, China’s official electronic news service; and China Internet Information Center, an organization that produces a government authorized portal site, www.china.org.cn. 63 Since these websites are all relatively new, it is not possible to do an historical analysis going back to the pre-marketization period (prior to 1978 or so.) Such an analysis would provide a more proper comparative perspective, and could be done in the case of newspapers. The results of my study could be biased by the fact that I am analyzing Internet websites (a newer media whose users include many young people), the fact that the websites are in English (meaning that they could be geared more toward foreigners), and the period in which my analysis was done (2004, prior to the 2008 Beijing Olympics, when China wants to put on a good face to the rest of the world.) The websites are all government-owned, or connected to government-owned publications or organizations, which might indicate a conservative bias. This conservative bias, however, could prove illuminating, because if evidence of media liberalization can be found on government websites, all the more reason

for thinking that it could be found in more independent media. With these caveats in mind, I present my findings. 64

One finding is that there are a large number of stories related to crime. In most cases, the government or authorities are behaving in a pro-active or aggressive way, targeting, nabbing, busting, smashing, fighting, jailing and even executing perpetrators of crimes. Here are a few examples of story headlines.

250 Serial Murder Cases Cracked (China.org.cn)
Police Seize Heroin in Yunnan (China.org.cn)
Graft Reporting Center Recovers US$360 Million in 16 Years (China.org.cn)
5 Arrested in Xian Lottery Scam (Xinhua)
2 Jailed for Male Prostitution (Xinhua)
52 Firms Shut Down for River Pollution (Xinhua)
Real Estate Tycoon Jailed for Fraud (People’s Daily)
College Student Killer Executed (China.org.cn)
Chinese Pornographic Website: Judgment Day (China Daily)

What is interesting about these stories - besides the fact that they contain political messages - is simply the acknowledgement that so many problems exist in China, an idea which points to a second major theme - the candid reporting of social problems. Examples of these kinds of articles are:

AIDS Info Shared with Sex Dealers (China.org.cn)
Education System Has Failed to Guide Students (China.org.cn)
Husbands Beating Wives to Be Blacklisted (China.org.cn)
China Faces Up to Power Shortage (Xinhua)
Laws Under Discussion to Target Neglected Officials (Xinhua)
China Has 740,000 Drug Addicts: Police (People’s Daily)
Sichuan Tackles River Pollution (China Daily)

A huge number of articles on accidents or disasters appear. A few examples of

64 The web pages that I have examined are those related to China news, foreign news and business news. I have not looked at sports or culture-related web pages, the latter of which may be an important area of change. Presenting findings statistically (for example, showing articles of a particular type as a percentage of total number of articles) is difficult because articles may remain on a website for a number of days and it is hard to know what the total number of articles is. Nevertheless an examination of these websites suggests certain clear themes or types of articles.
this area:

House Explosion Kills Seven (China.org.cn)
Road Accidents Kill 8,198 Lives in May (China.org.cn)
Number of Poisoned Villagers in Liaoning Climbs to 120 (Xinhua)
Two Female Bodies Recovered at Boat Capsize Site in Central China (People’s Daily)
Firecracker Mill Blast Kills Many in East China (China Daily)

Economic reform stories are also prominent. These include:

China Liberalizes Grain Trading Prices (China.org.cn)
China Wins Praise for Bold Reforms at APEC Meeting (China.org.cn)
China Approves Two More Private Airlines (China.org.cn.)
Shanghai To Streamline Licensing (Xinhua)
China to Liberalize Foreign Trade July 1 (Xinhua)
Reform in Air Cargo Status on Horizon (People’s Daily)
China to Further Deepen Tax Reform (People’s Daily)
Private Capital Dabbles in Public Service Sector (China Daily)
Minister: China Deserves Market Economy Status (China Daily)

Surprisingly, there are few stories touting China’s accomplishments or breast-beating nationalism kind of stories (in other periods, such as during the Hainan plane incident with the U.S. or the U.S. bombing of the Chinese Yugoslav Embassy, there were probably lots of stories of the latter type). Among the few I could find were:

Great Achievements Made in Antarctic Expeditions: Hu (Xinhua)
College Students Optimistic About People-Loving Govn’t (People’s Daily)
Is it Foolish for Japan to Compete with China? (People’s Daily)

On foreign policy issues, stories generally showed moderation except when China seemed to be the target of criticism (there were also a few stories criticizing U.S. policy):

History of Flying Tiger Gives More Reasons to Develop Sino-U.S. Ties (People’s Daily)
China’s Oil Strategy Not Conflicting With the U.S. Interest (People’s Daily)
U.S. Report on China’s Military Forces “Ill-Motivated” (Xinhua)
U.S. Still Largest Arms Dealer (People’s Daily)
U.S. Has No Excuse for Detaining Diplomats (China Daily)

As expected, there were also a number of stories criticizing Taiwan, though even here moderation sometimes found its way onto websites:

Terrorism Part of Taiwan Separatist Agenda (China.org.cn)
Taiwan’s Military Build-Up Sabotaging Peace (China Daily)
Chinese Mainland Market Open to Taiwan: Official (Xinhua)
Legal Aid Provided for Taiwan Firms (China.org.cn)

One other thing noticeable in this analysis is that there is very little direct criticism of the Chinese government. About the only items I could find in which the government was cast in a negative light or portrayed guilty of wrongdoing were:

Govt. Loses Hepatitis B Discrimination Case (China.org.cn)
Govt. Pays Residents for Wrongful Arrest (China.org.cn)

Newspapers Change in the Chinese media environment, in the area of consumer demand, is suggested by data on advertising revenue on newspapers and shown by data on newspaper print runs. (See Tables 7 and 8). Important to note about Table 7 is that the official Chinese Communist Paper newspapers that appeared in 1988 as the biggest advertising generators did not appear in the top ten in 2002. The decline of the party papers is brought home with more force by the data in Table 8, which show that the number of copies of them printed has declined sharply over the last decade and a half while other papers have seen large increases. The rise of the metropolitan newspapers is well-known. As one writer puts it, “Since the early 1990s, metropolitan newspapers (dushibao) have become the most popular media in urban areas. With less ideological color, the metropolitan newspapers pay close attention to the relevant events and policies
that affect everyday life in the urban areas.” 65 One paper that has done extremely well is *Guangzhou Daily*. The paper is noted for having big street sales and a high private subscription rate. Increasing its popularity has been “a more readable fare of news, sports and entertainment.” 66

* Party-related papers 67

---

67 Classifying Chinese newspapers is not such an easy thing to do. The CIA study by Todd Hazelbarth, *The Chinese Media: More Autonomous and Diverse – Within Limits*, published in 1997, lists only *Xinhua Daily*, *People’s Daily*, *Guangming Daily* and *Economic Daily* as official Communist Party newspapers, but Pei also lists *Beijing Daily* and *Nanfang Daily* as party papers in a list of the ten largest party dailies for 1981 (161). He Qinglian, in “Media Control in China,” China Rights Forum 2 (2004) also describes *Liberation Daily* as a “party-sponsored paper,” along with *Nanfang Daily* (23). More independent newspapers, such as *Beijing Youth News*, may also carry party propaganda, blurring the line between party and non-party papers.

Film Imports Another indication of media change in China is found in the film industry. Added to the basket of media products that Chinese can choose from are foreign films, which were banned during the Mao years and only from 1994 were being released again. One thing to note about Table 9 is that 16, or 40% of the 40 Motion Picture Association films released in China from 1994 to 2000 were rated “R.” This may not mean much since Chinese film importers

---

68 This figure is a latest circulation figure given in 2003-2004 China Media Yearbook & Directory.

69 Information for some newspapers for some years may be unavailable due to changes in yearbook formats.

70 The Motion Picture Association of America’s (MPAA’s) rating system has five categories: “G”: General Audience, All Ages Admitted; “PG”: Parental Guidance Suggested, Some material may not be suitable for children; “PG-13”: Parents Strongly Cautioned, Some material may be inappropriate for
had more “R” rated films to choose from: of the 4185 MPAA films released during the period, 2787, or 67%, were rated “R”. 71 Furthermore, China has strict film censorship regulations. As Article 26 of the Regulations for the Administration of Films stipulates, “Upon completing the procedures for the temporary import of films, a film import unit shall submit the films in question to the film censorship body for examination.” 72 What the Chinese are watching in theaters, then, may not be the same as what American moviegoers are watching. Nevertheless, what matters is simply the fact that foreign films are being shown in China, and modified or not, many of the themes they deal with, or contain, are not so not lighthearted - extra-marital affairs (True Lies), terrorism (Speed, Broken Arrow), an epidemic virus (Outbreak), computer hacking (Speed 2: Cruise Control), war (Saving Private Ryan), corruption (Enemy of the State) and serial killing (Bone Collector), to give a few examples. It should also be noted that the foreign films Chinese see in movie theaters are only a small percentage of the overall number of films they see - the Motion Picture Association of America complains that China has a piracy rate of 95%, and that member companies lose large amounts of money as a result. 73 One final point to note is that China does not have a movie rating system of its own. However, it is expected to adopt one, an action that could expand the range of permissible content by clearly designating target markets while at the same time proving commercially beneficial. 74

72 "Regulation for the Administration of Films," Promulgated on December 25, 2001 by the State Council, Contained in China’s Media & Entertainment Law (TransAsia Publishing Ltd., 2003), 183.

Source: Motion Picture Association

These are a few examples of how Chinese media content, and choices to consumers, are being expanded. Many other examples could be given - new foreign satellite channels (still officially restricted in who can receive them), racy call-in radio talk shows, spiced-up weekend editions of newspapers, and colorful magazines put out by private entrepreneurs. The changes are happening in nearly all sub-sectors of the Chinese media. \(^{75}\)

Important to underscore here is that changes are occurring because of changes in explanatory variables. Operating in the dual product market, media organizations now have to be responsive to consumer demand and advertisers’ interests, something that was not the case during the era of government and party subsidies. In the area of consumer preferences, to give one further example, we see cinema operators heavy loading foreign films during peak hours because these are most popular, accounting for 60-70% of total box office revenues even

---

\(^{75}\) One of the few areas where regulations are being tightened is the Internet. Access to some websites has been blocked, online chatrooms have come under more control and Internet bars have faced greater restrictions. Still, the number of Internet users in China is steadily growing (it had reached 87 million by June 30, 2004, according to China Internet Network Information Center), and people are gaining access to new ideas and information via this medium. Other areas also fall prey to periodic government crackdowns, slowing, but not stopping, the general liberalization of the media industry.
though they make up only one-third of the films released in China each year. The quest for advertising revenue is also a strong motivator, pushing, as we have seen, organizations like CCTV to place highly-rated programs in prime time slots, when advertising rates are highest. The inflow of private money, which in an earlier era did not exist in the Chinese media industry, or at least not in a big way, is also causing change, resulting in the publication of semi-legal tabloid newspapers, the sale of banned satellite dishes and the production of pornographic materials, to name a few changes. Changes in market structure are also having an impact, leading to an increase in the sheer volume of information and media entertainment goods as more newspapers, magazines, and other media organizations are set up. Barriers to entry now sometimes have more to do with capital and technical requirements than with actual government regulations. The liberalization of government regulations has made possible the entry of new players onto the Chinese media scene, both media companies from abroad and entrepreneurs at home. The basket of media products today is not only bigger than during the pre-reform period, it also contains new symbolic forms, everything from foreign films to live news reports.

**Implications for Democracy**

One final issue to consider is the impact that marketization will have on China’s prospects for democracy. Will commercialization help democracy, harm it or not make much difference? It may be that how a country evolves politically is not just dependent on the presence or absence of market forces, but also a variety

---

76 Ibid., 68.
77 Pei, *From Reform to Revolution*, 160, 162, 171.
of context-specific factors, such as culture, history and so on. In that case, an adequate theory would have to integrate cross-culturally valid principles of economics with factors that are specific to a country.

One problem in discussing these issues in regard to China is that there is a short supply of data on Chinese democratization, even though a huge amount has been written on this topic. Unless there is some way of measuring democratization, it is hard to say whether a country is making progress in this area. One organization that does do something like democracy assessments, though it doesn’t label them as such, is Freedom House. Freedom House publishes an annual survey of political rights and civil liberties in countries around the world. One is hesitant to use such data, however, as it is sometimes said to inadequately account for changes that have occurred in a country. In the case of China, for example, the country has received the lowest score of “7” for political rights since the November 1988-December 1989 period, when a downgrade occurred, and scored only slightly better for civil liberties with a score of “6” since 1998.  

(In the Freedom House Survey, “1” represents the most amount of political rights and civil liberties and “7” the least.)

Another problem is that there is no agreement about what impact commercial incentives for media producers, or corporations in general, have on democratic politics. Some scholars argue that usage of markets, or introduction of market reforms, contributes to the development of a civil society, produces legal institutions, fosters democratic learning and helps people more easily articulate

---

their political interests. Others, however, see market mechanisms as bad for democracy, even incompatible with it. These people argue that markets result in negative externalities, failing to supply, or underdelivering, information needed for making informed political choices, instead providing tawdry entertainment or sensationalist reporting needed for building audiences. A typical statement is this:

Today…friends of ‘liberty of the press’ must recognize that communications markets restrict freedom of communication by generating barriers to entry, monopoly and restrictions upon choice, and by shifting the prevailing definition of information from that of a public good to that of a private appropriable commodity. In short, it must be concluded that there is a structural contradiction between freedom of communication and unlimited freedom of the market, and that the market liberal ideology of freedom of individual choice in the marketplace of opinions is in fact a justification of the privileging of corporate speech and of giving more choice to investors than to citizens.

In some cases, the problem is not seen as the market as such, but rather the fact that competitive markets often don’t exist. It follows that the task is to “create ‘real economists’ markets, not just to endure business markets with monopolies and oligopolies.”

Still another argument is that the problem lies with citizens themselves, who fail to demand the information they need for making informed political choices. According to one version of this argument:

People remain rationally ignorant about the details of public policy because they have a low probability of influencing the course of events. Reporters and editors do not invest in

---

learning about public affairs since the labor market provides little reward for these skills. News about government will be underprovided and underconsumed as these trends are noted and bemoaned.  

In effect, what this means is that ultimately consumers are gatekeepers of the news. Whether a news product is offered or not will depend, in large measure, on whether it is demanded.

Which of these theories is correct can be debated, but it seems that all of them contain some element of truth - and this is relevant to China. It does seem that the introduction of markets will help people learn about democracy by giving them the opportunity to make choices, if only in the economic sphere. It also seems true that media organizations will have to be sensitive to the interests of business organizations on whom they rely for advertising revenue (Zhao goes so far as to say that they have already “turned themselves into mouthpieces and instruments of domestic and international businesses”  

Finally, it seems true that media providers will have to take their cues partly from consumers in the new commercialized environment. If their products are not demanded, they will lose revenues directly from consumers and also from advertisers, who either pull their ads or demand lower rates.

As important as marketization is, other factors may also bear on China’s prospects for democracy. These include past and present institutional arrangements throughout the society, cultural factors and other things specific to China, such as the country’s recent membership in the World Trade Organization. In China’s case, the role of the government is also extremely important as a shaper of media

---

84 Hamilton, *All the News That’s Fit to Sell*, 2.
outcomes, as is true in other countries. What should be stressed, then, is that marketization will not automatically lead to democracy. To predict political outcomes, it is necessary to see how economic factors combine with those which are not economic, and to understand how marketization is mediated by factors specific to an environment.

Conclusion

The major finding of this paper is that the emergence of a new media economics in China is having an impact on the basket of media products supplied in the country. This basket is reflective of consumer demand and advertising interests, and is influenced by an increase in the amount of private capital in the industry, more opportunities for entrepreneurial activity and the creation of media legislation, which increases predictability and helps attract foreign investment. The Chinese government still plays an important role in influencing media content, but gone are the days of highly intrusive micro-management. Now, media providers are economically self-sufficient, responsible for their own profits and losses. This has given them more autonomy, and increased - though not severed - their independence from the state.

Future research might focus on several areas – media conglomerates, the impact of foreign companies on the Chinese market, the growth of business news and the ways in which media change might lead to democratization. There has been little research on media conglomerates, perhaps not surprising given the fact that most of these groups have only been established within the last few years. It would be productive to study in more detail their organizational structure, and to
try to discern more clearly both the motivations of the Chinese government for orchestrating their formation and what impact they may have on media industry competition. The role of foreign companies in the Chinese market is also in need of more systematic study. In teaming up with Chinese companies in co-production deals and in investing resources in the establishment of joint ventures, it would appear that they are having a significant impact on the evolution of China’s media industry. A third area to look at is the growth of business news. Business news is a major sub-sector of the news industry, and is an area where foreign companies have been conspicuous in their presence. Worth examining are the kinds of deals that have been struck, and why this is an area where foreign companies have arguably been especially welcome. A last topic to consider is democratization. Of importance here is the role that marketization may have on political change in China - and elsewhere. Ideally, one wants a theory of media change that applies to all countries. What is needed in this regard is detailed study of how marketization is playing out in countries making the transition from communism (if, in fact, marketization is what is happening), and the impact that this is having on political evolution. This is a task that requires a coordinated effort of researchers from around the world. 86 I hope to have shed a little light on how the process is happening in China.

Framing the Candidates: How President Bush and Senator Kerry Were Portrayed During Campaign 2004

Presented to the Hawaii International Conference on Social Sciences
Framing the Candidates: How President Bush and Senator Kerry Were Portrayed During Campaign 2004

ABSTRACT

Because many Americans form their impressions of candidates from political advertising, it’s important to understand how candidates present themselves and their opponents in TV ads. A qualitative frame analysis was conducted on 118 ads from the 2004 George W. Bush and John F. Kerry campaigns to examine what frames, or dominant themes, were used to establish a portrait of the presidential contenders. Findings indicate that Bush’s ads portrayed the president as a consistent leader in times of change who shares common values with voters. Kerry’s ads, however, failed to provide a clear frame, opting instead to show Kerry in a variety of roles.

Presented to the Hawaii International Conference on Social Sciences
"A lot of people still don’t really know who I am," Massachusetts Senator John F. Kerry told reporters in spring 2004, just as he emerged as the Democratic nominee and began the general election campaign in earnest (Jackson, 2004). Like all presidential candidates, Kerry was obligated to establish a positive and consistent portrait of himself to voters so they would get to know him. To do this, his campaign created more than 60 TV ads during the 2004 general election. President George W. Bush created more than 50 TV ads. Both candidates spent more than $200 million during the general election to broadcast these ads (Brandweek, 2004).

Their hope with this record ad spending was to establish a clear and positive portrait of themselves as well as a negative portrait of their opponent that would stick with voters. To make sure their ads were having the right effect on voters, the campaigns used focus groups and surveys to market test the ads’ images and issues. Political consultants even enlisted some voters to undergo brain scans, called functional magnetic resonance imaging (or fMRI), while they watched political ads to test the ads’ effectiveness on both a conscious and unconscious level (Elias, 2004).

Political candidates go to great lengths to create, test, and broadcast their ads because research shows that many voters use TV ads to form their impression of political candidates (Kahn & Greer, 1994; Kaid, 1997). Furthermore, that impression is often changeable up to election day. Exit polls from the 2004 presidential race indicate that more than 20 percent of those who cast a ballot for president had not made their choice...
until the last month of the campaign (Edison/Mitofsky, 2004). Almost 10 percent of those from the exit poll decided whom to vote for in the final three days of the race.

Because so many Americans form their impressions of candidates from TV ads, it’s important to understand what impressions are being created in those ads. In other words, what images and issues do candidates use to establish a self-portrait? How clear and consistent are they in the images and issues they choose? How are those images and issues framed to portray themselves -- and their opponent -- to voters? How does that portrayal speak to the voting demographic being targeted? The present study, which includes a qualitative frame analysis of more than 100 TV ads from Bush and Kerry, provides answers to these questions.

LITERATURE REVIEW

Communications research has found that campaign ads are useful to study because the spots can substantially affect the candidate’s image in the viewer’s mind (Cundy, 1986, 1990; Kahn & Greer, 1994; Kaid, 1997; Scammell, 1990). Political commercials can produce high voting intent as well as positive attitudes toward the candidates, their abilities, and their characters (Thorson, Christ, & Caywood, 1991).

Consistency in a candidate’s image and views is also important to maintain in ads and other forms of communication. Presidential candidates who create and retain a consistent image of themselves -- and their opponent -- fare better than those candidates who produce multiple images (Devlin, 1994). Presidential incumbents also find success by maintaining a consistent portrait of themselves and their policies. Sloan (1996) argues that much of President Reagan’s reputation as “the great communicator” can be directly
attributed to the consistency and clear choices found in his speeches: “In analyzing Reagan’s speeches through the years, one is struck by how little they change over time…. He uses simple sentences and stark binary choices (slavery or freedom) to convey his message” (p. 796).

Political science literature also contends that there is consistency in the public’s “climate of expectations” for what constitutes a legitimate president or presidential candidate (Barber, 1977; Herzik & Dodson, 1982). Those expectations revolve around traits of personality, leadership, and individual virtue. Candidates can enhance their professional or personal qualifications by using means of persuasion such as logos, ethos, and pathos. First described by Aristotle, logos appeals are designed to win over an audience with logical, or issue-based, appeals. Ethos appeals, which are more image-based, show the positive character traits of a candidate, and pathos appeals play upon the emotions of the audience (Johnson-Cartee & Copeland, 1997). However, these means of persuasion are not completely separate. Political advertising is often most effective when an ad’s message combines logical information with emotion appeal (Richardson, 2002).

The need for a president or a presidential candidate to appeal to voters by playing up their personal character also derives from the current political climate. During the last 30 years, presidents have had to appeal to an electorate that is less politically partisan (Oppenheimer, 1996; Cook, 1994) and less likely to vote, (Droppelt & Shearer, 1999) while at the same time deal with a Congress that is increasingly more ideologically divided (Oldfield & Wildavsky, 1989). One way that candidates appeal for the votes of a less partisan electorate is to show in their TV ads that they personally mirror the society they wish to represent.
Much research has been done on campaign advertising to understand whether political spots mostly convey pleasing images of the candidate to viewers or whether the ads inform voters of the issues. Garramone (1986) looked at how political ads can create a favorable candidate image with voters. She classified political ads as either “issue” or “image” ads. Issue ads have certain distinct characteristics: They spend more time outlining the candidate’s policy stands, show the candidate speaking directly to voters in a “talking head ad,” use simpler production techniques and use language that is more specific. Image ads, on the other hand: spend more time playing up the candidate’s personal qualities, show the candidate in action with family or supporters, use more complex production techniques, and use language that is more general, which allows for more inferences to be made by the viewer. Other researchers looking at image and issue ads have used similar definitions (Thorson, Christ, & Caywood, 1991; Kaid, Chanlor & Hovind, 1992).

More recently, political communication scholars have stopped looking at image and issue appeals as merely separate groups. Richardson (2002) notes that political ads are often a combination of image and issue information. Furthermore, Richardson argues that political ads work best when they combine the logical appeals found in issue information with the emotional appeals often found in image information. Therefore, what researchers should examine are the ways in which image and issue appeals connect in advertising to create a consistent and compelling portrait of a candidate.

Frame analysis is one technique that researchers have used to understand how images and issues can unite around a central theme or storyline (Parmelee, 2002). That central storyline, with all its visual and verbal elements and image and issue appeals, has
the power to paint a portrait in the minds of voters of who the candidate is and who their opponent is. Furthermore, that portrait tends to be most powerful when it is clear, consistent, and speaks to the voting demographic being targeted.

UNDERSTANDING FRAMING

Framing theory and frame analysis can aid in discovering how the visual and verbal elements contained in political advertising can validate or invalidate a presidential candidate. Researchers have defined framing as a “schemata of interpretation” (Goffman, 1974) or a process through which information is organized around a central “story line that provides meaning to an unfolding strip of events” (Gamson & Modigliani, 1987). This story line, which includes visual and verbal elements, is constructed by “symbol handlers,” such as journalists or advertisers (Gitlin, 1980). Seen from this perspective, framing in political advertising allows campaigns to organize their issue, image, visual, and verbal elements around a central theme, or frame, thereby providing an efficient package for voters to interpret.

Frames also can be seen as independent variables that can “influence the audience’s perception of certain issues” (Scheufele, 1999, p. 108). Furthermore, experimental research shows that the process of framing entails increasing awareness of certain issues while directing attention away from other issues (Kahneman & Tversky, 1984). In other words, the power of framing comes from what symbol handlers choose to included and excluded. Entman (1993) notes:

Framing essentially involves selection and salience. To frame is to select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal
interpretation, moral evaluation, and/or treatment recommendation for the item described. (p. 52)

Frames have four locations in the communication process (Entman, 1993). The first location is the communicator, who consciously or unconsciously constructs frames. The second location, the text, contains frames that are “manifested by the presence or absence of certain keywords, stock phrases, stereotyped images, sources of information, and sentences that provide thematically reinforcing clusters of facts or judgments” (p. 52). Receivers, the third location, then process these frames and mix them with their own personal frames, which are part of the “commonly invoked frames” of the larger culture, which is the fourth location.

The personal frames referred to in Entman’s fourth location also can be thought of as schemas, or “mental maps” that serve as general guidelines for how people understand and interpret information they receive from journalists or advertisers (Graber, 1984; Patterson, 1993). In other words, the frames created in political ads have to compete with an individual’s schemas. Receivers of frames will place the most salience on information in political ads that matches their existing schemata -- or personal frame -- regarding what they expect to see and hear from politicians in a presidential campaign.

Framing research in political communication has been used mostly to understand what story lines journalists use in presenting news on political issues and activists (Gitlin, 1980; Pan & Kosicki, 1993). However, framing scholarship also includes studies on how advertisers frame their products (Parmelee, 2002). Morreale (1991) used a textual frame analysis as her method to explore the verbal and visual techniques used in Ronald Reagan’s 1984 general election campaign film, “A New Beginning.” She argued that “the Republicans used framing to create a ‘reality’” through the use of ideological, mythic and
rebirth frames in the film (p. 96). She also noted the utility of framing theory with regard to exploring political advertising (p. 6, 97).

METHODOLOGY

Frame analysis allows for a comprehensive, thick description of political advertising to get at the deeper level of meaning of how campaigns package candidates. Based on the information from the literature review and theory sections, the following research questions emerged:

(1) How did the Bush campaign frame the president’s candidacy for a second term in office?
(2) How did the Bush campaign frame their opponent, Senator Kerry?
(3) How did the Kerry campaign frame the senator’s candidacy for office?
(4) How did the Kerry campaign frame their opponent, President Bush?
(5) In what ways were those frames clear, consistent, and speak to the voting demographic being reached out to?

To conduct the frame analysis for the present study, a researcher trained in qualitative methods and frame analysis individually viewed 118 campaign ads from the 2004 Bush and Kerry campaigns. The ads were obtained from the official campaign Web sites of the two candidates. The guiding question was: “What frames were utilized in the ads?” The researcher watched each ad several times, using Entman’s (1993) framing definition as the basis for analysis. The researcher looked for what Entman called “keywords, stock phrases, stereotyped images, sources of information, and sentences that provide thematically reinforcing clusters of facts or judgments” (p. 52). Close attention
also was paid to how the videos chose to “promote a particular problem definition, causal interpretation, moral evaluation, and/or treatment recommendation for the item described” (p.52). Notes were taken by the researcher, who cited the keywords, images, and moral evaluations that were found in the ads. An examination of those keywords and images revealed emergent themes that arose from the data. In addition, exit polling data from Edison Media Research and Mitofsky International, which includes more than 13,000 sampled voters from election day of the 2004 presidential election, was consulted to understand how the issues and images found in the candidates’ frames spoke to voters.

**FINDINGS**

Frame analysis of the 118 ads revealed the following dominant themes for each candidate:

- **George W. Bush** framed himself as a consistent leader who has good, common values. He framed Kerry as inconsistent, weak on terrorism, and more economically liberal than most Americans.

- **John Kerry** framed himself as a man who wants to bring about change at home and abroad, as a fighter who can lead American, and as a man who is different from the caricature presented in Bush’s attack ads. He framed Bush as misguided and stubborn regarding the war in Iraq and a servant of the rich and powerful in domestic affairs.

However, the Bush ads provided a more clear and consistent portrait of Bush and his opponent than did Kerry’s ads. Kerry’s appeals were less consistent and more vague with regard to how he presented himself to voters. Especially in foreign affairs, he failed to spell out how he would bring about change. However, Kerry was quite consistent in his portrayal of Bush and his policies. The frames Bush and Kerry used to present themselves and each other to voters are provided below.
George W. Bush: He’s a consistent leader who has strong values.

The Bush campaign’s 54 TV ads seamlessly combine image and issue information around the theme of how Bush is a man of consistency and values in times of change. The Bush ad “Changing World” is one of many that highlights these themes visually and verbally:

ANNOUNCER: “The world is changing. Sometimes in ways that astound. And others that terrify. We depend more than ever on our values: family, faith, the freedom we celebrate. In today’s changing world the answers aren’t easy. We need a sense of purpose, a vision for the future, the conviction to do what’s right.”

TEXT: President Bush
Moving America Forward

GEORGE BUSH: “I’m George W. Bush and I approve this message. Together, we’re moving America forward.”

Visually, the ad illustrates just how much the world has changed during Bush’s first term: There is video of Afghan leader Hamid Karzai, then fighting in Iraq, then an image of firefighters gathered inside a U.S. firehouse. Showing firefighters in a firehouse “primes” viewers to remember the heroism displayed by the New York City Fire Department on Sept. 11, 2001. Priming, a technique in which preexisting memories are activated through visual or verbal stimulation, is often used in political advertising because it allows a campaign to access a viewer’s memories and transfer those pleasant or unpleasant feelings to a candidate (Richardson, 2002). In this case, the ad also primes voters to remember how resolute, and popular, Bush was in the days after the Sept. 11 attacks.

Showing firefighters immediately after Iraq war footage also serves a purpose: The effect subliminally connects U.S. involvement in Iraq to the events of Sept. 11. Making that connect was vital for Bush’s election victory. Exit polling found that 80
percent of those who believed the war in Iraq was connected to the war on terror voted for Bush, while almost 90 percent of those who felt Iraq was not part of the war on terror voted for Kerry (Edison/Mitofsky, 2004). In fact, Bush’s ads used terms such as “war on terror,” not “war in Iraq,” even when Iraq was clearly the subject of the ad. In Bush’s ad titled “Victory,” the flags of Iraq and Afghanistan are shown while an announcer notes: “And this Olympics there will be two more free nations -- and two fewer terrorist regimes.”

Bush’s consistency, or “conviction to do what’s right,” fits as an appropriate counterpoint to the images of change shown in the ad. Bush is depicted as a reassuring constant in a time of change. In fact, the tagline for several of Bush’s early ads was: “Steady leadership in times of change.” On domestic policy, Bush’s consistency is emphasized in a series of ads, including “Healthcare Agenda” and “Economic Agenda.” These ads share similar language, a narrator saying that “President Bush and our leaders in Congress have a plan,” while both ads show a flow chart that lists policy proposals such as tax-free health savings accounts and tort reform. In the ad “First Choice,” Sen. John McCain speaks of Bush’s foreign policy constancy when he says that Bush has “great moral clarity and firm resolve. He has not wavered, he has not flinched from the hard choices …” As footage of Bush is shown in “Changing World,” the announcer notes how the country needs a leader with “a sense of purpose, a vision for the future.”

To those swing voters who might disagree with Bush’s “vision for the future,” the ad cleverly uses another political advertising technique, inoculation, when the announcer says: “In today’s changing world the answers aren’t easy.” Political inoculation, just like a medical inoculation, immunizes people through exposure to a small dose of the harmful
agent (Johnson-Cartee & Copeland, 1997). The toxic substance in this case, fears by
many voters that Bush’s consistent vision might be misguided, is administered to viewers
when the announcer admits that “the answers aren’t easy,” hinting that some mistakes
might be inevitable. The effect of this political inoculation is to give wavering voters a
resistance to their nagging concerns about Bush’s handling of Iraq and other issues.
Voters are left to say to themselves, “Sure, Bush has made some mistakes -- but in times
of change the answers aren’t easy. At least he has a consistent vision for the future.”

The strong family values theme in the ad “Changing World” aims to make a
connection between the president and voters through the use of character appeals and
emotional appeals. These two means of persuasion are designed to win over the audience
by showing the positive character traits of a candidate and playing upon the emotions of
the audience (Johnson-Cartee & Copeland, 1997). The Bush ad employs these techniques
as the announcer says, “We depend more than ever on our values -- family, faith, the
freedom we celebrate.” Bush is then shown smiling with children and hugging his wife,
Laura, at their Texas ranch. Other footage in the ad includes a father showing his young
daughter how to use a Hoola Hoop. In Bush ads such as “Changing World,” the candidate
is displaying through his political advertising that he understands, and even mirrors, the
country and the culture he wishes to represent. In an era of weakened party loyalty, the
Bush campaign relied heavily on character and emotional appeals to sway voters who
might not agree with most of Bush’s issue positions.

However, the family images displayed in Bush’s ads also make subtle logical,
issue-based appeals. The tactic of talking about “our values” taps into the feelings of
many people that “family values” are eroding and needed to be preserved. The phrase
“our values” serves as an umbrella term to include such issues as abortion and gay marriage. In fact, exit polling from the presidential election found that voters listed “moral values” as being the “issue that mattered most” in deciding how they voted for president. Eighty percent of those people voted for Bush (Edison/Mitofsky, 2004).

**Bush on John Kerry: He’s weak on terrorism and too liberal**

A majority of Bush’s 54 TV ads attacked his opponent by name. Those attacks were remarkably consistent over the course of the general election campaign. The Bush ad “Wolves” is indicative of how Kerry was portrayed as too weak to be president during a time of war:

NARRATOR: In an increasingly dangerous world, even after the first terrorist attack on America, John Kerry and the liberals in Congress voted to slash America’s intelligence operations by $6 billion.

NARRATOR: Cuts so deep they would have weakened America’s defenses. And weakness attracts those who are waiting to do America harm.

GEORGE BUSH (narrating): I’m George W. Bush and I approved this message.

The visual imagery in the ad provides an analogy designed to create a sense of fear on a basic human level. The ad opens with footage of a heavily wooded area. The camera then jerks back and forth as the viewer briefly catches a glimpse of a lone wolf stalking between the trees. In the last scene, a pack of wolves runs toward the camera. The feeling of primal fear conjured up visually in the ad is complimented verbally when the announcer says Kerry has tried to “slash” America’s defenses even though we live in “an increasingly dangerous world.” The ad is meant to make Americans afraid of voting for a man who could be too weak to defend the country from terrorists, depicted in the ad as aggressive wolves.
This type of negative ad, often called a “fear appeal,” works because research shows that humans are more strongly motivated to avoid costs than to approach gains (Johnson-Cartee & Copeland, 1997). Creating a sense of fear of a presidential challenger is especially potent in a time of military conflict, when the stakes are so high if the wrong choice is made. Many Bush ads repeated and reinforced this fear appeal. In the ad “Risk,” the narrator asks, “John Kerry and his liberal allies -- are they a risk we can afford to take today?” In the ad “Global Test,” the narrator claims that “America will be forced to wait while threats gather” if Kerry becomes president. The tagline of the ad “Weapons” puts the fear appeal simply: “John Kerry’s record on national security: troubling.”

The ad “Wolves,” like most of Bush’s other attack ads, provides attribution to the claims being made. The effect is to make the assertions appear credible. When the narrator notes that Kerry “voted to slash America’s intelligence operations by $6 billion,” text in the middle of the screen reads: “Kerry and liberals in Congress: intelligence cuts $6 billion, CQ Vote #39, ’94.” The term “CQ Vote #39” refers to the magazine Congressional Quarterly, which publishes the results of all Congressional floor votes in the order in which they occur. Citing a nonpartisan media source such as CQ makes Bush’s partisan claims more believable. In fact, Bush’s Web site included a link to a page called “ad facts” that provided citations from newspapers and other sources to back up the campaign’s many claims.

While most of Bush’s ads rely on fear to communicate the message that Kerry is weak, other ads use humor. Another form of weakness is indecisiveness, or “flip-flopping,” and Bush ads such as “Windsurfing” use music and video cutting techniques to humorously ridicule Kerry. In “Windsurfing,” music from Johann Strauss’ “The Blue
Danube” plays over images of Kerry switching directing again and again as he windsurfs. This visually image of flipping back and forth is verbally reinforced when the narrator accuses Kerry of indecisively voting both for and against the Iraq War and “voting for the $87 billion to support our troops before he voted against it.” One reason a campaign uses humor in an attack ad is to minimize the possibility that the ad’s negativity will create a “backlash” effect on the sponsoring candidate (Richardson, 2002; Johnson-Cartee & Copeland, 1997).

The theme that Kerry is “too liberal” appears mostly in ads that attack Kerry’s economic record and proposals. The ad “Thinking Mom” is representative of how the Bush campaign portrayed Kerry as out of touch with mainstream America. The ad shows a woman in her minivan driving her two kids and listening to the car radio:

MOM: 5:30, I need to get groceries ... I'm gonna be late.

RADIO: John Kerry and the liberals in Congress have voted to raise gas taxes 10 times.

MOM: Ten times? Gas prices are high enough already.

RADIO: They voted to raise taxes on senior Social Security benefits and raise taxes on middle-class parents 18 times. No relief there from the marriage penalty.

MOM: More taxes because I’m married? What were they thinking?

RADIO: Three hundred and fifty times -- higher taxes from the liberals in Congress and John Kerry.

Many of Bush’s ads play up the issue of taxes to argue that Kerry is an unacceptable choice because he is out of the mainstream on economic policy. The charge that Kerry is too liberal can be found in many other ads, such as “Doublespeak” and “Wacky.” In “Doublespeak,” which accuses Kerry of being weak and a flip-flopper, the announcer adds, “The non-partisan National Journal magazine ranks Kerry the most
liberal member of the Senate -- more liberal than Hillary Clinton or Ted Kennedy.” The tagline for the ad “Wacky,” which claims Kerry wants to raise gas taxes, reads: “Maybe John Kerry just doesn’t understand what his ideas mean to the rest of us.”

**John Kerry: He’s a man of change, he’s a fighter, and he’s not who Bush says he is**

While Bush’s ads offered a simple and consistent image of both candidates throughout the campaign, the Kerry campaign’s 64 ads failed to provide a consistent frame for the presidential challenger. The themes in Kerry’s ads were mostly varied and unclear. Sometimes the candidate would frame himself as a change agent, a typical frame for any political challenger. However, other ads framed Kerry as a fighter, and many ads focused solely on refuting attack ads from the Bush campaign. The ad “Risk,” which shows Kerry speaking in his office, is typical of how vague Kerry’s framing was:

JOHN KERRY: Let me tell you exactly what I would do to change the situation in Iraq. I would immediately reach out to the international community in sharing the burden, the risk, because they also have a stake in the outcome of what is happening in Iraq. The American taxpayer is paying now almost 200 billion dollars and who knows how many more billons. And we’re paying the highest price in the loss of the lives of our young soldiers -- almost alone.

JOHN KERRY (narrating): I’m John Kerry and I approve of this message.

Not surprisingly, Kerry adopted the “change” frame, which has been used by both Democratic and Republican challengers in campaign advertising (Parmelee, 2003). This frame makes sense for challengers because voters must be ready for a change in order to remove an incumbent. However, in “Risk” as in many other Kerry ads, it is unclear how exactly the presidential challenger would be a change from the incumbent. Kerry talks of “reaching out to the international community,” but he never spells out visually or verbally how he would do that or how his outreach would be different from Bush’s attempts.
Kerry’s domestic policy ads also provide a somewhat fuzzy “change” frame, as can be seen in the ad “Ten Million New Jobs”:

NARRATOR: While jobs are leaving our country in record numbers, George Bush says sending jobs overseas makes sense for America. His top economic advisors say moving American jobs to low-cost countries is a plus for the U.S. John Kerry’s proposed a different economic plan that encourages companies to keep jobs here. It’s part of a detailed economic agenda to create 10 million jobs. John Kerry, a new direction for America.

JOHN KERRY (narrating): I’m John Kerry, and I approve of this message.

Once again, the ad frames Kerry as a change agent, a man with “a different economic plan.” However, while the narrator in the ad claims that Kerry has “a detailed economic agenda,” no details are provided to prove how he might create 10 million new jobs. While political advertising research indicates that relatively few ads address issues with real specificity, most ads do at least make some reference to policy positions (Joslyn, 1986). For example, Bush’s ad “Healthcare Agenda” proposed to “allow small businesses to band together to get insurance rates big companies get.” The Bush ad “War on Terror Agenda” promises the president would “renew the Patriot Act” and “create a national counter terrorism center.” Rarely were such details offered in Kerry’s ads.

Many Kerry ads focus on his Vietnam service, and in doing so frame him as a fighter. In the ad “Strength,” he links his military experience to his qualifications for the presidency by saying, “I defended this country as a young man and I will defend it as President.” In the ad “Defend America,” Kerry expands the fighter frame to include domestic policy when he promises to “fight to build a stronger middle class.” However, once again Kerry’s framing remains unfocused due to a lack of specifics for how exactly Kerry would fight for national security or the middle class.
One reason why Kerry’s ad failed to provide a consistent image was because the campaign was constantly forced to answer charges and refute frames served up in attack ads from Bush and independent political groups. The Kerry ad “Rassman” exemplifies the campaign’s defensive position:

NARRATOR: The people attacking John Kerry’s war record are funded by Bush’s big money supporters. Listen to someone who was there, the man whose life John Kerry saved.

LT. JIM RASSMAN: It blew me off the boat. All these Viet Cong were shooting at me. I expected I’d be shot. When he pulled me out of the river, he risked his life to save mine.

NARRATOR: The Navy documented John Kerry’s heroism, and awarded him the Bronze Star. Today, he still has shrapnel in his leg from his wounds in Vietnam.

The “Rassman” ad, which refers to and shows footage of Kerry as a heroic fighter, is meant to defend Kerry against attacks from groups such as Swiftboat Veterans for Truth, which ran ads depicting Kerry as dishonest and unpatriotic. While this ad clearly provides the “fighter” frame to counter the message in the attack ad, many of Kerry’s ads would simply refute attacks without offering a simple and consistent counter frame. This omission limited Kerry’s ability to provide a contrasting narrative of himself and his policies. By way of comparison, none of Bush’s ads specifically addressed attack ads from Kerry or independent political groups.

**Kerry on George W. Bush: He’s misguided in Iraq and a servant of the rich**

The specificity that is lacking in Kerry’s positive ads can be found in Kerry’s negative ads. Bush is framed as a misguided leader who stubbornly refuses to see the error of his strategy in Iraq, and a man who care more about the rich and powerful than
for average Americans. The ad “Obligation” is one of many that provides a detailed critique of Bush’s handling of Iraq:

JOHN KERRY: The obligation of a Commander in Chief is to keep our country safe. In Iraq, George Bush has overextended our troops and now failed to secure 380 tons of deadly explosives. The kind used for attacks in Iraq, and for terrorist bombings. His Iraq misjudgments put our soldiers at risk, and make our country less secure. And all he offers is more of the same. As President, I’ll bring a fresh start to protect our troops and our nation.

JOHN KERRY: I’m John Kerry and I approved this message.

While Bush’s ads seldom talked about Iraq by name, preferring to speak more broadly about “the war on terror,” Kerry’s attack ads constantly singled out Iraq for criticism. In the ad “Obligation,” Kerry is quite specific in just how poorly Bush is handling Iraq, mentioning that “380 tons of deadly explosives” were allowed to go missing because of “misjudgments” by the commander in chief. The theme of Bush’s incompetence can be found in many ads. In the ad “He’s Lost, He’s Desperate,” a narrator argues that Bush “rushed us into war” at a cost of “$200 billion.” In the ad “Juvenile,” a narrator says Bush has lead America into a “quagmire” in Iraq that has left “1,000 U.S. casualties” and “two Americans beheaded just this week.” Focusing attack ads on Iraq made sense for Kerry because exit polling on election day found that Kerry won 73 percent of voters who felt that Iraq was the most important issue in the race. In contrast, less than 15 percent of those who felt terrorism was the most important issue voted for Kerry (Edison/Mitofsky, 2004).

Kerry’s domestic policy attacks on Bush were quite specific in portraying the president as far more concerned about the big corporate interests than the middle class or the poor. The ad “Not True” is one of many that uses detailed figures to frame Bush as a servant of the rich and powerful:
JOHN KERRY: I’m John Kerry and I approved this message

NARRATOR: George Bush’s healthcare attack against John Kerry: Not true.
TEXT: “Not true” Source: ABC News 9/13/04

NARRATOR: The Kerry plan gives doctors and patients the power to make medical decisions, not insurance company bureaucrats.
TEXT: The Kerry Healthcare Plan; Doctors Make Medical Decisions

NARRATOR: The Bush record. A $139 billion giveaway to the drug companies.
TEXT: $139 Billion Giveaway to Big Drug Companies; Source: AdvancePCS 8/25/03

NARRATOR: A record 17 percent increase in Medicare premiums.
TEXT: 17% Increase in Medicare Premiums; Source: Washington Post 9/3/04

NARRATOR: Five million more Americans without health insurance.
TEXT: 5 Million More Americans Without Insurance; Source: US Census Bureau 2001-2004

TEXT: George W. Bush: wrong on healthcare, wrong for America

The lines “$139 billion giveaway to big drug companies” and “five million more Americans without health insurance” suggest Bush is content to let the rich get richer while the poor get poorer. Other ads consistently continued this theme. In the ad “The Truth on Taxes,” Kerry notes, “After nearly four years under George Bush, the middle class is paying the bigger share of the America’s tax burden and the wealthiest are paying less. It’s wrong.” The ad “Hoover” says the Bush Administration gave “handouts to Halliburton and Enron” while “losing 2.7 million manufacturing jobs.” The ad “Powerful” chides Bush for giving tax breaks to CEOs who have shipped jobs overseas. Framing Bush as the candidate of the upper class made sense strategically because most voters saw themselves as middle class. More than 80 percent of those who voted had a total family income of less than $100,000, and Kerry won 55 percent of voters who had a family income of less than $50,000 (Edison/Mitofsky, 2004).
CONCLUSION

Frames tend to be most powerful when they are clear, consistent, and speak to the voting demographic being targeted. By those standards, Bush’s ads provided a more compelling portrait of himself and a more damning portrait of his opponent than did Kerry’s ads. Bush framed himself as a consistent leader in times of change who has solid moral values. He framed Kerry as weak on foreign policy and more economically liberal than most Americans. These unambiguous frames constantly combined issue and image appeals as well as visual and verbal elements. Bush’s steadfast vision in domestic policy as well as the “war on terror” was shown as an issue appeal when his ads discussed administration plans for tax-free health savings accounts, renewing the Patriot Act, and creating a national counter terrorism center. That same resolve was also image based when Bush was shown, as he was in the ad “Whatever it Takes,” speaking with emotion while telling a crowd how ordering troops into battle is “the hardest decision, even when it is right.” The many image and issue elements combined in Bush’s frames also connected with voters who ultimately sided with the president when it came to the values debate and the link between Iraq and terrorism.

Focusing on family values also gave Bush the opportunity to make both an emotional as well as a subtle issue-based appeal. Being shown with smiling children and hugging his wife back at their Texas ranch allowed the incumbent president to look like an ordinary husband and father who personally mirrors the country and the culture he wishes to represent. From an issue perspective, using a code word such as “values” has the power to “prime” voters to invoke their own personal policy preferences on “moral” issues they care about. Using such code words is nothing new. As Graber (1987) notes:
Words are like Pavlovian cues -- just as animals can be taught to associate the sound of a bell with food -- so people are continually condition to associate verbal cues with past direct and vicarious experiences. Verbal conditioning can be done most effectively through what political linguists call condensation symbols. These are more popularly called code words. Examples are: “the American way,” “racism,” “special interests,” “rainbow coalition,” and yes, “where’s the beef?” (p. 185)

John Kerry, who early in the campaign said, “A lot of people still don’t really know who I am,” failed to define himself with a clear and consistent frame. He attempted to frame himself as a man who wants to bring about change at home and abroad, as an impassioned fighter who can lead America in a time of war, and as a man who is quite different than the caricature presented in Bush’s attack ads. He framed Bush as misguided and stubborn regarding the war in Iraq and a servant of the rich and powerful in domestic affairs. Kerry’s appeals were not consistent and fairly vague with regard to how he presented himself to voters. Especially with regard to Iraq, he failed to spell out how he would bring about change. However, Kerry was quite consistent in his portrayal of Bush and his policies, presenting detailed data and attribution.

More research needs to be done concerning the power of framing in political advertising. While there is much framing scholarship, less is known about how presidential candidates frame themselves and their opponents. It would be interesting to see if Kerry was more consistent in his framing during the Democratic primary stage of the campaign or whether his message was equally unfocused. In addition, it would be helpful to understand what factors might contribute to the consistency or inconsistency of a candidate’s framing. For example, changing key campaign personnel in the middle of a race might inhibit the ability of a campaign to present a clear portrait of their candidate.

Abstract

This paper examines health inequality between two ethnic groups (Han and the minority) in China during the 90s’ using the China Health and Nutrition Survey (CHNS). On average, minorities enjoyed better health than the majority Han in the CHNS data. But socio-economic determinants of health differed between the two populations. Particularly, income is found to be more important for the minority than the majority to gain a better health. This study also evaluates the validity of using self-perceived health status to predict general health in the context of China and between the two ethnic groups. It is found that self-perceived health is meaningful and provides valid and reliable information of the more objective morbidity measures of
health.

PRO-GAD CAPOOCAN: A CASE STUDY
GAD BEST PRACTICE

By

HERNANITA L. PELIÑO
MERLIE ALUNAN

Introduction

This case study is a section of a bigger study, the “Mapping of Gender Mainstreaming Initiatives and Outcomes in the Regional and Local Development Council in Regions VI, VII and VIII”. This is a descriptive-evaluative research project that maps and analyzes the extent and quality of gender mainstreaming in the Visayas. It likewise seeks to determine the extent of GAD mainstreaming in the planning, programming, budgeting, implementation and monitoring and evaluation (PPBIM) processes of government. The project was made possible through the cooperation of the German Technical Cooperation (GTZ) and the National Economic Development Authority (NEDA). The data collection methods used were focus group discussions, key informant interviews, questionnaire, site visit and documentary analysis of records.

The framework of analysis used in the study is the Gender Mainstreaming Evaluation Framework (GMEF). This framework has two elements: the major entry points in gender mainstreaming such as, people, policy programs/projects and enabling mechanisms; and, the stages of gender mainstreaming such as, foundation formation, installation of strategic mechanism, Gender and Development (GAD) application and enhancement of commitment and institutionalization. The same framework was used in the analysis of the GAD mainstreaming initiatives in Capoocan, Leyte. Based on this, Capoocan Local Government Unit (LGU) was considered as the “GAD Best Practice” in Region VIII, Leyte (Philippines). Pro-GAD Capoocan, the GAD Program of the municipality, specifies the strategies which provided direction towards gender-responsive local governance.

PRO-GAD CAPOOCAN is a comprehensive gender program designed to respond to various international and national mandates to mainstream gender in governance. The following is an account of the GAD experience of a local government unit in its effort to address short-term needs and some of the strategic and long-range concerns of women towards gender equality. The account also reveals how the practice of GAD in Capoocan has positively affected the whole community.

Gender Situationer

Capoocan lies along the national highway just before it goes up the historic Leyte mountain ranges, site of the one of the bloodiest battles of World War II in the Philippines. It is one of the coastal towns adjoining the famous fishing grounds of Carigara Bay, approximately 60 kilometers from Tacloban City to the northeast and about 50 kilometers from Ormoc City to the west. Lying thus between two of the largest cities of Leyte, Capoocan has access to the
educational facilities available in these urban centers as well as in its nearest neighbor, the old and populous town of Carigara. This information is notable because it might explain the increasing participation of women in the political life of their respective communities, starting with the town mayor herself who is now on her third term. Four of twelve municipal councilors and 56 of the 179 barangay officials are women (2005). Out of 91 municipal employees, 46 are women. This surely shows the move towards striking a balance between the two genders. However, though there is an almost even balance of men and women in special bodies (the school board, health board, peace and order council, barangay development council) of the LGU, they still lack the drive and the skills in articulating women’s issues. Generally, there is low level of participation in decision-making.

Capoocan is a farming and fishing community and it is customary to assign economic primacy to men in these livelihood areas. Thus women’s contribution to the economy is oftentimes forgotten or unrecognized, much to the women’s disadvantage.

Like most other women in the Philippine countryside, Capoocan women are poor and have little opportunity for economic amelioration. Because of their supposed “absence” from the economic sphere, they lack self-esteem and are easily humbled or humiliated. Due to lack of economic opportunities and skill, the women migrate to other places as house helpers, others are driven to prostitution. Domestic violence is an urgent issue among them. Physical abuse ranks highest among the most frequent forms of violence, followed by wife beating. Incidence of rape is uncomfortably high, and so is economic abuse. They also suffer from sexual harassment and discrimination. The women had low awareness on women's rights and reproductive health and rights as well. They are poorly served in terms of reproductive health. They are victims of multiple burden, the common lot of women world over.

Except for the above baseline data gathered through Participatory Rural Appraisal, however, Capoocan has not started to disaggregate information on its population on gender terms. Gender disaggregation of data has been identified as a research agendum of the Gender and Development Resource Center of Capoocan. This means that all data generating offices of the LGU will be tasked to disaggregate information on gender basis in order to have a clearer picture for GAD mapping and planning.

**PRO-GAD CAPOOCAN: BEGINNINGS**

In the year 2000, a Participatory Rural Appraisal research method was jointly conducted by the Capoocan LGU and the Center for Partnership Initiatives Development, Inc. (CPID), a non-government organization. This was the time when gender issues were first articulated for development planning. To deepen the understanding of the gender issues in Capoocan, the CPID conducted a follow-up study using more specific gender tools. The results of the study were presented to the LGU officials in 2001. This became the basis for the development of a GAD program.

Preparatory activities were done for in-depth understanding of GAD. Vilma Horca and Celestial Quiroz, staff of the Municipal Planning and Development Council (MPDC), personally visited the Office of the National Commission on the Role of Filipino Women (NCRFW) to establish
linkage with the agency and to consult over GAD matters, especially for programs and projects allowable on the GAD budget. They also received a book from the Asia Foundation entitled *The GAD Budget Trail*. The two also had a chance to see *The Vagina Monologues* at the Philamlife Theater, which gave them a few thinking points to bring home.

On November 15, 2001, Mayor Porciuncula issued Executive Order No. 2001-01, Declaration of Pro-GAD Capoocan as the GAD Program of the Municipality of Capoocan, Leyte. Specifically, the bases of this program are RA 7192 (Women in Development and Nation Building Act), DBM Local Budget Memorandum #32 and DILG Memo Circular #99-146. The Program was funded by the mandated 5% GAD budget for 2002, amounting to some PhP1,256,548.00, a great leap from the PhP80,000 allocated for GAD in the previous year. The generous allotment enabled Pro-GAD Capoocan to undertake several projects for the next fiscal year. PRO-GAD CAPOOCAN was formulated in partnership with the CPID, the moving force behind it.

Pro-GAD Capoocan adopted the following strategies in its implementation:

1. Community organizing
2. Education and training
3. Reproductive Health Services
4. Women’s Special Concern – VAW
5. Advocacy and networking
6. GAD institutional development

The program began with a conference on November 19, 2001 among elected women officials of the LGU to echo a seminar of WIN (Women Involved in Nation Building) which some of them have attended. In this conference GAD Budgeting and Planning was discussed. The conference was attended by 56 women municipal and barangay officials. The women were introduced to the significance of their participation in public affairs.

This was followed by some well-directed activities preparatory for the institutionalization of Pro-GAD, the drawing up of a GAD plan for the LGU, training of personnel, consciousness raising, and needs assessment. These activities involved the community as part of the fundamental approach to governance adopted by the incumbent leader, and also in line with GAD principles. The issues and concerns on which Pro-GAD Capooca is based were a product of consultation among the 21 communities themselves. It is now being implemented by the municipality and in 21 of its barangays.

The public learned about Pro-Gad during Local Special Bodies meetings, Barangay assemblies and regular meetings of the Barangay Development Councils (BDC) and People’s Organization. Radio guestings, the publication of the Lantawan newsletter and press releases in other local papers also helped in making the program popular. Women, the primary clientele, were urged to participate through focused group discussions, informal discussions and invitations to specific activities. Gender activities were carried out at the barangay level rather than at the municipal center, thus increasing the presence of women participants from the grassroots. The
The issuance of Executive Order 2001-01 in November 15, 2001 insured the relative stability of Pro-GAD Capoocan.

The following are the salient elements of Pro-GAD Capoocan:

**MAJOR ENTRY POINTS OF GENDER MAINSTREAMING**

1. **PEOPLE**

   People are stakeholders on whose shoulders fall the tasks of gender mainstreaming. They usually assume major roles of sponsor, target, change agents and advocates.

   **Pro-GAD mayor.**

   During her first term as mayor in Capoocan, Leyte, Hon. Marietta Porciuncula attended gender-related trainings conducted by different agencies/organizations. Her sensitivity and awareness of gender issues prompted her to set up some gender-related initiatives in her government, such as the PNP women’s desk with a policewoman as desk officer, and assistance for women in difficult circumstances in the MSWD. Early in October of 2001, CPID started talks with the mayor for the development of a GAD program for the LGU. During these consultations, CPID outlined the gender-related issues and concerns identified in the Participatory Rural Appraisal (PRA): poverty, lack of livelihood opportunities, incidences of violence against women, low level of participation in decision making, and maternal mortality among others. These consultations became the seeds for Pro-GAD Capoocan.

   **CPID STAFF and MGFT**

   On October 13, CPID facilitated the formation of a Municipal GAD Focal Team (MGFT). This was composed of the municipal mayor who acted as chair, SB committee on women as vice chair, and members drawn from among the officers of the MSWD, MPDC, MHO, Budget Office, the municipal Treasury, the PNP, Agriculture, Population Outreach, Engineering, Civil Registry, CPID Executive Director, Local Council of Women, CPID Staff and Gad Staff as secretary. The major task of the MGFT was to finalize the plan and to implement Pro-GAD Capoocan. The members were given gender sensitivity training and GAD planning orientation.

   The LGU initially deployed a six-member staff to the MGFT—two men and four women. A GAD office was established and CPID assisted in setting up the operations. The GAD Staff also underwent training to prepare them for their tasks. Three GAD Teams were formed, each team covering seven barangays. These teams were responsible for implementing Pro-GAD Capoocan at the barangay level.

   The teams would regularly meet to update one another on their field work, review their plans, share experiences, and assess the progress of their activities. In this manner Pro-Gad Capoocan gained an institutional foothold on the LGU.
Barangay GAD focal person (BGFP)

To facilitate the implementation of GAD on the barangay level, a GAD focal person is assigned in each of the 21 barangays of the LGU. The BFGPs in turn organized their own GAD focal team. In this manner more women were drawn into consultation and participation in decision-making. All of them were given gender-related trainings. Information at the barangay level was brought to the level of the local council of women at the municipal level.

2. ENABLING MECHANISMS

Enabling mechanisms are systems and mechanisms installed in the agencies and the funds allocated for GAD activities.

Organizational Structure

Different organizational structures were created both in the municipal and barangay levels. Among these are the Municipal GAD Focal Team which is the GAD planning body of the LGU, Municipal GAD Focal Person, Municipal GAD Staff, Pro-GAD Field Teams, the Overall Program Coordinator, Participatory Barangay Development Planning Team, Barangay GAD Focal Person and Barangay GAD Focal Team. They facilitate the implementation of Pro-GAD Capoocan.

GAD Budget

A GAD budget is a portion of an agency’s or LGU’s yearly appropriation which is not an additional amount over and above its regular budget (NCRFW, 2003).

Capoocan strictly adheres to the application of the 5% GAD budget policy. From 2001 municipal budget of Php 80,000.00, it significantly increased to Php 1,510,926.56 in 2005. The total GAD budget in the barangays also increased from Php 495,411.84 in 2001 to Php 588,964.29 in 2005 (Annex A). This was the funding source of the different GAD programs and projects.

GAD Plan

A GAD Plan is a systematically designed set of programs, activities and projects with clear objectives for addressing gender issues and appropriate strategies and activities with monitoring and evaluation indicators (NCRFW, 2003).

Planning and budgeting in the municipal and barangay levels is participatory, using the bottom-up strategy where the starting point for situation analysis and planning is the barangay. The identification of needs was done through the PRA-Gender approach. This was analyzed and validated by the community folk themselves. The formulation of the barangay plan was participated in by all members of the Barangay Development Council and representatives of different sectors of the community – fisherfolks, farmers, women’s organizations, community
volunteers, government agency representatives and the youth. These groups are composed of both women and men, though men still predominates. Refresher orientations on participatory governance and gender sensitivity are conducted. The Participatory Barangay Development Planning Team assisted them in the entire exercise.

The planning and budgeting process results to the formulation of two separate plans, barangay Annual Development Plan and the GAD Plan. These plans are presented to the general assembly before finalization. Before the budget is endorsed to the Sangguniang Bayan for approval, it is checked to ensure that the GAD budget is in place. A Letter of Instruction dated March 10, 2003 from the Mayor mandates the Municipal Budget Officer (MDO) to conduct stringent screening on the budget submitted. The barangay plans are then consolidated at the municipal level to form the Municipal Annual Development Plan and the Municipal GAD Plan. Planning at the municipal level is participated in by the MGFT and representatives of federated women’s organizations.

To guide the implementation of Pro-GAD Capoocan, a five-year Municipal Strategic GAD Plan was formulated. This still has to be subjected to validation before finalization.

**Gender and Development Resource Center**

On December 5, 2003, the Gender and Development Resource Center (GRC) was formally established with its own office and equipment. The Staff was increased to eight, five women and two men. The GRC is the hub of Pro-GAD Capoocan where counseling services are provided. It also provides temporary shelter and other services to survivors who are later referred to the Department of Social Welfare and Development (DSWD). As aid to Pro-GAD advocacy, the center was provided with equipments such as: a 41” TV set, DVD player, LCD and video camera.

**Philippine National Police (PNP) Women’s Desk**

The PNP women’s desk (PWD) was given a room of its own in the PNP station to answer to the need for privacy of victims of domestic violence. The PWD was also provided with a folding bed, beddings, hot-water bottle and dinnerware. A woman police officer is assigned to the desk.

**Bi-monthly Meetings**

Bi-monthly meetings among the GAD teams and the GRC Staff were maintained to update one another of the progress of their work and to share in problem-solving. Pro-GAD activities and accomplishments are regularly presented during the regular Monday staff meetings of the municipal officials and employees. Women community volunteers for the year 2003 were given year-end honoraria of PhP 787 each, a minimal amount, it may seem, but is well appreciated in a community where opportunities for earning is rare.
Day Care Centers

To unburden the women of their reproductive role so as to be able to engage in economic pursuits, day care centers were set up in the town as well as in the barangays. There are 21 day care centers with 325 enrollees, 173 girls and 152 boys. Eleven centers have permanent structures.

Community Organizations

Realizing the importance of unity, Capoocan sought to organize and or revitalize its community and people’s organizations. Each barangay has women’s organizations. There are municipal women’s organizations by sector. The municipal and barangay elective officials organized themselves into the Association of Women Legislators. The National Council of Women in the Philippines (NCWP) facilitated the organization of a Local Council of Women.

Gad-Related Trainings/Orientations/Conferences

The successful implementation of GAD planning and budgeting begins with properly oriented personnel at all levels. Early on in the GAD implementation process, GST, GAD Planning and Budgeting, anti-VAW, anti-sexual harassment, reproductive health, women’s rights, women’s economic empowerment, and basic legislation for barangay women legislators were undertaken for municipal as well as barangay personnel.

Committee on Decorum and Investigation (CODI)

Pursuant to RA 7877, otherwise known as Anti-Sexual Harassment Act of 1995, and to the Civil Service Commission’s Administrative Disciplinary Rules on Sexual Harassment Cases, Capoocan organized the Committee on Decorum and Investigation (CODI). This is composed of the Mayor, MPDO, MSWDO, Municipal Engineer, Disbursement Officer, MBO, and the HRMO as head of the secretariat.

Advocacy Program

Capoocan observes advocacy activities such as the Women’s Month, 16 Days of Activism for the Elimination of VAW and Purple Rose Campaign against Sex Trafficking. These activities refresh and revitalize awareness of women’s issues in the community and provide opportunities for participation and interaction. The advocacy program of Pro-Gad Capoocan was formulated by different sectors of the municipality through participatory process. These are disseminated through press releases, radio guestings, film showing, stage play presentations, video documentary and LGU publication. The initial two-year activities of Pro-GAD Capoocan were documented in the video-documentary entitled, And GAD Reinvented the Women of Capoocan, portrayed by local talents. Another notable advocacy action of Capoocan is the setting up of giant anti-VAW billboards at strategic places along the national highway.
Linkages

The strength of Pro-GAD Capoocan rests on strong linkages with different government agencies, women’s organizations, people’s organization and the academe. The CPID provided the greatest support for its realization. They also tapped the support of government agencies like the NCRFW, NEDA, DBM, National Statistical Board (NSCB), PNP, among others. National (NCWP, GABRIELA, IDPG, etc.) and local (Runggiyan Social Development Foundation and Marie Stopes) NGOs and women’s groups likewise provided assistance and support. The LGU has also forged a Memorandum of Agreement with the University of the Philippines in the Visayas, Tacloban College (UPV Tacloban). The academe provided trainings and research data.

3. POLICIES

Another entry point in gender mainstreaming is policy formulation. Policies are official statements and pronouncements of support for gender mainstreaming issues by the agency. Policies, in the form of legislations or executive orders, are encouraged to provide the legal basis for the operationalization of GAD programs/projects and for allocating budgets for this purpose. They are also safeguards for sustainability.

Since its inception in October 2001, the LGU has tracked up a number of policy statements addressing specific gender concerns (Annex B):

- Executive Order # 2002-1, dated November 15, 2001, declared Pro-GAD Capoocan as the official GAD program;
- SB Resolution # 2002-051, dated May 28, 2002, mandated the regulation of the operation of Sing Along/Karaoke and bar joints and prohibited the sale of intoxicating liquors and beverages to minors;
- Administrative Rule, dated February 21, 2003, set in place the Administrative Disciplinary Rules on Sexual harassment Cases;
- Memorandum Circular 2004-01 instructed the HRMO to ensure equal opportunity to trainings for female and male municipal employees, February 13, 2004;
- Special Order 2004-02, designated the Local Civil Registrar as statistics point with the primary task of ensuring record keeping of gender disaggregated data, February 13, 2004;
- Letter of Instruction, enjoined all school principals to withhold permission for the staging of beauty pageants until guidelines have been formulated by the Beauty Pageant Regulatory Board, February 13, 2004;
- Resolution No 2004-08, dated January 13, 2004, encouraged the institutionalization of the conduct of sectoral consultative assemblies between the municipal government and the different sectors of the Capoocan, Leyte community;
Resolution No. 2004-09, declared support to the established GAD Focal Team, January 13, 2004;

Resolution No. 2004-11 proposed the creation of Beauty Pageant Regulatory Board to align beauty pageants along gender sensitive principles for the Municipality of Capoocan, Leyte, January 13, 2004;

Letter of Instruction, dated February 13, 2004, enjoined all Barangay Captains to withhold permission in the staging of beauty pageants until guidelines have been formulated by the Beauty Pageant Regulatory Board;

Letter of Instruction to the Municipal Budget Officer, dated March 10, 2003, instructing him to do a detailed step in ensuring the barangay allocation of 5% GAD budget in the Barangay Annual Budget and to check on the GAD Plans; and

Resolution No. 2004-012 strongly enjoined all hilots/birth attendants to undergo proper training before accreditation with the rural health unit of Capoocan, Leyte, January 13, 2004;

The above policies evolved from consultations with all levels of the community, following the bottom-up principle. Other policies adopted to strengthen GAD include regular sectoral consultation, a policy recommended by the women leaders in the communities. As a matter of practice the LGU sees to it that an equal number of men and women participate in trainings and various activities.

Women were also influential in the greater focus given to reproductive health services. An ordinance regulating the operations of videoke bars was also the LGU response to the complaints of women.

4. PROGRAMS/PROJECTS/ACTIVITIES

Programs/projects/activities of the agency are initiatives/activities/interventions that respond to gender issues, problems and concerns.

The best way to note the impact of Pro-GAD Capoocan on community life is to examine the activities and projects it has so far undertaken from the time it was conceived in 2001 to the early months of 2005. The projects implemented reflect the results of the CPID and MFGT plans once they had been given an institutional mandate and organized as earlier noted, and given adequate awareness and consciousness training and skills enhancement in preparation for their task. These involve basic tools such as GST, basic facilitation and documentation, and training on community organizing. The GST will always remain a basic tool for GAD.
The following are some of the GAD projects, accomplished or on-going:

- **Education and Training**

  **GAD Trainings**

  Gender sensitivity training (GST), VAW, Reproductive Health, Women’s and Children’s Rights, Economic Empowerment, GAD Planning and Budgeting, Gender-Responsive Leadership and Management, Adolescence and Sexuality, Grassroots Leadership Facilitator’s Training and Basic Legislation for Barangay Women Legislators were among the GAD trainings conducted in the municipality and in the 21 barangays. These were attended by both women and men. During the VAW training, an anti-VAW billboard-making contest was launched. This is an on-going activity which could be conducted whenever and wherever it is needed.

  **GST for the youth**

  The streamers hanged on the gates of Asuncion S. Melgar National High School and Pinamopoan National High School in Capoocan read: Pro-GAD Capoocan Goes to Schools. Gender sensitivity training was conducted by the UPV Tacloban College students enrolled in Social Science 105, Gender Issues in Philippine Society, to third and fourth year students of the two high schools in Capoocan. The activity aims to raise the students’ level of awareness on the different gender issues at an early age, thus, changing gender relationships.

  **Hilot training**

  The hilot or partera attends to birthing and maternal and child health care in the remote barangays of Capoocan. By training them on the correct procedures of delivery and care of mother and child, the potential danger to both is lessened. The hilot kit was provided with a hilot kit which contained materials and accessories for their job.

  **Basic Journalism**

  Attended by 12 men and 19 women, this seminar was envisioned to provide knowledge in journalism to enable them to write their own stories.

  **Orientation Seminar on Young Women’s Reproductive Rights**

  The high incidence of early marriage, teen pregnancy, prostitution and domestic violence prompted the Pro-GAD team to conduct an Orientation Seminar on Young Women’s Reproductive Rights. This was done with the help of the Provincial Population Commission. Forty young women ranging in age from 15 to 24 attended the activity. The orientation centered on reproduction, women’s reproductive rights, and responsible parenthood.
Barangay Women Legislators Conference

This is a series of conferences intended to enhance the legislation skills of barangay women. It is hoped that this will result in the drafting of more legislations for women. This has resulted in the drafting of the legislative/executive policy recommendations.

Skills Training

One of the reasons for the poor economic status of women is the lack of skills to undertake economic ventures. One of the strategies of Pro-GAD Capoocan is skills training. At different intervals, women attended different livelihood skills trainings, such as: financial management and bookkeeping; project proposal making; integrated pest management; cut flower and plant propagation; orientation to cooperatives; abaca weaving and twining; candle and bag making for women and youth; fishtail production and food preservation and processing. One may note that majority of the trainings are related to the traditional role of women.

- Community Organizing

Realizing the importance of unity, Capoocan sought to revitalize its community and people’s organizations in both the municipal and barangay levels. These organizations are multi-sectoral to ensure maximum participation of women and men. For better understanding of gender issues, members were given GAD related trainings/orientations. The Local Council for Women was also formally organized.

- Socioeconomic and livelihood development

Five people’s organizations availed of livelihood assistance from the Municipal GAD Fund. The assistance run from PhP 30,000 up to PhP50,000. The assistance included the formulation of livelihood project proposal. A total of 135 women benefited from this project as of 2004.

The LGU also provided livelihood opportunities through its livestock dispersal program, vegetable seed distribution, and rice planting material. The LGU assisted the people in the marketing of their products. They participation in the annual “Bahandi” Trade Fair in Manila for possible business partnership. Capoocan sold nito products. Exporters placed orders, providing their own patterns and design.

- Priority focus on health, nutrition and family

Due to poverty, Capoocan women and children’s health is generally poor. Pro-GAD Capoocan considers this issue as a primordial concern of the LGU. Different health services were provided as a collaborative effort between the Department of Health and the Marie Stopes, an NGO. These are:

1. pap smear was given to 97 women in 2003
2. pre-natal check up was availed of by 851 mothers
3. birthing assistance to 841 mothers
4. post-partum check up to 727
5. Free Tetanus toxoid was given to 697 women
6. Family planning information is disseminated on a continuous basis.
7. 34 men were given free condoms; 15 women were given IUDs, 38 were given pills, and 20 underwent tubal ligation
8. Vitamin supplements were supplied to 795 women.

➢ Quick VAW Response Team

Bantay Panimalay literally means family watch. This is the Quick VAW Response Team that responds to VAW survivors’ needs. Bantay Panimalay is a community task force intended to carry on vigilance and prevention of violence against women (VAW). It offers services such as, counseling, temporary shelter, and legal and financial assistance. The Runggitian Social Development Foundation conducted orientations to three batches of prospective Bantay Panimalay team members. It is meant to augment the VAW response team composed of the PNP Women’s Desk officer, the MSWD, the RHU, and the MGFT secretariat. The Municipal Bantay Panimalay was organized and three barangays were chosen as pilot areas. Fifty three men and 50 women attended these orientations.

Bantay Panimalay has so far responded to reported cases of prostitution in Naugisan, physical injury and domestic violence in the town proper, and economic abuse in San Joaquin. In 2003, there were 28 reported cases of violence against women. VAW victims were given counseling, financial support, legal assistance, and temporary shelter. Their cases were also endorsed to the DSWD. The Bantay Panimalay teams acted on some known VAW cases even if they had not been formally reported.

➢ Gender Research

PRA-BDP

The establishment of the GAD Resource Center in December 5, 2003 stabilized the position of Pro-GAD Capoocan. One of its targets in 2003 was the establishment of a gender disaggregated data bank. More data means more deliberate bases for planning.

For 2004-2007 a second round of PRA-BDP was held in which 424 participants participated, of which 198 were women. The BDPs are development blue prints for the barangays.

Women’s Danger Zone Map

Because of the alarming incidence of rape and prostitution in Capoocan, Pro-Gad Capoocan conducted a survey to identify areas unsafe for women especially at night. A Women’s Danger Zone Map was then drafted. This map informed the street lighting project of the LGU. Law enforcers were assigned to patrol the dangerous areas identified.
Advocacy and Networking

People’s Lobby for the Approval of the 2002 Municipal Annual Budget

This is a major score for Pro-Gad Capoocan. The annual municipal budget for 2002 which included the 5% GAD Budget was stalled by the Sangguniang Bayan for political reasons of their own. The delay crippled the LGU and prevented it from delivering basic services to the constituents.

C PID initiated the lobby for the approval of the budget, with the support of the women sector who participated in the GAD Planning activity and who were the major stakeholders in the approval of the budget. The lobby tested the mettle of the Capoocan women leaders. The petition for approval was written up and signed by 86 members of the organization of women legislators in three days flat. Eleven organizations, cooperatives and other groups presented declaration of support.

The lobby was drummed up in media; more than a hundred lobbyists and supporters showed at the deliberations. They acted as as pressure group to the SB with specific role playing acts and floor tactics to force and direct decision to a positive end. The strategy worked. The show of people power ended the impasse and the LGU Budget was approved unanimously after a four-hour deliberation. But this was also a show of women power and proved to the women their capacity to make a difference in political decisions if they are organized.

Pro-GAD Capoocan would not have been what it is today had it not been for the strong linkages with different agencies/organization. CPID, an NGO, played a vital role in Capoocan’s mainstreaming efforts. Equally important is its linkages with national and local government agencies, non-government organizations, people’s organizations and academic institutions.

GAD Code

Crafting a GAD Code is one of the projects lined up this year. They are still in the process of gathering the needed data and information. The GAD Code would ensure the sustainability of GAD mainstreaming despite change in leadership.

Monitoring

The early institutionalization of Pro-GAD Capoocan and the initial and continuing assistance of CPID has made it possible for the LGU to set up monitoring mechanisms. Early on, focal persons were identified and their functions and mode of operation in place, from the barangay participants all the way to the LGU and municipal employees. The monitoring and evaluation committee of the MGFT conducts a continuous monitoring of GAD operations. They do this through regular meetings. The M and E Committee is made up of representative of the NGO, POs, Local Council of Women, Rural Health Workers’ Federation, and Capoocan Young Womens’ Movement The monitoring and evaluation is done through a set of indicators for the
particular plan over given periods. Results of the monitoring and evaluation become the basis for laying down policies or for planning.

While there is general compliance among the barangays, there were also noted cases when the budget is spent on other things or is never spent at all. Hence, the monitoring team is vigilant in monitoring the spending of the 5% GAD budget on the barangay level. This problem can be mitigated by the greater participation of women in public life in their communities.

**Affirmation of Gains**

“After two and a half years of implementing Pro-GAD,” the LGU reports, “there is an observable change in the relationship between men and women in Capoocan.” Men who have joined the GST orientations now share the household chores and take care of their children. Women on the other hand are more empowered to speak up and ask for what they need. They are actively articulating their issues and concerns. Women leaders are emerging whose opinion count as much as that of the men. There is now increased participation of women in local planning and decision making. The voices of women in the grassroots are now heard. There are more women participating in political and socio-civic activities in the municipality.

Women now have opportunities to improve their chances to earn a living. They have acquired livelihood skills which enabled them to participate in economic pursuits. Furthermore, the trainings on leadership, bookkeeping, fiscal management and cooperativism equipped them with knowledge and skills on how to manage their business and gain control over their lives. Intensified campaigns against VAW protect women, and young girls. Women are more conscious of their rights and are more open to report cases of VAW. Men and women are gradually gaining a sense of responsibility over their sexual behavior. The municipality is able to deliver better health care services to the women and their families.

Despite the gains of the program, resistance against GAD remains. GAD implementers have been harassed in the course of the intensified campaign against VAW. A GAD focal person was accused of malicious mischief for assisting two young women who were allegedly raped. Luckily the case did not prosper. Men feel that they are being sidelined in the current emphasis on women’s rights. Though this is not prevalent it is a concern that needs to be addressed if men and women are to live productively and in harmony with one another in our society.

The efforts of Capoocan LGU is a laudable step towards gender-responsive governance. Pro-GAD Capoocan received national and international citations and awards. It garnered a “High Achievement Award” in the First Contest of Gender Responsive Local Governments in Asia-Pacific. The contest was sponsored by the United Nations Human Settlements Programme (UN-HABITAT) based in Japan. As communicated in the letter from the UN-HABITAT dated March 2, 2004, Capoocan got the international award for its impressive activities made toward women-friendly societies.

“This is a great honor and a most welcome reward to the efforts we have been making toward putting the issues and concerns of our women in Capoocan at the forefront of development agenda and governance,” says Mayor Marietta Porciuncula.
SUMMARY AND CONCLUSION

Pro-GAD Capoocan is the GAD program of the municipality, declared through EO # 2001-01, dated November 15, 2001. It adopted a wide range of strategies in mainstreaming GAD in governance, starting with community organizing, education and training, socio-economic development, reproductive health services, women’s special concern (VAW) and advocacy and networking. Specific programs/projects/activities were undertaken under each strategy. Pro-Gad Capoocan is in the right tract of gender mainstreaming in governance. It has the elements stipulated in the Gender Mainstreaming and Evaluation Framework (GMEF). The entry points in GAD mainstreaming are all in place, as follows:

- **People.** Pro-GAD Capoocan has a top level support, starting with the Mayor. In mainstreaming, top level support is crucial. Other people involved in the process are the Municipal GAD Focal Team, Municipal GAD Coordinator, GAD Staff, Pro-GAD Field Teams, Barangay GAD Focal Persons and Barangay GAD Teams. All these have undergone gender-related trainings. Strong support was given by the Center for Partnership Initiatives for Development, Inc., an NGO.

- **Enabling Mechanisms.** Lot of institutional mechanisms were put in place to facilitate the implementation of the program. Foremost of these is the setting up of the GAD organizational structure. Gender-related trainings and conferences were conducted for all sectors in the municipality. Other mechanisms include: GAD budget, GAD plan, GAD Resource Center, PNP Women’s Desk, Bantay Panimalay, Day Care centers, Committee on Decorum, community organizations, socio-economic development program, advocacy program and GO-NGO partnership.

- **Policies.** Capoocan is the municipality in Region VIII with the most number of gender-related policies promulgated in support of their Pro-GAD Capoocan program. What it needs now is a GAD Code.

- **Programs/Projects/Activities.** In line with the identified key strategies are specific programs/projects/activities. These range from reviving/strengthening community organizations, GAD conferences and trainings, livelihood development program, to Gender Research, advocacy and networking.

Pro-GAD Capoocan show-cased the integration of GAD principles and concepts in the planning, programming, budgeting, implementation and monitoring and evaluation (PPBIM) processes in government. The LGU adopted the participatory approach to governance. In general this is carried on on two levels: the first on the municipal level, and the second on the level of the barangay. Assisted by the CPID and the newly formed MFGT, the LGU embarked on GAD planning in the municipal and barangay levels. This was also participated in by active women from the different sectors of the community. It is at the barangay level where the effectiveness of participatory GAD planning can best be seen. The planning process starts at the barangay
level. Situational analysis and needs assessment are conducted and validated by the participants themselves prior to the planning exercise. The barangay plans and budget are integrated into the municipal plan. This is the bottom-up approach in planning and budgeting. The dominant presence of women skewed the barangay development focus from infrastructure to the practical and strategic needs of women. The stakeholders are likewise involved in the implementation of projects/programs/activities and in monitoring.

In its totality, Capoocan LGU is in the fourth stage of GAD mainstreaming (Annex B). It has institutionalized GAD in governance. It is, therefore, considered as GAD Best Practice in Region VIII (Philippines).

For the past two years, 2002-2004, the Pro-GAD program tracked up a number of achievements which stabilized its presence in the municipality and brought a wide range of benefits to women, first of all, and also to their communities. The program placed the LGU in the national and international limelight having earned the “UN-HABITAT High Achievement Award” in the First Contest of Gender Responsive Local Governments in Asia-Pacific.

It can be gleaned from the experience of Capoocan in GAD mainstreaming that for GAD to be effectively integrated into LGU governance, the following factors/strategies have to be considered:

1. top level support
2. political will and commitment
3. participatory governance
4. bottom-up strategy
5. vertical integration extending to the lowest level of government
6. formulation of GAD policies
7. GAD plan and budget
8. strong advocacy and networking
9. gender sensitive advocates
10. extensive training for all sectors of the community
11. gender analysis and needs assessment prior to planning
12. sex disaggregated data
13. programs/projects that respond to the practical and strategic needs of women and men

Though there may be loopholes and shortcomings, the learning gained by Capoocan through its Pro-GAD Capoocan program is something worth emulating by other local government units in the region and elsewhere.

Auricular acupuncture is popular in addiction treatment, but studies testing its efficacy have produced equivocal results. We posited that the presence of co-occurring mental and physical health disorders might be a reason for this variance. In this pilot study, electrical auricular acupuncture using the detection and stimulation of all active points was offered to persons with co-occurring disorders. The use of electrical stimulation of auricular points offers several advantages over the use of needles, which will be discussed. Participants (N=22) were randomly assigned to either the electro-acupuncture treatment group, or to a control group that simply offered relaxation with music. Active points, including addiction, mental and physical health related points, were stimulated in the treatment group. Ten treatments were given over six weeks.

Both groups showed significant improvement in measures of symptoms, functioning, mood, and cravings. However, no differences between the groups were found on the weekly or pre/post six week intervention measures. The intervention group showed somewhat lower functioning from the outset, which may have affected results. The results suggest that the inclusion of targeted points related to psychological and physical health conditions does not add to the effectiveness of auricular acupuncture. But, other diagnostic tools commonly used by acupuncturists were not used here. These results suggest that simple, inexpensive relaxation techniques can play a useful role in the treatment of co-occurring disorders. However, we have observed that some clients will attend acupuncture, but not relaxation groups, so acupuncture may still fulfill a purpose.

ADDRESSING HOMOSEXUALITY IN MALAYSIA: ISSUES AND CONCERNS

The trial of Anwar Ibrahim (former Deputy Prime Minister) in September 1998, has brought out many issues and concerns about homosexuality, which forced and provoked open discussion on sex and sexuality usually perceived as a taboo subject in this country. An issue of significant controversy, it has become a marker in the society, forcing the society to face and discuss the issue of homosexuality. Homosexual activities in Malaysia have been around for a long time but it was not seen to be dangerous until it was highlighted and criticized by the local press during the trial.

In Malaysia, homosexuality is considered illegal and a sin that is punishable with long prison sentences of up to 20 years and canings. The trial itself had caused a lot of anti homosexual sentiment to surface, bringing about the establishment of People's Voluntary Anti-Homosexual Movement (PASRAH) an organization vowing to eradicate homosexuality. It reportedly hopes to wipe out gays, starting with imposing severe penalties and closing down gay gathering places.

This kind of response indicates that there are negative feelings and low tolerance towards a group of people whose sexuality preference is different from the rest of society. Therefore, this paper will address the issue of the extent of homophobia in the society. If left unchecked, the value system may be influenced to form a strong case of prejudice and discrimination against the homosexual. The paper will also explore to what extent is Malaysian society’s attitude towards homosexuality in general.

In order to determine the above, this study will employ a content analysis of both print and electronic media between the years 1998 to 2005.

The study will also be supported by in-dept interviews of the target group looking at the rights and legal protection that they seek, to enable them to live freely and be treated with respect.
Title: Keeping “Hands-On” In Large-Enrollment Research Methods Classes: A Hybrid Model

Author: Beth Post, Ph.D.

Abstract

Research is a "hands-on" experience. It could be argued that learning how to do research, or even learning how research is done by others, should also be a hands-on experience. A majority of undergraduate psychology programs in the U.S. have traditionally chosen to include a research methods course in their curricula, and, in many cases, provide their students with some form of active involvement in the research process. Recent increases in enrollments at larger universities and colleges have brought changes to this traditional approach, however. Large class sizes enrollments, often in the face of few or no assistants, make it difficult for the methods teacher to provide real-time, meaningful research experiences for learners. The psychology department at University of California, Davis was faced with just this situation, which provided strong impetus to make changes in the introductory research methods. The curriculum was changed from a traditional lecture/discussion format to a hybridized live lecture/online laboratory format. A further innovation involved the use of online-based experiments which generated data sets that students could use to test hypotheses. This paper will present the strategies used to implement the resulting course, discuss the challenges faced, with varying success, in the two-phase development of the curriculum, and review implications of course evaluations for the role of online learning in a research methods context. Results of pre-post testing will also be presented. Specific online and live strategies will be discussed, examples of student research projects will be displayed, and commercially-available resources used in the curriculum will be reviewed.

Abstract

The Land Grant Universities in the six upper Midwest States of Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin have been working collaboratively with US Environmental Protection Agency (EPA) Region 5 to develop processes that support social science indicators for watershed programs. This effort to identify university social science expertise and link that with local watershed staff was initiated in 2003 as part of an interagency strategic planning process to improve collaboration between USEPA and Land Grant Universities in the upper Midwest. USEPA approached the Land Grant Universities and asked for assistance in better
understanding social science and human dimensions associated with the impact of its watershed and natural resource protection programs.

The goal for the universities involved in this six state effort is to consult where needed, and conduct where appropriate, social science based evaluations that integrate biophysical and environmental changes in geographically targeted areas. There are three objectives for this effort: (1) coordinate subject matter expertise from the Land Grant Universities with regional (multi-state), state, and project-level needs; (2) identify social science data needs and collection procedures that can be used to evaluate non-point source pollution (NPS) management efforts at regional, state, and project-levels; and (3) engage university faculty and other experts in collaborative social science evaluation projects with USEPA and state NPS staff. This effort is broad-based, and features linking a variety of social and community indicators of change to environmental outcomes.

This paper and presentation will discuss the framework by which Land Grant Universities work collaborative with USEPA in identifying and then implementing social science based evaluations. It will outline issues involved in successful collaboration. Furthermore, it will discuss the range of social science indicators being examined and introduce a range of data collection, analysis processes and policy issues related to this unique partnership in the upper Midwest States.

IMPACT OF SOCIAL RULES IN CREATING A LIVABLE SPACE
SPACE SYNTAX ANALYSIS FOR TRADITIONAL DESERT SETTLEMENTS
THE CASE OF AL-ARISH - EGYPT

KEYWORDS: Social pattern – Spatial configuration – Inheritance – Desert Settlements

ABSTRACT:
The transformation of the traditional desert houses in “Al-Arish” old settlement through various cultures and civilizations is a particularly unique case. The way the traditional house absorbs new members and accommodates new nuclear families at the same plot area is an interesting case. Previous researches have examined configuration characteristics of the traditional houses in “Al-Arish”. This paper will focus on the interpretation of morphology and social structure. It is almost a truism within space syntax research that the sociologically significant aspects of a building are directly reflected in its spatial configuration. Since space configuration, within space syntax, is essentially described as a mathematical graph whose nodes are the spatial elements of the building plan, and whose links are the different connections between them, it follows that the graphical representation of the plan should offer us a direct insight into the sociological structure embedded within the plan. (15) (Sonit Bafna 2001) In the selected area for the case study, there are different house types referring to three main time periods; 1) pre-occupation period (type-a) unchanged original house forms, 2) occupation period (type-b); and 3) post-occupation period (type-c). House plans were examined using space syntax methods, and relationships to shifts in social traditions and family structures were analyzed. Typically the guest courtyard and the family courtyard, as the central living spaces, have always been an essential part of the social life of the society, their transformation were emphasized. Results of the study related to transformation process and the feedback of the changed social structure and the impact of the Islamic inheritance roles on the house forms were simulated and discussed for further research into accommodating solutions for contemporary needs of the inhabitants as guidelines for current housing practices.1

RESEARCH OBJECTIVES:
This paper aims to sketch a way of understanding the impact of the social rules and traditions on the spatial pattern, in other words detecting the society's impact on space. The paper intends to examine and explore the transformation process of Sinai’s traditional houses and the changed social behavior from living within complex family structure to nuclear family structures with segregated household.

METHODOLOGY:
This paper aims to highlight the major problems of the local inhabitants in the traditional quarter of Al-Arish city in north Sinai. This paper will demonstrate how livable the spatial form can be, and investigates how the fast rate of change in social patterns is absorbed by a slow rate of the spatial form. It also examines how the existing spatial pattern of the old desert settlements acts constructively as a generator in bringing new patterns of culture within a large almost unchanged urban fabric of the traditional quarter of “Al-Arish”. A number of case studies in the selected area, where a house is divided into six smaller houses that
accommodate six nuclear families, will be analyzed and evaluated. Inheritance and traditions are playing a major role in forming such changes.

1. One of the first publications in the field of space syntax analysis were in, Hillier B, Hanson and Graham, “Ideas are in things: the application of the space syntax method to discovering house genotypes”, Environment and planning B14, 1987. Some other publications explaining the terminology related to space syntax analysis like, Hillier B, Lcaman, Stansall, and M Bedford, “space syntax”, Environment and planning B3, 1976.

This paper will be developed according to the theory outlines of society and space derived by Professor Bill Hillier in his paper presented to space syntax symposium 2001. He is reversing the normal order of things this by looking first at space and trying the discern society through space: by looking at society through the prism of space. He tried to define key mechanisms linking space to society and then use these to suggest how the questions about the future of cities and societies might be better defined. (Hillier, B. 2001).

Figure 1. Characteristics of the spatial pattern of the traditional desert settlement structure in Al-Arish

A similar approach will be followed in analyzing the selected case study of understanding the society through observing and analyzing the spaces around. The unique phenomena of overfill process that take place in the traditional desert settlements in “Al-Arish” city will be analyzed to understand the changes that happened to the society, space and spatial forms. (Fig.-1)

1. INTRODUCTION:

Spatial form can be understood as patterns of organized spaces, structured according to some social principles, which affects the size, connections and configuration for rooms and the relation between the inhabitants. Home is closely connected to identity and culture and the ways in which the requirements of home are satisfied vary considerably from place to place. (Bronwyn M., 2002). In Egypt, where the research was carried out, housing problem is a multi-faceted problem caused by rapid growth of population and the absence of appropriate shelter along the full urbanized Nile valley. Sinai Peninsula represents 6% of Egypt’s total area. It provides a wide range of development potentialities. The urbanization of Sinai is one of the major Egyptian national goals under the geographic, economic and above all the political aspects. The governmental efforts in developing Sinai Peninsula aims at constructing as much houses as it could be to occupy the desert without really taking care of the existing Sinai’s inhabitants to improve their living quality.

Figure 2. Family courtyard, the most dominant space in the traditional houses that connects all other spaces and accommodates most of household activities

Architects and planners have been more concerned about the built forms and their impact upon different groups of people. (Bronwyn M., 2002). The spatial form of the traditional quarter in “Al-Arish” is a unique built form, which had experienced maximum flexibility and livability. The selected area for the case study was the heart of the city in the past, containing I-, L- and U-forms traditional big-family houses with average house areas of 1400 m². (Fig-2) After 1981, the end of the Israeli occupation for Sinai, the Egyptian government encouraged attracting new migrants from Nile valley, which leads to new economical structure
for the whole area towards tourism and trading. Most of the local inhabitants especially in the traditional quarter have limited financial resources and they have a rapid growth of population, which led to an overfill process to the urban fabric of the traditional quarter. Consequently, this area is suffering from the lack of open spaces, public facilities and planned infrastructure. (Ragab M., 1999) This paper intends to highlight the changes of the social pattern through analyzing the transformation of the spatial configuration of the traditional houses of “Al-Arish” desert settlement through three time periods; pre-occupation, during the occupation and post-occupation periods.

2. IMPACT OF TRADITIONS AND INHERITANCE RULES:
In Islamic societies, as in most other societies, inheritance represents the most important method of transferring wealth from one generation to the next. Inheritance has a close relationship with family law in that it transfers a dead person’s “legacy” to his next of kin. Determining which one is entitled to inherit (namely the heirs) depends largely on the family system. According to pre-Islamic Arabs, men only had the right to inherit. The basis for regulating laws in regard to inheritance is found in Qur’an (Moslem’s holy book):

Sura al-Nisa’ 4:11: “God charges you, concerning your children: to the male the like of the portion of two females, and if they be women above two, then for them two-thirds of what he leaves, but if she be one then to her a half; and to his parents to each one of the two the sixth of what he leaves, if he has children; but if he has no children, and his heirs are his parents, a third to his mother, or, if he has brothers, to his mother a sixth, after any bequest he may bequeath, or any debt. Your fathers and your sons- you know not which out of them is nearer in profit to you. So God apportions; surely God is All-knowing, All-wise.”

Women appear in the scale of obligations as “half human”, in that they receive half of what a man does. Old commentators and some modern Muslim as well, claim that this position is an improvement in the status of women, as they possessed no inheritance in the pre-Islamic society.

In regard to widows: “In what your wives leave, your share is a half, if they leave no child; but if they leave a child, ye get a fourth; after payment of legacies and debts. In what ye leave, their share is a fourth, if ye leave no child; but if ye leave a child, they get an eighth; after payment of legacies and debts. If the man or woman whose inheritance is in question, has left neither ascendants nor descendants, but has left a brother or a sister, each one of the two gets a sixth; but if more than two, they share in a third; after payment of legacies and debts; so that no loss is caused (to anyone). Thus is it ordained by Allah; and Allah is All-Knowing, Most Forbearing.”
Figure 3. The number of households was increasing through the division of plots caused by the inheritance rules from one side and from the other side the horizontal overfill process caused by the new migrants coming from the Nile valley

As mentioned in Quraan (Muslim's holy book) above, in Islam there are complicated rules for inheritance to be followed in case of the death of the family leader, which affects the spatial formation of the residential house continuously.

Needless to say, the rules set out in the Qur'an are not applied correctly if at all. In fact what is applied is the hadeth and Sunnah which are invariably the sources of the interpretations of the schools of jurisprudence. The Qur'an lays down rules that are essentially simple if correctly applied and, above all, it enjoins people to write a will for the equitable disposition of their assets after their death. Wills are not encouraged in most Islamic societies and are, in some jurisdictions, indeed prohibited in spite of the existence of ahadeeth condemning intestacy. In any case the testator is restricted to willing a maximum of one third of his estate and usually only to other than his legal heirs.

Social and religious factors have enormous impact on the transformation of the existing spatial organizations especially in the desert settlements, where the huge sizes of the houses permit the division process of the inherited house after the death of one of the family members. The average original area of a traditional house in Al-Arish varies between 1200 and 2500 m² (Ahmed R., 1999, PP. 105). The average number of family members living together as a complex family is 8 - 12 persons. The complex family can absorb up to 5 new nuclear families and merge them to live all in one big house.

To demonstrate the overfill process happening through the inheritance process; let us examine an example of a simple common case. A man has six children, 3 males and 3 females; in case of his death, the portion inherited by his children will be distributed as follows; each of the three males gets double of his sister. In other words, their inheritance will be divided into nine portions. Each male will get two portions and each female gets one portion. In restrained financial circumstances, the male son brings his wife and forms a new nuclear family within the same house on an area of two ninths of the house area. Female usually uses her small portion, which is about one ninth (in this example) of the plot area as a small shop. However, this scenario leads to a continuous overfilling of the spatial pattern and to subdividing the divided plots.
CASE SELECTION

“El-Fawakhria” traditional quarter in “Arish” city is chosen, as a case study, where most of the traditional houses are still in good conditions. It was observed that most of the houses had the same morphology, color and almost the same spatial configuration. “Arish”, the oldest settlement in Sinai Peninsula was formed on the pilgrimage route from north-west African countries to Mecca. Most of “Arish” areas transformed from rural to urban character, except “Al-fawakhria” quarter, which still conserve its traditional character and house forms.

3. TRADITIONAL SPATIAL PATTERN / Pre-occupation period (type-a):

The tribal system allows the senior of the tribe (Sheikh) to allocate the plot area for each of his tribesmen according to their closeness to the senior of the tribe. The houses were generally big houses having areas up to 2400 m². The tribal system dominates the structure of the families and the nature of life within the spatial pattern. The inhabitants of “El-Fawakhria” are relatives and belong to one big family named Fawakhria. Streets and walkways inside this area belong to semi-public category. The pedestrian passages around the dwelling blocks are considered as semi-private. Newly married couples are expected to live with the husband’s family. For the husband, there is no change in his residence or in property rights. Traditional big-family houses can accommodate up to 5 new married couples at the same house. The new comers are using the same existing services and facilities. The traditional house has only one entrance and one guest room with its courtyard.

Two different generations; senior and junior are living together under one roof in a joint residence, where the authority always rested with the senior generation. The majority of people living in big-family houses (type-a) are complex families (non-nuclear families). This overall family structure was closely associated with the typical courtyard houses in “Fawakhria” area, where a room is allocated for each of the couples living under the same roof.
Figure 4. Permeability graph for three houses of the pre-occupation period showing the integration and the accessibility between the different house spaces

House A-1: Entrance \(\rightarrow\) GC \(\rightarrow\) GR=SC=L \(\rightarrow\) K=B=FC=P \(\rightarrow\) BR=T

House A-2: Entrance \(\rightarrow\) GC \(\rightarrow\) T=FC \(\rightarrow\) GR=T1=T2=L=SC \(\rightarrow\) BR=L=K=B

House A-3: Entrance \(\rightarrow\) GC \(\rightarrow\) FC=GT \(\rightarrow\) BR=S=K=B=TL=GR \(\rightarrow\) P=BR=T1

Abbreviations: GR= Guest courtyard, GR= Guest room, BR= Bed room, T= Terrace, FC= Family courtyard, SC= Service courtyard and P= Peer

A typical traditional “Arish” house composed mainly of two courtyards. The first front-yard is allocated for guests’ reception and considered as semi private space, which is mainly used by male only. The second courtyard is the heart of the house allocated for family uses, where most spaces are connected through it. Occasionally in some of the very large houses, a third courtyard was found, where kitchen, laundry, main store, bathrooms and other services are allocated and was used only by female family members. Typically, one had to walk through the guests’ yard and then main courtyard to reach any of the house rooms. The main family courtyard provided space for circulation and was used for daily activities, cultural rituals, growing vegetables, drying clothes and special events for all family members. All house rooms are connected through the main courtyard, in a way that the largest room was designated for the senior couple, a room for each married junior couple living in the house and a room for girls and another for boys. Therefore, the family courtyard is constituted the main core of the traditional desert houses in “Al-Arish”. Rooms allocated for junior married couples functioned as a house, where there are no connections between the different rooms. The only access to the rooms is through a single door from the courtyard. The main largest room allocated for the head of the household, is the most important for the family structure, although it does not differ from other rooms from the spatial organization.

4. Horizontal Overfill Process: During the occupation period (type-b):

During the period of the Israeli occupation of Sinai Peninsula, the inhabitants were not allowed to expand their settlements. During wars’ times the wandering prohibition was a daily system, which the inhabitants have to live with. The residential blocks acted as a defensive unit against foreigners consisting of up to 20 houses. The local inhabitants invented a temporary solution to overcome the negatives of the wandering prohibition through creating doors that connected the different houses together. Local inhabitants could exchange food, medicine and visit each other through this unique alternative. This alternative proves how far a spatial pattern can be livable to absorb the inhabitants’ needs within the same urban context.
Figure 5. Permeability graph for three houses of the during-occupation period showing spaces integration and accessibility

**House B-1:** Entrance } GR=T } BR=BR=S=FC } K=B

**House B-2:** Entrance } FC } T } GR=H } BR=K=SC=L=R

**House B-3:** Entrance } GR=H=G } BR=T=S=L } FC=B=K

Abbreviations: GR= Guest courtyard, GR= Guest room, BR= Bed room, T= Terrace, B= Bathroom, K= kitchen, SC= Service courtyard, H= Hall

Figure 6. Inhabitants of the traditional settlement in Al-Fawakhir residential block invented a solution to overcome the wandering prohibition ordered by the Israeli occupation by creating doors between houses to exchange medicine and other living materials. Some of the junior generation worked with the Israeli authorities especially in the building sector. The search for separate identity for each married couple, after the death of the senior generation, led to more and more segregation and individualism within the same family structure as well as the house form. The main
change in this transformation stage (type-b) was that each new family from the second generation within the house had formed its own entrance and services. However, majority of the existing houses belong to type-b houses that had been divided into 2 to 4 new nuclear families, each have its own separated property. The role of the family courtyard decreases and the guests’ courtyard had completely disappeared through the division process. The average new created house areas varied between 50 to 300 m² (Ahmed R., 1999) and the majority of the new formed houses didn’t have a façade to the main street. Most of the houses at this stage are accessible through new formed corridors within the original house area and the family courtyard, if there is any, became too small comparing to those originally found in the traditional houses.

5. VERTICAL OVERFILL PERIOD: Post-occupation period (type-c):
In “Al-Arish”, new house forms were built close to the traditional residential old center. This was following the increasing population due to the end of the Israeli occupation and its being the capital city of North-Sinai governorate, which accommodates government officials and receives the highest percentage of migration at the time. New buildings constructed at this period were typical multi-story apartment buildings, since the residents were mostly government officials, who arrived from the Nile valley to settle in Sinai.

The spatial pattern of the traditional residential core of “Al-Arish” had been harmfully influenced by the new construction wave of multi-story buildings accommodating the new migrants. The multi-story houses surrounded the traditional zone and completely destroyed the privacy of the families living in traditional
single-story houses. Therefore, the family courtyard lost its privacy and its symbolic importance for the family members. The main family courtyard, where all family activities used to take place, transformed to corridors connecting the different separated households and lost its original function as the core of the traditional house of “Al-Arish”.

The traditional family structure itself was influenced by the new type of buildings. Inherited plots became a good source of money to the younger generations, especially after the increase of land prices. Houses of this phase (type-c) had very small plot area comparing to types-a and b and varied between 20 to 150 m². Small plot areas, formed through the multi-inheritance processes, were mostly used as shops. Multi-story residential houses found its way to the area, and accelerated the transformation of urban patterns.

Figure 8. Multi-story buildings surrounding the traditional houses are destroying the privacy of the families living in traditional single-story house

In houses type-c, it was observed that the courtyard was transformed into corridors that linked the different households and the rooms were no longer designated for couples, due to the fact that the majority of the inhabitants shifted to nuclear families. According to plot forms and unplanned multi-division processes, new formed houses had very small room sizes and some of them were windowless.

6. COMPARISON OF CASES

Nuclear family structures became dominant, as the complex family system had disappeared along with the increasing individualism. Household sizes have decreased, suggesting a higher number of independent household formations upon marriage. The courtyard proved along the different time periods its symbolic and functional importance, although its role had been decreased over the time. Family courtyard in the early stages (type-a) had two main functions; circulation for accessing all rooms connected through it and accommodation for most of the family daily life activities such as; planting, washing clothes, cultural rituals and special events. During the occupation time, areas of the courtyards became smaller (type-b) and a new function had been added to the courtyards, as corridors connecting different households to exchange goods, medicine and different living needs. The function of this important element in later stages in post-war period (type-c) was limited to circulation and accessibility purposes (corridor) for the different house room, which became the dominant role for the yard.

The tribal system and the complex family structures in “Al-Arish” reinforced the function and the role of the courtyard as a central multi-functional yard in the pre-Occupation period. The gradual disappearance of complex family structures and the increasing domination of nuclear family structures is parallel to the loss of daily life functions in the courtyard. The changes in the social pattern and the influence of the occupation period on the society were reflected as well in the transformation of the configurational properties and the spatial pattern of the central space from main central courtyard in the pre-occupation period to a connectivity corridor in the post-occupation period.

The master bedroom designated for the head of the household in the pre-occupation period was one of the observable features of the traditional houses. Consequently, master bedroom was no longer sustained in later periods upon the disappearance of the complex family structure that allowed several nuclear families with only one head for household. Also the guest courtyard was one of the characteristics of “Arish”
traditional houses which disappeared upon the decrease of the area of the houses caused by the multi inheritance and subdivisions processes.

7. CONCLUSION:
This paper intended to explore how dynamic and livable traditional housing has been spatially configured and what were the resulting inhabitants' attitudes. However, it was remarkable through the analysis of the different spatial pattern and house forms along the three periods that the transformation of the spatial configuration was always a reflection to what had been changed in the family structure. This paper was a sort of implementation to the theory of Hillier; how to see the society through the prism of space. The space transformation and configuration in the case study area in “Al-Arish” was so rich and livable to reflect the real and actual needs and changes along a period of time.

Figure 9. Justified Permeability graphs of the selected houses, considering the family courtyard/ family hall as the graph root space

Evidently, the Israeli occupation for the Sinai Peninsula influenced the spatial pattern of the desert settlements. Traditional spatial form of desert settlements acted as a livable dynamic body that acted and reacted to the surrounding conditions and context. The morphology of the houses and the residential blocks allowed a simultaneous movement between the houses in spite of the wandering prohibition ordered by the occupation authorities. The unique spatial pattern of the traditional houses absorbed all social and political changes happened along the three periods.

The principle of -looking at the society through the prism of space- was highlighted at this paper. Looking at houses from “Arish” settlement would clearly tell us about the social pattern for the family living in this house. Overall, it was possible to relate transformations in spatial configuration to changing family structure, in which the household size has decreased considerably as a result of the transformation from complex family types to nuclear family types. When house and apartment plans from these periods were compared, findings revealed that the transformations in spatial configuration were parallel to shifts in family structure.

Consequently the hierarchy of the space organizations has been changed through the different periods. At residential block level, there was a decrease in the areas considered as private and semi-private accompanied with an increase in areas belonging to public and semi-public. These changes reflected the tendency towards more extroverted architecture in the post-occupancy periods.

Abstract

The Role of Religion and Cultural Alternatives in Health Maintenance and Health Access Among Latino Immigrants

The role of religion and cultural alternatives in health maintenance and health seeking behavior are studied using three sources of data: 1) interviews of 96 Latino immigrants, 2) interviews of 12 Latino Home Town Association leaders and 3) interviews of five pastors/community health workers in churches serving immigrant communities and observations of a religiously anchored alternative organization. Seventy percent of the community sample lacked health insurance. Interviewees expressed extreme barriers to health care access when approaching county hospitals and clinics including very long waits for service, financial concerns, a lack of full communication with providers, and being treated rudely without respect.

The data suggest that because of these access barriers many turn to cultural alternatives involving religious or spiritual significance: 1) Prayer and faith were widely used to stay in good health and to treat health problems. Many expressed the view that “without faith there is nothing.” Ninety percent of the community respondents stated that they prayed for their own health or the health of a loved one on a regular basis. 2) Many frequented botanicas (herbal drugstores) and were using herbal remedies. In botanicas, herbals are often combined with religious icons and spiritual remedies. 3) There was extreme ambivalence in the use of folk healers when the term “curandero” was used. Some stated that they did not believe in “brujeria” (sorcery). However, when more neutral terms for folk healer (e.g., naturalista) were used the response was more
positive. Still, the use of folk healers was not the main channel for alternative health in this sample.

The study explored alternative health channels at the neighborhood level—specifically, the development of religiously anchored non-profit organizations linking health services and spirituality at the neighborhood level. QueensCare is highlighted as an example of this trend. In this program registered nurses provide weekly health screening in neighborhood churches with follow-up low cost clinical care. The care given is very holistic—body, mind and spiritual. These organizations provide an important alternative health safety net for uninsured Latino immigrants.
Economic Policies and Inter-ethnic Relations  
-Malaysia and Sri Lanka-

Navaratnam Ravinthirakumaran

Abstract:  
Despite the voluminous scholarship on the proliferation of inter-ethnic conflict in the multi-ethnic developing countries, a phenomenon of great significance remains largely unexamined: the impact of economic activities on inter-ethnic relation across multi-ethnic developing countries. In most multi-ethnic developing countries, the government attempts to play an important role in managing inter-ethnic relations by undertaking various economic activities; such as policies and strategies.

Both Malaysia in Southeast Asia and Sri Lanka in South Asia were generally a colonial inheritance and there was greater similarity in the economic systems of the two multi-ethnic countries. At the time of independence in 1957, Malaysia shared much in common with Sri Lanka in terms of its economic, social and cultural factors, including ethnic composition and the inequalities between ethnic groups. In comparing the records of Malaysia and Sri Lanka, during decolonization, expectations were that Sri Lanka would remain peaceful, whilst Malaysia risked extensive conflict. The reverse has proved to be the case. Sri Lanka deteriorated into a state of large-scale ethnic tension while Malaysia has been successful in preventing any ethnic tension from occurring and has managed to maintain some form of inter-ethnic relations with economic development.

The principal problem here, while maintaining with a similar pluralistic society, why Sri Lanka gradually deteriorate into a state of large-scale ethnic conflict during many periods of its post independence history, when a country like Malaysia succeeded in maintaining
a stable political structure and relatively harmonious relations between ethnic groups. In this regards, the research mainly focus on following questions: what are the origins of economic policies and policy regimes in both Malaysia and Sri Lanka, what do governments hope to achieve through the implementation of such policies, how do they work, whether the programs achieve what is intended, and what is the impact of economic policy and policy regimes on political stability and economic development in both countries since independence.

The purpose of this research is to answer those questions focusing on the overall performance record but putting special attention to the ethnicity, which is used here broadly to denote distinctions based on economic activities in Sri Lanka and Malaysia, both of them are multi-national and multi-ethnic state. The findings suggest that the implementation of different economic policies and strategies toward economic development and political stability in the post-colonial period had a major impact on current levels of inter-ethnic relations in the Malaysia and Sri Lanka.

ABSTRACT

How Treatment Works for Pregnant and Post-Partum Women with their Children in Treatment: A Case Study

Scott Ray, Ph.D., Gary Talarchek, Ph.D. & Theata Blakes, MSW

Treatment centers for pregnant and post-partum women with accommodations for their children were initially funded by the Center for Substance Abuse Treatment (CSAT) in the early 1990s in response to two major concerns: (1) rising birth defects attributed to prenatal drug exposure; and (2) research documenting that the real concerns of substance-abusing women for providing for the care of their children without placing their legal custody at risk was one of the greatest single barriers to treatment. Infinity Treatment Center for Women and Children was established under those initial initiatives. Over the years Infinity has provided a successful array of services including a modified therapeutic community approach to all phases of residential treatment enhanced by a wide variety of wrap-around services and strategies for aftercare.

In addition to programmatic details, this presentation includes extensive data on changes experienced by Infinity clients from intake through follow-ups at six and 12 months post-intake and six months post-treatment on substance abuse, criminal involvement, mental health, and social functioning, including education and employment. Women persisting six months or more were followed-up at a rate of 94% at 12 months post-intake, and 91% at six months post-treatment. Results were based on measures from the Global Appraisal on Individual Needs Quick Screen (GAIN-QS) and the Government Performance and Results Act (GPRA) instruments. Clients experienced significant (p<.05) improvement on indicators in each of the investigated domains.
Likewise, children were assessed at quarterly intervals. Children five and under were assessed on developmental issues using the Battelle Developmental Inventory (BDI). Children five and above were assessed for behavioral problems with the Achenbach Child Behavioral Checklist (CBCL). Results on both measures verified significant improvements ($p<.05$) among children while in residence with their mothers at the Infinity Treatment Center.

AN EXAMINATION OF THE TRIPARTITE MODEL OF SOCIETY

Relating Business, Government & the Civil Society

A Work in Progress

Abstract

The balanced tripartite model consisting of the civil, commercial and political sectors can be a useful representation of society. Reviewing the evolution of cultural forces, inherent tensions and the cooperative need between components- together with the rebalance mechanisms necessary for stability- provides structural insight into the dynamics of the modern liberal democratic society. Successful balance is found to rely upon maintaining acceptable variances between the expectations of each sector and the performance of the others. Without an approximate balance of power the model’s aberrations, such as totalitarianism or anarchy, occur. The relevance of sociological model trends are examined and found relevant to rebalance. The model’s application to the global society, which lacks an empowered civil sector, provides perspective on the developed problems and events of the modern world. Conclusions are sought on the usefulness and limitations of the model as a means of understanding the relation of business to the greater society.
A. Introduction

The tripartite model has evolved to represent the relationships between the three dominant sectors in contemporary society – the political, economic and civil. Considered within this structure society is virtually all inclusive of the community of interrelated individuals with a common set of those values which define acceptable norms of behavior.

The model’s usage correlates with efforts to probe solutions to what Cowen (2001) classifies as the three major groups of problems in the history of world change, “…the economic problems of subsistence and surplus, the political problems of stability and security, and finally the religious or ideological [civil] problems to do with our understanding of self, society and salvation.” The model’s most direct application to the nation state is within a liberal democracy.

The modern democratic society, despite occasional faults, is a triumph in the organization of complexity. It is a mosaic of diverse component parts, each developed over centuries of human endeavor and now fitting together in a functioning whole. Balance and long term stability must be achieved within the context of continually competing and shifting forces. The kinship ties which were the binding force of the earliest human societies have been left in history. Today, society must accommodate divisions of labor, numbing bureaucratic rules, social stratification, external threats, the twin ubiquitous of the tax collector and the warrior, and an elaborate government with functional checks and balances.
Models are paradigms and thus assumptions about the world. The inherent problem with a paradigm is the commitment to the world functioning in that mental construct – an emotional investment. The tripartite model developed herein is about power and the balance of same. Other models have been developed which are attributed to historical events and social forces acting within the state.

To understand the means by which stability is maintained in this system requires a brief examination of the evolution of human society and current functioning of the three main social sectors and their interrelationship via a working model. The model’s validity is reinforced when applied to global society not as a representation of reality but by displaying the lack of civil empowerment and the almost daily consequences of imbalance. Finally the model’s effectiveness and limitations are summed.

Note: The tripartite model analysis offers personal utility for the author in an ongoing examination of the relationship between commerce and the whole of society without direct incorporation of any social ideology. If there is a bias it is toward the laissez faire free market: However, with a caveat that it should be modified by structural changes in ownership and governance by size. Unforeseen in the time of Adam Smith, the current situation tends to distort commerce’s benefit to the common good and violates the principle of doing no harm.
B. The Evolved Society

Prehistory saw Homo sapiens, existing only at the subsistence level and organized into hunter/gatherer bands of 25-50 persons. Kinship ties are believed to characterize these commune like societies with leadership temporarily ceded to the specially skilled who could find and lead in the acquisition of the specific daily necessities for existence. This interdependent society was simple in structure with little evidence of social or economic stratification.

With the advent of agriculture, surpluses were generated. This profoundly changed society. Elite arose to take charge of the distribution of surplus and thus developed a social divide between the commoners and the political rulers. McNeill & McNeill (2003) note that this period witnessed specialization and division of labor, which in turn brought greater accumulation of wealth, “It also makes that society more stratified, more unequal. If a cooperative framework can be maintained, the larger the web [roughly, the interconnectedness] gets, the more wealth, power, and inequality its participating populations exhibit.”

The millennia leading to the Middle Ages saw the growth of cities and development of empires, the increase of commerce, expanding as the known world grew and the great struggles for territory and power began. The religions of the world and other social institutions had come into being.

Esping-Andersen (1990) noted the profound change between the Middle Ages and modern times when capitalism brought about the commodification of labor and goods necessary for survival. For the individual, this substituted for prior reliance on family, church and lord for survival: An impact surely equivalent to the aforementioned creation
of surplus. Commodification gave rise to the needs for welfare or entitlement in various degrees, provided by the political at the behest of the civil.

Finally, the movement toward nationhood began. As described by Cowen (2001) “From the power vested in the productivity of the land, in the material and spiritual authority of the church, in the financial independence of the town and the intellectual independence of the universities, there emerged a complex of forces shaping the new society. Slowly, and with many checks and balances, [there] came a concentration of powers which from the thirteenth century increasingly took the form of sovereignty. This had two main aspects: providing the law and order within the territory, and defending it against attack.” “In the three westerly kingdoms of England, Spain and France, it was the acceptance of hereditary monarchy at the apex of the system which pointed the way forward.”

To reach the present democratic form, the absolute rulers gave way, first to the nobility and then to the people, albeit with reluctance. A balanced system was finally achieved in the form of today’s democracy and the astounding situation in which the ruling political sector serves at the will of the people.

The economic sector originated with the ancient traders who, as a class were reviled but tolerated as a necessity to convert one society’s inherent resources to desired goods from afar, including the exotic luxuries, such as silks and spices (or obsidian), desired by the despot. Rulers later discovered commerce as a means to generate the wealth needed to finance their wars and thus a means to expand empire. Generally they took firm command of the economy and this eventually led to Mercantilism. Classical economic theory, embodied in the works of Smith and then Ricardo came into being, separating the economic from the political sector and establishing a free market. Finally,
the modern nation views the economic sector as a way to maintain a healthy, employed economy and to create the tax revenue to support its government and to fund policy initiatives.

The classic concept of civil society emerged with the polis of the Greek city-states of the Classic Era, while the more modern concept, the body of citizens and their pluralistic associations existing parallel to the political state, arose with the Enlightenment, Thomas Paine and Hegel. The political state yielded power and, dramatically came to be serving at the pleasure of the civil. Ernst Gellner (1994) highlighted the aforementioned paradox inherent in this transformation, developed through a succession of steps which included the Magna Carta and the United States Constitution. Born with considerable disruption and bloodshed, the system of democracy now finds the citizen beholden to the state, the leaders of which in turn, can be held to standards of non abusive use of power or be peaceably ousted by those same citizens of the civil sector. Thus Karl Popper’s Open Society had arrived.

Three sectors have thus evolved to become the liberal democracy within a somewhat fragile framework

**The Political Sector**

The political sector is comprised of government at all levels elected, appointed or part of the standing bureaucracy. The judiciary, because it is a part of the three branches of the federal structure (and because it is to a degree influenced by the public sentiments) is included as are the various quasi independent agencies and alliances created to carry out the mandate of governing and protecting the nation. To the extent that treaty or informal agreement creates participation in external bodies, such as the United Nations,
World Trade Organization or World Bank, that participation is considered political despite sharing some economic objectives.

**The Economic Sector**

The economic sector consists of all corporations and their allied institutions and organizations which function to promote the free enterprise system practiced in a democracy. Thus it includes Chambers of Commerce, Public Action Committees (PACs) sponsored by business, lobbyists and trade associations. The economic sector also consists globally, of banking systems, the financial services industry, hybrid alliances both private and political (the latter would include the World Trade Organization (WTO), International Monetary Fund (IMF) and World Bank, each of which should be considered hybrid political/economic entities).

**The Civil Sector**

The civil sector contains all of society not classified as economic or political and thus encompasses individuals as well as their myriad organizations. It is described as the aggregate of all pluralistic associations and interests in each of which individuals are free to join or leave at any time and to set their own objectives. Religious, fraternal, labor, environmental, philanthropic, labor unions, academic institutions, ethnic or other forms of cultures and community are all under this umbrella.

As described by Rosenblum and Post (2002) “Civil society is a zone of freedom for individuals to associate with others and for groups to shape their norms, articulate their purposes, and determine for themselves the internal structure of group authority and identity.” [Note: The Civil Sector as defined and used herein is equivalent to the *Civil*
Society found in most of the general literature, although its definition there has assumed wide latitude.

The ‘uncivil’ such as criminals, terrorists or those seeking the forcible overthrow of the system – those not abiding by the laws of the society are excluded from the civil sector.
C. Models

Virtually all social models are theoretical constructs of processes or structures with logical qualitative relationships between principal elements. They are assembled to discover new insights or test hypothetical understanding. Advantage is found in the ability to break down complexity into its key characteristics. The inherent, general limitation of a model is that it is a representation of a far more complex reality and must therefore simplify that reality, frequently into some type of abstraction. Models admit to whatever ideological bias the originator may impart.

A listing of all social models is beyond the scope of this effort. A few are noted for their insights into the politically charged areas outside the purview of the tripartite. Their tangential perspectives on the tripartite model are important for future research. The following are some social areas and models which aim at the motives behind the tripartite and thus provide insights into its operation.

Political Sociology

Political sociology seeks to study the social basis of politics, its inequalities, and how movements and trends outside of power affect policies or, alternatively how social forces change political policies.

Three essential models of political sociology as noted by Goertzel(1976) are;

Marxist Political/Economic Model. An expectation of tension, conflict and change in a social class oriented theory
Power/Elite Model. Belief that elites persist and are necessary but endanger society by leading to a future totalitarianism. Opposed to both Marxist and liberal democracy formats.

Pluralist Model. The liberal democracy, which lacks the intellectual force of the other models. Government is viewed as a reactive representative of interest group initiatives and possesses little freedom from their leadership.

Political Spectra

Dealing with models can entail introduction of spectra of beliefs, demographics or other variables, including ideological frameworks. These axes include; urban/rural, assimilation/multicultural, left/right, liberty/security, and outcomes/processes. It is premature to more than note these dimensions relative to the tripartite model.

Welfare Capitalism

Concern for the direction of the welfare state, a fixture of the mid 20th century industrial society, began in the latter part of the century as the perceived forces of the market and globalization were credited with its diminishment. Fundamentally the welfare state looks after the personal needs of society’s individuals and especially those unable to do so themselves.

The welfare requirement was foreseen by the icon of the free market, Adam Smith (1976) when speaking of the sharing of wealth by the higher earnings of labor. Terming the ‘lower ranks’ as the majority of society, he said “…what improves the circumstances of the greater part can never be regarded as inconvenience to the whole [and] it is but
equity [that they] should have such a share of the produce of their own labour as to themselves [be] tolerably well fed, clothed and lodged.”

Esping-Andersen (1990) provided the landmark separation of three ‘regimes’ of welfare capitalism – liberal, conservative (corporatist) and social democratic. He identified the United States, Germany and Sweden respectively as the exemplars of each.

A brief description of each and the welfare delivery mechanisms are:

Liberal – Limited and means tested. Government and market plus non-profit organizations provide.

Corporatist – Heavy reliance on the state to supply

Social Democratic – The so called Nordic model, engendered by working class/middle class separating welfare from the market. State sponsors and delivers.

A more detailed study of the Nordic model of the Scandinavian countries is provided by Goetschy (1994) covering the social democrats’ hegemony. The regime was achieved by class compromises between labor and capital. Today’s strain of the European Unions’s emergence and economic globalization in general are credited with having placed a welfare burden on the Nordic countries and extending to all of Western Europe.

Perhaps motivated by the diminishment of welfare, Salamon, Sokolowski and Anheir (2000) applied Esping-Andersen’s categories to their study of non-profit/state relationships added a fourth regime:

Statist. In which the state has power over social policies but is constrained on actual provision. It exercises power on its own behalf, or that of economic elites and is not an instrument of the working class
The modification of the liberal regime has come about in the current era, when for example market pressures and bankruptcies of companies result in jeopardizing pensions and decreased medical benefits for retirees. The question arises of how much welfare the market (employer) is now to be required to carry.

**Computer Simulations**

Simulations are drawn from either sociology or economics and there is little indication of broad simulation capabilities to represent society as a whole. The objective is to understand social processes by simple interaction records, hoping to see complex behavioral characteristics emerge from transactional patterns. One study for example seeks to find ties between political actors implicit in their actions on various public issues.

**Tripartite**

The tripartite is a functional representation of the cooperation and tension between sectors but primarily it is a balance of power, power of each sector to defend its interests and treatment. Missing and perhaps superimposable are the various sociological models noted above.

An example of added sophistication for analysis of the liberal democratic society is found in the work of Wilson and DiIulio (2001) where the distribution of power is described for the setting of government policies. The authors set four models and admit to their applicability, individually or in combination, dependent on circumstance. They cite

- Economic Determinism – client interests, e.g., farmers
- Elitist – Powerful, but changeable, interest groups
Bureaucratic – Discretion delegated to the government agency

Pluralist – Diversified groups from the broad civil sector.

Notes: 1) The model referred to herein as tripartite and consisting of the three sectors is a relatively recent convention with no origin traceable by this author. Usage is fairly widespread and effective, recently by Chambers (2002), Post, Lawrence, & Weber (1999), Waddock (2002) and Carroll & Bucholtz (2001).

2) Aberrations of the tripartite, when one sector becomes dominant – mercantilism, anarchy, socialism or totalitarianism, are excluded since pure power manifested in one or possibly two sectors alone provide for no balance.
D. Tripartite Democracy

The civil society was empowered when it won the hallmark voting franchise and freedom of association. With strength of voice thus guaranteed in a democracy, balance with the political and economic sectors followed. Selected aspects of the dynamic are relevant to the model.

Manifest in the workings of society is a view which follows the divide of two strains of intellectual development – the literal, scientific, fact driven path which ultimately resulted in the pragmatism of the market. Alternatively the humanistic, ’what kind of life, and how it should be lived’ thought processes propelled initially by both religion and philosophy defined the second path. Controversy continues in their uneasy heredity of today in the democratic society.

Over time the three significant substructures emerged as the physical/scientific and the humanistic streams merged into a stable society with three balanced Sectors – Political, Economic and the pluralistic remainder, termed Civil. Together they function and share power in a liberal democracy in a productive dynamic of both cooperation and competition for resources.

- The Political Sector embodies the principles derived from the metaphysics and is subject overall to the will of the governed. However it is frequently influenced by narrowly focused, single issue groups of all persuasions. It looks to the civil sector for legitimacy and to the economic for a healthy economy: (which will produce reasonably full employment and tax revenue to fund its operations and programs). The state must be sufficiently strong to enforce ‘civility’ as defined by the rule of law intrinsic to a democracy.
• The Economic Sector, derived from the physical well-being and materialistic line of human development is powered with a cohesive ideology of self interest and economic liberalism. It operates under a franchise from the remainder of society, and thus, is a creature of the state. It looks to the political sector for tolerance and support to operate in accordance with its own interests.

• The Civil Sector, pluralistic in nature, is grounded in the philosophy of freedom, equity and democracy, and capable of enforcing its will when performance of the political or economic components does not fall within the tolerance limits of its expectations. It looks to the economic for the means to sustain life and improvement of well-being in an efficient and ethical manner and to the political sector for security, freedom, and equity under the law, with redistribution of surplus where appropriate. Beyond this its needs are for jobs and low taxes.

Totalitarian regimes quickly coopt or eliminate the civil society on coming to power.

The physical representation of the model depicts the three sectors, each at the apex of a triangle, and each connected to the others.

The Tripartite Corrective

Harmonious operation of the sectors is dependent on balance. The actual performance of each sector is measured against the expectations of the other two. Within a margin of tolerance a gap is allowed between expectation and performance, where there is unease but before action (usually political) is taken against the offending third.
Within a democracy there is a progression of events meant to restore any imbalance exceeding tolerance and when direct appeal is ineffective. (Post, Lawrence & Weber (1999).)

- Either expectations or performance change when public awareness is raised through the expressed opinion or facts voiced by an influential source such as the media or a political figure. Alternatively a major catastrophe such as the Triangle Shirtwaist Fire and deaths of women and children in New York City in 1911, which resulted in major workplace laws, may galvanize the civil sector to demand action (Linder 2002).

- Action is initiated as the issue is supported by a growing number of institutions or groups and the political sector is thus challenged to act

- Formal government action follows and legislative action begins to pass appropriate laws or, the Supreme Court provides the Constitutional basis for action.

- Finally, there is legal enforcement, the degree of which may be determined by the ideology of the Administration, e.g. views on antitrust enforcement altering by political party.

The issue may fail to result in legislation, in which case the performance/expectation gap becomes an irritant which lasts till the protests recur and there is another attempt at legislation. Alternatively, interest may wither and the issue dies.

Historically, violence has occurred even in democratic societies when performance/expectation gaps have not been remedied. Corrective Trends follow a wide spectrum of transitory standard bearers until solutions are found. These trends, not always
attended by violence, have included Populism, the Progressive Movement, the Slavery and Civil Rights issues, and find expression today in the WalMart social/economic debate are part of the continuing dialogue. The latter case is framed between poor wages and working conditions against the good of lower prices for a substantial public.

**Direction**

To understand the direction of society it is useful to examine a characteristic and a concept – Pluralism and the Common Good

**Pluralism.** Myriad social forces are represented in the pluralistic society of the modern democracy. The Enlightenment exaltation of the individual, the Reformation, the fragmentation and atomization of the industrial age, diasporas, and intensified globalization, have produced unique individual wants and organizations within the civil sector. Individual background, occupation and personal beliefs motivate the individual’s associations.

Thus, within a single culture or nation it is now common for one individual to maintain autonomous association and loyalties to diverse groups, each with their own interests, culture or special cause. The civil society is comprised of these groups, representing both a blessing for individualism and a frustration for the communitarian. Overall it disburses the concentration of the balancing power of the civil sector.

**The Common Good.** Waddock (2002) describes the concept thusly, “…the critical role of institutions in the political sphere is to determine what actions, policies, and rules are in the public interest or the common good and to set the rules of society that foster that common good [which are] the particular standards and values that people in a
society generally agree are in the best interests of that society…In most democratic nations, the common good is underpinned by values such as social justice, equity and fairness, and human dignity.” A publication by the Markulla Center (2003) notes that the concept has been in existence for over two thousand years in the writings of Plato, Aristotle, Cicero, and more recently, John Rawls. Rawls (1993) termed this tendency toward some shared goals as the “overlapping consensus” which could only exist when the society had agreement of *justice as fairness*.

The critics of pluralism cite relative values, individual freedom and unequal sharing of the burdens, all as reasons for disparagement. On a more pragmatic basis the fundamental utilitarianism of the social contract of a democratic society requires limits to individual freedom and self interest in the broader civil sector, no less than it must for the corporations of the economic sector.

Without denigrating the debate or the legitimate positions of each side of the communitarian/ classic liberalism perceptions, it would seem that the most useful approach to the common good is expressed by Raeder (1998), that it is “All we can truly have in common with our fellows in a great society, and thus the only basis for a genuine agreement regarding the ‘kind of society’ in which we would like to live, as opposed to opinions about the particular manifestations it should assume. Commitment to such shared general values, not the pursuit of common concrete purposes, constitutes social cohesion in a great society.”
E. Global Considerations

The tripartite model considered for global society is useful for the paradoxical reason that it demonstrates two missing factors which keep it from being rational. Specifically absent are the binding lines of cooperation between coherent sectors and an empowered civil sector. However, there are shadow indications of a rationalization of global society, moving toward the model’s structure.

Significant attention has been directed toward two controversial aspects of world society – globalization and the global civil society.

Tony Judt in the February 10, 2005 issue of the New York Review of Books makes the point that globalization is not primarily about trade, communications and economics. He quotes Guehenno (1995) that “Having lost the comfort of our geographic boundaries, we must in effect rediscover what creates the bond between humans that constitute a community.” This interconnectedness has been eloquently expressed, before by McLuhan through his Global Village (1962 &1964), implicitly in the Universal Declaration of Human Rights of 1948, and since by the McNeills’ Human Web (2003). Modern technology makes inexpensive transportation and communication possible. This results in an accelerating melding of cultures, diasporas of magnitude, and shared transcontinental values, together with an encroaching cosmopolitanism.

Structure

A brief examination of the three traditional sectors in the global arena is relevant:
Political: The Treaty of Westphalia in 1648 bequeathed to future generations the idea of national sovereignty and with it a 350 year experiment in what has been termed an anarchy of nations. Sovereignty of course did not eliminate wars of trade, power and hegemony. Of recent times however the ruler’s supreme authority within a territory has been challenged on other grounds. Armed intervention in the name of democracy, human rights and humanitarian need have been deemed justified, usually by an alliance of nations.

Economic: The jealously guarded sovereignty of governments generates goals which frequently differ from those of other nations. Thus, they tend to operate independently. The net effect positions commerce, with its higher degree of complexity and sophistication, to stay well ahead of any one government and its abilities to tax, regulate or otherwise curb wrong practices.

Civil: The concept of ‘Civil Society’ had resurgence, post Soviet control of Eastern Europe, as those nations reinvented and strengthened the needed institutions. A further resurgence of interest in the concept leads to a frequently mythological status in the literature as a utopian possibility. Rationality is beginning to prevail as writers such as John Keane (2003) support it as a normative ideal, but are not confusing it with near term reality.

The global civil society currently lacks an articulated, unifying vision. However, McNeill (1992) discussed this coalescence of society with his expectation of the economic [and political] processes creating a “consciousness of the human species as a whole, [participating] in a global system”. Thus, human rights seem to be a departure point for a concept of world citizenship and the expansion of a global Civil Society.
Challenges

Leadership. Lacking a focused leadership or coherent civil sector it is unsurprising that global problems are approached somewhat *ad hoc*. The Copenhagen Consensus represents one such effort. The project, an initiative of Bjorn Lumborg (2004) assembled a group of eminent economists to study and *rationally* prioritize projects for the global welfare. The resultant conclusions finalized on such challenges as diseases, malnutrition, climate, governance, subsidies and trade all of which made the initial list of topics.

Pace Dolitsky (1998), drawing on the work of Eisenstadt, offers the observation that …”different institutional spheres [for example political, religious, economic] within the same society increase and/or decrease in complexity at much different rates; there is no reason to believe that they will all reach similar stages of …complexity”. The original religious sphere has expanded to become the current pluralistic and secular civil sector without diminishing the point that all sectors do not necessarily move forward at the same rate.

The economic sophistication of the business/investment community (commerce) has globally tended to outstrip the ability of the sovereign political entities to exercise normal and accepted governance. Interestingly, the growth of the civil sector through single issue organizations, their mobility and effectiveness in seeking direct, as well as political, action to change the economic sector seems to be an attempt by society to rebalance itself. Global environmental movements, World Trade Organization protest demonstrations, and the trend to legitimize certain non governmental organizations, are all examples of this rebalancing phenomenon.
Purpose. Critics of economic globalization see ever growing exploitation of people, undeveloped nations and the environment and other global commons in an ungoverned quest for profit. Alternatively, the economic sector sees commercial enterprise as having created the wealth of the world and with it an extraordinary elevation of the general quality of life. It further believes that with time the proportion of society benefiting from this progress has grown.

Trade. International trade presents a unique challenge when the pressure to combine mandates pursuing humanitarian objectives with extension of favorable trade conditions. Bhagwhati (2004), a strong proponent of free trade argues for separation of the two issues but, by example, works for equal pursuit of both objectives.

Rational Connections

Articles in two issues of *Foreign Affairs* addressed the redistribution of power from the nation to the markets and civil interests, as well as a significant solution to the sovereignty retention issue. Jessica Matthews (1997) makes three relevant points; emphasizing the growing influence of the Non Governmental Organizations(NGOs), the fact that a conceptual global civil right of all people has superseded sovereignty to the point that interference in internal affairs by other nations is legitimatized in the case of national strife or, more recently, when a common good is perceived to be jeopardized. Finally, nations no longer have the option, politically or economically, to withdraw from the global arena without harming the economy of the country.

Stung by the collapse of the League of Nations few saw that the time had come in 1945 for a forum where all the nations of the world could engage in constructive conversation. However the United Nations was born. Despite subsequent frustration over
political impotence, bureaucratic bloat and corruption there have been victories, specifically in humanitarian efforts. Through its almost sixty year durability (certainly a manifestation of hope by all nations), a certain respect for the institution has developed. This is exhibited by the desire for legitimacy of action which brings world leaders to appeal for its support in times of crises.

Anne-Marie Slaughter (1997 and 2004) expands earlier work by Keohane and Nye to note a pragmatic movement toward cooperation between functional parts of governments facing common problems. The process, termed *Transgovernmentalism*, sees the central banks, judiciary, insurance and security agencies and others in network with their foreign counterparts. The results achieved to date have included standardized procedures, commonality of jurisprudence, informal memoranda of understanding and shared information. Sovereignty is undisturbed, and to a degree removed from partisan political influence. These procedural matters yield unthreatening pragmatic solutions.

An increasingly interconnected world occasions regular debate on the survival of the nation state. There are of strong opinions both from the conservative, and radical, liberal parts of the political spectrum. However the requirement for maintenance of internal order and the fervor of nationalism (as well as the reluctance to yield any sovereignty) within each country mitigates for the state’s longevity.
F. Going Forward

Review of the evolution of liberal democracy and relationships between the three sectors of society lead to a general conclusion:

The tripartite model is satisfactory as a conceptual structure for the liberal democracy. However, full representation of the dynamics of relationships between the current political, economic and civil sectors requires superposition of the sociological factors driving society.

The relative values and strength of purpose of the civil society, countering the drive for wealth in the economic sector and politically coercive power in the government, make it the key to achieving balance and thus validates the model.

Proof of validity is found in the major Movements of the past which resulted in change. To the resolution of such issues as Civil Rights and workplace safety may be added a global perspective representing the will of civil forces include the English Reform Laws of the early/mid 19th Century, and the more recent resurgence of democracy in parts of the former Soviet Union.

Considering this phenomenon in the light of the sociological models leads to a second tentative conclusion;

Sociological model trends are an indication of the expectation/performance gap which, when growing, foretells of significant change.

Another example clarifies this point – the late 19th century in the United States saw tremendous accumulations of individual wealth built on monopolistic business practices – an era of the so called ‘robber barons’. The power/elite model was essentially
in place and radical elements dwelt on the class differences. Welfare capitalism was virtually nonexistent as a concept. After decades of accumulating pressure (growth of the gap) the Antitrust Laws were enacted, followed shortly by corrections of labor and working condition corrections. A rebalance began which continued beyond mid 20th century, introducing benevolent welfare capitalism in a liberal regime.

Domestic social trends of today bring about unrest over the dislocations, governance failures and inequities perceived as faults of the economic sector and expressed in anti-globalization, distress over outsourcing, and the concentration of wealth (elitism) and a system apparently moving from liberal to statist. The Sarbanes-Oxley Act represented a partial rebalance of the business governance problem and was an immediate reaction to a blatant departure from the norms of society.

**Qualifying Conditions**

The usefulness of the tripartite model in a liberal democracy depends on its relationship to reality. Several factors govern this ability to mirror society or to present caveats in its use.

**Survival of Civil Society.** There are concerns about civil society and specifically the ability of democracy to survive in too large a society. Putnam’s perception (2000) is that of a decline in *social capital* in the United States during the latter 20th century. Social capital is roughly defined as the amount of coordination and cooperation between citizens which allows a smooth functioning democratic society. It may be gained or lost depending on the degree of that society’s willingness to associate. Thus Putnam’s findings of decline were viewed as a civil weakness.
Fukuyama (1995) emphasized the importance to society that it acquires social as well as physical capital in order to flourish. He deemed trust as the cornerstone of stability and smooth functioning of society [countered today with lowered level of esteem in which commerce and political leadership is held].

Kim (2004) in an analysis of Weber raises the issue of whether the rise of secularization and rationalism undermine liberal democracy by dilution of focus in the civil sector. Chambers (2002) counters the tripartite balance concept, believing that possibly both the state and capitalistic economic relations are harmfully intrusive to the freedoms necessary for the civil society.

**Representation** Although single lines of sector interconnection and monolithic entities are considered for each sector there is fragmentation brought about by myriad issues. Thus an entire field of forces exists, both between the sectors and within each sector. Their alignment at any one time, translated to action may temporarily counter general trends.

**Exclusion** The needs and desires of all segments of each sector are ideal if inclusively represented. However, some major parts seem to have opted out of the system. Shipler (2004) calculates that the differences in voting patterns between economic strata of society are significant. Specifically he finds that if the lower economic levels of society voted in the same percentage as the top then 6.8 million more voters inclined favorably toward welfare measures would have been at the polls. Within the economic sector, grants of advantage by the government, e.g., the more sophisticated tax advantages, tend to exclude smaller businesses from equal benefits.
**Sector Coherence.** The three sectors are fluid entities with some ill defined edges, spanned by hybrid organizations, coalitions and internally conflicted motives.

**Global.** Missing an effective global civil sector leaves the global political scene as an arena of military hegemony, mitigated by strengthened ties of commerce. Hence the tripartite model serves the dubious function of highlighting what is absent.

**Forward**

As a Work-in-Progress this study began with a simple structure of three sectors and an appreciation for the rebalance mechanism which results from a performance/expectation gap which exceeds limits of toleration. The introduction of social factors and models holds the promise of measuring the size of the disparity and potential for prediction of when change will occur. Globally the model is on a weaker foundation and represents an ideal for which there is no assurance of direction.

US Foreign Policy Recommendations Regarding Syria
“There’s no doubt that Syria is a big problem.”
--Secretary of State Condoleezza Rice, testimony before the Senate Foreign Relations Committee, February 16, 2005

“[The Hariri assassination] is just one in a string of things that [Syria has] done over the last 20, 25 years that—that shows they’re not responding to any other pressure.”
--General Wayne Downing, US Army (Ret.) ‘Hardball with Chris Matthews,’ February 22, 2005

**Syria as Agitator—and What the US Should Do About It**

Syria is a state sponsor of terrorism, second only to Iran as the world’s biggest terror supporter; it has chemical weapons, and likely desires other weapons of mass destruction, though not to the extent that Iraq at one time did; until recently it occupied and still controls its neighbor Lebanon, though Israel’s occupation is more visible; it supports anti-American and anti-Israeli terror groups, though not to quite the same extent that the Palestinians do; it brutally suppresses its own people, though not to the same degree that Saddam Hussein did; and its Baathist government supports the insurgency of its formerly more powerful rival in Iraq.\(^2\)

These deplorable actions by Syria have served the causes of murder and repression throughout the Middle East for decades. Despite this, Syria has always received less attention than warranted from US and international policymakers because their cohorts were always one step behind a more egregious violator of peace and human rights. Collectively, however, the synergy is so striking that Syria must be declared the world’s “Most Devious Nation”—reaping credentials, not for a few first place wins, but rather, numerous second place finishes. Call them the “Buffalo Bills of the Mideast.”\(^3\) But

---

\(^3\) The NFL’s Buffalo Bills were runners-up in four straight Super Bowls to begin the 1990s and are thought of as one of America’s consummate second-place teams.
unfortunately, there’s no reward or attention for second place, and it’s why Syria has been able to avoid much of the consideration and wrath of successive White House administrations.

**Syria’s Regional Importance**

Syria has always been seen as a follower and not a leader when it comes to impeding peace in the Middle East, although they have not been viewed in this way. The notion that Syria is a minor player in the international peace process has to be augmented with the truth; they indeed profoundly influence events in Lebanon, Israel, Iraq, Iran, and Turkey; ergo the United States. This realization should have come long ago, but it is nevertheless crucial today to alter Syria’s benign label by examining the facts surrounding their historical role as grand agitator in the Middle East. The region’s understanding must shift so that truth is indeed perception, not the other way around. As President Bush said in his weekly radio address on March 5th, 2005, “Syria’s support for terrorism remains a key obstacle to peace in the broader Middle East.”

In addition, he laid out but a few of the ways that Syria plays a large role in affecting the region:

The US government expects Syria to find and turn over supporters of Saddam’s regime. Syria should not use its territory to support international terrorist groups. The United States expects Syria to adhere to UN Security Council Resolution 1559; which calls for the removal of troops from Lebanon; and Syria is expected to help free and fair elections to take place in Lebanon. These requests are all very reasonable and are aimed at making the world more peaceful.

General Montgomery Meigs, US Army (Ret.), has said of Syria’s control of Beitut, “if you take Lebanon away, Hamas and Hezbollah lose one of their major staging areas for actions against Israel.”

Asad’s regime has spread anti-Semitism, further stifling Syrian reconciliation with Israel over the Golan Heights and the overall Mideast peace process. Asad himself even used the international attention brought from the visit of Pope John Paul II in May 2001 as a global platform to deliver anti-Semitic remarks.

---

4 President George W. Bush, radio address, 5 March 2005.

Historic Context

American-Syrian Relations
In recent decades, some cooperation between Syria and the United States has occurred. However, as a result of the Six Day War, Syrian-American relations were severed in 1967 and weren’t restored until the Syrian-Israeli disengagement agreement in June 1974. In 1990-91, Syria joined with the US as a member of the multinational coalition of forces in the Gulf War. The US and Syria also consulted closely on the Taif Accord, ending the civil war in Lebanon. In 1991, Syria accepted US brokering of peace talks with Israel. Other moves by Syria to improve relations with the US came from their efforts to secure the release of Western hostages held in Lebanon and through the removal of travel restrictions of Syrian Jews. The most recent presidential summit was in Geneva in March 2000 between President Clinton and the late President Hafiz al-Asad, and limited cooperation in the war on terror began after September 11th, 2001.9

Despite these sporadic incidences, their bilateral relationship can generally be characterized as cold and serious differences persist. Syria has been on the US list of state sponsors of terrorism since the list’s inception in 1979. Because of its continuing support and safe haven for terrorist organizations, Syria is subject to legislatively mandated penalties, including export sanctions and ineligibility to receive most forms of US aid or to purchase US military equipment.

The US withdrew its ambassador and imposed additional administrative sanctions on Syria in 1986 in response to evidence of direct Syrian involvement in an attempt to bring down an Israeli plane. A US ambassador returned to Damascus the following year, partially in response to positive Syrian actions against terrorism such as expelling the Abu Nidal Organization from Syria and helping free an American hostage earlier that year. According to the US State Department, “there is no evidence that Syrian officials have been directly involved in planning or executing terrorist attacks since 1986” [my emphasis].10

Syria Accountability Act of 2003

US policymakers have been struggling for decades to nudge Syrian compliance on the multitude of issues outlined above, but without much success. With the implementation of the Syria Accountability and Lebanese Sovereignty Restoration Act of 2003 (SAA), unilateral economic sanctions were supposed to force the Syrians out of Lebanon, halt their support for terrorists in Iraq and Israel, and lead them to relinquish their WMD and associated programs. However, it is clear that unilateral US economic action will not have the desired impact on the Syrian government, mainly because of the small level of contact between the two nations.

Theoretically, imposing United Nation’s restrictions on Syria’s petroleum exports would be a source of leverage because they constitute a large portion of that government’s

---

9 Bureau of Near Eastern Affairs “Background Note: Syria” US Department of State, August 2004.
10 Ibid.
revenue. Practically, however, implementation of oil sanctions are largely ineffective, as the world should now be all too aware. And since Syria was the nation most complicit in helping Iraq sidestep the UN Oil-for-Food program, it certainly would have the knowledge to help itself avoid the same sanctions via a similar network of international corruption. Syria’s 500,000 plus bpd would require international cooperation to control, and although its volume is not large enough to have a real impact on the global markets, developing nations like China would not welcome any additional supply pressures, making sanctions unlikely to pass through the Security Council. According to Jon Alterman, the director of the Middle East Program at the Center for Strategic & International Studies and formerly with the State Department, “we [the United States] do not have many tools to use in our relationship with Syria. Their status on the US list of state sponsors of terrorism limits US government and private sector activities in Syria, and the absence of a vibrant economy in Syria limits our ties still further.”

If the economic sanctions from the SAA don’t produce results, surely the Act’s other components meant to punish the Syrians will leave them quivering—such as the provision that calls for limiting the movements of Syrian diplomats in the US and/or freezing assets of the Syrian government and certain individuals in the US; or maybe the Act’s “prohibition on aircraft of any air carrier owned or controlled by the Syrian government to take off from or land in the United States,” will cause Syrian panic? As it stands, there aren’t enough Syrian assets in the US to substantially impact Syria, and there was essentially zero air travel between the two countries even before the 2003 legislation. Therefore, these punishments are in effect nothing more than symbolic gestures—the kind of symbolism that (unfortunately, but realistically) will not get Syria to give up their terror sponsorship or their WMDs. According to the US State Department:

Implementation of sanctions comes after many months of diplomatic efforts to convince the Syrian government to change its unacceptable behavior. Secretary Powell conveyed US concerns to Syrian President Asad repeatedly, including in their May 2003 meeting. The Syrian government has failed to take significant, concrete steps to address these concerns.

The SAA’s intentions are honorable, but because it lacks teeth, it will have little affect on reversing Syria’s hostile policies. It should be viewed as only a start toward tougher action against Syria and by no means a panacea. According to the White House,

11 China, as a permanent member of the UN Security Council, has the power to veto any Security Council resolution.
14 Ibid.
15 Syrian government and individual assets in the US is likely to be too small to put any genuine financial pressure on the Asad regime.
The President will consider additional sanctions against the Government of Syria if it does not take serious and concrete steps to cease its support for terrorist groups, terminate its weapons of mass destruction programs, withdraw its troops from Lebanon, and cooperate fully with the international community in promoting the stabilization and reconstruction of Iraq.\footnote{Office of the White House Press Secretary. “Fact Sheet: Implementing the Syria Accountability and Lebanese Sovereignty Restoration Act of 2003” 11 May 2004.}

Unfortunately, the other sanctions in the Act from which the president can choose would also prove unfruitful and meaningless toward affecting a change in Asad.

Others have also criticized the SAA, such as Claude Salhani of the CATO Institute, who wrote in March 2004 that the Act would not bring about the desired American change in Syria. He argues, however, that the SAA is far too hostile and confrontational, not too weak. According to Salhani, the Act does not offer enough carrots to go along with the many sticks, and that it ultimately “leads in the wrong direction in the fight against anti-American terrorists by escalating an unnecessary conflict in the Middle East that will only strengthen those who wish us harm.”\footnote{Salhani, Claude. “The Syria Accountability Act: Taking the Wrong Road to Damascus” The Cato Institute, 18 March 2004; Accessed 18 May 2005; available from http://0-www.ciaonet.org.bianca.penlib.du.edu/main/focus01frm.html; Internet.}

I could not disagree more with Mr. Salhani’s belief that a softer policy will compel Syria to change. Just as President Eisenhower advised President Kennedy in dealing with the Soviet Union, only demonstrations of military strength are respected by nations like Syria. Time and time again, the most effective means of altering Syrian behavior has been through the use of diplomatic pressure and the threat of force, not by offering rewards to cease callous behavior.

Asad even said in February 2005, “Washington has imposed sanctions on us and isolated us in the past, but each time the circle hasn’t closed around us. If, however, you ask me if I’m expecting an armed attack, well, I’ve seen it coming since the end of the war in Iraq.” It seems likely that Asad feared Bush’s tough talk would turn into action and was therefore largely responsible for Asad’s pullback from Lebanon. Nonetheless, as appearances are so important in the Mideast, Asad can’t be seen as weak by bowing to US demands. That is why he commented in a speech before Syria’s parliament on March 5\textsuperscript{th}, 2005, “there is an impression, which is wrong, that Syria is in a predicament and we have to find a way out.”\footnote{Nwazota, Kristina. “Syria’s Role in the Middle East” PBS Online NewsHour; accessed 20 May 2005; available from http://www.pbs.org/newshour/bb/middle_east/syria/us.html; Internet.}

To refute Salhani’s contention even farther, I cite remarks made by Jon Alterman in responding to a statement by Bush administration officials in April 2003: “The fact that administration comment tailed off so quickly suggests that the Syrians backed down
...The pattern often is that the United States threatens the Syrians, and the Syrians back off.\footnote{Alterman, Jon. “Tensions with Syria: Harbinger for Region” Center for Strategic & International Studies, 16 April 2003.}

Pressure worked on Bashar Asad’s father in 1992 following the Madrid peace conference when he finally agreed to lift the travel ban on Syrian Jews. And although such actions are not common, Turkey also successfully pressured Syria to end its support for PKK terrorists and give up claims to disputed territory.\footnote{Ma’oz, Moshe. “Guest lecturer” University of Denver, 18 May 2005, Denver, CO.}

The effectiveness of the recall of the US ambassador from Damascus in protest of the Hariri assassination will be minimal. A mentioned earlier, this measure was employed before, when the Reagan Administration pulled its ambassador in 1986 as the result of direct Syrian government culpability in terrorism. The US ambassador returned to Damascus the following year as after some Syrian counterterrorism concessions, but has the world seen a complete cessation of Syrian terror since then? The answer essentially is no: while support for anti-Israel and anti-American terror groups continues in Syria to this day, there have been no further acts of terrorism committed by Syrian government members directly since that 1986 incident. Does this imply that the Syrians learned not to support terrorism altogether or did they simply learn not to support it directly? Clearly, they are now more prone toward plausible deniability, through their use of proxy terrorists in the form of Hezbollah and other groups, but with similar objectives of murder.

**Syria in Lebanon**

Skimming from the UN Oil-for-Food program brought Iraq and Syria billions more, a source of revenue that has since dried up for President Asad. To also lose the Lebanese source would be damaging to his personal bank account as well as to Syria’s already troubled economy.

A concern should be that as Syria pulls back from Lebanon, international pressure on their myriad faults will fade, leaving a misperception that world opinion has created a kindler, gentler Syria, one that has reformed and can now be dealt with in good faith. International sentiment will assume that if that Syria no longer occupies Lebanon with
soldiers, then there will exist no farther problems emanating from Syria. Once the US and international focus shifts away from Syria, they will freely reengage their all-important economic ties with Lebanon, maintaining Asad’s grip on both countries. This will easily be accomplished because economics are much less visible than politics, car bombs, and assassinations. Massive street demonstrations will not be formed around economic remittances; and in the absence of those protests will come an absence of international pressure on Syria. Ayman Abdul Nour, founder of the “All 4 Syria” website and an Asad supporter said, “we always hope for delay. If we can delay withdrawal, the Lebanese will start to fight among themselves, the Americans will turn their attention to Iran, the French will be caught in internal politics.”

This withdraw, which was significant in numerical and symbolic terms, will not sufficiently alter the on-the-ground realities of Syrian influence in Lebanon. Similar to how the mafia controls a geographic area without the need for large armies, Syrian loyalists will ensure Lebanon’s economic vitality for Asad, though perhaps at the expense of political influence. The loss of some unconditional political influence will be the only real result of the Hariri assassination, the UN pressure resulting from resolution 1559, the massive popular demonstrations in Beirut, the US pressure, and the suggestions by Arab nations like Saudi Arabia to vacate Lebanon. Without persistent attention, highlighting Syria’s other provocations, terrorists will continue to use that country as a base of operations, US troops will continue to be attacked from the Syrian side of the border, insurgents will continue to flow from Syria into Iraq to confront US troops, and weapons of mass destruction will continue to be pursued by terrorist supporters, retarding the peace process. In the absence of additional persistent massive domestic, Lebanese, regional, American, and international pressure, what incentives will the Syrians have for altering these policies on their own?

Will Asad now capitulate to US desires for democracy and peace to spread throughout the Middle East? Evidence suggests that such bliss is unlikely while Asad remains in power. He is now trying to re-secure his power within his own government, by taking

---

24 The fact that Syria’s large force of some 40,000 troops in Lebanon at its peak was actually profitable for Syria instead of being costly indicates the extent of the Syrian pillaging and pilfering. The fact that Syria’s troop level had receded to around 15,000 even before the Hariri assassination suggests that the same economic benefits could be reaped by Syria without the cost of stationing an unnecessarily large force in Lebanon. The implication is that even if Syrian troops withdraw completely, the security personnel, Syrian citizens, and networks that are left behind will still ensure a steady flow of remittances to support the Syrian economy. Significant economic benefits, at this point, without the physical and diplomatic costs can be attained by Syria without troops. See also Rudge, David. “Syria doesn’t need military to control Lebanon” Jerusalem Post, 24 May 2005; accessed 24 May 2005; available from http://www.jpost.com/servlet/Satellite?pagename=JPost/JPArticle/ShowFull&cid=1116901693621&apage=2; Internet.
such steps as enforcing mandatory retirement for senior officers of the military.\textsuperscript{25} Recent suggestions by Syrian politicos that Asad may not be the singular force in Syria like his father was but rather that a more oligarchical group may have wrested power from him appears to be behind Asad’s mistrustful/fearful/suspicious purges.\textsuperscript{26} This paranoia is characteristic of all the great dictators, from Stalin to Hitler to Saddam.

\textbf{Democracy and Human Rights}

Initial indications that democratic reforms would follow the death of Hafiz al-Asad in 2000 have faded after dozens of “Damascus Spring” democracy advocates were imprisoned. And the current President Asad believes that external “trouble” will require him to spend more money on the army and security issues, slowing or impeding reforms.\textsuperscript{27} President Bush stated in November 2003, “Dictators in Iraq and Syria promised the restoration of national honor, a return to ancient glories. They’ve left instead a legacy of torture, oppression, misery and ruin.”\textsuperscript{28} The associate director of the Middle East division of Human Rights Watch, Jenny Sherry, said Syria’s restrictive state of emergency laws, make the prospect of a fair trial for detainees unlikely.

Certainly in no way are political prisoners fairly tried in Syria. For years now they have been brought before the special state security court. I have personally been inside that court and watched trials, they are absolutely unfair, with no minimal international standards or guarantees for a fair trial, and most importantly there is no right of appeal of security court decisions. Since 2001 the security court has been specifically targeting reformist members of parliament and other human rights activists and sentencing them to long prison terms.

Human Rights Watch says Syrian courts aren’t likely to give the political dissidents fair treatment. And according to Amnesty International, thousands of political prisoners continue to languish in Syrian jails.\textsuperscript{29}

\textbf{Support for the Iraqi Insurgency and Terrorists}

\textit{Insurgents}

\begin{footnotesize}
\footnotesize
\begin{itemize}
\item^{26} Klein, “Appointment in Damascus.”
\item^{27} Klein, “Appointment in Damascus.”
\end{itemize}
\end{footnotesize}
Since early on in the Iraqi insurgency, Syria facilitated attacks which led to the deaths of many Iraqi civilians and US military personnel. Of the 248 foreign fighters caught in Iraq by September 26, 2003, 123 of them were Syrian, according to L. Paul Bremer III. Secretary of Defense Rumsfeld had this comment about Syria:

> We know that Syria has been a hospitable place for escaping Iraqis and we know that Syria has facilitated terrorists with the cooperation of Iran down through Damascus into Beirut into the Bacaa Valley and down into Israel as well as we see buses come out of Syria filled with people who were coming in to join the fray. Early on. So let there be no doubt the powers that be in Syria and Iran are not wishing the free Iraqi people well.  

General Meigs has said that the US has “got to be very careful about interference from Syria and from Iran . . . the Baathists in Syria are very much engaged in trying to make this insurgency work. And that is going to be a problem that the administration is going to have to take on even more strongly as we go forward.”

The Syrian’s often talk of their inability to control their long border with Iraq, preventing them from stemming the tide of insurgents who come to kill US citizens there. If that is the case, then why have they had success in controlling their long border with Jordan? And why do insurgents tell of receiving safe transit through Syria to Iraq and make comments like their only regret during their time in Iraq was, “I didn’t have the good fortune to shoot any Americans.”

If Syria is indeed as unhelpful as these quotes would have us believe, then why the American delay in taking decisive action against Syria? The natural reluctance to use military force is understandable, and it should be the last option, but I believe that it will turn out to be the necessary choice in order to protect out soldiers in Iraq, the future of that nation, and the region as a whole. Like a cancer, sometimes it is best to just excise a tumor completely rather than treat it bit-by-bit after each relapse, hoping that it doesn’t recur.

**Terrorist Connections**

Syrian ambassador to the United States Imad Moustapha even went so far as to deny Syria’s terror links altogether: “Syria has never, ever had any hand with any terrorists ... or anything that is happening in the occupied territories. What’s happening in the occupied territories, a vicious circle of violence and counter violence, has everything to do with the Israeli policies there.” But at a March 2005 meeting of Palestinian factions in Cairo, “the Hamas and Islamic Jihad delegations consist[ed] only of representatives from

---

Syria and Lebanon. The Hamas team [was] being headed by Khaled Mashaal, while the Islamic Jihad [was] represented by Ramadan Shallah. The two live in Damascus.  

Additionally, Syrian support of Hezbollah is support for terrorists who perpetrate and incite violence. That was confirmed just recently by Europe’s ban of Hizbollah’s al-Manar television channel, which will no longer be available on European satellites. European Union broadcasting regulators in Brussels agreed to step up action against TV broadcasts which incite hatred or promote racism and xenophobia, like al-Manar television. The rallies held by Hezbollah in favor of Syrian occupation of Lebanon illuminates their close relationship.

Asad was characterized as evading the issue in his response to the question of closing Palestinian “reactionist” group offices in Damascus. “If you’re an American and I don’t want you here, should I send you to Africa or to the US, your country? . . . That’s what I told [Assistant Secretary of State William] Burns: Where should I send [the Palestinian radicals]? To the Mediterranean, on a boat?” But he also claimed there were no Palestinian extremist offices in Damascus. “They have houses. They live in the houses, meet with people in the houses. That’s what they call offices. . . They don’t have members in Syria; all their members are in Palestine. The only thing they used to do was call in the media to express their position.” That contradicts US and Israeli beliefs that even the suicide bombing of February 25th, 2005, which killed 5 in Tel Aviv, was planned from Damascus. And as members of these radical terror groups have said about their leadership structure, the political wing [from Syria] trumps the military wing. So if the orders come from Damascus not to bomb Israel, they therefore must also instruct members to bomb Israel. In short, terrorist kingpins live in Syria.

Even seemingly positive concessions made by Syria such as the capture and handover by the government of Sabawi Ibrahim al-Hassan al-Tikriti, half brother of Saddam Hussein and one of the United States’ most wanted members of Iraq’s former regime, and the beginnings of Syria pulling its troops out of Lebanon, have been met with skepticism.

Princeton University professor of Near Eastern studies Michael Doran told the New York Times that he believed Syria was behind the assassination of former Lebanese Prime Minister Hariri, saying it was the latest chapter in Syria’s cycle of provocation followed

36 Klein, “Appointment in Damascus.”
37 Nwazota, Kristina. “Syria’s Role in the Middle East” PBS Online NewsHour.
by conciliation. “Ever since the 1980s Syria has played this game of being both the
arsonist and the fire department.”

Professor Doran also remarked, “they miscalculated how badly the Hariri assassination
would backfire. Now, they’re trying to curry favor with Washington to prevent the
United States from coming down too hard on them. They’ve backed themselves into a
corner, and they’re trying to get out.”

“All regardless of how they try to portray us, we will not fall into this trap,” Ambassador
Imad Moustapha said during a March 2, 2005 interview.

We are not enemies of the United States of America. We don’t need to create
hostilities with this country. Actually, we have repeatedly invited the United
States to constructively engage with Syria. We told them, if there are problems
and issues between us and you, let’s sit together, let’s engage, let’s put them on.

Moustapha said a hostile relationship serves neither country.

“I don’t think it’s useful to Syria to be portrayed as an enemy to the United States,” he
added. “But... also it doesn’t serve the long-term interests of the United States to create
more and more enemies in the Middle East.”

In January the U.S. had given Asad a list of thirty-four wanted men assumed to be in
Syria. Asad claims that the information provided by the US is not complete enough for
him to find the men. “Many of these names we don’t know. What does his face look
like? What’s his real name? Maybe he’s using a fake name or a fake passport. You
should give us precise information because we can’t find them.”

**Case Study**

**Panama**

An interesting example of years of US reluctance to engage military forces in favor of
naive optimism is found in the case study of the events that led to the US military action
in Panama in 1989, Operation Just Cause.

The genesis of the Manuel Noriega headache for America dates back to 1979, when
Carter administration officials blocked federal indictments against Noriega for drug
trafficking and arms smuggling, and manifested from that point up until the invasion. In
August 1983, Noriega assumed command of the Panamanian Defense Force (PDF). In
May 1984, Noriega and the PDF intervened in the presidential elections and rigged the

40 Nwazota, Kristina. “Syria’s Role in the Middle East” PBS Online NewsHour.
41 Klein, “Appointment in Damascus.”
results to produce a victory for Noriega’s candidate. In September 1985, Dr. Hugo Spadafora, a popular critic of Noriega, was brutally tortured and murdered after making serious and credible allegations about Noriega’s illicit activities. In June 1987, Noriega announced he would remain head of the PDF for an additional five years. The next day, his planned successor went public with details about Noriega’s crimes. That same month, the US Senate approved a nonbinding resolution calling for Noriega to step down. Noriega supporters attacked the US embassy with rocks and caused extensive damage. Then Panamanians staged a general strike that caused Noriega to suspend the free press. The US responded by suspending military aid to Panama, cut contacts with their government, and subsequently removed Noriega from the CIA payroll. General Woerner then assumed command of SOUTHCOM and publicly criticized Noriega.

After all that, the US still believed that it could negotiate with General Noriega. Between August and December 1987, The US tried to work a deal with Noriega to step down and permit free elections of a new government. However, in February 1988, federal grand juries in Miami and Tampa indicted him for racketeering, drug trafficking, and money laundering. Panama’s president then fired Noriega, but he responded by ousting the president and replacing him with a more reliable politician. When, in March 1988, PDF officers staged an unsuccessful coup d’etat against Noriega, the plotters were brutally tortured and executed. Noriega next created Dignity Battalions to augment the PDF forces. This induced the Reagan administration to finally consider military action, but DoD and others opposed it. Economic sanctions were considered while the administration again attempted to get Noriega to step down voluntarily. Between April and June 1988, economic sanctions were implemented against Panama. US President George H. W. Bush came into office in January 1989 and in May 1989, presidential elections were held in Panama. Noriega stole the election with widespread fraud. Dignity Battalions assaulted opposition candidates and crowds in front of the world media. On October 3rd, 1989, Noriega survived another coup d’etat and executes the plotters. On December 15th, 1989, the Panamanian National Assembly appointed Noriega “Maximum Leader” and head of the Panamanian government. It further declared that a state of war existed between Panama and the United States. The next day, PDF soldiers fired on an American vehicle and killed a Marine Corps lieutenant. A U.S. Navy lieutenant and his wife observed the shooting and were arrested. The lieutenant was severely beaten and his wife was physically abused and threatened, particularly disturbing President Bush.

Finally, Chairman of the Joints Chiefs of Staff General Colin Powell recommended the use of a large-scale military force to remove Noriega from power. Secretary of State James Baker agreed and argued that military force was needed to destroy the PDF so that a truly democratic civilian government could be installed. President Bush ultimately observed, “This guy is not going to lay off. It will only get worse.” President Bush then ordered the invasion of Panama and Noriega was removed shortly thereafter, returning democracy, stability, and the safety of global commerce to the isthmus.

---

It is important to remember that during the Cold War, Panama was a strategic ally of the United States. The US held a large base there that helped with the anti-Communist activities in Nicaragua and El Salvador and protected the canal. Noriega had worked for the CIA in helping fight the drug trade, providing valuable information, while simultaneously, however, profiting financially from drug trafficking himself. And a large number of Americans living in Panama were in peril, as evidenced by the killing of the US Marine lieutenant. As this was occurring, US senators like Jesse Helms had been squawking about the perils of engaging Noriega and warning against his remaining in power.

Similarly, many in Congress today have been warning about Syria for some time. As with Panama, its central location in a strategically important region, by ally Israel, between Iraq and Turkey, and close to Iran, is worry of special US attention. These locations are obviously important in the twenty-first century’s version of the Cold War, the war on terror. Like Noriega, Asad has helped the CIA regarding al Qaeda since 9/11, but he also helps other terrorists at the same time. He benefited from the illicit funneling of Iraqi oil in violation of the UN sanctions. And now he is threatening the lives of American volunteers, contractors, diplomats, and soldiers in Iraq.

The United States has repeatedly asked Syria to alter its behavior, and has received only token gestures in return. Shortly after the terrorist attacks of September 11th, 2001, President Bush emphatically told the world, “either you with us, or you are with the terrorists.” Although Syria has helped CIA officials since 9/11 against al Qaeda, clearly they are not one hundred percent in America’s camp. Their cooperation against al Qaeda has come only as a result of mutual interests. Al Qaeda has always opposed the secular Baathist regime in Syria, just as they opposed Saddam Hussein’s Baathist government in Iraq. Syria has a history of fighting against Islamic extremists in their own country simply to protect their autocracy, not out of an abhorrence to terrorism.

Syria’s alliance against America with Iran, a founding member of the “axis of evil,” on February 15, 2005 (the day after the Hariri assassination) was a harbinger of increasing tension. Their announcement on May 24, 2005 that they will be completely severing all ties with US military and intelligence forces further indicates their increasing hostility to America. This rapid deterioration of relations signifies that a peaceful solution to Syrian agitation may no longer be possible.

The precedence exists in recent US foreign policy for military engagement with Syria—counterterrorism (Afghanistan and Iraq); WMD (Iraq); occupation (Iraq); political repression (Iraq and Panama); humanitarian (Haiti, Somalia, Kosovo, Iraq) and; protection of American citizens (Panama and Grenada).

Rarely have all of these conditions existed simultaneously in one country—as they now do in Syria.

**Use of Military Force**

The military option is, as always, the last option that should be considered. In the case of present-day Syria, however, it is increasingly becoming an alternative that is worthy of consideration. In the current debate over US military action against Syria, much of the attention is focused on whether the US military is even capable of such an operation due to the numerous engagements presently tying up America’s defense resources. Retired US Army General and military analyst Montgomery Meigs responded when asked if US forces were able to currently engage Syria as well, by saying that it “... is going to be hard . . . The forces are pretty well stretched. Could you surge to another contingency? Yes. Would it be very hard? Yes. Would logistically it be very hard? Very much so, given what we’ve got to keep sending to Iraq. ...” But at the same time, it must also be considered that the large military contingent just east of Syria also makes the move toward Damascus that much easier, compared to the initial logistical movements undertaken for the 2003 action against Iraq.

Excerpts from a conversation between retired US military generals Montgomery Meigs, Barry McCaffrey, and Wayne Downing further highlight the possibility for military action against Syria:

MEIGS: . . . You can do enough things over the short term to push [Syria] into a situation where they’re going to either have to comply or you’re going to have to take some serious action.

DOWNING: . . . to topple the Bashar Asad regime I think is out of the question. However, to conduct a military surgical operation, a strike against the base areas that they’re using for the insurgency in Iraq is very much within our capability. And when I say a surgical operation, I’m talking about airstrikes and I’m also talking about putting some people on the ground to capture some of these people and to bring out documents and proof of what’s going on. That’s very, very much within our capability. . . . I think we are very, very fed up with the Syrians now as a result of this Hariri bombing.

---

47 ‘Hardball with Chris Matthews’ MSNBC 22 February 2005.
48 I include this lengthy exchange to compensate for my lack of military experience, and thereby defer to the experts on the manners of military execution.
MCCAFFREY: I think we can threaten the Syrians, threaten the Iranians, airstrikes, special operations strikes. As a matter of fact, conventional power against the Syrians is probably possible, a cross-border foray by a division of the United States Army.

[In response to a question about whether President Asad can hurt the US and what his response would be if the US took military action against Syria:]

DOWNING: No, I don’t think he can do that. I think he can probably pull out his kleenex and wipe his nose with it. But he really can’t do a lot else. . . We don’t want to have a war with Syria. But what we do want to do is moderate their behavior. Now, going to the military side of this thing, I think that we do need to hit the base areas in Syria, in eastern Syria, with some surgical strikes. I think that [] not only would it have a material benefit in stopping some of the infiltration and some of the support for the operations, but it will also be a very, very dramatic signal to Asad that we’ve had enough of this stuff with them and he’s got to knock this off and start getting control of his regime.49

Conclusion

General Downing summarized the Syrian situation well by telling us to just remember. . . it’s not just Iraq. It is just not the assassination of Hariri. It has been the support of Hezbollah, the group that killed more Americans than any other terrorist group in the United States prior to 9/11. It’s been the collaboration with the Iranians, funneling supplies into Hezbollah and, of course, the great effect that this has had on the Middle East peace process. So Syria has to have a change in behavior.50

President Bush’s insistence that Syria pull completely out of Lebanon is encouraging, but it will not complete the task of taming Syria. Bush said, “President Asad has said he is removing to the Bekaa Valley. That is a half-measure. It is a measure, but it is a half-measure. And 1559 is very clear. We worked with France and the Security Council to pass 1559 which said complete removal, not half-measures, but total removal.”51

The President’s national security advisor Stephen Hadley’s remarks are also encouraging that the pressure will remain on Syria at least until the withdraw is complete. “Initial reports are encouraging. At the end of the day it is going to be deeds not words that matter.”52

Former ambassador to Syria and assistant secretary of state for the Near East Edward Djerejian has said properly working with the Middle East

49 ‘Hardball with Chris Matthews’ MSNBC, 22 February 2005.
50 ‘Hardball with Chris Matthews’ MSNBC, 22 February 2005.
is going to take a great deal of intelligent handling. We want the march to freedom to happen in the Middle East but we don’t want unintended consequences where in these changes the wrong people come to power. . . That is not a formula for stasis. On the contrary, we should continue to encourage vigorously political and economic change.\textsuperscript{53}

As George W. Bush remarked in a 1999 speech, “in the defense of our nation, a president must be a clear-eyed realist. There are limits to the smiles and scowls of diplomacy. Armies and missiles are not stopped by stiff notes of condemnation. They are held in check by strength and purpose and the promise of swift punishment.”\textsuperscript{54} Threats of force and possibly force itself will be necessary to end the shell game being played by Asad. Temporary and token gestures should not be accepted for perpetuity when it comes to world peace.

The foreign policy recommendations for the US regarding Syria are simple: Threaten Syria with military force, giving them time to comply while allowing our forces to prepare in Iraq and Afghanistan. Make sure that all demands are met fully and in a lasting form. If and when that does not happen, explain that they were given many decades to become honorable members of the international community and their failure to do so will now be redeemed with force. An analysis of past practices and current agitations demonstrates that ultimately force will be necessary to fully achieve all US demands. Diplomacy always is the best choice, especially when dealing with honest brokers. And the military option should always be the last resort, but it is not always the worst choice. Would any form of democracy and human rights have come to Iraq during Saddam Hussein’s reign? And although it is still in it’s early stages, it appears that the US invasion of Iraq will be a net positive for global democracy and freedom. If Syria is left to its own devices, terrorism, repression, and agitation will continue and peace in the region will remain illusive.

At the conclusion of his recent interview with reporter Joe Klein of Time Magazine, Asad asked, “Please send this message: I am not Saddam Hussein. I want to cooperate.”\textsuperscript{55} If that is the case, then cease trying to appease critics by taking only half-steps: get completely out of Lebanon, completely shut down the Palestinian terrorist existence, provide better security at your Iraqi border, turn over insurgents, provide democracy and human rights to your people, and stop seeking weapons of mass destruction. It requires no dialogue; only compassion and action.

Using 2000 Census data and new metropolitan area definitions, children in the rural portions of the Northeast, South, Midwest, and West are compared on several measures of well-being. Measures include single-parent families, high school dropouts, idle teens, householder educational attainment, vehicle availability, telephone service, poverty, English-speaking ability, and parental working status.

Children in the rural South are faring worse than children in all other rural regions of the U.S. on eight of ten indicators of well-being. Children in the rural Midwest and Northeast are similar and doing better than average for the rural United States on many measures of well-being. Children in the rural West fall right around the rural national average for all but two indicators – difficulty speaking English and lacking secure parental employment – where the rural West has the highest percentages. Results are from a new report, City and Rural KIDS COUNT Data Book.
“The Effects of the 1996 United States of America Telecommunications Act On Radio Station Ownership”

"The Effects of the 1996 United States of America Telecommunications Act On Radio Station Ownership"

Abstract

On March 7, 1996 the Federal Communications Commission implemented the provisions of the Telecommunications Act of 1996, which brought about sweeping changes in all areas of the Telecommunications industry in the United States of America. One medium that was most affected by this new law was broadcasting, specifically radio. The provisions of the act loosened and in some cases eliminated ownership limitations of radio stations in local markets and nationwide. This study, examines both sides of the ownership issues created as a result of this law.
“The Effects of the 1996 United States of America Telecommunications Act On Radio Station Ownership”

Introduction

Regulation of radio as an industry or service in the United States began in 1910 with the amendment of the Interstate Commerce Act, bringing interstate and foreign wire and wireless communication under federal jurisdiction for the first time (Sophos, 1990).

In 1922, an initial Radio conference was initiated by then Secretary of Commerce Herbert Hoover. Representatives from both government and industry were invited to participate (Hilmes, M. 2002). One of the recommendations to come out of this meeting was that radio should be operated in the public interest, not just to serve the interests of the business or industry controlling it (Hilmes, M., 2002). Subsequent radio conferences were held in 1923, 1924 and 1925. It was the 1925 conference that resulted in the Radio Act of 1927, which then led directly to the Communications Act of 1934 (Hilmes, 2002).

The Federal Communications Commission was also established under President Franklin D. Roosevelt in 1934. Its purpose was to create a specialized, regulatory body, charged with ensuring that radio would serve the public interest, and to prevent the control of this new medium by large national companies (Hilmes, 2002).

Deregulation of the broadcast industry (including radio) began in the 1970s via three actions. Court decisions challenged some protective policies. During the Carter Administration, its paperwork reduction programs questioned the legitimacy of some regulations, either through efficiency or necessity. By the time the decade of the 1980s arrived, both competition and economic opportunities, it was argued, were sufficient to
allow for relaxation of previous rules, particularly as they pertained to ownership of
broadcast outlets (Bates, 1995).

Beginning in 1980, the Federal Communications Commission (FCC) started the
process of deregulating the business of broadcast media (Bates, 1993). The concept of
“public interest” was going to be served by market forces; in other words, a free market
system, through competition, would ultimately the public interest better (Bates, 1993).

While the legislation addressed a number of issues of deregulation, which
included not only broadcasting, but also cable television, telephone, Internet, and other
communications industries (Clinton, 1996).

The business of radio, as it relates to the Telecommunications Act of 1996, was
altered by both deregulation and relaxation of ownerships rules (Bates, 2002). This act,
signed into law by President Bill Clinton, was designed to be the most comprehensive
look at media ownership regulations in the agency’s history (Clinton, 1996). Through
this legislation, the Federal Communications Commission (FCC), was mandated by
this Congressional Act to pursue “the core public interest concerns of promoting
diversity and competition” (Evans, 2002). Along with this diversity, the goal was to
further competition, promote diversity in programming and viewpoints, and serve the
public good (Evans, 2002).

When the Telecommunications Act of 1996 became law, one benefit touted was
that opportunities would increase for smaller businesses to compete against larger
corporations (Beech, 1998). Since the implementation of this act, there have been a
number of points of view expressed, both pro and con, about the effects of the
relaxation of ownership regulations by the Federal Communications Commission.
According to Lawrence Gasman, “The Clinton administration’s greatest achievement may well be the passage of the Telecommunications Act of 1996. The 1996 revision of the 1934 Act is the first attempt to reform the whole of telecommunications law, not just one specific aspect of it” (Gasman, 1996).

The beginning of deregulation of radio (and other media) saw a lifting of governmental restrictions on not only the content, but also the expression of various ideas. This flew in the face of the lifting of the Monroe Fairness Doctrine in 1987 (Hanson, 1999). Some studies have concluded that the repeal of the Fairness Doctrine had no measurable influence on the amount of public affairs provided by the groups of radio stations (Loomis, 1998).

In particular, the deregulation of the broadcast radio industry focused upon ownership, which allowed for greater holdings of stations by a person or corporations (McConnell, 2003). In 1938, the Federal Communications Commission banned ownership of two AM radio stations in one market. Following suit in 1953, the agency banned local FM combination ownerships. In 1964, the FCC banned combination ownerships when their signals overlapped. In 1970, AM/FM combination ownerships were banned. This changed in 1992, when the FCC allowed “same-service combos,” which allowed two AM and two FM in markets with fifteen or more stations, as long as the market share did not exceed 25%. In smaller markets, three-station “combos” were permitted. (McConnell, 2003).

But in 1996, through the Telecommunications Act, Congress lifted local ownership limits again, based upon a sliding scale. Markets containing 45 or more radio stations were allowed eight to one owner. In markets with fourteen or fewer
stations, five outlet combinations were permitted, but could not consist of more than half of the market total. One of the biggest rules to be relaxed was that national ownership limits were removed (McConnell, 2003). Large-scale mergers and acquisitions followed, and in 1998, the FCC “flagged” radio mergers, giving one owner up to 50% of Arbitron-market revenue, or to of 70% (McConnell, 2003).

**Methodology**

The purpose of this study was to examine the results of what the Telecommunications Act of 1996 have been, in regard to ownership of broadcast radio stations in the United States. Through a review of the literature, representing the past eight years since the signing of the act into law, a substantial number of points of view have been collected representing both sides of the issue. The sources utilized include articles from scholarly journals, popular press, textbooks, and the Internet. These points of view will be presented, along with a discussion and conclusions of the effects of the law upon the radio medium. There are several issues to be examined, as they relate to the Telecommunications Act of 1996. These questions/issues include:

1. What are the advantages and positive attributes of the Telecommunications Act of 1996, which relaxed the rules of ownership and allowed for consolidation within the radio industry?

2. What are the disadvantages and negative attributes of the Act?

3. What do the results of the examination show since the signing of the bill into law?

Since the implementation of the Telecommunications Act of 1996, much discussion has been initiated by and to the Federal Communications Commission, in regard to whether or not the relaxation of the ownership rules is of positive benefit to
the public. These discussions, as of this writing, are still ongoing. The controversy
over the rules of ownership prompted the efforts of this research.

**Points of View – For the 1996 Relaxation of Radio Ownership Rules**

Does ownership affect changes in formats for radio stations? According to Kevin
Gray, this deregulation, which allows for greater ownership of properties, has begun a
wave of radio format changes. As a result, owners and programmers are coming up
with new combinations of music and programming, in order to serve the public, which in
turn is remaking the face of the radio medium (Gray, 1997). Some in the radio industry
say that large owners with strong resources are demonstrating a willingness to
experiment within markets. Jacor Communications, for example, in Louisville, Kentucky
is cited for the variety of formats it presents in this market, which includes a 1970s rock
station, and a joint venture with a station that plays new age jazz (Flamm, 1997).

Another example involves two stations in San Francisco, KMEL and KYLD, which
held nearly identical urban formats. Evergreen Media Corporation purchased them
both. The company turned one into an African-American urban and the other into a
Latino format. The result, according to Broadcast Programming consultant Casey
Keating is “two thriving stations that have found their focus” (Flamm, 1997).

CapStar Chief Executive Officer Steve Hicks says, “Consolidation is actually
increasing the diversity of programming. We are able to serve a bigger audience and
create a broader spectrum of formats” (Flamm, 1997).

Since owners hold more stations, more chances are being taken, not only with
formats, but also with other programming. As a result, there are more choices for the
listeners, since more different types of programs are available (Ansolabehere, 1998).
The solutions offered by the 1996 Telecommunications Act were partially predicated on market-based options. People know what they want and as a result, will respond to programs which offer what they wish to hear. In that sense, the media serves the public by being more democratic (Ansolabehere, 1998).

The head (at that time) of the Federal Communications Commission, Michael K. Powell, offered that the act promotes competition and puts the various media (including radio) into business, economic and market realities (Powell, 1998). Powell stated, “As we policy leaders tackle the intellectually and psychologically draining task of facilitating telecommunications reform, we need to muster the courage to yield our regulatory primacy back to the market. I firmly believe that if we accomplish this task, those who look back on our efforts years from now will be able to do so with admiration” (Powell, 1998).

One long-standing argument, since the beginning of the 20th century is that the United States government has regulated the broadcast industry due to limited space on the electromagnetic spectrum. This limited space should prevent anyone from “owning” the airwaves, nor allow for undue control of much of it. But since that time, the development of new media, such as the Internet have weakened this argument, because of expansion of broadcast and other communication opportunities (Hendricks, 1999). Telecommunications reform paid off well for radio companies. According to Richard Rosenstein, a media analyst with Goldman Sachs, “The consolidation (in radio ownership and markets) has created clusters of stations that have been able to
compete much more efficiently, and the numbers are showing that ‘the rationale for consolidation makes sense’ (Rathbun, 1997).

The act paved the way for broadcasters to own up to eight radio stations in a major market. With that kind of market presence, both ratings and advertising revenue have gone up (Rathbun, 1997). David Pearlman, American Radio Systems Co-Chief Operating Officer said, “As we gain (audience) share, we are much more attractive to the advertiser, who is spending the money” (Rathbun, 1997).

Industry representatives have praised the results of the 1996 law. Eddie Fritts, President and Chief Executive Officer of the National Association of Broadcasters, stated in a Senate Commerce Committee hearing in 2002, saying that the broadcast radio medium remains a diverse, local, community oriented medium (Ramsey, 2002). Fritts also said, “Today, the industry (radio) has rebounded financially, but, just ten years ago, sixty percent of stations were losing money. In sum, the Telecommunications Act has been a success for our listeners. And what’s good for our listeners is good for our industry” (Ramsey, 2002).

From one management perspective, consolidation of operations, particularly within similar markets, makes good sense. In a recent merger of three small stations (KVRC-AM, KDEL-FM and KYXK-FM) in the Arkadelphia, Arkansas market (population, 10,000), the purchaser, Jay Bunyard, predicted that the consolidation “will be good for Arkadelphia and Clark County in general” (Newsom, 2002). Both of the sellers, Eddie Graham and Phil Robken said the sale of the stations would have distinct advantages for listeners of all three radio stations. For example, it will be easier for people to telephone both stations with a single once the merger takes place (Newsom, 2002).
“It’s kind of like one-stop shopping,” Robken said. “I just think it will be better for both the listeners and the advertiser’s marketplace” (Newsom, 2002).

Another advantage of the Arkadelphia, Arkansas sale will be that the consolidated radio stations will be jointly better off financially than as separate broadcast properties. Robken also said, “There will be one owner who will have both (stations), who will have the resources to devote to the best quality of programming” (Newsom, 2002).

The sharing of resources is another “pro” argument. There are several advantages in regard to this type of management consolidation. The arguments are that talent, sales staff, engineers and promotions efforts can be maximized. The advantages are greater capability, flexibility, and cost savings (Irwin, 2002). This has occurred in many other businesses and industries. Consolidations have occurred in banking, motion picture theatres, and insurance companies, to name a few (Robinson, 2003).

Infinity Broadcasting Chief Executive Officer Mel Karmazin says “I believe that changes (as the result of the 1996 act) are tremendously beneficial for everyone who owns a radio station, whether a single station or the maximum allowed by the FCC. This gives independent operators a choice to sell and exit the business if they choose. But even if they don’t, they could be just as effective as they were” (before the rules change) (Taylor, Reece, Ross, Carter, 1996).

Lowry Mays, President and CEO of Clear Channel, the largest radio conglomerate in the United States following the deregulation in 1996, stated, “It (the law) gives us the ability to get into a lot of new, good markets (with stations) that already
have exciting strategic positions and fantastic local management in place” (Petrozzello, Rathbun, 1996).

Since the Telecommunications Act of 1996 was signed into law, the radio industry has changed. But, some argue, so has the nature of business in general. As Philip Napoli states, “Media organizations are both political and economic entities. They are able—and even expected—to influence public opinion, government policy and citizen voting behavior…At the same time, media organizations’ continued existence in a capitalist system such as ours depends upon their ability to maximize revenue and minimize costs (Napoli, 1997).

Even one Federal Communications Commissioner, Jonathan S. Adlestein, who points out many weaknesses associated with deregulation in radio, admits that “Now, I understand that some consolidation can be a good thing. In radio, as in other sectors, economies of scale can lead to services that would not otherwise be possible” (Adelstein, 2003).

Despite many criticisms of the effects (and potential effects) of the 1996 act, there are those who feel that the end result is still positive and preferred. Stuart A. Shorenstein and Lorna Veraldi write in an industry magazine, in a discussion of a (then) upcoming FCC review of media ownership rules in 2003, “It may be that competition would insure localism, diversity, and other desirable outcomes in the absence of ownership rules—not because that is what the government dictates, but because that is what consumers demand” (Shorenstein, Veraldi, 2002). Federal Communications Chairperson Michael Powell, who supported deregulation strongly, along with his supporters argued that there was no real choice here—that changes in technology are
occurring, constantly and quickly and that the United States must keep abreast of these changes, or fall behind the rest of the world in media dominance (Kalb, 2003).

**Points of View – Against the 1996 Relaxation of Radio Ownership Rules**

One key element of the Telecommunications Act of 1996 is that the law relaxed media ownership rules. In practice, this has allowed for increased ownership concentration in all sizes of radio markets. One of the points of argument is whether a greater control of media resources into fewer hands is a preferable public policy (Ekelund, Ford, Koutsky, 2000).

The 1996 act eliminated a cap on the number of radio stations a single company can own nationwide. This relaxation of local ownership limits, which allows a single owner to control up to eight stations in the country’s largest markets, has led to more stations controlled in fewer hands (Adelstein, 2003). According to Jonathan Adelstein, FCC Commissioner, in the first year after the signing of the act into law, more than 2,100 of approximately 11,000 radio stations in the United States changed hands. Most of those properties sold went to concerns that already owned stations (Adelstein, 2003).

In 1996, the two largest radio group companies owned fewer than 65 stations. Six years later, the largest radio group owned approximately 1,200 radio stations. The second largest held 250 (Adelstein, 2003). Adelstein says that according to one FCC report, in the six years following the adoption of the 1996 act, the number of radio station owners in this country has declined by 34 percent. The FCC found that this decline is due to mergers between existing owners, for the most part (Adelstein, 2003).
Deregulation and Radio Ownership

One of the primary effects desired by the FCC in the concept of deregulation was that of providing local ownership, or what the agency terms “localism.” The argument has been advanced that the opposite effect has occurred. As the number of owners continues to decline, local, independent owners are fading from view, since they cannot compete with the larger, more powerful conglomerates (Rapela, 1999).

According to Radio Business Report, more than two billion dollars worth of radio station sales were announced in the month following the signing of the Telecommunications Act of 1996 into law. That equaled a full year of radio station sales at any time during the decade of the 1980s (Henry, 1996).

In the March 11, 1996 edition of Broadcasting & Cable magazine, it was reported “Radio’s rush to consolidate set new records last week, when more than a half-billion dollars changed hands in just two station deals. Infinity Broadcasting Corporation made the largest-ever-radio-only deal, buying 12 stations owned by Granum Holdings LP. Also last week, Clear Channel Communications, Inc. paid $140 million for U.S. Radio’s 13 stations, plus options to purchase five others. Counting several recent deals it has made, Clear Channel’s portfolio would balloon from 39 radio stations to 52 (Petrozzello, Rathbun, 1996). Media business broker William J. Steding said in 1997, “Last year and 1997 will represent the two highest levels of station trading in the radio industry ever” (Petrozello, 1997).

But according to Tom Carpenter, “In order to save money, Clear Channel sacrifices the uniquely local nature of radio. Certainly, there is value to having national or regionally distributed programming. Radio is made richer with the availability of popular syndicated shows that reach multiple markets. However, the
misrepresentations and falsifications of Clear Channel’s use of voice tracking are quite a different matter. In the Clear Channel behemoth, entire radio stations are operated without a single live and local announcer. This might be what critics refer to when they charge that Clear Channel is killing local radio” (Carpenter, 2003).

Another point for relaxation of the rules by the FCC was that of radio station ownership diversity. The Commission wanted to enlarge ownership opportunities to minorities. In 2002, Broadcasting & Cable magazine reported that the number of stations, which were owned by African-Americans, had dropped by 26% since deregulation spurred a conglomerate-buying spree (McConnell, 2002).

In Billboard magazine, Frank Saxe writes that deregulation has created “nearly insurmountable obstacles” for minorities to enter the business of broadcasting. This was taken from a series of five studies released by the FCC on December 12, 1999. The studies found that the barriers have been increased, not decreased, since the signing of the Telecommunications Act of 1996 (Saxe, 2000). Then FCC Chairman William Kennard said, “There is a severe and tragic lack of women and minorities in this field. It’s bad, and it’s gotten worse…” (Saxe, 2000).

William O’Shaughnessy, a former chairman of public affairs for the National Association of Broadcasters, feels that the facts show locally owned and locally-operated hometown-community radio stations, operated in the public interest by broadcasters who “speak the language” of the neighborhoods, are disappearing. As a result, these independent voices are being snuffed out by what he terms a “cookie-cutter cacophony” of the same music and homogenized programming, sometimes spiced up by stunts and vulgarities (O’Shaughnessy, 2003).
Court decisions have also played a part in the time since the 1996 act was made law. One case, titled “Fox v. FCC,” in some minds has made possible further concentration of ownership. They see it as a war between business capital and the public interest. Alex Poroske writes, “Many small players in the industry and media watchers say they are waiting to hear the bells toll an end to truly independent mass information and media outlets” (Poroske, 2002).

Mike Mills wrote in CQ Weekly in 2002, that the deregulation (indeed the entire Telecommunications Act of 1996) is now considered a regulatory failure (Mills, 2002).

FCC Commissioner Michael Capps has been outspoken in regard to the question of broadcast ownership in the new age of deregulation. He says that now there is data to support what the new law has accomplished, which is that the United States has 30% fewer radio station owners than in 1996. He feels that this has affected consumers adversely with regard to the issues of the quality of radio programming (Schiffman, 2003).

One of the most outspoken opponents of the Telecommunications of 1996 is United States Senator Russell Feingold. He is upset at what he sees as a bad trend in the broadcast industry, with Clear Channel controlling more than 1,200 radio stations. As a result, he has continued to criticize and in 2002, launched an assault against the law and the deregulatory provisions (Absher, 2002).

Senator Feingold vocal concerns are that radio is a public medium, and that the role of government is that is serves the public good. In his view, the concentration of ownership in radio has caused “great harm” to business and the general population (Feingold, 2002).
One anonymous editorial writer in Broadcasting & Cable magazine wrote that the broadcasting industry was turning into conglomerates. In their opinion, the Telecommunications Act was supposed to foster competition and diversity and so far has done neither (Anonymous, 1997).

There has been more criticism leveled at the effects of deregulation in regard to the radio business. United States Congressman Howard L. Berman of California spoke at a Senate Committee hearing on consolidation in the radio industry. He stated at that hearing “consolidation of the radio and concert industries has had a variety of negative repercussions on recording artists, copyright owners and consumers” (Berman, 2003). Berman accused the act of creating illegal activities (on the part of radio conglomerates, namely Clear Channel), a sharp reduction of music programming diversity, disparaging effects on the creative industry, the “exorbitant” rise in concert ticket prices, advertising price and rate-fixing, loss of jobs, the proliferation of non-serving stations (for local publics), along with blatant “anti-competitive behavior” (Berman, 2003).

According to the Internet website “Cotton Candy,” the Future of Music Coalition, 10 parent companies control two-thirds of radio listenership and revenues, with the top two (Clear Channel and Viacom) controlling 42 percent of listenership and 45 percent of industry revenues combined. This the author refers to as the “Clear Channelization” of the radio industry (Borlik, 2002).

The critics of the Telecommunications Act of 1996 argue that with deregulation of radio broadcasting, competition has been at best reduced, and at worst, eliminated in some markets.
In regard to the sale and consolidation of the radio station properties in Arkadelphia, Arkansas, some local reaction has been negative. “None of the management, news, sales or talent personnel actually live within the city limits of Arkadelphia,” said Carolyn Graham, one of the former owners (Graham, 2004). The formats of each station were changed and much of the air operation was automated via computer and satellite feeds. “Other than normal business hours (Monday through Friday), anyone wanted to contact the station will have to leave a message on an answering machine, because no one is present on the premises”, Graham added (Graham, 2004).

**Discussion and Conclusions**

It is interesting to note here that Federal Communications Commission Chairman Michael K. Powell, son of United States Secretary of State Colin L. Powell, is an African-American. He was the second African-American to lead the agency. The concept of deregulation of the Telecommunications industry began with an African-American chairman (William E. Kennard, who was the first African-American to head the FCC.), where the 1996 act was signed on his watch. Powell was a strong proponent of the deregulation concept and the 1996 act (Dingle, Jones, 2001). Yet the numbers of minority owned radio stations have continued to decline since deregulation was introduced. Although some minority owners sold their stations, and made considerable sums of money in some cases, the ultimate goal for an increase in minority ownership of broadcast radio stations has not been realized.
The concept of localism is also under attack. Deregulation was supposed to have as a primary objective the benefit of local programming and service to the radio station’s community. Local ownership has been consolidated, and in many cases, virtually eliminated by mergers and acquisitions, which has resulted in the creation of “media conglomerates.” Critics charge that market concentration has gone up, and placed the control of the broadcast radio stations in the hands of a few—a few who wield great power, both in monetary resources and political pull (through contributions). Since the 1996 Telecommunications Act, the number of owners in radio markets has declined dramatically (according to FCC data), as has the number of formats offered to its listeners.

Today, four companies control 90 percent of all nationwide advertising revenue. The largest radio broadcasting company, Clear Channel Communications, owns in excess of 1,200 stations. Cost-cutting measures by new corporate owners have resulted in a scaling back of local news coverage, job cuts, and the homogenization of programming across the nation.

Consequently, prices in radio advertising have risen to an all time high, with a stiff increase coming since March of 1996. This is most likely due to two factors—station owners trying to recoup their costs of station purchases, along with the lack of competition in the marketplace.

There have been some positive effects from the introduction of deregulation. It has done away with outdated rules, streamlined FCC approval procedures, and encouraged the use of new technologies. However, deregulation seems to put the interests of business over that of the public. The fact that the FCC is currently looking
at ownership rules is an indication that something may be wrong here—and that they may try and make some corrections. Despite the FCC’s best intentions, and positive effects of the law, the Telecommunications Act of 1996, particularly in regard to the deregulation of radio station ownership has created more problems than it has solved.

Radio historian Mike Adams wrote in 1999, “We are left at the end of the broadcast century with a corporatized version of radio broadcasting, one that serves the bottom line and the lowest common denominator, rather than enlightens and challenges” (Massey, Baran, 2001).

The concept of our media being controlled by a few companies is troubling. The fears of vertical and horizontal media integration have not been addressed here—the study was restricted to the medium of radio only—but they would certainly add to the concerns, which are many and varied as they relate to the medium of radio alone.

Ultimately, the question has to be asked: Did the Telecommunications Act of 1996 accomplish what it was intended to do by Congress and the Federal Communications Commission? In this writer’s view, the end result has not been determined, as the medium of radio is constantly changing, and the rules that govern it as well. At this point, the negative effects have outweighed the good effects—and it appears that those negative effects will not subside at any time in the near future.

Abstract

Since the inception of the practice of Public Relations, ethical behavior has been a cause for concern for persons in and out of this profession. Organizations such as the Public Relations Society of America have created suggested codes of conduct for the public relations practitioner. This paper examines both sides of the argument for such a code, and the reasons for and against the idea of establishing guidelines for the profession of Public Relations.
"Public Relations Ethics and Standards: An Oxymoron?"

Introduction

Public relations professionals, much like their counterparts in the news media continually face dilemmas regarding ethics in the performance of their work. According to Michael Winkleman, public relations professionals and educators have been engaged for some time in a vigorous discussion of the role of ethics within the profession.¹

Craig Miyamoto, a Public Relations Society of America Fellow, has stated, “It’s a pretty scary world we (public relations people) work in these days. Public relations activities of influence – and that includes such simple activities as communications meant to educate – are being closely scrutinized. The general public is on our case…the news media is on our case…even we are on our case.”²

Miyamoto also said, “At a time when the public relations profession is most needed, at a time when institutions and values are being attacked from all sides, we (public relations workers) are taking out lumps – and mighty big lumps they are. Is it ethical? Or is it just good business.”³

The contributions of such early pioneers as Edward L. Bernays and Ivy Ledbetter Lee did much to inject a spirit of professionalism into the practice of public relations. They were firmly opposed to P.T. Barnham’s credo, “There’s a sucker born every minute.”

But throughout its history, critics have charged that public relations practitioners too often manipulate the public interest for private gain, uses and manipulates the press,

³ Ibid
special events, and other activities merely to create an image that masks or distorts what would be an otherwise blatant commercial effort.⁴

According to Steven R. Van Hook, “Many people perceive public relations as something less than respectable—as clever strategies to convince the public that what’s wrong is right. Some see public relations professionals as manipulators of the public mind, rather than conveyors of truth.”⁵

**Background**

The question of “right or wrong,” is a difficult one. In ancient Greece, Aristotle established in the practice of Rhetoric the concept of credibility (ethos), as a form of proof and a mode of persuasion.⁶ One dictionary defines the term ethics as “a system of moral principles governing the appropriate conduct for an individual or group.”⁷

The problem of determining what is right and proper has been under scrutiny for hundreds of years. At least three general types of theories have evolved into three basic ethical systems, which are commonly examined: deontology, teleology and relativistic.⁸

The system of deontology is duty-based in nature and relies on moral obligation. Deontological ethics says that all actions are inherently right or wrong.⁹ The best-known deontological theory is the one associated with the philosopher Immanuel Kant. Kant defined moral laws that constituted categorical imperatives—principles that define appropriate action in any and all situations.

---

⁷ *Webster’s Universal Dictionary and Thesaurus*, 1993, Tormont Publications, Montreal, Canada.
The deontological system would then “depend on the inner-based, self-discipline of each individual public relations practitioner, and because we are all human, and of different environmental backgrounds, it changes from person to person, depending on their own cultural and traditional biases.”

The teleological system is outcome-based. “The teleological ethicists believe that ‘the ends justifies the means.’” Philosopher John Stuart Mill called this theory utilitarianism. In his description, the good that may come from an action is weighed against or balanced against any possible harm, or ill effects. The individual then acts in a way that maximizes good and minimizes harm. So the “litmus test” for determining what is right behavior depends on what the outcome will be from the result of it.

The third ethic system generally described is called either relativism, or sometimes it is referred to as “Aristotle’s Golden Mean.” This system is based upon what is best for the majority, or, the greatest good for the greatest number. This type of ethics system is typically compared to that of a governmental democracy. As the Mr. Spock character said in the motion picture ‘Star Trek – The Wrath of Khan,’ “The needs of the many outweigh the needs of the few…or the one.”

These are three basic theories which have evolved to help understand what drives humans to determine what is right and wrong, and how to recognize the differences.

---

10 Ibid
11 Ibid
14 Ibid
In the 1930s, the requirements for someone to work in public relations were loose, and many people who said they worked in public relations were typically press agents, who were not above tricks to get attention for their clients.\textsuperscript{15}

Otis Baskin and Craig Aronoff write, “Whenever the potential for influencing public opinion exists, the issue of social responsibility (including ethical duty) becomes significant. Many observers feel that institutions should assume responsibility for the consequences of their actions. According to Donald Wright, this implies that public relations people…should act at all times with the best interests of society in mind.”\textsuperscript{16}

There have been several organizations through the years, which have developed codes of ethical standards, or conduct, for workers in the area of public relations. These include the Public Relations Society of America, the International Association of Business Communicators and the International Public Relations Association Code of Conduct.\textsuperscript{17}

One of these organizations, the Public Relations Society of America, was formed in 1948, largely due to ethical and legal breaches of conduct down through the years. A “Code of Professional Standards” was established in 1950 by this organization.\textsuperscript{18}

The questions surrounding ethics are on the minds of many people in the United States these days. Events have rocked the corporate world in the past year, namely the so-called “Enron scandal,” and others, have drawn a great deal of attention and discussion toward the issue of ethics and ethical behavior in business.

\textsuperscript{17} Van Hook, Steven R., “Ethical Public Relations: Not an Oxymoron,” \textit{All About Public Relations}, web page address -- \texttt{http://aboutpublicrelations.net/mbio.htm}, --2002.
In a recent article printed in the June 16, 2002 Sunday edition of the Memphis Commercial Appeal, an Associated Press article asserts that company investors were urging a white-collar cleanup, that corporate misdeeds have shaken investor confidence, and contributed to a dour stock market climate.19

Current United States Treasury Secretary Paul O'Neill, a former CEO of the Alcoa Corporation, called the current climate “a disgrace in this country right now—the unethical behavior of company executives.”20

What constitutes good ethical practices in the public relations profession, and are there any clear-cut answers for the practitioner? The question of ethics, as to whether or not it is a paradox for public relations professionals to strive for ethical behavior at all times, is always a subject for discussion.

But today, in our current corporate environment, where does a public relations practitioner draw the line in his or her work? At what point is this so-called “line of ethics” crossed? Is ethics still an important and necessary part of public relations work and are standards the answer?

Views – “For” Public Relations Ethics and Standards

Jay Black and Ralph D. Barney wrote in the Journal of Mass Media Ethics, “Ethical behavior is the right thing to do. The best reason to behave ethically is the personal knowledge that you have acted in a morally appropriate manner.”21

In the history of public relations, there appears to be a perception of “sleazy,” or unethical practices being perpetrated on the various constituencies that the field purports

---

to serve. One university professor has even called public relations professionals, “The whores of journalism.”

The concept of basic distrust between the media and public relations professionals is a long-standing issue. According to Philip Seib and Kathy Fitzpatrick, “Some of today’s journalists were actually taught that public relations is inherently unethical.”

In a 1994 study of newspaper editors, it was found that many journalists expect public relations professionals to be evasive and to withhold information." While journalists may have their own problems regarding ethics and ethical behavior in gathering, writing and delivering the news, they generally tend to look with disdain on public relations practitioners.

Steven R. Van Hook has stated that ethics “does matter, both in the big picture and in the bottom line.” Van Hook has acknowledged that many people perceive public relations as something “less than respectable.” This would underscore the importance of ethical behavior by public relations professionals.

David Guth and Charles Marsh say that public relations professionals live their lives under the guidance of several codes of ethics: societal codes, professional codes,

22 Sanders, Luther W., Ed.D., Professor of Journalism, University of Arkansas at Little Rock, Class Lecture, Spring, 1993.
24 Ibid
25 Sanders, Luther W., Ed.D., Professor of Journalism, University of Arkansas at Little Rock, Classroom Lecture, Spring, 1993.
27 Ibid
organizational codes, and personal codes. So, under these established values, ethical behavior would not be a goal, but a part of the daily life of the public relations practitioner.\textsuperscript{28}

In the book Strategic Communication in Business and the Professions, the authors write, “Trust in organizations begins with leaders serving as role models for ethical behavior.” “Employees may refrain from ethical behavior if they see their leaders performing unethical acts. Managers may ask, “If ethical behavior means different things in different situations, how do I know for sure that my own actions are proper?”\textsuperscript{29}

Dr. E.W. Brody, a journalist, professional public relations counselor and professor of journalism at the University of Memphis (Tennessee), says that the essence of public relations is that “We’re dealing in relationships.” He also states that public relations “…is the management of relationships, and that public relations becomes the conscience of the organization. One should never over-promise and under-deliver, but much better to do the opposite—under-promise and over-deliver to your client or publics.”\textsuperscript{30}

Brody also says, that as public relations professionals, “We not only need to talk the talk, but walk the walk.”\textsuperscript{31} This would seem to lend itself to the argument for ethical behavior in the areas of business in general, and in particular, the work of public relations.

The Public Relations Society of America, in a document approved by the PRSA Assembly in October of 2000, \textsuperscript{32}adopted a “member code of ethics.” In the document, it is written, “The foundation of our value to our companies, clients and those we serve is their ability to rely on our ethical and morally acceptable behavior…our new code elevates our

\textsuperscript{31} Ibid
\textsuperscript{32} PRSA Member Code of Ethics, October, 2000, Public Relations Society of America, New York, N.Y.
ethics, our values, and our commitment to the level they belong, at the very top of our daily practice of Public Relations.”

The Public Relations Society of America (PRSA) code provides a member statement of professional values, which includes advocacy, honesty, expertise, independence, loyalty and fairness. It also states (in the preamble), that “ethical practice is the most important obligation of a PRSA member.” In addition, the PRSA code provides a “Member Code of Ethics Pledge,” whereby each member is asked to pledge him or herself toward ethical conduct, and to adhere to the code of ethics pledge.

A member is asked to sign and date this pledge, with the understanding that those found to be in violation of the code, might be barred or expelled from membership in this professional society.

Much emphasis has been, and is being placed on the importance of ethical conduct in the practice of public relations. Many reasons are given, from a variety of sources. One of these, Sarah J. Zupko, suggests that many organizations and educators are calling for the establishment of a “universal ethics code,” in order to provide a common set of principles, tenants and standards.

Zupko also lists additional reasons for ethical behavior in the work of public relations: (1) The resolution of moral dilemmas, (2) Trust, which would result in greater opportunities for participation in management policy decisions, (3) A more stable arena for

\[33\text{ Ibid}\]
\[34\text{ Ibid}\]
\[35\text{ Ibid}\]
professional conduct and behavior in the work, and (4) Enhance credibility with both management and the additional publics that practitioners serve.37

In the book Media Now, the authors write, “Continuing growth and change in the practice of public relations require continuing attention to the issue of ethical conduct. Public relations professionals face conflict between the interests of their clients and standards of conduct defined by the Public Relations Society of America’s Code of Ethics. These standards require practitioners to maintain high standards of honest and fair play and always to operate in the public interest while serving the interests, and maintaining the confidence, of their employers.”38

One example would be the failure in the late 1990s of Bridgestone/Firestone and Ford Motor Company to warn the public and their customers about structural weaknesses in tires installed in the Ford Explorer sport utility vehicle, and then to remain silent or uncaring for many weeks after the failures became public knowledge. More than 140 deaths and more than 500 injuries have been attributed to accidents in the vehicles equipped with the faulty tires.39

The public relations practitioners who worked for these companies didn’t initiate the actions that led to these events, but one could argue that they played a role in perpetuating the deception by promoting the company’s actions, and then defending them as innocuous, even after they became public.40

Views -- “Against Public Relations Ethics and Standards”

________________________________________________________________________

37 Ibid
39 Ibid
40 Ibid
In many instances, public relations professionals engage in propaganda efforts. As agents for their organizations, “Propaganda agents are the people who facilitate messages directly and through the media for an institution…their purpose is to send out ideology with a specific objective to a target audience for the benefit of the institution, but not necessarily for the good of the receivers.”

Shirley Biagi, in her book *Media Now*, offers an opposing perspective, which seems to argue the point that public relations people can be professional, while still acting in what some might perceive to be in an unethical manner. “At the highest level of the profession, PR people are low-key, candid, creative, knowledgeable, warm, witty, harming, friendly, personable, self-confident. The best ones communicate as well or better than some of the best journalists today; they are true communications technicians. We have found few hollow shells of human beings, bereft of moral conviction and marching in step with whatever orders their clients or employers bark out. Many were genuinely excited about their profession; some were swellheaded; only a few harkened back to their journalism days to assure us they were really ‘okay.’”

Then, too, we saw no cabals or international PR conspiracies to control the public’s mind—though quietly controlling minds is, in fact, what PR people attempt to do on a case-by-case basis. PR people have chosen their profession, and most seem reasonably satisfied with being effective advocates for their clients…Some will even admit that what they do is manipulation, but manipulation with a noble, higher goal in mind: defending or

---

advancing the cause of their client. There are two sides to every story, goes the argument. They are, in a sense, the equivalent of attorneys in the court of public opinion.” 42

Edward Bernays, arguably at least one of the founders of modern-day public relations, wrote, “The three main elements of public relations are practically as old as society: informing people, persuading people, or integrating people with people.”

In 1955, Bernays wrote, “Public relations is the attempt, by information, persuasion and adjustment, to engineer public support for an activity, cause, movement, or institution.” 43

By 1985, Bernays had further defined the practice of public relations as “giving a client ethical advice, based on research of the public that will win the social goals upon which the client depends for his livelihood.” 44

In the book Public Relations—A Value Driven Approach, the authors write, “Are public relations practitioners ethically obligated to communicate the full truth of a matter? In all our different relationship-building activities, do we strive to present an unbiased view of the complete truth, as we know it? Or do we strive to present only the information that will benefit our organization—in other words, do we deliver only selective truth? To oversimplify, are public relations practitioners objective communicators, like journalists, or are we advocates, like lawyers? 45

Craig Miyamoto, speaking about the ethics dilemma in public relations, states, “In public relations ethics, there are no right or wrong answers. There are only courageous decisions. In public relations, you need to take every risk you can.” I believe that it is

43 Ibid
44 Ibid
unethical for public relations professionals to fear failure. In public relations—as in life—we need to make courageous decisions, day-in and day-out.”

Speaking bluntly, Miyamoto also says, “Your employer signs your paycheck. No work, no public relations ethics decisions. It’s as easy as that.”

Mass communication professor Dave Berkman takes the “con” or opposing view to some of his university peers and public relations professionals. He says, “The bottom line in PR is to make the client look good. If, in a given instance, it happens that truth and desired image coincide, fine; but that is only a coincidental concern.”

In a 1994 study of newspaper editors regarding dealing with public relations people brought this comment: “Public relations people are hired by someone to represent that particular constituency. It comes with the job…any newsperson worthy of the title recognizes the job of a PR person and should never assume the PR view of things is necessarily the way it is…I don’t like some of the things I’ve encountered PR people doing over the years, but I accept it as part of the process.”

Public relations practitioners exercise ethical behavior do so out of a sense of personal morality, and wanting to be respected by his/her various publics, rather than as a result of vague, codified ethical guidelines, it is argued by Donald K. Wright. Wright also

---

49 Ibid
argues that “ethic codes are largely ineffective because there is no enforcement mechanism, and the codes are only as good as the people who subscribe to them.”51

Much of Wright’s criticism is directed at the codes of the various professional associations. He feels that many codes are filled with “meaningless rhetoric.” Ultimately, Wright says, public relations professionals conduct themselves ethically because “they believe in themselves and want others to respect them.”52

Wright conducted a study to examine the ethical and moral values of people in public relations work, with the primary thrust of the study that, “public relations never will be any more ethical than the level of basic ethical morality of the people who are in public relations.” He found that the structure of moral values of American public relations workers was based on morality, including socio-economic, religious, puritanical, financial and social responsibilities.53

On many occasions, the ethical, or proper thing to do is unclear to the practitioner in the public relations arena. On October 29, 1998, former United States astronaut and United States Senator John Glenn, then 77-years of age, went back up into space in the space shuttle Discovery.54 Throughout the nine-day flight, NASA arranged for interviews and press conferences, which featured Glenn, along with other officials, some from his historic flight in the Friendship 7 in 1962, which orbited the earth three times.

The purpose of the flight was to participate in the experiments and measurements along with the rest of the crew, while at the same time taking part in experiments, which were to test the effects of space travel on the aging.

52 Ibid
53 Ibid
NASA took full advantage of the publicity. Both the agency and Glenn authorized the sale of Mattel-created “Hot Wheels” action-pack kit for children. This toy contained a figure of Glenn with official outfits, small outfits of both the old and new space vehicles, and other items.\textsuperscript{55}

Some observers (including journalists) saw the presence as primarily a public relations stunt, designed to give the space agency a much-needed boost in image, which had suffered a great setback with the tragic Challenger explosion in 1986.\textsuperscript{56}

Obviously, it worked. The media loved the angles and stories provided to them. The events captivated the imagination of the general public. In fact, the mission was ranked as the “best stunt” of 1998, in a poll reported in PR Week magazine. Interestingly, the events came at a time when NASA was asking a skeptical Congress for additional funding.\textsuperscript{57}

Some people might call this shameful, unethical exploitation for ulterior purposes. Others would call it a brilliant public relations effort. Both charges were leveled toward the agency as a result.

\textbf{Discussion}

\textsuperscript{56} Ibid
\textsuperscript{57} Ibid
The question of ethics has been discussed since the beginning of the practice of the work of public relations. “It is clear,” wrote 20th Century philosopher Ludwig Wittgensten, “that ethics cannot be put into words.”

It appears that two schools of thought came into being, with two pioneers in the field. On the one hand, Ivy Ledbetter Lee believed in open communications with the media, and was known as being frank and candid to the press. He believed in honesty, especially in telling the story of business. He fought the muckrakers, many of who were perceived to be at times, practicing unethical behavior themselves.

On the other hand, Edward L. Bernays, who arguably competed with Lee in the field, saw public relations as a type of science, applying psychology and behavior manipulation to achieve the ends for his clients.

If you compare the two, Lee appears to be the more forthright, and perhaps “upright” of the two public relations fathers. Bernays would appear to be somewhat the opposite, believing that full disclosure was not necessarily in the best interests of the cause.

At a time when ethics has come into question in our world, particularly in political and business circles, it appears that more attention has been placed in the area of public relations. Suspicion can fall on public relations professionals, whenever they go about doing their work. Public relations work draws from several areas: journalism, public speaking, rhetoric, propaganda, psychology, and others.

What is right or wrong? What is ethical or unethical? The best attorney’s answer would be, “it all depends.” It all depends upon the point of view. With several theories concerning ethical behavior, it can become confusing. In this study, three were identified. There are others, and variations of these three. If the public relations person adheres to one school (for example, “The end justifies the means,”), and the journalist to another (what
is best for all), then there will be a disagreement as to the approach is an ethical one. It becomes a question of concepts, and opinions—and those vary.

Codes of Ethical Conduct, or behavior, have been developed, debated, and advocated, even adopted. But even one of the most prominent codes, that of the Public Relations Society of America, has “softened” its approach. PRSA developed its first statement of principles in 1950, and has modified it since then. But between 1952 and 1985, only 168 cases were investigated, with only ten resulting in sanctions. It appears that unethical behavior is easier to assert than to prove.

The J.C. Penney Company’s statement of business ethics concedes, “No set of principles can eliminate the need for human judgment.” There is much variance as to what can be defined as unethical behavior. Ludwig Wittgensten says, “Defining ethics can be tough—almost as tough as behaving ethically.” It is difficult to measure, identify and conceptualize into a set of standards. While several of the current “codes of conduct” have been identified, it is interesting to note that now a call is coming out for a universal ethics code.

Part of the role of the public relations professional is that of being a counsel to the company or organization. In the case of the Bridgestone/Firestone/Ford case, it is unclear from the research as to what role the public relations staff had with these companies. One typical job function of a PR person is that of “damage control,” or as it is more commonly known, “crisis management.” It could have been that the public relations staff was providing counsel to the company, while management did not heed their advice. The possibility exists that the public relations staff did not know of these problems. They should have, since knowledge is paramount for the person in the PR role. But, if the information were withheld from them, does that make their public relations efforts unethical?
The inevitable comparison has always existed between public relations professionals and journalists. But their roles are, in actuality, quite different. It is true that public relations practitioners do their work with a lot of journalism efforts. But, they are quite different. A journalist is supposed to report the news and information to their readers/audience without bias, coloration, or slant. A public relations professional not only informs, but also persuades and advances the cause of their client. Journalists and public relations people are not the same, and should not be held to identical standards.

It is also interesting to note that several of the sources accessed for this study contradicted them. There were quotes listed by the same authors or speakers under both the “for” and “against” points. In some cases, they may have recognized how difficult it is to grapple with the issue of professional ethical behavior in public relations. The dilemma is not only how to define ethical standards, but also how to deal with it.

**Opinion**

Ethics is a difficult issue. In my mind, public relations work has become an essential part of management. Colleges and universities are seeing enrollments grow for majors in this field. The need for ethical behavior is being called for in all fields, and public relations is no exception.

Part of the call for ethics revolves around these codes of ethics, or behavior. I believe that basic codes, or tenants to guide behavior are good. What I do not agree with is the call for enforcement. Up to this point, public relations professionals are not licensed, so the issue of who or what agency would serve as the “ethics police,” is a real question—and at this point, a real point of argument.

Ethics are beliefs about right and wrong that guide the way we think and act. That, in many respects, is a personal set of beliefs. While we can agree on several points of
contention, there is a lot of flexibility in the field of public relations, which make ethical standards difficult.

Let’s face it—regardless of what some may say, the world is not always black and white. The issues are not always clear-cut. Again—it depends. Here’s an example: A Jewish married woman has sexual relations with a German soldier during World War II. Did she commit adultery? Some would say absolutely, while others would say it was her business. Now, here’s another bit of information about this example. The woman had sex with the soldier in order to save the lives of 200 Jewish men. Was it adultery? Was the behavior justified? Ethical?

Due to the varied nature of the business of public relations, the need and desire for respect may never be what it could, or perhaps should be. Public relations professionals need to do a better job—with all of their “publics.” Ethics comes down, ultimately, to individuality. Our own personal ethics governs our behavior, what we are willing to do, and how far we are willing to go. Ethical behavior is a part of our character, and our daily lives. While it is an important issue for the practitioners, I believe that it is best dealt with through education, recommended codes of conduct, and personal commitment.

Public relations professionals are in a position of advocacy for their publics. There are many instances where PR counselors face conflicts between the interests of their clients and the various codes of conduct, or ethical behavior. Again, it is up to the practitioners to maintain high standards of honesty and fairness, to operate in the best interests of their public(s), and maintaining the confidence of their employers. Ethical behavior is, ultimately, an individual decision, based on that individual’s values, their responsibilities, their clients, and the circumstances in the moral dilemma. “Let your conscience be your guide,” in all of your efforts.
Title: Redefining Haudenosaunee Healing Practices Using Early European / Haudenosaunee Encounter Narratives

Topic Area: Social Work

Name: Haring, Rodney

Department and Affiliation: School of Social Work, State University at Buffalo

Mailing Address: 12190 Brant Reservation Road, Irving, New York 14081

E-mail: rcharing@hotmail.com

Abstract:

Past literature in the healing practices of the Haudenosaunee has focused primarily on two features; these included the use of psychoanalytic theory and practice in the realm of psychological ailments and the use of botanical methodology in combat against physical disease. This paper contends that healing in Haudenosaunee society is better aligned with social work ideology and practice and that psychology and herbal treatment knowledge are properties found within a social work framework. Analyses conducted of early European / Haudenosaunee encounter narratives were used to compare contemporary definitions of social work versus those of early Haudenosaunee healing practices.

Environmental Justice Analysis: How has it been implemented in the Draft Environmental Impact Statements?

Abstract:

Since the signing of the Executive Order 12989 on February 11, 1994, environmental justice analyses are required in the draft environmental impact statements (DEIS’) prepared under the National Environmental Policy Act. From a total of 2062 DEIS’ produced during 1994-2001, approximately 994 documents had some form of environmental justice assessments. These DEIS’ were evaluated as a separate subset to determine which agencies were preparing the analyses. In addition, the types of methods used in the analyses and how decisions were made in these assessments was the focus of this research. The results show that about half (47.9%) of the documents had environmental justice analyses with an average around 65% for more recent years. Most analyses are being conducted by the US Navy, Department of Energy, Federal Highway Administration, and the Army Corp of Engineers. Only about half (49.3%) of the documents focused on low-income as the sole variable. Recommendations are made for practitioners and policy makers to rely more on geospatial tools like geographical information systems and to build more sophisticated methods for environmental justice analyses. Something a collaborations between practitioners at EPA and CEQ, along with the DEIS preparers, and academe have the capacity for doing.
Acknowledgements

Dr. Tzoumis acknowledges David Walker, Kaily Walker, KJK Walker for their support. Ms. Rose thanks her "young adults", Jill, Matt and Rob for all of their love and support. Her parents for always being there for me and mine. Her mentor, Kelly, for letting me be a part of this fantastic adventure and for her friendship which means a lot to me.
Environmental Justice Analysis: How has it been implemented in Draft Environmental Impact Statements?

Introduction

This study examines how environmental justice considerations are incorporated into draft environmental impact statements (DEIS’), which are generated for federally proposed actions under the National Environmental Policy Act. A major impediment towards including environmental justice in DEIS’ is the lack of a standard definition that can be quantified or measured for the concept, and the determination on when there may be a disproportionate impact to those communities once they have been identified as being at risk. It has been difficult for preparers of DEIS documents to know how to measure, and then, make a determination of impact without some detailed guidelines for these concepts. Granted there has to be flexibility in guidelines which are applied across the United States to account for different communities and populations. However, having to create a new and unique approach for each community has proven to be problematic for DEIS’ preparers. In addition, there is no comprehensive review of environmental justice methods that can be used in DEIS’ or analytical measures for preparers to start with when working on communities that may have environmental justice concerns. Therefore, we examine how environmental justice has been analyzed in DEIS’ since it became a requirement and evaluate whether the sophistication of that analysis has improved over time.

We ask the research question, what types of tools and analyses are being implemented in DEIS’ for environmental justice assessments? While there has been considerable debate in the literature on how to define and identify environmental justice communities (Rubin et al, 2002), advancing to the stage of applying those definitions has remain elusive for preparers of DEIS’. Because the guidance is broad and generally not prescriptive in how to conduct environmental justice assessments, we anticipate a wide range of tools that have been implemented as well as a general improvement in sophistication of those tools over time as DEIS preparers become more familiar with the concept and its assessments.
To answer our research question, we examined all of the DEIS documents since the environmental justice executive order requirement was signed into law on February 11, 1994 by President Clinton (Executive Order 12898). The four-page order simply states that “each federal agency shall make achieving environmental justice part of its mission by identifying and addressing, appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations.” This simple, yet groundbreaking, executive order established an Interagency Working Group on Environmental Justice headed by EPA, with representatives from a wide variety of executive agencies and offices. This Working Group serves as a clearinghouse, coordinates data collection, and reports to the President on environmental justice strategies. In addition, it provided assistance to DEIS preparers on the definitions of terms in the executive order such as minority, minority population, low-income population, disproportionately high and adverse human health effects (Council on Environmental Quality, 1997). President Clinton also issued a memorandum along with the executive order that directs federal agencies to analyze environmental effects, including human health, economic and social effects of federal actions, and effects on minority and low-income communities. This memorandum was the link from the executive order to the preparation of DEIS’ which are required for all major, significant federal actions under NEPA (Clinton, 1994). To evaluate the DEIS’, we first explain the conceptual and working definitions analysts use from the guidance materials on minority and low-income to identify the environmental justice communities. We also explain how DEIS’ preparers are instructed to make determinations of disproportionate impact.

**Definitions of Environmental Justice for DEIS Preparation**

In July 1999, EPA issued the final guidance on how environmental justice should be considered in DEIS reviews (EPA, 1999). This guidance is intended to be used by EPA reviewers in conjunction with the EPA’s Policy and Procedures for the Review of Federal Actions Impacting the Environment (1998) and the Council
on Environmental Quality’s (CEQ) Guidance for Considering Environmental Justice under the National Environmental Policy Act (CEQ 1997). DEIS’ preparers must demonstrate in the analysis for environmental justice how a conclusion was made in regards to the determination on whether or not an impact was disproportionately high for an identified environmental justice community or population. EPA (1999) recommends that methods useful for identifying whether a minority or low-income population is disproportionately and adversely affected by a proposed action include locational and/or distributional tools (e.g. geographical information systems), ecological and human health risk assessment, and socioeconomic analyses. It also suggests the use of obvious sources of data from the Census, and state and local agency departments such as taxation and employment, commercial database firms, or community members.

CEQ (1997:8-9) is careful not to provide a standard definition for environmental justice communities that could be not applicable in identifying these communities across different regions of the United States. Instead, it suggests sources of data that are similar to EPA’s sources such as public health agencies, industry, and include being aware of cumulative and intercultural factors that may amplify the effects. CEQ (1997:10-11) even states that it will not prescribe any specific format for examining environmental justice such as designating a specific chapter or section in a DEIS on environmental justice issues. CEQ instructs DEIS preparers to integrate environmental justice concerns in an appropriate manner so as to be clear, concise, and comprehensible within the general format.

The impact of the environmental justice analyses is stated in the EPA (1999) guidance. The identification of a disproportionately high and adverse human health or environmental effect on an environmental justice community does not preclude a proposed action from going forward or compel a conclusion that a proposed action is environmentally unsatisfactory. However, if environmental justice concerns are relevant to the DEIS, then EPA has to factor it into the project rating that occurs on all DEIS’ under the requirements of the Clean Air Act Section 309 (1971). There has not been a single DEIS that has been rated as environmentally unsatisfactory based on the environmental justice analysis. To begin
evaluating the methods for how environmental justice analyses have been conducted in DEIS’, first the operational definitions of low-income and minority population have to be explained as well as the approach for determining disproportionate impacts.

**What is a Low-Income or Minority Population?**

Under the CEQ (1997:25) guidance, low-income population is defined as an area with the annual statistical poverty thresholds from the Census Current Population Reports, Series P-60 on Income and Poverty. Agencies are instructed to consider a community as “a group of individuals living in a geographical proximity to one another or a set of individuals where either type of group experiences or common conditions of environmental exposure or effect.” Populations affected by the proposed action first are identified in terms of racial and ethnic composition, and incomes. To do this, the composition of the community is compared to the characteristics of the larger region. For instance, comparisons are made between the percentage of the environmental justice community residing near a proposed project in relation to the percentage of that same community located within a single or multi-county surrounding the proposed project. Thus, environmental justice communities surrounding the proposed project are characterized in terms of income distribution levels and racial/ethnic diversity then those same factors are examined to the larger region for comparison to determine if there is a potential minority or low-income population that could be impacted. For the analyses, EPA (1998) proposes a variety of computer related tools like geographical information systems, digitized files form the Census, zip codes, and a variety of existing data bases like the Toxic Release Inventory, CERCLIS, Permit Compliance System, a variety of aerial and emergency operations systems, and Department of Transportation’s chemical transit information, to name a few.

Minority populations are specifically defined as individuals who are members of the population groups such as American Indian or Alaskan Native, Asian or Pacific Islander, black not of Hispanic origin, or Hispanic. Using this definition of minority persons, EPA (1998) states that minority populations are identified by either: a) the
minority population of the area exceeds 50% or b) the minority population percentage of the area is “meaningfully greater” than the minority population percentage in the general population or other appropriate unit of geographic analysis. The selection of the appropriate unit of geographic analysis may be a governing body’s jurisdiction, a neighborhood, a census tract, or other similar unit that is to be chosen so as to not artificially dilute or inflate the minority population. A minority population also exists if there is more than one minority group present and the minority average as calculated by aggregating all minority persons meets one of the above stated thresholds.

EPA (1998) described in detail how the Interagency Working Group came up with the concept of “meaningfully greater” to identify minority populations. A minority population may be present if the affected area is “meaningfully greater” than the minority population percentage in the general population of the other appropriate unit of geographic analysis. The affected area refers to the region of the proposed project. The analyst is told to use the potentially affected populations under various alternatives as a benchmark for comparison where possible. A simple demographic comparison to the next larger geographic area or political jurisdiction should be presented to place population characteristics in context and allow the analyst to judge whether alternatives adequately distinguish among populations (EPA 1998: 14-16).

EPA (1998) also warns about using census data since it can only be disaggregated to the census tract or census block levels whereas “pockets” of minorities or low-income communities could experience disproportionately high and adverse effects, which are missed in the traditional analysis. Analysts are strongly encouraged to identify whether high concentrations or pockets of minority and low-income populations are within the specific geographic areas. The analyses are instructed to look at each situation on a case-by-case basis to determine if there is a disproportionately high and adverse effects occurring from the proposed action. Specifically for low-income analyses, preparers are instructed to consider state and regional low-income and poverty definitions along with the Census Current Population Reports.
In making a determination on disproportionately high and adverse human health effects for an environmental justice community, three factors are to be examined to the extent practicable. First, analysts are to determine if the risk and rates of health effects are significant or above generally accepted norms. This can include bodily impairment, infirmity, illness or death. Second, analysts are to determine if the risk or rate of hazard exposure is significant and appreciable exceeds (or likely to exceed) that of the general population or other comparison group. Third, analysts are to determine if the health effect by cumulative impact or multiple adverse exposures from environmental hazards is likely to occur.

EPA (1998, Section 5.3) also suggests as one alternative, the development of an index or ranking systems for scoring potential disproportionately high and adverse effects that could be applied to targeted areas and used as a tool to screen locations. One EPA regional office developed a sophisticated ranking scheme to determine whether an environmental justice indicator exists. The formula provides a means for determining whether an environmental justice situation exists and includes factors such as population exposed, degree of impact, and degree of vulnerability (EPA 1998). The example cited in the EPA (1998) guidance explains how three variables that include population density, percent minority population, and the percent of economically depressed household data were the most critical analytical factors in the index.

Ultimately, EPA (1998:18) states that the analyst is to ascertain which techniques will best suit the project and be flexible to consider additional avenues which may be unique to the project. Over reliance on Census data is discouraged, and more collection of data from state agencies and local officer is suggested.

Finally, environmental justice assessments are to be conducted for all reasonable alternatives in the DEIS. The conclusions from these analyses, including any results that find there are no environmental justice issues for a proposed project, should be described fully in the DEIS. Using these definitions form EPA and CEQ, we look at all of the DEIS’ from the start of the executive order to 2002.
Methods

To evaluate how environmental justice analyses have been conducted in DEIS’, we examined all of the documents from 1994-2002. The data collection only includes up to the first quarter in 2002. During this period, there were 2062 DEIS documents submitted to EPA. Approximately 47.9% of all DEIS documents that were submitted during this time period for review by EPA included environmental justice analyses (n=994). Generally about half of the documents were including some level of environmental justice assessment, even if it is simply recognizing that there were no environmental justice concerns associated with the proposed project. The other DEIS documents did not include any statement about environmental justice.

One way to examine how pervasive the environmental justice assessment have been in DEIS’ is to evaluate the number of DEIS’ submittals along side with the DEIS’ that included environmental justice assessments. Figure 1 shows the total amount of DEIS’ distribution over time submitted for EPA review along with the DEIS’ that had incorporated environmental justice analyses. Another way to examine how pervasive environmental justice assessment have bin in DEIS’ is to construct a percentage or rate of inclusion per total over time. In Figure 2, the percentage of annual DEIS’ using some form of environmental justice analysis is graphed over time to standardize the difference in numbers of DEIS’ submitted each year. These figures show an important trend over time. When looking annually at DEIS documents, it appears federal agencies incrementally began to incorporate the new requirements into DEIS’ for environmental justice. Beginning in 1994, the year the executive order was issued, about 8.4% of the documents included some environmental justice analysis. This increases to 27.8% by 1995, just one year later. One explanation for this increase is that in the early years was the DEIS preparers had little guidance from CEQ or EPA on how to conduct the assessments. While certainly more proposed projects probably had environmental justice concerns than reflected in these percentages, the preparers as well as EPA reviewers may not have been accustomed or trained in environmental justice analyses and no DEIS’ before them were useful to use as guides.
By 1996, federal agencies started to more actively address environmental justice with 40.5% of the DEIS having some analyses then moving to 56% in 1998. By 1999, federal agencies preparing the documents were including environmental justice between 65% to 70% of the documents. It is not likely that proposed actions were impacting minority and low-income communities more during these years than previously. Instead, this indicates that preparers of these documents were getting more aware of how to include environmental justice into the DEIS’, and it is reasonable to assume that the analyses would be getting more sophisticated in how to handle different communities with low-income or minority populations. Thus, by 1999, at least 1338 DEIS’ had been made available with environmental justice analyses that preparers in the following years could use as a reference for a baseline in assessing communities. Therefore, today more than half of the DEIS’ address environmental justice issues.

Content analysis was performed on the subset (n=994) of DEIS documents that at least mentioned environmental justice. A variety of variables were coded to capture the range of environmental justice methods being used. This included the type of analysis performed, what geographical units were used, the level of empirical analysis used (if any), and the outcome of the determination for a potential impact. The expectation was that based on the guidance, a diversity of methods would be used to assess environmental justice communities with more advanced methods being implemented over time.

Results

Who is preparing the environmental justice analyses?

A variety of federal agencies are preparing DEIS documents which include environmental justice assessments (Table 1). The Federal Highway Administration (22.3%) had largest amount of total documents with environmental justice analyses as a percentage of the subset (N=994) with the Forest Service (13.2%) and Army Corps of Engineers (9%) following behind. Smaller contributors to the
subset include the Bureau of Land Management (7.3%), Navy (6.3%), and the Department of Energy (4.8%). All other agencies had less than 4% of their documents with environmental justice analyses as a percentage of the sample of 994. These percentages are not surprising since the majority of documents submitted during this same time frame were the Forest Service (25.8%), the Federal Highway Administration (15.4%), Army Corps of Engineers (9.2%), and the Bureau of Land Management (7.7%). All other agencies submitted less than 6%. Table 1 shows the break down of all the agencies that included environmental justice in some manner in their DEIS documents.

Also reported in Table 1 is the percentage of DEIS’ with environmental justice included per total DEIS submitted to EPA for each agency (Table 1 column 3). This comparison standardizes for the high volume producers of DEIS’. Based on this comparison, those agencies that produced at least 35 documents during this period and included environmental justice were Forest Service (24.5%), National Park Service (30.0%), Bureau of Land Management (45.6%), Army Corp of Engineers (46.6%), Federal Highway Administration (69.4%), Department of Energy (82.8%), and US Navy (90.0%). This shows that agencies like the Army Corp of Engineers, Forest Service, and Bureau of Land Management are frequently preparing documents and including environmental justice analyses. Agencies such as the Department of Energy and the National Park Service may not be preparing as many documents as other agencies, yet these agencies are including environmental justice analyses frequently in their documents.

Table 2 shows the geographical profile for the states and territories of the United States that submit DEIS’ with some level of environmental justice analysis. Geographically, California was involved as the state with the single largest number of DEIS documents (136) submitted from 1994-2002, and it had the highest frequency in their documents of including environmental justice analyses (13.7%). Other states where geographically proposed projects were located included environmental justice in the DEIS document include Washington (4.9%), Nevada (3.4%), New York (3.3%) with all other states contributing less than 3%. While it is not surprising to have California as the largest state for DEIS’ with
environmental justice analyses, it was surprising that given the definitions of minority and low-income in the executive order, more states in the southwest, west or south were not represented in the sample.

**Type of Analyses for Environmental Justice Assessments**

The main research question investigated is what types of analyses are being conducted for environmental justice assessments in DEIS documents? We expected a diversity of approaches that should become more sophisticated over time. The data show in Table 3, of the 994 documents with some environmental justice assessments, about half included some level of empirical analysis (49.3%) while only a small percentage (4.4%) relied upon a qualitative history. A little less than half (46.3%) of the documents merely stated that there was no impact without a substantial analysis either qualitatively or empirically. Overall, there was not a high level of sophisticated methodology being used that relied on empirical analyses to make the determination on either the identification of minority or low-income populations, or potential impact to those communities.

We also evaluated further the type of analyses based on the use of low-income (see Table 4) and minority (see Table 5) factors. About half (51.5%) of the DEIS’ documents had no minority empirical analyses and a little less than half (47.9%) employed the use of descriptive statistics, and only 6 documents actually had statistical tests using race as a factor. In the area of income, most documents (54.1%) had no empirical analysis for income and less than half (45.2%) employed the use of descriptive statistics, and only 7 documents actually had statistical tests using income as a factor. Because of the degree of support and instruction for the use of empirical methodology by EPA and CEQ, this finding was somewhat surprising. We expected to find more reliance on these data sources mentioned in the guidance documents.

**Who is impacted and to what degree?**
Besides investigating the type of analyses being implemented to assess environmental justice, we evaluated which groups may be potentially impacted, and how frequently? We found of the 994 documents, about 45.2% of the DEIS’ included low-income as the sole factor. Analyses also included a variety of combinations of race and income. For instance, all races and low-income was included 19.6% of the DEIS’. Native American and low-income (10.4%), Hispanic and low-income (3%), and African American, Hispanic and low-income (2.4%). A small percentage of documents also extended the environmental justice community to include persons under the American Disability Act. One result of this finding is that low-income populations were more likely to be identified as potentially impacted than minority groups from proposed actions in the DEIS’.

Based on the findings for environmental justice analyses stated in the DEIS’, the degree of impact was tracked (see Table 6). Most of the DEIS documents (93%) reported no potential impact based on the analyses. However, some documents report slight (3.9%) or moderate to severe (3.1%) potential impacts. Thus, the outcomes of the environmental justice analyses are yielding an impact only a small percentage of the time. One conclusion could be, if the analyses are adequate, the environmental justice communities are less than 6% of the time having proposed projects by the federal government that could potentially have a disproportionate impact on their communities.

**What analyses were actually performed?**

One way to make some conclusions about the adequacy of the analyses is to determine what methods were actually performed. The geographical unit or spatial distributional area is a key factor to performing any environmental justice assessment. It is the foundation for determining an environmental justice community at the start of the analysis. Therefore, we tracked the spatial units being used and what these units being compared to as required in the guidance by EPA guidance (1998).

We found that most analyses did not include a geographical unit (57.2%). When a geographical unit was included to identify a potential environmental justice community, the most frequent unit
used was the Census block or tract (17%). Other units used much less frequently included the county (8.8%), the radius around the proposed project (6.2%), and the city (6%). DEIS' much less of the time (5% or less) used the zip code, reservation, island, or region as a geographical unit. In other words, generally these analyses were not getting to neighborhoods or communities that might be the so-called “pockets” of minority or low-income groups mentioned by EPA guidance.

When evaluating the comparison population which should be the larger spatial area used in relation to the potential environmental justice community, there were similar results. This group was used for the purpose of relating it to the minority or low-income comparison group to determine if the potential environmental justice community is “meaningfully greater” concentration than the rest of the population in the analyses. We found similar results that included geographical units such as the county (8.8%), state (5.6%), city (2.8%), radius around the proposed project (2.7%) were relied upon as the comparison group with again most documents (65.2%) not including a geographical comparison group.

Keep in mind most of the documents did not use empirical variables in the environmental justice analysis. Of those that did, the data was focused on minority and poverty rates (18.6%) or minority, poverty and household income considerations (6.7%). Very few analyses included variables that were listed and encouraged for use in the EPA guidance documents such as public assistance, unemployment, education rates, or other data gathered from nontraditional sources like community groups, nonprofit organizations or other more local government sources. Certainly, the encouragement to use risk, rates, or other indices/scales was for the most part not incorporated into the analyses as suggested by EPA and CEQ.

In addition to the issues on type of analyses and methods utilized, we wanted to capture the notion of attention given to environmental justice. Empirical analyses may not always capture the qualitative detail or description which may be useful in understanding the analyses performed. Therefore, to track how much attention was given to environmental justice in each DEIS as a gross indicator, we tallied up both the number of pages, and
paragraphs for each environmental justice section. This is a standard technique used in policies like nuclear energy, smoking, and other issues that appear in newspapers or other public documents (Tzoumis, 2001).

We found that about 20% of DEIS’ dedicated at least 1 paragraph and about 12% dedicated about 2 paragraphs. The remainder of the DEIS’ 3 or more paragraphs with the largest space being 133 paragraphs. Another attention indicator is the number of pages devoted in the DEIS to environmental justice. When comparing the number of pages, there were about 34.6% of the DEIS’ with at least half a page giving attention to the environmental justice topic. About 12% of the DEIS’ dedicated at least 1 full page to the topic. The greatest number of pages was 38. Thus, several of documents are discussing the issue of environmental justice if not performing empirical analyses.

In addition, we coded the number of DEIS’ that listed environmental justice in the table of contents as a header that a member of the public could easily find the analyses. Many (70%) of the documents listed the topic environmental justice in the table of contents, which made it easy for the community to look up in the participation and comment process. One significant problem for members of the public is trying to locate these analyses in the document particularly if it is not listed in the table of contents. We tracked where environmental justice was located in the document and most (96.2%) of the time it was a separate section but there was no consistency on where it was located in the document. For instance, some documents had it in the socioeconomic impacts or others under alternatives. There was no pattern to where a member of the public could expect to find these analyses, particularly, if it was not listed in the table of contents.
Discussion

There are several findings that need to be seriously considered by policymakers at EPA, CEQ and the DEIS preparers. First, most documents find no potential impact of proposed projects to minority or low-income communities (93%). However, many of the analyses were not sophisticated enough in the use of geographical or empirical methods to ensure this decision of no impact was a valid or verifiable determination. Many documents still are not including environmental justice analyses in the DEIS. Second, even if these analyses were accurate, it might have been difficult for affected community members to find the analyses since there is not requirement to place the environmental justice analyses in a standard section of the document where it could be easily found. Placing it in the table of contents as a minimum should be a requirement to assist with the public involvement process for communities.

Second, clearly there has to be flexibility in using different methods and approaches toward understanding environmental justice issues. We are not suggesting a one-size-fits-all methodology towards identifying these communities or the potential impacts. However, there is not enough rigor in the current methods being utilized or a discerning enough level of detail that can capture the so-called “pockets” of environmental justice populations that may exist in a community surrounding the proposed project. This lack of using geographical tools and other information that is available at the neighborhood level was one of the most surprising findings of this study.

EPA could assist with solving this deficiency by encouraging further development of empirical measures which involve spatial or locational analysis when documents are being developed. We expected to see an increase in the use of geographical and informational tools for decision making in these analyses over time. EPA could also encourage development of an index or scale to guide analysts by working with the academic community that studies urban regional planning, and environmental policy and management. More investment in developing methods for evaluating environmental
justice could be developed by government and the academic communities working together than is currently available.

Abstract

This article discusses the first set of findings from a larger ongoing longitudinal study on Japanese university students’ English study methods. The article details the mixed methods approach and results concerning if and how students’ English study methods change from the high school to the university level. It was hypothesized that most students would feel the pressure of the new demands placed on them at university after their university entrance examination studies had passed and would hence seek out different study methods to meet those new demands. Overall, results from this sample indicate that students view their high school English learning as deficient and will make alterations to their study methods at university, particularly by placing emphasis on listening and university facility use, in order to compensate for those deficiencies. Other trends and results of interest, such as students’ newly found freedom and responsibility, are discussed.
Introduction

As demonstrated in a previous article (Rubrecht, 2003a), university educators in Japan (including but not limited to instructors of English) should question whether or not students who have matriculated to university are fully prepared for the academic demands that await them beyond the high school level. Academic instruction in Japan prior to university aims primarily to assist students in passing their university entrance examinations. Three years of English study each at the junior high and high school levels, plus the likely attendance of juku (cram school) or other academic instruction outside of the school system does not guarantee that students will be ready to face the rigors and challenges of university English classes where they must engage in and perform functions in English never previously expected of them (e.g., speaking, writing, and listening in the target language). In fact, as the Japanese education system relies largely on yakudoku (literally “translation reading”) or some other form of grammar-translation below the university level (Gorsuch, 1997; Rubrecht, 2003b), the chances are great that students will be required to do more than simply translate for their English courses at the university level.

With university matriculation comes the encountering of a new curriculum. This curriculum has its own agenda about which students have little understanding. Being so caught up in the examination process, they do not consider their future university studies (Mutch, 1995). This disregard for university course content, though natural in the face of examination preparation, nonetheless presents university freshmen with additional problems. Having not yet developed a schema for studying at university, coupled with a high school learning environment where (a) ways of learning were prescriptive, (b) there was little room for students to explore and experiment with modes of learning, and (c) learner autonomy was implicitly discouraged (Holden & Usuki, 1999), students do not enter university English classes with a “clean slate” regarding study methods (Long & Russell, 1999). With little idea about what to expect from university courses, including how to prepare and study for such courses, they may utilize the same study methods they used in high school, a move that could prove academically disastrous. As effective study methods have consistently been found to be related to academic performance (see Bailey & Onwuegbuzie, 2002, for an overview; see also Hsiao & Oxford, 2002), how university students approach and view their studies after university matriculation becomes a point of
concern for students, educators, and parents alike.

This article discusses the first set of findings (hereafter referred to as “the present study”) from a larger ongoing longitudinal study and presents results gathered after one year of data collection concerning Japanese freshmen university students’ study methods before and after university matriculation. The overarching question behind this research asks if students’ English study methods, when compared to the methods they used in high school, undergo change over the course of their university experience. It is hypothesized that most students would feel the pressure of the new demands placed on them after their university entrance examination studies had passed and that by the time they graduate from university, most would have sought out new ways to cope with the demands of university study. The present study utilized both quantitative and qualitative methods for data collection.

**Research Background**

Previous literature regarding the issue of potential study method change in response to the new demands and opportunities afforded Japanese university freshmen is surprisingly scarce. What is abundant, however, is literature detailing what can be found on the university entrance examinations and how the senior high school years essentially only prepare students for these examinations.

Although it is not the purpose of this research to point out perceived flaws of the Japanese university entrance examination system, the criticisms leveled at the examinations neatly sum up why one should suspect that the language learning practices at the high school level should differ from those found at the university level and, consequently, why students’ study methods should change in response to these differences. The criticisms can be divided into three distinct premises: the underlying purposes of the university entrance examinations, the limited range of English skills the examinations test, and the consequential washback onto the high school level created by the examination system. Each of these will now be briefly explained.

Stated thirty years ago, Anderson’s (1975) perception that the university entrance examinations are used as a means to judge and manipulate students still holds true today. The examinations represent the culmination of students’ study and hard work, but because graduation from university is practically an indispensable prerequisite for later success in
Japanese society (Beauchamp, 1998), entry to university becomes a crucial endeavor that is governed by the need to screen and rank students into the structure of the university system. For potential employers, academic credentials count far more than academic performance, making the competition for admittance to the more elite universities intense (Leestma & Bennett, 1987). In the words of Pettersen (1993), “in this cold meritocracy, a student’s entire future depends not just on getting into college, but into the right college” (p. 58). With screening more important than learning, and because of “vested interests, parental fears and ambitions, and an indigenous preference for a hierarchical society” (Wray, 1999, p. 144), the university entrance examinations continue to function in a way not initially intended but which nonetheless finds a place in Japanese society.

Common sense dictates that effective foreign language study should include all four skill areas (i.e., reading, writing, speaking, and listening) in addition to components of the target language culture. In Japan, few students below the university level are exposed to even half of these areas. Although English or other foreign language sections are found on most university entrance examinations (Watanabe, 1996), the content of these examinations is limited mainly to written sections requiring an understanding of grammar and vocabulary (Vogel, 1978) as well as requiring the ability to translate from English to Japanese (Teweles, 1995). Knowledge about English is tested, not ability to perform or otherwise communicate in the language (Berwick & Ross, 1989; Kitao, Kitao, Nozawa, & Yamamoto, 1985; Kobayashi, 2000; Law, 1995). As pointed out by Brown and Yamashita (1995), only a handful of university entrance examinations even bother to test students on their English listening skills.

As expected, the combination of an examination with an underlying agenda coupled with discreet and pre-defined testing areas makes for devastating washback that determines methodology and pedagogical practices in the high school English classroom (Anderson, 1975; Beauchamp, 1998; Blumenfeld, 1992; Duke, 1986; Kay, 1995; Kobayashi, Redekop, & Porter, 1992; Leonard, 1998; LoCastro, 1996; Shimahara, 1979). Secondary education becomes little more than organized examination preparation (Shimahara, 1979) where high school instructors are forced to make classes lecture-driven so that the maximum amount of information can be imparted to students. This passive method of instruction has drawn criticism, for it fails to teach students to effectively communicate in the foreign language (Takizawa, 1994). As related by Wray (1999), complaints from a panel of educators and company presidents sponsored by the English
Language Education Council centered on the failings of these examinations, specifically on how they do not emphasize communication and promote only those skills outside listening and speaking, thereby causing high school teachers to teach English as if it were a “dead language.”

As already mentioned, English instruction at the high school level involves translation, mainly because of the vocabulary and grammar needed for the examinations (Bridges, 1998) and because the examinations have no speaking component (Hayes, 1979). *Yakudoku* is the translation method of choice (Anderson, 1975; Duke, 1986; Law, 1995). Class time often involves mechanical drills and the memorization of grammatical structures and vocabulary (LoCastro, 1996; Nishiyama, 2000; Samimy & Adams, 1991), with most of the instruction done in Japanese (Hyland, 1994; LoCastro, 1996). Although it has been documented that high school students believe their English classes to be foundational and useful for diverse purposes in later life (Kobayashi, 2000; Matsuda, 2000; Rubrecht, 2004), they resign themselves to their more immediate goal of university entrance. This discreet and passive nature of instruction fails to foster communication in English (Browne & Wada, 1998) and only increases students’ dependence on their instructors to provide them with information regarding what and how to study.

There are other reasons why the Japanese keep communication out of English language instruction below the university level. The same today as nearly 140 years ago during the Meiji Restoration, English continues to be the medium of information, technology, media, and the transfer of culture from foreign countries into Japan (LoCastro, 1996). For these purposes, communicative competence (Savignon, 1983) in the language need not be emphasized. For the Japanese, teaching translation rather than communication has long been accepted as a deficient yet necessary part of the education process.

The impact of the university entrance examinations extends beyond simply what students study. It may be argued that the examinations just as deeply influence how students study. Rausch (1996) believes that the examination system squeezes out of students an “awareness and reliance on any natural or preferred learning style” (p. 12). This situation may not matter much initially because it is in the interest of the high schools and their instructors to prescriptively teach students what they will encounter on the examinations. Being forced to study a certain way for certain subjects (such as memorizing to “learn” English vocabulary) can be beneficial if it aids students in passing the examinations. However, when the examination hurdle has been cleared, students are left with learning
styles that (a) are not of their choosing, (b) may conflict with their natural or preferred learning styles, and (c) give students the erroneous impression that there are few and limited ways to study foreign languages. Students will consequently be left to fend for themselves at university, under-equipped and hobbled by their high school instruction.

Some researchers in Japan have found results supporting the notion that university English courses, compared with high school courses, focus more on student learning than on student testing. Johnson (1996) reports that via a questionnaire using learning orientation factors and strength of motivation questions with a pool of Japanese university freshmen learning English, it was discovered that four learning orientation factors emerged, none of which were related to testing purposes (e.g., for examination preparation, the passing of university-level English courses, etc.). Rather, “students want to learn and use English for future work, for enjoyment, to experience the culture of English speakers, and for knowledge of the English-speaking world” (p. 55-56), which are factors similar to those reported by other researchers (e.g., Clément & Kruidenier, 1983; Dörnyei, 1990; Johnson & Takeo, 1996; Matsuda, 2000) and represent English language learning goals never before pursuable by these students.

The work of Rausch, Johnson, and others therefore indicates the following two points:

1. Learning style is necessarily channeled into specific study methods below the university level in response to the university entrance examinations but need not be so channeled at the university level, where such rigorous examinations no longer exist.
2. English is not so much a subject for testing purposes at university as much as it is a subject to be incorporated by the students for other purposes.

Taking these two points into consideration, it becomes necessary to assess the role of English at the university level, students’ attitudes toward English language learning at this level where there are no life-altering examinations, and students’ subsequent approaches to the learning of English in university classes. The present study aims specifically to address this last area. Do students’ study methods undergo change as they are forced to fulfill new demands, or do students cling to the “tried and true” methods of English language learning that they practiced in high school, regardless of whether or not such methods are really
useful and required for the wider range of language learning activities found at university and beyond? When provided the opportunity at university, do students revert to more natural and personally fulfilling methods of study that were closed off to them in high school? These are just a few of the questions this longitudinal study aims to answer.

**Methodology**

The present study (the first phase in the longitudinal study) meant to assess:

1. how incoming Japanese university freshmen claimed to have studied English in high school.
2. how these students planned to study English at the commencement of their first semester at university.
3. how they claimed to have actually studied after one semester of study at university.
4. how they claimed to have studied after their second semester of study at university.
5. student perceptions of their study methods at university (e.g., if their study methods were the same as or different from their high school English study methods, if the study methods they were using at university were useful or detrimental to their study/grades, etc.).

**Study Site and Participants**

All data collected involved students at a single private Japanese university located in central Japan. Analyzed data came only from students who were screened and met the following criteria:

1. All participants must be native Japanese, with Japanese as their native (i.e., first) language.
2. None of the participants may have lived abroad for more than one year since entering elementary school.
3. None of the participants may have stayed abroad for longer than 30 consecutive
days (such as in an exchange program).
4. All of the participants must be entering freshmen in their first semester of university study.
5. All of the participants must have studied English in high school.
6. All of the participants must be English majors.

As a note of caution, students majoring in English at this university may not be considered typical Japanese university students because the university pushes them relatively hard in their studies. University study in Japan has commonly been considered a “four-year vacation” (Keaton, Kelly, & Pribyl, 1997, p. 327) because the pressure of university entrance is over and students play a waiting game until graduation and recruitment by employers, but the students enrolled at the university in the present study are not allowed the luxury of relaxing. Even so, this difference was never considered detrimental to the study. In fact, because the students at this university are required to do considerably more than just attend classes for course credit, study methods can potentially become a point of considerable importance for them.

Instrumentation

To most effectively tap into the beliefs of the incoming EFL (English as a foreign language) freshmen, a four-step approach was used that employed both questionnaires and interviews:

Step 1: Administration of a questionnaire at the beginning of the first (i.e., spring) semester.
Step 2: Administration of a follow-up questionnaire at the end of the first semester.
Step 3: Interviews with several students during their second (i.e., fall) semester.
Step 4: Administration of a third questionnaire at the end of their second semester at university.

By using a mixed-methods approach, it was hoped that information could be gleaned that would simultaneously be broad in scope to allow for the painting of an overall picture of these students’ past and planned study methods as well as be precise enough to encompass specific reasons for planned continued use and/or abandonment of past study
methods. Because the present study meant to tap learner beliefs of how they study English (in the past, present, and future), questionnaires were thought to be limited as to the information they could provide. As Japanese students from the elementary to the university level may not be aware of or ever question their study methods, it was thought that questionnaires alone could not do a sufficient job of probing for information. Interviews could aid in data triangulation and, if conducted in a thorough and thoughtful manner, “allow learners to reveal beliefs which are not addressed in [a] questionnaire and to describe the reasons, sources, behavioral outcomes, and other dimensions of their beliefs” (Sakui & Gaies, 1999, p. 486). Additionally, it was thought that the quantitatively-driven research portions would allow for deep understanding of meanings while the qualitatively-driven research portions could verify those meanings (Onwuegbuzie, 2000).

**Instrument Construction**

In line with questionnaire construction theory, the questionnaires (called Questionnaire 1, Questionnaire 2, and Questionnaire 3, respectively) presented unnumbered questions that were as short and unambiguous as possible and were printed on the minimum number of pages (Dörnyei, 2001). They were written in Japanese and proofread by a native Japanese speaker. Questionnaire piloting was also conducted.

The questionnaires were composed of multiple choice and open-ended questions, with the latter type dominant on all three questionnaires so as to encourage the students to provide and explain their answers in their own words and so as to not let them be restricted by predetermined categories. In general, Questionnaire 1 meant to gather background information on this group of freshmen (e.g., age, educational experience, etc.), the study methods they used in high school, and why they studied English. Questionnaire 2 delved further into past study methods and students’ reflections on how they studied after their first semester at university. Questionnaire 3 asked students to relate if and how their study methods changed (a) from high school to their first semester at university, (b) from first to second semester, and (c) from high school to university in general. Students were provided informed consent and anonymity at every stage of the research.

The interviews conducted with students meant to establish:

1. how the participating students studied English in high school (e.g., if they used educational institutions, specific study methods, etc.).
2. whether or not students considered their study methods in high school as effective.
3. students’ study methods thus far at university.
4. students’ views on comparisons between how they studied English in high school and at university.
5. students’ perceptions concerning topics of interest uncovered from the first two questionnaires.

The semi-structured nature of the interview questions allowed the direction of the interviews to change and evolve depending upon how the participants responded to them. This allowed for the probing of potentially interesting response themes (Merriam, 1998). Questions were posed in the students’ native language of Japanese to allow freer participant expression, although English was used occasionally.

All interviews were held in my university office, which afforded privacy and allowed for the audio recording of the interviews. Average interview length was 25 minutes. Each interview consisted of (a) an explanation phase so the students would know what to expect in regard to the kinds of questions asked and that they should answer honestly and freely, (b) a question phase delving into their study habits and other topics of interest, and (c) a “cool down” phase inviting the students to add information not addressed in the interviews. The students were asked to participate in future interviews, to which all agreed. All interviews were later transcribed into English for data analysis.

**Questionnaire Administration**

Questionnaire 1 was administered during the second week of the first semester. Questionnaire 2 was administered during the eleventh week of the first semester. Questionnaire 3 was administered during the twelfth week of the second semester. Students were informed by email that the questionnaires were located in the university’s Self Access Center (SAC). The email, sent by the SAC coordinator, urged students to complete the questionnaire in the SAC during their required weekly SAC time, though some students took the questionnaires home to fill out later. Students were given two full weeks to return the questionnaires. Any questionnaires received after this two-week period were not included for consideration in the data analysis phase.
Participant Interviews

Because it was deemed necessary to conduct interviews prior to the administration of Questionnaire 3 (i.e., after students had experienced university life but had not forgotten how they studied in high school), I initially chose students who answered both Questionnaires 1 and 2 (n = 71; male = 40, females = 31) and who evinced characteristics across a broad spectrum in terms of educational background, varied study methods, and so on, the reason being that, first, there was no guarantee that those students who were selected would not drop out of the university or opt not to participate in a series of interviews. A large initial base of interviewees would hopefully help prevent problems associated with participant “mortality.” Second, as I had yet to determine trends behind students’ study methods, it was hoped that a large “random” selection of perceived types would shed some light onto why students would desire to either retain their high school study methods or change to adopt new ones.

Unfortunately, very few of the solicited participants acquiesced to interview participation, thereby forcing me to broaden my search to include any willing students who filled out both questionnaires. Eventually, only six such students agreed to interview participation.

Research Results

The following results should be viewed with caution. To begin with, although there was a total of 226 freshmen English majors enrolled at the university at the beginning of the 2004 academic year, relatively few students filled out the questionnaires. Questionnaires 1, 2, and 3 had response rates of 130 students (57.5%), 101 students (44.7%), and 72 students (31.9%), respectively, indicating a steady decline in student participation. Moreover, while it was hoped that students who filled out one questionnaire (particularly the first one) would fill out all three, this was rarely the case. Only 29 students filled out all three questionnaires (less than 13% of the target freshmen). Why there was such relatively poor cooperation from the students can potentially be explained by a number of factors, including student apathy toward questionnaires and location and timing of questionnaire administration (in the SAC during students’ required study time, often at busy times of the semester). Regardless, this low and inconsistent participation was not thought to unduly
influence the effectiveness of data gathered because it was never imperative for students to have answered all questionnaires for student perceptions and trends to be identified. Furthermore, each questionnaire screened students to make sure they met all participation criteria.

An additional problem encountered was that some students did not complete the questionnaires as instructed. In some cases, they did not rank responses when required. In other cases they left questions or entire pages blank. Although considered only partially complete, such questionnaires were not discarded. As most of the skipped questions tended to be open-ended questions requiring deep self-reflection, it is likely that they did not answer such questions either for a particular reason or because they did not have an answer. Due to some students failing to answer some questions, where appropriate, the number of students who responded to a question is provided in parentheses below.

**Questionnaire 1**

Table 1 details information of interest from the students’ background. Overall, the students appeared to be typical university freshmen in terms of age, reasons for studying English in high school, mean length of time studying English prior to university matriculation, and types of learning English outside the regular school system.

Of particular interest were results depicting that while on average students spent
two years receiving instruction from native English teachers, the high standard deviation along with an inspection of the data indicated that only a few students had such English learning exposure while many others had no such exposure at all. This was thought to be a significant finding for two reasons. First, having mostly native English speakers as instructors at university, as was the case for these students, would expose the students to demands likely not required of them in high school under instruction from native Japanese instructors, such as listening to live English on a daily basis. Second, native English instructors would likely conduct classes in ways foreign to the students (i.e., via Western pedagogical and methodological patterns). Both of these reasons could potentially cause students to reexamine their previous study methods.

As can also be seen, juku was the most common institution of English instruction for this sample, but the relatively high standard deviation also suggests that a great number of students spent little or no time at juku, and that those who did attend such classes attended them for generally lengthy periods of time. In addition to juku, yobikō (preparatory school), and home tutors, some students mentioned other methods of English study, but the figures were too insignificant to warrant calculation.

Table 2 lists how students responded to questions concerning how they studied English in high school.

<table>
<thead>

</tbody>
</table>

These results were not surprising, nor were the responses to the follow-up question of “was the response you ranked as number 1 in the previous question a useful study method for you?” 74 students (63.8%, n = 116) responded that it was useful while 43 students (37.1%) responded that it was not (with one student providing both a “Yes” and “No” answer).

Questionnaire 1 provided students space to relate (a) what they considered to be the most effective way(s) of studying English, (b) how they planned to study now that they
had matriculated to university, (c) if the study methods they planned to use at university and
the study methods they used in high school were the same or not, and (d) why they thought
their proposed study methods at university would be the same or different from those used
in high school. Some difficulty was encountered in categorizing these and later responses,
partly because of the open-ended nature of the questions and partly because students’
responses could be placed in multiple categories. For example, when asked about their most
effective method of studying English, several responded with “reading English passages
aloud,” which incorporates both elements of reading and speaking. Several students even
offered multiple methods, all of which had to be taken into account and placed in
appropriate categories. The breakdown of the most common answers to questions (a)
through (c) as explained above looks as detailed below in Table 3.

<table>

</tbody>
</table>

Categorizing responses to question (d) became somewhat complicated. Few
students answered that they would use the same study methods, making categorizing almost
unnecessary, but some responses included their not knowing any other way to study, their
past methods have so far been successful for them, watching Western movies has been
useful, and studying alone is most effective for them. It was easier to categorize the
responses of students who said that they would use different study methods, although 36
distinct categories were generated as a result. Responses (n = 119) included because high
school English was not useful (17 students, or 14.3%), the university has good facilities and
there were few or no foreigners present in high school (both by 9 students, or 7.6% each), and because they professed needing listening ability, as listening practice was not done in high school (6 students, or 5.0%). The picture that developed from this question was that the SAC would be extensively used, particularly for improving listening ability.

Table 4 below lists how students planned to study English specifically for their first semester at university, while Table 5 details students’ responses to questions concerning their motivation and effort as found in the final section of Questionnaire 1.

</table>

The reason behind students’ choice of majoring in and learning English at university was thought to be of importance because motivation can be indicative of goals and desired outcomes (see Rubrecht, 2004). 56 students rated their future job as the main reason for studying English at university (45.9%, n = 122). The next highest top rating was for communication (25 students, or 20.5%). The most common number two reason was for communication (36 students, or 29.5%), followed by for a future job (24 students, or 19.7%), which are not dissimilar from Johnson’s (1996) findings reported above. In classical terms, it would appear that the students in this sample possessed mainly instrumental motivation as well as a lesser yet still apparent integrative motivation orientation for learning English.
When asked more directly what they would consider their main reason for studying English to be, the above figures were largely confirmed. Of 123 respondents to this question, the highest rated reason was for “instrumental purposes” (66 students, or 53.7%). However, surprisingly, the next highest number one rating was for “personal purposes” (30 students, or 24.4%). “Integrative purposes” was the highest second-ranked reason (52 students, or 42.3%), again followed by personal reasons (30 students, or 24.4%). It can be seen that most of the students are therefore learning English mainly for instrumental reasons but have integrative reasons in mind as well. That personal reasons are also present is in line with past research on language learning motivation in EFL contexts (Dörnyei, 1990), particularly with Japanese learners of English (Benson, 1991; Rubrecht, 2004).

Questionnaire 2

Similar to Questionnaire 1, Questionnaire 2 was divided into three parts: a student screening section, a section to clarify responses derived from Questionnaire 1 that revolved around the educational study methods students professed to use in the past such as juku, and a section that allowed students to reflect on their study of English after their first semester at university. The section about past educational study methods was important because several students who answered Questionnaire 1 professed that they would continue to use such institutions, which ran counter to my suspicion that once reaching university such institutions would no longer be necessary, hence further stimulating students to alter their study methods. The final section asked open-ended questions on what they thought of their English studies in their first semester, how they studied, if the study methods they employed were successful for them, and whether or not they planned to use those methods again in the second semester.

While half of the students who responded to this questionnaire reported studying English outside their high schools (51 students, or 50.5%), only 2 students (0.2%, n = 96) said that they would like to continue using additional English-learning institutions, their answers being English conversation schools. The 79 students (85.9%, n = 92) who said they would only study English at university gave reasons that included added time and expense for these other institutions and how the university fulfills all their language learning needs. Overall, it appeared that students were content with receiving all of their English education at university.

The questions in the final section of this questionnaire asked students how they
approached their English studies during their first semester, if they believed those study methods were useful, if they planned on studying via said methods, and if they planned to continue using said methods. These questions were asked because it was thought that most or all of the students who had filled out Questionnaire 1 would also fill out Questionnaire 2, which was not the case. Upon comparing student names and numbers on the two sets of questionnaires, it was discovered that only 71 students had filled out both questionnaires. As there were other questionnaires given to students at the beginning of the semester when Questionnaire 1 was distributed, the students may have just been confused as to which questionnaire they had filled out. This discrepancy in continuation from Questionnaire 1 to Questionnaire 2 meant it was difficult to ascertain if students’ study methods had changed or remained the same.

However, Questionnaire 1 had asked students how they planned to study and if those methods coincided with how they planned to study during their first semester. These answers from these 71 students were then compared with Questionnaire 2’s responses of how the students actually studied during the first semester. 57 students (86.4%, n = 66) responded that they planned to discontinue their high school study methods at university, though as in Questionnaire 1 students often gave multiple responses or responses that could be placed into multiple categories. The most common reasons given why they would change their study methods overwhelmingly involved perceived deficiencies with their high school English instruction, with 27 responses directly attributed to such reasons. Such deficiencies included just doing reading and writing, only learning by memorization, and the fact that the English learned in high school is not usable at university or in the real world. Relationally, students identified their previous study methods as bad, ineffective, or impractical (9 responses).

The answers of how students planned to study in the upcoming second semester (in Questionnaire 1) were compared with how students said they actually studied (in Questionnaire 2). It was found that 20 students who mentioned a proposed plan of study actually studied that way, with most answers involving either listening or use of the SAC. When asked if the study methods they actually used in the first semester were effective or not, 44 students answered affirmatively, 22 answered negatively, 4 students did not answer, and 1 student said both “Yes” and “No.” Of those 20 students who answered both questionnaires, 15 thought their planned and actual study methods were effective. 1 student did not answer concerning study method efficacy while 4 students said they used their
planned study methods but found them ineffective.

**Questionnaire 3**

Administered one month prior to the end of the students’ second semester, Questionnaire 3 meant to tap into students’ views about if and how their study methods changed from high school to their first semester at university and from their first to second semester. Students were encouraged to be specific about ways in which their study methods did or did not change. They were also requested to indicate if, overall, they continued to use past study methods and if those study methods were effective for them. Finally, students were requested to indicate if the study methods they employed in high school were the same or different overall from the study methods they were now using after almost two full semesters at university.

Although the response rate for this third questionnaire was the lowest yet at 72 usable questionnaires, Questionnaire 3 was still informative. Difficulty was again encountered in categorizing responses, but Table 6 below presents the most common responses to the various questions posed.

<table>
<thead>
<tr>
<th>Table 6. Most common responses to Questionnaire 3’s open-ended questions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>How did your study methods change from high school to first semester at university? (n = 71)</strong></td>
</tr>
<tr>
<td>· listening became central at university: 18 students (25.3%)</td>
</tr>
<tr>
<td>· avoided direct translation at university: 5 students (7.0%)</td>
</tr>
<tr>
<td>· engaging in conversation at university: 5 students (7.0%)</td>
</tr>
<tr>
<td>· needing to do reading first and checking word meanings later at university: 4 students (5.6%)</td>
</tr>
<tr>
<td><strong>How did your study methods not change from high school to first semester at university? (n = 69)</strong></td>
</tr>
<tr>
<td>· continue to write to learn English: 12 students (17.4%)</td>
</tr>
<tr>
<td>· learn new vocabulary words: 6 students (8.7%)</td>
</tr>
<tr>
<td>· nothing special: 6 students (8.7%)</td>
</tr>
<tr>
<td><strong>How did your study methods change from first to second semester? (n = 66)</strong></td>
</tr>
<tr>
<td>· no change: 29 students (43.9%)</td>
</tr>
<tr>
<td>· did more listening: 9 students (13.6%)</td>
</tr>
<tr>
<td><strong>How did your study methods not change from first to second semester? (n = 63)</strong></td>
</tr>
<tr>
<td>· nothing special/no change because classes have not changed: 20 students (31.7%)</td>
</tr>
<tr>
<td>· still do a lot of listening: 7 students (11.1%)</td>
</tr>
<tr>
<td>· still do reading: 6 students (9.5%)</td>
</tr>
</tbody>
</table>

One area of interest from these responses came from the fact that listening was referred to repeatedly as an area of change. In fact, when asked how their study methods changed from high school to university, 41 students (57%, n = 71) mentioned listening in
some capacity at university.

This questionnaire revealed other interesting figures. When asked if their study methods changed overall from high school to their first semester at university, 54 students answered affirmatively (76.1%, n = 71), with the more common reasons being a focus on listening making English easier to understand (6 students, 8.5%), the need to do more listening practice (5 students, 7.0%), increased exposure to native English-speaking teachers, more conversation, the students simply becoming more used to English, and the need to do more things now at university compared to high school (4 students each, 5.6%). When asked if there was change from first to second semester, only 19 students answered affirmatively (27.5%, n = 69). Based on student responses, most answered that there was no change because they maintained study methods between semesters (6 students). Change was only necessary, it seemed, when the students professed to either study harder second semester (3 students) or because they became more positive about their studies, spoke aloud more, had more free time to study, or used the SAC more (all by 2 students each).

The final section of the questionnaire asked students to consider their English study methods overall and to consider if they continued or discontinued using those methods. Different from the questions in Table 6, the questions reproduced in Table 7 were meant to elicit a more global perspective regarding study methods without the need for students to write lengthy explanations. As can be seen below, a high percentage of students thought they used their high school study methods in both first and second semester. It appears, though, that most students were transferring methods between semesters. Finally, the vast majority (93.1%) reported that their study methods overall were different between high school and university. When asked why they believed their study methods differed, students remarked that speaking (19 students) and listening (12 students) have become necessary and that university English study is more practical than high school English study (8 students).

<table>
<thead>
<tr>

</tr>
<tr>
<td>· Yes: 60 students (83.3%), 49 of whom thought that the study methods employed were effective</td>
</tr>
</tbody>
</table>
What turned out to be the most surprising result from this questionnaire was that when asked how their study methods changed from high school to first semester at university, 41 students (56.9%) again specifically mentioned listening in some capacity¹. For example, students mentioned needing to listen to and/or mimic their tapes or CDs, study by listening now when they never did before, and how listening represents meaning above and beyond just sounds.

The Interviews

Six students (4 males, 2 females) consented to participating in interviews. From the interview transcriptions, trends or other answers of interest were sought. As described in the methodology section above, parts of the interviews were dedicated to exploring topics uncovered from Questionnaires 1 and 2.

The interviewees were Akira, Masashi, Riku, Tsuyoshi, Emiko, and Misa (all pseudonyms). To briefly relate how they responded to the interview questions concerning how they studied in the past and how they studied at university, it was discovered that only Akira and Masashi had studied at institutions outside of high school. Only Emiko said that she maintained her high school study methods at university (mainly because the advanced study techniques she used like shadowing and listening to English radio at least thirty minutes per day had been so effective for her previously).

Several themes of interest were uncovered in the interviews. First, Akira, Tsuyoshi, and Emiko all mentioned that university in Japan is either just for play or at least has a freer atmosphere than does high school (i.e., students need not be as serious about studying as they were in high school). Riku mentioned how high school study is only for university entrance examination preparation. Misa mentioned how her university instructors were not as strict as her high school teachers had been. Tsuyoshi would agree with her, as he claimed that his strict high school teachers caused him to be more efficacious in his studies.

¹ Although conversation involves listening, responses of conversation were not included in this total.
Another theme uncovered from the interviews centered on how the existence of native English instructors at university brings about change in students’ study methods. Not only did some students (e.g., Akira, Masashi, and Emiko) find talking to the native English instructors beneficial in helping them reach their goal of improving their English, but having these instructors requires them to take a different approach to their classes.

Of particular interest was the fact that many of the responses found in the first two questionnaires matched in terms of expressions used. For instance, the following three Japanese expressions were found frequently enough in students’ responses to warrant making them an area of exploration in the interviews:

1. *nareru* (? ? ?), or “get used to”
2. *mi ni tsuku* (? ? ? ?), or “gain (an ability)”
3. *tomadou* (? ? ?), or “be perplexed or confused”

For example, when students were asked in Questionnaire 1 how they planned to study now that they had reached university, several gave the response of “getting used to English” (*eigo ni nareru, ? ? ? ? ? ?*). Although for this specific question only 11 students answered with this particular phrase, the phrase of “getting used to English” appeared in various other places throughout Questionnaire 1 and was even described by one student as being the best shortcut to learning English.

It was hoped that students using the same expressions would evince some deep significance behind their thinking processes, making the exploration of the topic worth probing in the interviews. Table 8 below lists the responses of the interviewees when asked their opinions about the frequency and use of these common expressions by the freshmen class.

<table>
<thead>
<tr>
<th>Table 8. Interviewee opinions about common expressions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Akira: <em>Nareru</em> means getting used to the environment because there were no native English teachers in high school, and it is important to get used to the pattern of the classes at university.</td>
</tr>
<tr>
<td>Masashi: These expressions reflect middle or average ability. The Japanese will use these expressions because they are reserved (i.e., do not say yes/no clearly) when not yet perfect at doing something.</td>
</tr>
<tr>
<td>Riku: No deep meaning to the expression, just that students have understood little by little.</td>
</tr>
<tr>
<td>Tsuyoshi: Believed students thought questionnaires were difficult, so they just found ways to answer.</td>
</tr>
<tr>
<td>Emiko: <em>Mi ni tsuku</em> is from a TV commercial a few years ago. <em>Nareru</em> means to have made efforts.</td>
</tr>
<tr>
<td>Misa: <em>Nareru</em> means being able to deal with classes, or getting used to the style of the classes.</td>
</tr>
</tbody>
</table>
Although not all of their opinions matched, Akira and Misa mentioned very similar things, that is, that *nareru* involved getting used to the pattern or style of the classes. Following from what Masashi stated above about how students would likely continue using their old high school study methods at university unless exposed to or taught other methods, this need to get used to university classes and university life not only follows from what has been speculated elsewhere (see Rubrecht, 2003a) but also makes sense. Exposure to foreign teachers who only speak English in class means that getting used to a new way of learning becomes imperative.

**Discussion, Implications, and Continued Research**

The present study represents the first step of examining if and how Japanese university students change their study methods in the face of new academic requirements encountered in university English courses. It should be stressed that these results cannot be taken as conclusive, nor can they be generalized to other students in other English programs. For the purposes of this research, it was deemed that generalizability could be sacrificed if a better understanding of the phenomenon at hand (i.e., of changing study methods) could be obtained (Onwuegbuzie, 2000). Even with this caveat understood, several issues of interest deserve dissemination, explication, and further consideration regarding the larger longitudinal study and potential other future research.

Looking across the results from this preliminary investigation, the somewhat unexpected general emphasis by these freshmen on expecting to study differently at university compared with how they studied previously in high school was evident in their reported views on (a) listening and (b) SAC use. For instance, from Questionnaire 1, the second most commonly reported answer to the question of how the students planned to study at university was “listening” by 38 students (the only greater response was “utilize foreign teachers and friends,” reported by 39 students). When also asked in Questionnaire 1 how they planned to study at the beginning of their first semester at university, students responded with “listening” and “utilize the SAC” (the first and third most common responses, respectively). As conveyed above, Questionnaire 2 showed that 20 students who proposed doing listening or utilizing the SAC as a study method for the first semester
reported actually studying in those ways. For Questionnaire 3, responses to the question asking how students’ study methods changed from high school to university evinced listening as the most common response. When asked how their study methods changed between semesters, most students answered with the response “no change” followed by “did more listening.” The second most common response to the question of how their study methods did not change between semesters was that they continued to engage in a great deal of listening.

The interviews echoed these questionnaire response trends. Three interviewees mentioned listening as a study method at university. With the exception of Masashi, all interviewees mentioned utilizing the SAC as a method of study. That the interviews produced the same themes as identified in the questionnaires is encouraging and indicates that the data collection techniques employed for the present study performed well, especially considering that (a) only one interview was carried out with only six students, (b) the interviews were conducted at the beginning of the second semester prior to the administration of Questionnaire 3, and (c) the short interviews covered a limited range of topics.

That students identified listening and SAC use as their most commonly proffered study methods indicates two things. First, I believe it means that students see a pressing current need for listening and/or a need to compensate for the years of high school instruction that largely lacked listening components. Stated simply, listening represents half of what is required for (face-to-face) communication. Because students’ high school learning was not for communicative purposes, listening gets singled out as the skill most desired. Second, students probably mentioned using the SAC as often as they did because the university not only actively encourages students to use the SAC facilities but also requires students to attend the SAC weekly every semester (with dire consequences for non-attendance). Thus, essentially from day one, students learn of the importance of going to and using the SAC. As the SAC is fully equipped with modern audio/video equipment, the latest in computer technology, and is also the location of occasional homework assignments designated by instructors, students soon identify the SAC as a study instrument. Whether or not students continue to view the SAC in such a positive light over the course of their four years at university remains to be seen.

When viewing all of the present study’s results, it was discovered that in addition to listening and SAC use, these freshmen appeared ready to abandon their high school study
methods for two interconnected reasons. First, students perceived multiple deficiencies in their high school English instruction that lead them to believe their previous study methods (and relatedly, their high school English instruction) were not practical nor usable in the real world, including at the university level. This belief was foreshadowed by students’ responses from Questionnaire 1 indicating that most students expected to study differently at university compared with how they studied in high school. In the end, it was discovered that students viewed their high school EFL learning as being impractical and essentially only for testing purposes, a theme that has been discussed elsewhere in a similar situation (see Kang, 1999). Second, students tended to equate university life with freedom, the “window of free time” between the rigors of university entrance and the secure yet potentially monotonous workplace. In fact, the free nature of university may be a crucial point with regard to study methods because students can realize that change is possible or even necessary once at university. Whereas high school represented the need to pass an examination, university represents coming-of-age opportunities to explore life, including diverse study methods.

Ironically, this sense of freedom may in part originate from the presence of the native instructors at university. It appears that these instructors represent in part, the symbol of this freedom and advancement “into the world at large.” Few students learned from native English instructors below the university level, as evinced from responses to Questionnaire 1, yet so many students reported in Questionnaire 2 that they would rely on the native instructors and do more with their English studies because the native instructors taught the courses. Results of a study by Long (1997) indicate that Japanese students have generally positive attitudes concerning their foreign instructors and that students evaluated their native instructors by different standards than their Japanese counterparts. Perhaps the students in the present study placed a great number of expectations on the native instructors. While it has been documented that such instructors draw special attention as being representatives of the target language culture and invite long-lasting consequences outside of and beyond the learning environment at university (Bergin, 1999; Shimizu, 1995), perhaps students will change their views of their instructors after their “newness” has worn off.

The notion of freedom at university may actually be evinced by the fact that many students predicted they would change study methods while relatively few students reported change in their study methods between semesters. I say this because Japanese freshmen
arrive at university from a wide range of different high schools. High schools in Japan run the gamut between public and private (Lynn, 1988), coeducational or single-sexed (Okano & Tsuchiya, 1999), and academic, vocational, or a mix of both (Beauchamp, 1982), meaning that students’ learning and experiences in high school, while likely similar in many respects, are definitely not consistent. Some students are challenged more than others, and some students are provided more opportunities to learn and excel more than others.

The consistency is apparent when students predict that their study methods will change upon university matriculation. They realize their high school English lessons were aimed at helping them pass the university entrance examinations, but they also realize that those lessons – including the study methods they fostered and, to a certain extent, the contents of those lessons – did not fully prepare them for what they would encounter at university. First semester therefore becomes the time when students make predictions about how they will study (which, as found in the questionnaires, often coincide with how they were unable to study in high school). They get a feel for the new environment and try out new methods because they are free to do so. By the end of first semester, students come to realize what is expected of them, what they are able to do, and how much effort they want to expend in their classes. The students who made study method changes between first and second semester, it may be speculated, are still searching for personally appropriate methods (e.g., methods that fit their learning style). This freedom at university therefore means freedom to learn.

Like with other matters in life, with freedom comes responsibility, something these students seemingly recognize. I would argue that as these students take on freedom at university they also take on responsibility for their own learning, that is, students shift the endeavor of learning from instructor-guided teaching to individual learning. As mentioned above, high school English language instruction in Japan, being as heavily influenced as it is by the university entrance examinations, does not foster or promote learning autonomy in students. However, based on the present study’s results, students appear increasingly more autonomous as they take on more responsibility for their own learning, which is precisely the definition of autonomy (Holec, 1981, as cited in Usuki, 2001). Whether these students equate freedom with responsibility on their own or were guided to this view by others (their instructors, their parents, etc.) is a question open to further investigation.

For continued research for the longitudinal study, listening, SAC use, and students’ impressions about university will be further explored. These students’ study
methods will still be examined, as trends only tell part of the story. Future questionnaires in the next and subsequent years will involve students detailing their current study methods, the efficacy of those methods, and the impressions students have about if and how those methods are improving their skills in English (i.e., if students consider those methods to match their learning styles or learning preferences). Additionally, as students change their study methods they probably also change their views about university life, English use, and even themselves, some inquiry will target their views on these and other matters. Other researchers are encouraged to conduct their own studies on students’ study methods, in Japan and elsewhere, so that a more global picture of method change can be documented and better understood.

Geocaching in Michigan: Attitudes and Behaviors of Organization Members

Geocaching, “geo” for geography and “caching” for the process of hiding a cache, involves individuals setting up caches all over the world and sharing the location coordinates on the Internet so that others may search for the cache with a GPS (global positioning system). Initiated spring 2000 outside Portland, Oregon today people in 213 countries participate in this sport. In just four years more than 138,000 caches have been hidden to engage more than 100,000 participants worldwide. The behavioral aspects of the sport are the focus of this paper as we examine geocaching organization members’ attitudes and behaviors toward environmentally responsible behavior in this technologically dependent natural area sport.

An electronic message contacted 480 geocachers in Michigan and invited them to participate in a questionnaire regarding geocaching. The survey instrument focused on a variety of areas, including environmentally responsible attitudes and behaviors. The sample consisted of Michigan Geocaching Organization members. Responses were received from 250 geocachers (52% response rate). Survey respondents were mainly white (97%), men (72%), 43.5 years old, with some college education. Most respondents were employed fulltime (74%).

Respondents were relatively new to the activity, in that most respondents (46%) had 1 – 2 years of geocaching experience. Many respondents (41%) engaged in finding rather than hiding caches, though 55% of the respondents had hidden at least one cache within a 10-month period. At least 80 percent of respondents agreed important or very important experience components were to experience nature, get away from the usual demands of life, get physical exercise, and test their skills. Geocaching has increased the number of visits to parks and recreation areas for more than 80% of the respondents. These areas include city parks, county parks, State parks, and federal parks and outdoor areas. About half of the respondents were willing to travel 50 miles or less (one way) to find a cache, although another third were willing to travel 100 miles or more.

About one-quarter of the respondents said they always ‘cache in – trash out’, a behavior encouraged by their national organization. More than half of the respondents strongly agreed that “it is mostly up to me whether I cache in – trash out” and “most people who are important to me would approve of my caching in – trashin out”. Nine in ten respondents said it was very important to pack out everything you bring into an area. Thus, strongly environmentally responsible attitudes and behaviors appear to exist within this group.

This empirical examination of participants in this emerging activity indicates an increased use of public lands by geocachers, but strong environmentally responsible attitudes and intended behaviors. The data also indicate a strong belief in not contributing to littering, and moderate interest in cleaning up after other people. This desire to keep public lands clean and natural looking for future visitors is an area that managers can emphasize in partnership with geocaching organizations.
Class, Race, and Space:
The Efficacy of Social Networks in Mixed-Income Housing

Abstract

Years of research have shown that being confined to the inner city leaves residents of those communities with little access to essential social and economic resources (i.e., networks to jobs, etc) (Wilson 1987, 1996; Brooks-Gunn, Duncan, Klebanow, & Sealand, 1993; Massey & Denton 1993; Jargowsky 1997). The people who are trapped within poor urban neighborhoods are limited not only by rising social problems and structures in the community but also by a lack of opportunistic networks. All of these barriers combine and result in a lack of important and necessary resources and opportunities. Residential isolation combined with concentrated poverty are believed to be the source of many attendant problems. These include high levels of unemployment, crime, out-of-wedlock births, and welfare dependency, making social and economic mobility difficult to attain (Wilson 1996, 1987; Jargowsky 1997).

One of the most recent efforts that has been implemented in large-scale to deconcentrate poverty is found in the affordable housing industry. Academic scholars have long noted the problems associated with concentrated poverty but it has only been in the last decade that professionals in the affordable housing industry have begun to modify housing policies to address some of the problems associated with concentrated poverty. Mixed-income housing is increasingly becoming an alternative model to traditional assisted-housing initiatives. Mixed-income housing is becoming more popular because of its potential to reduce social ills within neighborhoods and provide individuals and families with greater access to resources.

With this change in housing policy, it is essential to consider whether current and new residents are in fact benefiting socially and economically by living in mixed-income
communities and to understand the assumptions behind this new housing model. One of the premises behind a mixed-income approach is that people, and especially children, will benefit from living close to people who are not poor because those people can be viewed as having important values that are in accordance with “mainstream society”. One of the primary assumptions is that by placing people in close proximity to one another they will interact and social networks will be formed, which will ultimately result in reducing social isolation and provide greater economic opportunities.

This thesis is an empirical examination of the mixed-income concept. It addresses the viability of a mixed-income approach to address problems of concentrated urban black poverty. Specifically, this thesis looks at the effects of living in mixed income communities by examining residents in these communities.

My design will include a mixed-methodology approach using both quantitative and qualitative components. A qualitative methodology is ideal for understanding the processes at work in a mixed-income neighborhood and the way in which the neighborhood contributes to economic self-sufficiency and social interactions. The use of a qualitative methodology enables me to have the ability to examine both the individuals at the sites as well as the spatial context in which they live. In order to better understand these issues of race, space, and class I will examine two different types of mixed-income developments as well as a third low-income site that does not include the mixed income component. The third site will be used as a control. First, I will conduct in-depth face-to-face interviews with people at all three of the sites. Second, I will construct a survey with the information I have obtained through the in-depth interviews and survey respondents at each of the three sites to garner information about their social
networks as well as demographic information. Third, through fieldwork I will do a
descriptive analysis of the neighborhoods to better understand the concept of
neighborhood effects. Fourth, I will use quantitative methods to examine the larger
neighborhood context and to compare the different neighborhoods and their similarities
and differences.

This research will address the question of what are the social and economic
implications for families living in a mixed-income community? Do residents of these
communities form social relationships? What is the efficacy of these relationships? Do
they result in reducing social isolation and or in bolstering social and economic
opportunities, or do they further entrench/stigmatize the poor? This research will shed
new light on the assumptions behind mixed-income strategies as a means of
deconcentrating poverty, the ways in which race and ethnicity effect the viability of a
mixed-income approach, the efficacy of social networks, and provide new insights for
social scientists that can further the discussion of race, space, and class.
Political Ritual and Social Function in Local Government: An Ethnographic Study of a City Council Meeting.

Durkheim was one of the first sociologists to consider the concept and purpose of rituals in society. Society feels the need to uphold and reaffirm at regular intervals the collective sentiments and the collective ideas which make its unity and its personality (Durkheim, 1915). This paper is concerned with the role played by rituals and rituals as symbols in a local political organization. A number of sociologists as well as anthropologists have applied a particular theory of ritual to the politics of advanced industrial societies. Most of these studies suggest that rituals act as a means of reaffirming social values and provides renewed social cohesion (Shils and Young, 1953). Another group of scholars argues that political rituals are not necessarily promoting value integration, but are rather mobilizations of bias (Lukes, 1975; Schattschneider, 1960). Using fieldwork, I test Durkheim and ‘neo-Durkheimian’ assertions that rituals in modern societies provide a means of communicating and reaffirming moral values as well as providing grounds for social solidarity. In addition, I examine the alternative concept of “mobilization of bias” in political rituals. I examine Durkheim’s theory of the social functions of ritual in the context of the political rituals performed at a City Council meeting, to understand whether Durkheim and neo-Durkheimian theory is still applicable in contemporary political rituals. First, I will provide a working definition for ritual. Second, I will discuss Durkheim’s theory of religious beliefs and ritual. Third, I will examine the neo-Durkheimian’s theory of ritual. Fourth, I will examine City Council meetings in light of the mobilization of bias function. Fifth, I will discuss the role of ritual in my own fieldwork. Finally, I will discuss the limitations of my research.

An Understanding of Ritual

Rituals are grounded in and governed by rules. Rules allow rituals to be patterned and involve some normative pressure on its participants (Lukes, 1975). The literature on rituals has revolved around the topic of religion or with religion and magic (Wilson, 1957; Firth, 1951). Despite this concentration on religion, rituals need not be inherently religious. There are a
number of rituals that are practiced outside of the religious sphere. There are practices similar to
religious rituals, such as political ceremonies, where references to the supernatural or mystical are
either not central or else absent (Lukes, 1975). This research will address these practices, where
religion does not play a central role.

Symbolism plays a role in our understanding of ritual. Some sociologists and
anthropologists have stressed the non-instrumental character of ritual, others the symbolic nature
of rituals. The non-instrumental form is described as, “the standardized behavior in which the
relationship between the means and the end is not intrinsic” (Goody, 1961: 159). The expressive
form has been defined “where the means appear clearly disproportionate to the end, explicit or
implicit, whether this end be that of knowledge, communication, or production” (Sperber, 1974:
16). It becomes difficult then to untangle what constitutes symbolic rituals. Symbols allow for
humans to actively respond to a reality that imposes itself and humans can actively create and re-
create the world acted in (Charon, 1985). As previously stated, rituals are governed by rules. It
is the combination of rituals and symbols that link together to produce the actor’s behavior.

To more clearly understand what is a ritual and what is not a ritual, a working definition
is necessary. For the purposes of this paper a ritual is defined as, “rule-governed activity of a
symbolic character which draws the attention of its participants to objects of thought and feeling
which they hold to be of special significance” (Lukes, 1975: 291).

*Durkheim and Rituals*

Durkheim suggests four social functions of rituals. First, a disciplinary and preparatory
function. Religion acts as a means of imposing self-discipline on an individual. Second, a
cohesive function, namely that religion and rituals in general bring people together and in turn
reaffirm their solidarity. Third, there is a revitalizing function to rituals, where members are
made keenly aware of their social heritage. Fourth, Durkheim mentions the function of euphoria,
a function where people have the sense of pleasantness based on social well-being. Theories regarding symbolic rituals stem from the Durkheimian tradition.

Durkheim used religion as a means to explain rituals and sacred objects. There are two main components of Durkheim’s interpretation of religious belief and ritual. The first of these is a cognitive means of understanding the social world. In other words, religious belief can be understood in terms of the social world in a symbolic manner. Religion was defined as, “a system of ideas with which the individuals represent to themselves the society of which they are members, and the obscure but intimate relations which they have with it” (Durkheim 1915: 225). This first interpretation is found on the individual level. Individuals are strengthened in the social natures.

The second way of interpreting religious beliefs and rituals is through sociability. Sociability binds the individual to the social entity as a whole (Durkheim in Giddens, 1972). Religious rituals or rituals in general can be seen as a way of expressing social realities. This expression can provide a flag or can be seen as a rallying sign for others. The sociability aspect provides the grounds for the group to renew the sentiment of the collectivity (Lukes, 1975).

This is why all parties political, economic or confessional, are careful to have periodical reunions where their members may revivify their common faith by manifesting it in common. To strengthen those sentiments which, if left to themselves, would soon weaken, it is sufficient to bring those who hold them together and to put them into close and more active relations with one another. (Durkheim in Collins, 1994: 209)

Durkheim’s early work has been instrumental in providing a base for understanding public rituals. Although Durkheim focused on religion as his example for explaining ritual, his theory can be applied to a wide array of contemporary political rituals.

**Neo-Durkheimian Theory**

Political rituals are critical mechanisms for social solidarity and cohesion. A number of studies have been conducted to further apply Durkheim’s theory of ritual in contemporary society
(Shils and Young, 1953; Warner, 1962; and Bellah, 1968). A study conducted by Shils and Young (1953) examined the meaning of the Coronation in Britain. Shils and Young contend that adult members of society have some level of standards and beliefs about which there is agreement.

The polis or community is not just a group of concrete and particular persons; it is, more fundamentally, a group of persons acquiring their significance by their embodiment of values which transcend them and by their conformity with standards and rules from which they derive their dignity (65).

Thus, Shils and Young argue it is the importance of the moral rules and the expression of those morals that bind a society together. The Coronation acts as a ceremony in which the affirmation of moral values can be expressed, it is an act of national communion (Shils and Young, 1953). Shils and Young suggest that the Coronation as well as other ceremonial events act as a space in which society reaffirms their moral values and renews their devotion to those values. “The Coronation Service itself is a series of ritual affirmations of the moral values necessary to a well-governed and good society” (Shils and Young, 1953: 67). The Coronation allows members of society to come together and express their internal agreement about what is important.

Although the Coronation is a symbolic act that could take place out of the public eye it does not. The Coronation Service and the process that follows is shared and celebrated by nearly all the people of Britain (Shils and Young, 1953). Through radio, television, newspapers, and festivities throughout the country, the Queen and the people were brought into a great nationwide communion (Shils and Young, 1953). In order to convey the appropriate moral messages, the Coronation ceremony includes an elaborate display of symbols and rituals. These symbols and rituals include such items as the presentation of the Bible. The Bible acts as a symbol that the queen will be mindful of the law. “The Bible is the vessel of God’s intention, a source of continuous inspiration in the moral regulation of society” (Shils and Young, 1953: 69). Similar symbolic rituals include: the oath, the anointing, presentation of the sword and the orb, and the
benediction. Each of these symbolic rituals acts as a means of conveying the moral principles of society.

In another example of the neo-Durkheimian tradition Lloyd Warner (1962) examines ceremonies in the United States. Warner specifically studies Memorial Day ceremonies. Memorial Day ceremonies, like the Coronation, are viewed as a means of expressing collective representation. These ceremonies not only express a unification of society but a sacred unification as well. “They consist of a system of sacred beliefs and dramatic rituals held by a group of people, who when the congregate, represent the whole community, and they are sacred because they ritually relate the living to sacred things” (Warner, 1962: 278). Thus, differences in faith and class are set-aside in order for the community to come together.

Other holidays celebrated in the United States perform the same function. Holidays such as Christmas, the Fourth of July, and Thanksgiving facilitate this same form of social integration. These ceremonies provide a basis for individuals to minimize their differences and to reaffirm the values of society. These holidays are a part of the “ceremonial calendar of American society, which functions to draw all people together to emphasize their similarities and common heritage; to minimize their differences, and to contribute to their thinking, feeling and acting alike” (Warner, 1962: 7).

The Durkheimian and neo-Durkheimian traditions provide a framework for interpreting and understanding rituals in modern society. I use the theory of the social function of rituals to better understand the way in which rituals play a crucial part in the integration of modern societies. In particular, I will examine the question of whether the social functions of ritual are an appropriate means of understanding the politics of City Council meetings?

Methodology

I carried out a three-month observation study at a City Council meeting in a large metropolitan area. The meetings are held in a large governmental office building in the central
city. The Council is composed of 17 members. Seven of the members are at-large member and 10 of the members are district Council members. The Council meets once a week on Thursdays at 10:00AM for a public meeting that typically lasts between an hour and an hour and a half in length. I attended all of the Thursday weekly meetings. I began my observations the first week of February and concluded my observations at the end of April.

During the study, I took field notes on all the public meetings I attended. Council members are present at the meetings as well as members of the public, reporters, photographers, assistants to the council members, and security officers. I did not interact with the Council members although I did occasionally interact with other members of the public who were in attendance. I did not conduct any interviews while at my site, instead my focus was on what I could discover based solely on observations. I collected over 80 pages of field notes during this three-month period.

Council meetings are structured meetings that follow the same format every week. A “City Council Calendar” is available every week that lists: “Bills on final passage,” “Bills on second reading and final passage,” and “Bills on first reading.” The Chair of the Council leads the meetings every week and follows the same format every week. Each meeting begins with a prayer, followed by the approval of the previous meeting, requests for leaves of absence, a welcome to the public, presentation of resolutions, presentation of any new bills or resolutions from each council member, presentation and vote of bills on final passage, and finally speeches by council members. One might expect, as I did, that the majority of the meeting would center around the bills on the agenda. I expected that the presentation of bills and voting on bills would dominate City Council meetings. This is not the case; on most days, the resolutions dominate the meetings. The resolutions generally occupied half to three-fourths of the time allotted for the meeting. In contrast, the presentation and voting on bills traditionally took about a quarter of the time. It is for this reason that the focus of the analysis is on the presentation of resolutions at City Council meetings.
I developed my argument using dimensions and language presented in Emile Durkheim’s, *The Elementary Forms of Religious Life* (1915) as well as other texts that present Durkheim’s work on ritual and symbolism. I use my observations at City Council meetings as a means of understanding and examining Durkheim’s four social functions of rituals. My data relies almost entirely on my observation field notes, and secondary source material on political ritual and social integration. The names of all members of the council and public as well as the place have been changed.

*The Prepatory Function*

Rituals prepare individuals for social living. Rituals provide a structure and a discipline for individuals. “Social existence is possible only as individuals are able to accept constraints and controls” (Nisbet, 1965: 138). According to Durkheim, asceticism is an inherent element in all social life.

City council meetings are ridden with the prepatory function of ritual. These prepatory rituals begin even before one enters the room where the council meetings are held. In one example, security is present at every council meeting and each person is checked before they enter the room. My first encounter with security was managed by a series of commands from the security officers: “Um okay we just need to search your bag. Okay hold out your arms. All right turn around please. All right you’re done.” Each interaction with the security officers was managed in the same fashion in order to maintain the ritual and ultimately to impose a constraint on the individual. Constraints provide a means of shaping the behavior of the individuals who are participating in the ritual. I too was a part of the prepatory ritual of security. I upheld my role as an individual being shaped for social living in accepting the constraints of the situation:

I place my backpack on the desk. I reach in the pockets of my coat and pull out my keys. I set the keys on the desk. I turn around keeping my arms out, he moves the club across my backside.
The security officers are upholding their role in maintaining a ritual to provide structure and discipline for individuals in society. Each person who allows the security officers to do their job participates in the molding of individuals to accept constraints in society.

There are visual symbols placed around the room as well to facilitate asceticism. These visual symbols include both the placement of furniture and other obstacles as well as signs placed around the room. The furniture provides a particular structure that in turn regulates the behavior of individuals:

There are a number of chairs set up around the perimeter of the room. There is also a wide hallway that lines the perimeter leaving a wide space between the chairs and what appear to be marble columns. There are two rows of the marble columns. A metal fence connects the columns and there is a gate across from where I sit that swings open to let people into the middle part of the room. There is a security guard in front of the gate.

The desks where the council members as well as the desk where the Chair sits are separated from the public area:

In the middle of the room there are a number of wooden desks set up with wooden chairs sitting behind each desk. There are maybe 30 of these desks in the room. Towards the front of the room there is what appears to be an altar. On the second step of the altar is a very large pulpit with a microphone and a huge wooden chair behind it. The wooden chair has a large cushion and looks like it was made for a king.

The way in which the furniture is arranged structures the behavior of those in the room. The gates and columns limit access to the center stage area of the room. The altar and desks for the Council members function as a means of separating themselves from the public.

There are signs placed around the room as well to discourage certain behavior. There are two signs in particular that I notice; these include a “Handicapped Only” sign that is on the fence that attaches the columns, as well as a sign that reads, “Do Not Approach the Railings.” Each of these signs conveys a clear message of expectations for the public in this setting. These signs are a part of the ritual of Council meetings, and aid in preparing the public for their role at the meetings.

Security, the furniture, the columns and rails, as well as the signs placed around the room facilitate boundaries and constraints on individuals. The reason in part for these controls is to
regulate the behavior of individuals in order to maintain harmony. The public is constrained by both physical barriers as well as written materials in order to impose self-discipline, so that the Council can perform its function of honoring individuals and passing bills.

The Cohesive Function

Ceremony and ritual brings people together and thus serves to reaffirm their common bonds and to enhance and reinforce social solidarity (Nisbet, 1965). “Rites are, above all, means by which the social group reaffirms itself periodically” (Durkheim, 1915: 553). Through City Council meetings, the council members can set aside their differences in order to reaffirm the moral values of society as well as the values of the council.

From the evidence I have obtained through observations it appears that the “Resolutions” part of the meeting is the space in which this reaffirmation occurs. Council members present resolutions to an individual or a group. Sometimes a resolution is presented by an individual council member but was issued through a group of council members, for example:

The resolution is to honor the YMCA Black Achievers. Councilman Rich, Councilman Garcia, and Councilwoman Brownstone walk up to the lower podium. Councilman Rich begins to speak on behalf of the rest of the members.

Ultimately all resolutions are supported by all members of council. In another example, a resolution is proposed by councilwoman Brownstone and passed by the entire group.

Brownstone: A resolution concerning a seal for African American achievement for eleventh grade students at William Morrison High School.

Chair: All in favor indicate by saying aye.

Council: Aye.

Chair: Those opposed? (silence)

Chair: The ayes have it, the motion carries.

In a final example, the Chair of the council introduces the council members involved in the resolution and indicates the support of the entire council.
Our first order of business is to present the resolutions that were passed at last week's council meeting. Will Councilwoman Brownstone, Councilman DeSoua, and Councilman Marino please come to the front in order to present the resolution concerning Doc Frash. I am excited and pleased that this resolution is being presented to honor Doc Thrash’s life and accomplishments and is supported by all members of council.

The presentation of resolutions allows for a space in which members of council do not argue, and where council members act as a cohesive unit in support of the values associated with each of the resolutions passed. Resolutions are signed by all members of council and when voted on all council members vote in favor of the resolution. Over my three-month period of observations all resolutions passed without any opposition. Council members set aside any differences in order to come together to share in this collective sentiment. “Whatever their stated purpose, the essential thing is that men are assembled, that sentiments are felt in common, and that they are expressed in common acts” (Durkheim, 1915: 553).

The Cohesive function may in part explain the emphasis on resolutions and the de-emphasis on the presentation and voting on bills. Resolutions allow the opportunity for the public to share in solidarity with the council. People can come together and reinforce their shared set of beliefs. When resolutions are introduced in council meetings, council members unanimously vote in favor of the resolution. I never witnessed a meeting where anyone opposed a resolution. In contrast, however, council members often opposed bills or asked for the consideration of an amendment to a bill. In one example, a bill that discusses a service agreement between the city and the Redevelopment Authority that will deal with neighborhood blight is on second reading and final passage. One of the council members offers an amendment to the bill. He is visibly upset about the current state of the bill, “this tax-supported debt program will fail.” Other council members join in and an argument breaks out between two of the council members.

Councilman Henny: Will you please read the amendment? (The clerk reads the amendment aloud)
Councilman Kramer: Is this amendment even legal? I mean is this legal or political? Can the chief council please advise as to whether this amendment is even legal, this seems like a political move.

The discussion continues and eventually the amendment is put to a vote.

The clerk begins calling out each city council member’s name. As each member is called they provide a response of either aye or no. The votes are tallied and there are 12 “ayes” and 5 “nos.” The motion falls and there is a group of people in the back of the room who start to clap. A man in the back is holding up a yellow sign that says, “Thieves at Work!”

The bills or amendments to bills are introduced by individual council members and are often political in nature. It is apparent from the example provided, that bills or amendments to bills, do not necessarily provide the same cohesive function as resolutions. Thus, the bills do not bring about the same feeling of solidarity as resolutions. When voting occurs, the votes are often split, indicating a divide in people’s allegiances. This same divide does not occur when council votes on resolutions. It is for this reason that I believe the emphasis in these public meetings is on resolutions as opposed to bills. Since these meetings are open to the public the presentation of self becomes very important. The presentation of resolutions not only brings together members of the Council in solidarity but the Council can present itself to the public as a cohesive unit as opposed to a divided group. Having the Council appear to be unified rather than divided gives the public a sense of well-being and calm that a cohesive, organized unit is settling the matters of this community.

The resolutions are presented to a diverse group of individuals and groups. In one example a resolution is presented to an African American woman who is considered by council members to be a leader in the African American community.

Vicky Lee is the Emily Post of this city; she is an expert etiquette advisor. Vicky Lee is a woman who stopped working as an editor ten years ago and decided to go into the bridal world in order to better represent African Americans. She felt that African Americans were not being well represented in terms of seeing their faces in bridal magazines so Vicky Lee decided to bring that issue to the forefront by working as a wedding consultant.

In another example, a resolution is presented to a woman from the Girl Scouting board to honor the advances made by women.
Girls and women have made a number of advancements over the years and in part these advancements can be attributed to the Girl Scouts. Today we would like to honor those advancements by presenting a resolution to Ms. Brown, a representative from the Girl Scouting board.

By honoring the Girl Scouts and Vicky Lee, the council can reinforce the value that women are important members of society. The council also brings in these different individuals and groups that might otherwise not be in attendance to publicly display this notion of solidarity. Those receiving the resolutions come to the council meetings to obtain their awards and at the same time reaffirm social solidarity with other members of society. By presenting resolutions to a diverse group the council is able to reinforce social solidarity not only within the council itself but solidarity with other communities as well. Since people often live their lives occupied with their personal interests, the ceremony of presenting resolutions enables cohesion.

Since society is a necessary condition of human civilized living, it is imperative that this condition be remedied, that periodically at least man be given the opportunity to commune with his fellow social beings and to express his solidarity with them. (Nisbet 1965: 139).

The presentation of the resolutions provides a space in which social solidarity can be expressed and common bonds can be reaffirmed.

*Revitalizing Function*

Ceremonies and rituals aid in perpetuating and renewing faith and values in society. “Traditions must be perpetuated, faith must be renewed, values must be transmitted and deeply embedded” (Nisbet, 1965: 139). The resolutions as well as the prayers given at the City Council meetings provide this revitalizing function. Each week a different council member asks a religious delegate to give the prayer at the beginning of the meeting. The religious members have included bishops, rabbis, priests, and ministers. Although the question remains as to why exactly religious members come to governmental public meetings, in part the explanation may lie in their
revitalizing function. These religious delegates help to renew the faith of the members and remind the council of their purpose and moral obligations. In one example, a rabbi is giving the invocation.

The Rabbi is giving the prayer. The prayer begins with explaining how the council is fulfilling one of the commandments by trying to promote justice and fairness. He talks a great deal about God’s wishes and America in general. He thanks the council for doing all they do and trying to do God’s will.

In another example, as a part of his invocation a reverend is telling the story of a boy named Timmy and a blacksmith:

The boy and the blacksmith were friends and one day there is a fire in Timmy’s house. Timmy is calling for help and the blacksmith hears him. The blacksmith comes to the house but Timmy is on the third floor and the blacksmith cannot reach him. The blacksmith decides to climb up on the burning building and each time he puts a hand on the building he scorches his hand. Finally, the blacksmith gets to the window where Timmy is and he puts Timmy on his back and climbs down. When the blacksmith gets to the second story he falls. Both Timmy and the blacksmith wind up being okay but Timmy’s family dies in the fire. A judge has to figure out whom Timmy is going to go and live with. A bunch of families show up who are interested in adopting Timmy. Each family states their case and finally the blacksmith comes up. The judge asks the blacksmith what do you have to give to Timmy? I have these (the reverend holds out his arms). The judge awards custody to the blacksmith. (The reverend continues talking)

You all know who Timmy is don’t you? Timmy is the child living in North Loveton who doesn’t have enough to eat. That is why you are all here, you are set up to help people and that is what you are here to do.

The invocations given each week are ritualistic and function as a means of renewing faith and the values of the council. “Men celebrate certain rites in order to remain faithful to the past, to keep for the group its moral physiognomy” (Nisbet, 1965:139).

The resolutions themselves function in part to convey the values of the council and their social heritage. Although the resolutions are presented to those outside of the council, those that are chosen to receive this honor uphold or promote some value found in the council as well. In one example, a resolution is presented to the YMCA for Black Achievers Day.

Councilman Rich begins talking about the YMCA. He is talking about how the YMCA builds strong kids, strong families, and strong communities. That some of the most important things about the YMCA is its ability to overcome barriers, the professional
successes that have come out of the YMCA, and its commitment to continued community involvement.

The director of the YMCA Black Achievers program speaks up:

This is a day I am going to remember for the rest of my life. For this is the day that we are recognizing black children’s achievement and success.

This example illustrates that the revitalizing function serves not only the members who traditionally attend the council meetings but values are transmitted to and from other members of society as well. At another meeting, a man is being honored by Councilman Garcia for his work with the Latino community:

We are here today to recognize the work of this man and this amazing group that has benefited and continues to benefit the Latino community. El Grupo del Barrio is a group that successfully combines and promotes education, peer socialization, and spirituality.

This resolution and articulation of this resolution expresses the moral values of both the individual being honored as well as the council.

The resolutions clearly illustrate the values that are an integral part of the group. These rites serve to sustain the vitality of the social heritage and to keep the crucial parts from lapsing from memory. “The group periodically renews the sentiment which it has of itself and of its unity; at the same time individuals are strengthened in their social natures” (Durkheim, 1915: 536).

The Euphoric Function

Ceremony and ritual serve to establish a condition of social euphoria, in other words a social feeling of well-being (Nisbet, 1965:139). This is especially important in cases where adverse conditions disrupt the smooth functioning of the group. These adversities threaten the sense of well-being of the group. The group can then counterbalance the disturbing action through ceremony and ritual. In one example a council members speaks out of turn to identify a group of people in the room:
A group of adults has come here today to show their support for public education. (The adults are holding signs). These adults have students and they care about these students and about public education. These people are involved in the ongoing training for parents who care about public education. (Everyone in the room claps).

The issues surrounding public education in this particular community have created tension at the council meetings. Thus, by a group displaying an expression of dissatisfaction they can address the issue that has caused them grief. Another illustration of this point comes from a meeting where a councilman is recognizing a group of former prisoners:

I want you to look at this group standing at the back of the room. These individuals are former prisoners who were used in medical testing conducted by the University of Glasbow. These individuals continue to cope with the problems brought on by those medical experiments still today. I am proposing a resolution acknowledging these courageous individuals.

In this instance, the wrongdoings of the past are publicly revealed and expressed in order for the group to bear witness to the past and remedy the situation. This coming together of individuals, and expressing a like emotion aids in compensating for the original loss. Durkheim’s theory, however, is limited in its ability to understand the general sentiment of the group. There is an assumption that because the group is a collectivity it shares the same sentiment and this sentiment raises social cohesion. Durkheim uses funerals and the rituals surrounding death as a means of explaining the euphoric function. “Of course they have only sad emotions in common; but communicating in sorrow is still communicating; and every communion of mind, in whatever form it may be made, raises the social vitality” (Durkheim, 1915: 574). It is difficult to know whether the group in fact shares the same sentiment but what is important is that there is a perceived sense of solidarity. Through the ritual of proposing and passing resolutions the group is able to maintain the feeling of well-being.

Mobilization of Bias

While I found Durkheim’s social functions of ritual to be relatively comprehensive in explaining rites, there is an additional social function that exists. This new category is referred to
as the mobilization of bias (Schattschneider, 1960). The mobilization of bias is, “a set of predominant values, beliefs, rituals and constitutional procedures that operate systematically and consistently to the benefit of certain persons and groups at the expense of others” (Bachrach and Baratz, 1970: 43). Steven Lukes (1975) further extends this category to note that ritual has a cognitive dimension and is situated within a less-structured, conflictual, and pluralistic model of society. Rituals can then be seen as modes of exercising or gaining power. The addition of bias as a social function requires the consideration of the internalization of particular political paradigms. It is necessary to consider the mobilization of bias as a function of rituals. The resolution presented to Vicky Lee, the wedding consultant and businesswoman, is an example of this bias. Although Vicky Lee is being awarded a resolution in her honor for her role in the African American community, Vicky Lee appears to have an agenda that extends beyond thanking the council for this honor:

Vicky Lee is looking around at the group who is flocking her on all sides. As she looks around she mentions each and every persons name that is standing around her and says what they do for a living. I see my niece up here a recent graduate of Titum University, I see my friend and colleague and amazing business woman Margaret Baker, I see Tony Kramer a wonderful wedding photographer, I see Amy York an editor for “Bridal Star” magazine, I see. . .

The tribute continues like this for some time. Although it is difficult to say definitively what Vicky Lee’s specific agenda is at the Council meeting, she appears to be exercising power in order to promote her business and her business associates. The promotion of her business and her associates may in turn be at the expense of others in the community. The mobilization of bias is an important means of studying political rituals, however, my own research is inadequate for producing sufficient examples of this bias.

The mobilization of bias requires a much deeper understanding and examination of political rituals. If we are to truly understand the deeper meaning of politics and rituals we need to concentrate on the mechanisms through which politics influences what individuals want, what they regard as possible and even who those individuals are (Edelman, 1964: 20). Most
importantly, a close examination would address the way in which social control is managed and manipulated in a class-structured society. “Rituals, can serve to reinforce and perpetuate dominant and official models of social structure and social change” (Lukes, 1975: 302).

‘The Law’ is then a powerful means of understanding ritual and symbolism. The law is established in part to instill the vision of social order. Through this social order justice is achievable through a regular and sanctified process (Lukes, 1975). The laws ability to maintain order and prevent chaos makes it a highly valuable and useful function for society.

It protects us on the one hand from arbitrary power exercised without regulations. It saves us from the mob, and also from the dictator. It prevents capitalism from turning into communism, democracy from becoming the rule of an unthinking people. It gives all people an equal chance for success, and at the same time protects those who have been born in more favored positions of privilege and power. (Arnold, 1962: 34).

Thus the council meetings act in a similar fashion as the law. Resolutions are often presented to groups or individuals with less power or prestige than the council members occupy. For example, the children from the “African American Historical Oratorical Competition,” the organizer of “Barbershop Talk Family Day,” and the Emily Post of this city, Ms. Vicky Lee were all honored with resolutions. The resolutions provide a forum in which these individuals and groups can receive official approval through an important body without compromising the power position of the Council. The law is the greatest instrument of social stability because it recognizes the desires of the underprivileged, and gives them a forum in which these yearnings can achieve and receive official approval without involving any particular action which might joggle the existing pyramid of power (Arnold, 1962: 34).

Limitations

Three months of observations at City Council meetings provides a solid base for beginning to understand the political functions and rituals, however, I am extremely limited in my ability to generalize any of the findings. Although it appears that the social functions of ritual
described by Durkheim are present at the Council meetings, further observations as well as interviews are warranted.

I purposefully did not choose to interview council members, in order to garner a better basic level understanding based solely on observations. I felt that due to time constraints I would not be able to interview a sufficient number of council members. I was concerned with the possibility of introducing further bias into the study by only interviewing a few individuals. In further research, however, semi-structured interviews would be advantageous. Interviews would provide a clearer understanding of why council members think some of the symbolic rituals such as the invocation and the resolutions are included in the meetings. Interviews with those people receiving resolutions would be fruitful as well. Interviewing the honorees would provide me with a better idea of how resolutions get negotiated and who is a greater force in driving the resolutions. Interviews would also provide information on how the honorees felt about receiving a resolution and what they consider the function of the resolutions to be. I was unable to obtain that information simply through observations.

Schattschneider’s theory regarding the mobilization of bias is crucial to understanding political rituals. My research was limited in being able to sufficiently address this point. Although I am convinced that power is being exercised at council meetings I do not have sufficient evidence to move beyond the instrumental and symbolic aspects of the political rituals. Further observations as well as interviews would shed more light on this social function.

Further research at other city council meetings in both large and small cities, would provide valuable information about the ability to generalize findings. Important information could be collected about the structure of meetings in other communities. This would enable researchers to understand whether there are significant differences in council meetings found elsewhere. My observations provide further evidence and support for Durkheim’s theory of the social function of rituals. Although these observations provide but a glimpse into the world of local politics they can sufficiently advance the debate regarding the mobilization of bias versus
the more simplistic notion of political ritual as producing and expressing value integration and social integration.

Conclusion

In this research, I have tested Durkheim and neo-Durkheimian theories regarding the social functions of ritual in a local governmental organization. There is evidence for the social functions of political rituals described by Durkheim, that include a preparatory function, a cohesive function, a revitalizing function, and a euphoric function (Nisbet, 1965). Likewise, these functions are displayed at various times depending on the nature of the situation and what function needs to be promoted. Additionally, I included another social function, the mobilization of bias. Although there is evidence for the four social functions described by Durkheim and other neo-Durkheimians, in order to understand political rituals in a more meaningful manner the mobilization of bias should be considered more thoroughly.

Political rituals can provide a variety of social functions, some of which create social cohesion and others that mobilize bias and exercise power. Previous research conducted by neo-Durkheimians have often been too simplistic in their interpretation of rituals and not included the cognitive dimension of exercising power. Political rituals should be examined more thoroughly in order to more deeply understand who is promoting specific agendas and how rituals are used to strategically and effectively get participants and observers to internalize particular paradigms.

The public right to know in a sea of global media.

Helen Shaw    Athena Media

Speaker bio: Helen Shaw is managing director of Athena Media, a content creation and media consultancy company based in the Digital Hub in Dublin Ireland. She was formerly managing director of public radio at RTE, Irish public broadcasting, in Ireland and completed a fellowship at Harvard University in 2002-2003 on media globalisation. She is the author of the forthcoming Irish Media Handbook – published by Gill and Macmillan later this year.¹

¹ ‘We have to stop thinking of public broadcasting as a stand-alone organisation and see it as the principal node in an emerging network of public and civil initiatives that taken together, provide the basis for new shared cultural space, a digital commons, that can help forge new communal connections.’ – Prof Graham Murdock (Loughborough University, UK)².

How could there be an issue about information flows and participatory democracy in an age of global media? We are, it seems, drowning in a sea of content and choice. Yet despite the plethora of digital choices and new media offerings the debate over media control and freedom and its impact on the quality of information in the public domain has never been sharper. Public broadcasting is frequently proclaimed dead or dying but beneath the surface the reality may be the concept of public media content is not dying but being transformed by both the landscape of new technologies and a move to seeing information as both a global resource and public good beyond the matrix of media conglomerates.

In Europe public broadcasting in the last twenty years has gone through a wave of peaks and valleys dictated often by the level of national and state support for the concept of publicly funded broadcasting content. In the mid 1980s-to 1990s the push to deregulated, open markets and the prospect of expanded broadcasting horizons through digital led many to see the death of public service broadcasting.

The Peacock report in the UK in 1986 recommended all BBC services would be sold on subscription and defined public broadcasting in the future as largely delivering only the things that commercial operators would not provide – leaving commercial operators free of public obligations. That market view of media content production has prevailed from the centre of the European Union. As the European Commission’s Director General for Competition has stated– ‘the emphasis has shifted from protection of some broadly defined public interest ….towards opening up markets, ensuring free and fair competition and promoting the interests of consumers’ (Lowe 2004:1)

¹ see www.athenamedia.ie/
Yet since the turn of the century, and particularly post 9/11 and the subsequent invasion of Iraq, many states are reflecting on not just the need to protect some vague concept of public interest but also the clear connections between public, not for profit media and participatory citizenship.

The overwhelming market emphasis on consumer needs and rights is being balanced by a renewed public focus on the needs and rights of citizens and the recognition that consumers and citizens are not the same creatures. Indeed not only are they not the same but the needs and rights of consumers versus citizens can frequently be in conflict.

The market view of media content creation has also ensured that public broadcasting is frequently defined in terms of its audiences pushing many mixed economy broadcasters, who, like RTE, receive both public and commercial advertising revenue, into a populist model chasing audience figures as aggressively as their commercial competitors. In a sense, this confusion of mission has at its core confusion over whether public media is serving consumers or citizens. Unless citizenship comes first many broadcasters have ended up in no-man’s land attempting to please both advertisers and public interest simultaneously. For public broadcasting the other dilemma it is facing is the impact of media fragmentation where the concept of a public tax, or TV licence fee, on content becomes challenging when many people are watching a diverse range of channels, mostly commercially funded, and feel reluctant to pay a content tax or fee for something they may not wish to receive or want.

The BBC in its strategy for its Charter renewal has anticipated this by defining public media content as a public good similar to public health and education and similar to other civic public goods like libraries and museums. Even if you never use the libraries the western European intellectual philosophy which anchors their public funding in that it is in everyone’s social and civic interest to have free and open access to information, knowledge and ideas.

In Ireland the debate over public media was altered by the bringing together of a temporary, ad-hoc committee of independent professionals in the Forum on Broadcasting (April 2002). The Irish public broadcaster, RTE, had previously applied for a TV licence fee increase which was rejected by the then minister although RTE’s funding was, at that stage, two thirds dependent on commercial advertising revenues. A somewhat hostile stand-off, with some political and newspaper commentators calling for the privatisation of the public broadcaster, was changed through the work and report of the Forum which provided an intellectual framework to consider the nature of media content and society beyond the self-interested positions of the players involved. The Forum placed the continued need to fund RTE in a social and civic framework and indeed the civic and cultural needs of a small

---

3 The Forum on Broadcasting was established under ministerial order to produce an independent report on the future of broadcasting in Ireland. The Forum report was issued in August 2002 and the ad hoc members were Dr Maurice O’Connell (chairman), Gillian Bowler (businesswoman), Jean Callanan (business sector), John Horgan (leading media academic), Donal Kelly (former RTE political broadcaster), Declan Kiberd (literature academic and writer), Patricia Quinn (then Head of the Arts Council). The Irish Department for Communications responded by November 2002 and its documents are available on its website www.dcmnr.gov.ie
nation (just 4 million people) where over 80% of homes have access to trans-national broadcasting from the UK BBC and commercial channels.

It defined the need for enhanced regulation and increased accountability for broadcasters, particularly the public broadcaster, but clearly outlined the social and national need to have a securely funded, and clearly mandated, public broadcasting system. Such a system underscored national and civil society in conjunction with a healthy and openly competitive market. It is that competition between providers, both public and private, which secures choice and quality.

The work of the Forum report and the Government’s response led to a significant increased in the TV licence fee by the end of 2002 but with increased accountability mechanism, including a Charter for RTE, which defines its role and social contract with the public. The Charter effectively creates a public mandate for RTE and provides the public broadcaster with operational and ethical framework which can be used to measure the broadcaster’s performance on an annual basis.

Other initiatives also included a decision to combine broadcasting regulations and create a super-regulator (Broadcasting Authority of Ireland) across public and commercial broadcasting (a process which is still awaiting new broadcasting legislation). Even more interestingly a Ministerial decision to siphon off 5% of the RTE TV licence fee to create a Broadcasting Funding Scheme which any broadcaster can avail off to make specific content including cultural and heritage programming.

This debate over the future of broadcasting as serving consumers or citizens is seen in the UK super-regulator Ofcom which states its exists to serve the interests of the ‘citizen-consumer’ – merging the two together in a typical Anglo-Saxon kenning. The initial and primary focus of Ofcom was consumerist but lobbying from public advocacy bodies forced the word ‘citizen’ into the frame creating what is, I believe, an unrealistic hyphenated animal which suppose that all consumer interests match all citizenship interests.

That gap between consumers and citizens is one we see every day in both our own lives and in public policy’s attempt to manage the often conflicting rights of individuals and communities. As consumers we tend to think as individuals – what is the best price/result for me – often regardless of the social impact of that result. Naomi Klein’s bestseller ‘No Logo’ attempted to get consumers to look behind the

5 The Government had initially planned to speed track this new legislation and regulation but it has now put back the publication of new legislation until Autumn 2005 reflecting the current debate over the scope and scale of the new regulator and the need to create a viable, long-term digital content and transmission strategy.

6 The Broadcasting Funding Scheme was passed into law in December 2003 and the fund will be operated and managed by the current regulator, the Broadcasting Commission of Ireland (BCI). The fund is worth in excess of Euro 8 million a year and the funding scheme will begin to operate by mid 2005 – by which point it will be worth in excess of Euro 20 million. The genres of content open to be funded include Irish language, history, culture, heritage, archive programme initiatives etc. The fund will be open to all terrestrial broadcasters regulated in Ireland both public and private.
price and the label at the origin of the product and the social and human price paid for goods manufactured in developing world sweatshops. As individual consumers we think short-term rather than long term and seek to maximise our satisfaction in the market place and frequently need incentives or penalties to think of global price tags in terms of the environment, natural resources or human rights impact of our consumer decisions.

In Ireland there are a couple of examples which fit the bill. Some years ago our Government introduced a levy on plastic bags to order to reduce their use on a national environmental basis. The levy was not popular with consumers or retailers yet within six months it had reduced the use of plastic bags radically, changed the living environment for people, and increased consciousness about waste and resources. The levy was a citizenship rather than a consumerist focused measure which, within a matter of months, saw people not just using cloth ‘green bags’ but actually ticking off retailers who gave them a plastic bag for free. Equally the smoking ban in Ireland which last year saw all buildings including pubs having to implement a smoking ban was resisted by both smokers and retailers who argued their consumer and market rights. The social, communal and long-term rights of the entire country won out and again within one year had not just become a way of life but had reduced cigarette smoking by 18-24%.

In a global media environment where a handful of mega-conglomerates dominate the world’s content creation the public domain aspect of information and citizens is paramount. While previously the concerns about media independence generally centred on excessive state control or political interference - today the axis of influence is seen as both state/political and market/commercial. Intensive media ownership concentration has become the hallmarks of media markets like the US and a state directed market liberalisation policy influenced the US Federal Communications Commission’s (FCC) June 2003 media ownership deregulation and the UK Communications Act 2003. Ironically in the UK it was the House of Lords, led by film director Lord Puttnam, which pushed vigorous debate on the UK Communications Act and forced the insertion of the public interest clause which can be used as a veto in media mergers.

The House of Lords debate in 2003 used US examples of the impact of media ownership concentration, particularly in the radio market, and how it had eroded real choice and public news service obligations. In the US the impact of increased media deregulation from 1989-1996 was accentuated by the US’s weak public broadcasting model which is neither securely funded nor clearly defined. PBS TV has no more than 2% of the TV market share and its lack of resources has undermined its foreign news coverage which resulted in it being the only TV service in the US which actually lost audience during the US invasion of Iraq in spring 2003.

The subsequent debate over the role of the media in reporting the post 9/11 environment is now the subject of many books. Influential US media like the New York Times have had to apologise to readers for cases of unquestioning coverage in the run up to war. The lack of independent media sources has been blamed on the connections between politics and big business in the US and on the relatively insignificant role the public broadcaster plays. While NPR is both admired and trusted its coverage of the conflict remains dependent on the BBC since it has a small foreign bureau staff - smaller than most middle-ranking newspapers in the US – compared to the BBC which is the largest news gathering force in the world. Public TV’s foreign news gathering is equally limited by resources and its reputation is more based on commissioned quality factual documentaries.

The extremes of the US media market have provided warning flags to both public and policy debates in Western Europe. In Ireland over 80% of all homes have access to trans-national TV services and over a third has digital TV\textsuperscript{10}. Ireland has the second highest penetration of digital TV in Europe yet no digital terrestrial platform. Digital is delivered through BSkyB satellite or NTL cable networks and BSkyB alone has at least 25% of Irish homes. The challenge rapidly facing the Irish state is how to secure the free to air delivery of its terrestrial services, particularly its publicly funded services, in a global TV world where half the TV content being watch is delivered from non terrestrial and therefore non regulated companies through a satellite offering which again is non-national.

The issue of sports rights and the challenge of maintaining the Irish language, which is overwhelmed by English content, have also focused policy attention on the need to protect and ring-fence the public and national interest in what the electronic media provides.

Throughout 2004, following the Hutton report in the UK, and the resignation of the Chairman, Gavin Davies, and the Director General, Greg Dyke, of the BBC there has equally been a focus on the level of political interference and control in public broadcasting and indeed on the accountability of public broadcasting to its public audiences. One year after the BBC resignations the BBC is now facing into its Charter renewal negotiations, for its funding, with a commitment to increase mechanisms of good governance and accountability but equally with the knowledge that it was the BBC, not the Blair Government, which won the public relations campaign and that, if anything, the level of Government pressure highlighted through the Andrew Gilligan/David Kelly case has probably made it more difficult, not more likely, for the Government to exert direct pressure on the organisation again. In reality the history of public broadcasting’s often tense relationship with the state is that these high profile flares up can often secure future independence by showing both sides, and indeed the public, the stakes that are being played.

Increasingly the public good aspect of information and knowledge is linked to public representation and participation as well as to deliberation. ‘A better informed political debate is the only way for...people to determine how broadly or narrowly to define our interests’, Prof Joe Nye of Harvard University wrote in his study The Paradox of

\textsuperscript{10}ComReg (Irish telecommunications regulator) market survey end 2004.
Power\textsuperscript{11}. Essentially the connection between a healthy popular democracy and information has been well mined from Plato to Thomas Jefferson and while media globalisation can challenge and threaten that connection the digital era also offers us the potential to reinvent and expand the concept of a public information domain.

Prof Graham Murdock talks about a new digital commons in his model of a reinvention of public broadcasting in that he, like others, sees the potential for public media to expand and make real their connection to their public through interactive multimedia. Far from seeing public broadcasters are media dinosaurs he sees not for profit content media as the key means of balancing our hyper consumerist and free market model by ensuring that new media is used as a social and democratising tool rather than solely a profit engine. New media offers public communities the potential for greater representation and participation through digital offerings but only if that space is defined and retained through legislation and regulation. In Ireland the development of community radio and television, in association with the new 5\% Broadcasting Fund could mean that previously disenfranchised minorities and communities get a voice and the ability to exercise their Article 19 right of the UN Charter on Human Rights to ‘seek, receive and impact information and ideas through any media and regardless of frontiers’.

In many senses the very pressure of the global media market has re-ignited the public media fire not just for broadcasters but for policy-makers. Joseph Stiglitz at the World Social Forum in Mumbai in 2004 talked of the need to convert the market globalisation model into a social one where global needs and rights like health, education and information would be seen and identified as global goods\textsuperscript{12}. The concept of a global goods philosophy has been re-kindled by the Tsunami tragedy on Dec 27\textsuperscript{th} 2004 in South East Asia. For many across the world the human, social and environmental impact of the disaster underscored the inter-connectedness of our global world and the need to find new global civic means of managing it.

The free flow of information, independent of commercial and political pressure and control, is the backbone of both national and international civic society. As Jefferson said ‘the information of the people at large can alone make them safe’ while James Madison saw ‘free communication among the people’ as the core of self-government and that it was ‘the only effectual guardian of every other right’.

Health, education and environmental rights and issues can not adequately be dealt with without the existence of such a free flow of information, knowledge and ideas. This has been dramatically seen in international AIDS programmes in the developing world which failed to have impact because there was a trusted and free means of communications and indeed the World Bank is now investing millions in making that and serving that connection between development and media.

As we move forward in 2005 the potential and need for a reinvention not just of public broadcasting but of the concept of a social model of global information is evident. The raison d’etre for public broadcasting at a national level is common across the global, indeed our market driven global economy makes that more apparent all the

\textsuperscript{11}Nye, J. ‘The Paradox of Power – why the world’s superpower can’t go it alone’ Oxford University Press (2002), pg 139 chapter 5 ‘redefining the national interest’.

\textsuperscript{12}The Irish Times, op -ed by Helen Shaw, Jan 27 2004
time. The rationale is there to extend the national to international, the local to global and connect the communication forces which can help us humanise our world.

Nye makes the point that globalisation pushes downwards as well as upwards, increasing the significant of the local in the global sphere and fuelled not just the increased speed of e-communications but the falling cost of communicating at speed across the world. His phase ‘soft power’ reflected the growing significant of global cultural and communication goods in the new, digital information age.

The rapid development of the internet, allied with the roll-out of broadband networks, has on the one hand opened up vast new territories for the media empires to colonise but on the other hand it has also presented the means of transforming public, or not for profit, content and participatory communications. While Ithiel de Sola Pool’s description of new media as ‘technologies of freedom’ has been challenged in many ways the internet, and its ability to truly become an interactive multimedia content space, remains the means by which public media is and will be transformed and re-born. The net combined with new digital transmission platforms like DVB-M – which can make television a mobile medium – offer both commercial and social opportunities.

The forces which drive global profits to companies like News Corp and Viacom can also be used in a counter-flow to build and expand global not-for-profit media. In the future public ‘broadcasting’ may be more accurately re-named public media reflecting the convergent nature of new technologies and content creation for public media will become more diffused and decentralised with the majority of the content being made by independent production houses rather than centralised within public companies. The internal competition between producers will ensure better quality and accountability than the old centralised model and indeed more and more countries may begin to adopt a public media competition model where there is more than one public ‘broadcasting’ or media house and where some funds are made available to all broadcasters in order to stimulate ‘public interest’ content across both the private and public media. Our view of the old PBS model will become less dependent monolithic institutions and more on a spread of outputs which can benefit the widest stretch of the public. Many of our existing public broadcasters are and will become content providers ensuring the best value for public funds through a content market and independent production. The nature of the global information age will means more content can be shared internationally – so that public media can at one level enhance the local through specific cultural programming and connect to the global through production partnership and alliances ensuring that the combined resources of five or six public providers can deliver high quality and shared content.

While the challenge to a truly global reinvention of public media will be the vast difference in resources and technologies from north to south, the long-term potential remains that media globalisation forces can also ensure a greater spread of existing public media content into the development world.

The World Bank’s symposium on broadcasting in Washington last May brought together public broadcasters from across the world to explore the connection between global media and development. The project raised the potential for the combined
resources of global public media to become a lever not just in development but in diffusing the concept of not-for-profit information across the world. SABC in South Africa is attempting to play that role Africa while the spreading ideal of content beyond the conglomerates is generating debates in India and China. While the internet can be controlled through service providers and portals it remains the vehicle for new global communities, virtual communities which cross territorial and political boundaries.

For public media’s the envisaged future must include the development and creation of virtual global public media communities where information can be received, disseminated and exchanged, extending our national visions into a shared global public space which crosses language and boundaries. The nature of this development will be that more international public resources will be used to support the a global public information space in the recognition that through that all our other global public goods ambitions, like the UN Millennium Goals the Kyoto Protocol or the UN Charter on Human Rights, will be more effectively and efficiently achieved. Francis Bacon’s adage that ‘information is power’ is more true than ever today and the most powerful means of affecting change in the world will also be through the realisation of information as a global good which provides the framework for the realisation of all other global goods.

Teaching for Social Justice: Moving Students toward Multiculturalism

Changing demographics tell us now, more than ever, there is a need for professionals to be prepared to provide effective services to persons of varied backgrounds. Colleges and universities often serve as one of the first major avenues through which persons are introduced to and educated about diverse groups. Thus, increasingly, colleges and universities are desperately attempting to find the best approaches for addressing growing multiculturalism and globalization. Strategies range from including diversity information in college orientation programs to infusion or integration into curriculum and required or elective courses.

When multiculturalism in the college curriculum is considered there are a number of factors to be explored. Among these factors are course content, modes of delivery, use of effective adjunct resources, establishing the appropriate environment, and other pedagogical issues (Garcia & Von Soest, 2000). Knowing the types of biases and prejudices students hold regarding different groups is also important as this can inform the instructor of what and how course content should be approached. This paper addresses each of these factors. Based on approximately 15 years of teaching social justice, anti-oppression, and multicultural courses at the graduate and undergraduate levels, the author presents the important elements of one such course. Student assessments of the effectiveness of classroom strategies and activities in increasing their knowledge and expanding views are presented. Students’ quotes are also used to highlight the type and nature of some of the biases and prejudices students shared.

Course Overview

The specific course reported on in this paper is required for students majoring in social work or those minoring in social welfare or African American studies at a predominately white university in the South. Students from other disciplines, including nursing and criminal justice, often take the course. The course syllabus states the purpose of the course is to...

...examine[s] issues related to gender, ethnicity, race, culture, sexual orientation, physical or mental ability, age and national origin. It is designed to introduce the student to a range of issues of oppression and social and economic injustice pertinent to the field of social welfare and to the profession of social work. References will be made to policies which affect populations negatively impacted by oppression and/or social injustice.

The course is a three-hour credit course, meeting once a week for 2 hours and 50 minutes for 15 weeks. The objectives for this course are to allow students the opportunity to: (a) demonstrate awareness, understanding and appreciation of cultural and social diversity; (b) gain an understanding of oppression and specifically how poverty, racism, sexism, ageism, heterosexism and legal bias affect these population subgroups in their social functioning; (c) articulate the role, values and the responsibility of the social work profession in relation to oppressed populations including people of color, women, gay and lesbian persons; (d) gain an understanding of issues related to oppressed populations and the implications for social change; (e) develop an awareness of personal and professional values and clarify conflicting values and ethical dilemmas in professional practice; and (f) gain
an understanding of social policies as they affect oppressed populations in light of principles of social and economic justice.

The structure and format of the course are presented to the students on the first day of class and appear in the course syllabus as follows:

This course is developed to be very interactive and builds from session to session. Students are expected to actively participate in the teaching-learning process. Different methods to be used include lectures, presentations, field trips, videos, in class exercises, and the general exchange of ideas, thoughts, and opinions….

Professionalism and mutual respect for the opinions and experiences of others is also accentuated on the first day of class and reinforced with the following statement in the syllabus:

It is my hope that each person in this class will leave more educated, aware and understanding of those different from themselves. For this to occur we must approach each area of focus with an open mind. Many of the topics we address will be very emotional to some. For others, these issues will have an even greater impact as they influence how we view others and ourselves. These are issues central to one’s development as a professional social worker and human service provider. There is a great deal of diversity of thought regarding the topics we will be discussing. As a result, I am sure that we can look forward to many informative, interesting and well-articulated exchanges. Throughout these exchanges we will conduct and express ourselves with respect for others. In this regard, slurs, and/or derogatory remarks about any group will not be tolerated. Failure to comply will result in dismissal from the class and failure of the course.
Class attendance is mandatory and students are expected to attend class regularly. Since the course meets once a week, students are strongly discouraged from missing class. There is a strong attendance policy that is highlighted for students on the first day of class. Additionally, the following statement is on the syllabus:

“Students are expected to attend class every week. Missing two classes could result in the student’s final grade being reduced one letter grade. Missing three or more classes could result in receiving a failing grade for the course.”

Class Activities and Components

A variety of instructional and experiential methods are used in the course. They are presented below with a brief explanation.

*Class discussions* refer to the numerous in class conversations held in reference to readings, current events, videos, cultural presentations, and diverse worldviews and experiences.

*Lectures* refer to the limited lectures conducted by the professor. These introduce constructs that are essential for understanding the dynamics of the phenomena discussed in the class. They include dominate/subordinate relationships, social justice and injustice, oppression, and related concepts (e.g., racism, sexism, heterosexism, ableism, and classism). Application of the new terms to readings and videos is emphasized. The textbook used in the course is Paula Rothenberg’s (2004) *Race, Class, and Gender in the United States: An Integrated Study (6th ed.).* The book provides a wide variety of readings on topics related to bias, prejudice, discrimination, and oppression.

*Group cultural project* refers to a major class assignment done in small groups. These are done on American Indians, Asian Americans, Black Americans, Gay/Lesbian persons, and Hispanic/Latina Americans. Students are instructed to
self-assign to a group based on the group they know the least about and about whom they want to learn more, the group they like the least, or the group with whom they have the most difficulty. No one is allowed to share their reason(s) for selecting the group they chose. This serves to counter concerns students may have regarding whether individuals think they “don’t like” or “have difficulty” with certain groups. Students are not allowed to be in a group of which they are members. Students are strongly encouraged to provide a cultural experience as they provide the following mandated information: group history/overview, cultural nuances, contributions to the U.S., a policy issue of relevance to the group, common myths, cultural sensitivity in work with this population, an issue of relevance for women in that cultural group, and the impact of doing the project on their beliefs, feelings, and knowledge. Additionally, the students must have a panel of three people who are members of the group on which the presentation is being done, one of who must be a social worker. The panel provides feedback to the students in the class on the accuracy of the information, the quality of the presentation, and anything that was offensive or especially pleasing to hear in the presentation.

*Individual paper* refers to an assignment focused on raising self-awareness regarding students’ culture, ethnicity, and/or heritage. Students are forced to examine their thoughts, beliefs, attitudes, and customs and how they are connected to their ethnicity, culture, and heritage. Students begin this paper with identifying any racial/ethnic groups and other groups to which they belong. Of these groups, students are instructed to identify one racial/ethnic group of focus for the remainder of the paper. Students must then provide a historical overview of that racial/ethnic group in the United States that addresses the group’s treatment and status in the
U. S. from historical and contemporary perspectives. Students then address the cultural aspects of that group, providing information like language, religion, art, food, music, and worldviews. Students are required to analyze their personal culture in relationship to the cultural information on the group of focus, looking for similarities and differences. The students conclude with a summary of what they learned from the assignment.

*Journal* refers to the assignment developed to provide students with an ongoing record of their thoughts, feelings, ideas, and any incidents related to oppression, discrimination, prejudice, advocacy, social injustice, and inequity/equity. It allows students a place to express themselves and say what they felt they could not or would not share in class. Emphasis is put on critical thinking and self-reflection.

*Videos* refer to a variety of videos aimed at encouraging critical analysis of the social construction and meaning of identity. One video, an USA network sponsored program entitled the National Hate Test, provides 16 different vignettes designed to have you identify hidden biases and prejudices, along with your values. Combined with factual information, the scenarios address such issues as racism, ageism, sexual orientation, anti-Semitism, xenophobia, ableism, and others. An internet version of the test can be found at [www.usanetwork.com/functions/nhday/nat2.html](http://www.usanetwork.com/functions/nhday/nat2.html).

Students are also shown an excerpt from an Oprah Winfrey episode focused on race. Included is the story of Josh Solomon, a young white male who changed his skin pigmentation with medication to live as a Black male. A segment of the show also documents the different experiences of two young Black males who are cosmetically made White. Discussion about the emotional costs of racism is a part
of the video. The video confirms there are differential race based experiences in
the U. S. based on skin color.

A third video students review is an Emmy winning video entitled Ethnic
Notions. Distributed by California Newsreel, this video critically analyzes the
social construction of differences. Using the history of Black Americans, the socio-
cultural interpretations of race and the contrived use of race as a means of power
and control is well presented and provides a much needed analysis.

A fourth video, distributed by Stir Fry Productions, that the students watch
is the Color of Fear. This video documents 8 men engaging in powerful discussion
about race and its meaning in contemporary society. Referred to as one of the most
powerful videos dealing with race, the Color of Fear serves a pivotal role in the
class as it raises consciousness regarding white privilege and the role of allies in
fighting racism.

*The Conducive Environment*

The classroom environment is important if students are to engage in honest
dialogue about oppression, social injustice, discrimination, prejudice, and
worldviews. Setting an environment that is conducive to such discussion is
important and given attention each class period. This process is initiated on the
very first day of class by student introductions. Each student must share with the
rest of the class their name, racial/ethnic heritage, college classification, and major.
Students are also encouraged to be honest in addressing whether or not the class
was required and if they would have taken it if it were not required for them. When
each of the students are finished the professor shares the same information,
explaining to the students that they will not be asked to do anything the professor is
not willing to do. This is done to get the students to begin to think about their
ethic identity. It also initiates the students into the practice of talking and sharing aspects of self in a group setting.

Another technique used to facilitate a safe environment is a confidentiality contract. The confidentiality contract states that while students are encouraged to go out and discuss what we discuss in class, they can not connect any statements to any identified person. They are, however, allowed to discuss anything the professor says and identify the professor as saying it. The professor emphasizes the importance of confidentiality and shares that intentional violation is viewed as an issue of professional ethics. Students are informed that the penalty for intentional violation of confidentiality is automatic failure of the course. Students are told that they have the right to not sign the contract and refusal will not effect their grade. Should a student decide not to sign the contract they are told that their refusal to sign will be shared with the class. This allows each individual to decide how much they want to share knowing someone did not sign the contract. The contract can be modified in whatever way students like. It is explained to them that the contract should reflect what they need to feel safe.

Students are also encouraged to disagree with the professor. The power differential in the classroom is acknowledged and the professor expresses the value she puts on individuals who are themselves and who don’t attempt to “professor please.” The importance of honesty is reemphasized. They are constantly reminded in all sessions of the class and for all assignments that how much they agree or disagree with the professor’s thoughts, ideas, and beliefs will not impact their grades.

Students’ fears of talking about such sensitive and emotionally charged issues in a diverse group setting are discussed. Fears students have about how
conversations about these issues will be interpreted by others are also addressed. It is made clear that “bashing” of any group will not be allowed, but the realities that have and do exist will be discussed. Students are reminded that they will always have an opportunity to provide clarification for anything they think might have been misinterpreted.

Additionally, the professor makes sure to discuss with the students the potential implications of having an African American professor in the context of this kind of course. These discussions revolve around how having a professor of color could influence the classroom dynamics for the Black and White students. Students are asked to give conscious thought to how the professor’s racial identification might influence their classroom behavior. Some attention is also given to how the issue of skin color might influence interactions with both groups, as well as the classroom dynamics. The professor uses her light complexion as an opportunity to discuss how skin color could potentially serve as a barrier or an advantage in same race and cross-racial relationships, including relationships with students.

Group discussions are also governed by a set of group rules that assist in establishing the classroom environment. The students are presented with a draft of group rules that can be modified by a majority vote. It is emphasized to the group that it is their class and the group guidelines should include what they need to feel safe. The guidelines presented to them include that it be mandatory to be respectful of different opinions, effort will be made to be aware of body language and nonverbal communication, and effort will be made to seek clarification rather than jumping to conclusions. Students are also reminded that it is acceptable and
encouraged for them to disagree with the professor and one another, while being
reminded that each person will be respectful in their use of language.

Recurrent Course Themes

There are a number of recurrent themes that the students are told they will hear reinforced throughout the semester. These also represent premises off which the professor operates throughout the semester. No one group has a monopoly on maltreatment is one theme. Another theme is that no one person can speak for an entire group. The professor also shares some philosophies that impact how the class is conducted. Among these is the professor’s belief that each person has a humanitarian commitment to create a socially just society. Students are also reassured that it is not the goal of the professor to get the students to think like the professor. Students are encouraged to engage in critical thinking, to question how they know what they know to be true, to question all sources of information, including the professor, and to develop a more proactive attitude towards informing ones self.

Methodology

This paper presents on the specific feedback provided by students during two separate semesters of an undergraduate, sophomore or above-level social work course taught at a predominately white institution in the South. There are two different kinds of information from student assignments used in the analysis for this paper, one assignment at the beginning and one at the end of the semester. Approval for use of the data was sought from the Institutional Review Board at the university where the course that provided the data was taught. Exempt status was given.
Design and Procedure

The first assignment used in this analysis was related to a homework assignment focused on students’ biases and prejudices. On the first day of class, students are instructed that they are to turn in the biases and prejudices they have toward women, any racial/ethnic groups, GLBT persons (gay, lesbian, bisexual, and transgendered persons), poor persons, and any other groups they wish to identify. Students are also instructed that the most important aspect of this assignment is that they be honest. They are told that the value of the assignment is lessened if they are not honest. To encourage honesty from the students, they are instructed that they DO NOT have to put their names on this assignment. It is explained to them that the homework will be collected at the beginning of the next class period when the class roll is called. When students’ names are called for the roll the following class period, they turn their homework face down on a desk in front of the classroom. If a student brings a sheet up when their name is called the student is given credit for having turned in the assignment. Students could conceivably turn in a blank sheet of paper and be given credit for it. While this has never happened, some students put more time and effort into the assignment than others. After all of the sheets are turned in the professor mixes them up in front of the students to let them see that they don’t remain in the order of the names on the class roll. Once students turn in this assignment there is no way to connect a student to their assignment, unless the student chose to put their name or some other identifier on their document. This information is typed up into one document with individual responses being given a number. At the end of the semester all students are given a copy of these and they are discussed as a class. Before sharing this document with students, the professor reviews the statements to remove
information that could have been shared by the student throughout the course of the semester that might identify their biases/prejudices as theirs. Students are informed of the deletions in advance whenever possible. While some student quotes are used for emphasis in the present paper, a deeper qualitative analysis of any self-perceived changes in their biases and prejudices at the beginning and end of the course will be used for another paper that has a different focus. Depending on which final exam option students choose, they may use their biases/prejudices as a part of the final. This will be explained in more detail below.

The second assignment used in this analysis is related to the students’ final exam. Due to the nature of the course and the role of self-reflection and self-awareness in it, students are given a final exam with an option that forces them to engage in critical thinking and identify the ways in which the course was meaningful to them or achieved the course objectives. The final exam had two options and represented 10% of the total grade. Students were informed that they could choose either option with no penalty. Both options carried equal weight and students were informed that the assignments are graded equally. Students were also told the professor did not have a preference for which option they chose. They were also assured that their grade would not be based on how much they thought the course objectives were met or not met (Option 1) or how much they thought they had changed in terms of their biases and prejudices (Option 2), but the quality of their answers and how well they explained their answers. Option 1 provided students the opportunity to assess the success of the course in meeting the specific objectives listed on the course syllabus. Option 2 provided the students with the opportunity to address the utility of the course in assisting them in engaging in self-examination of biases, prejudices, behaviors, and beliefs. This option involved
identifying the biases and prejudices students turned in at the beginning of the semester as anonymous. Because Option 2 required students to identify which of the bias/prejudice statements were theirs, the professor felt it necessary to provide an option that would not force students to identify something that was previously provided anonymously in some cases. Additionally, students who did not complete the homework assignment needed a viable final option. Thus, exam option 1 was provided.

Regardless of the exam option selected, the exam contained the students’ evaluation of the course assignments in terms of expanding their views on different issues and learning new information and knowledge. These variables were measured using a likert-type scale. Students were instructed to circle the number that best describes how you feel about how these different components in the class contributed to you learning new information and knowledge and circle the number that best describes how you feel about the usefulness of the course assignments in terms of expanding your views on different issues. Following each of these statements was a list of class videos and activities students had watched and engaged in throughout the semester. Possible answers ranged from 0 – 4 with 0 equaling “not useful at all” and 4 indicating “very useful.”

Sample

The students used in this analysis represent the total number of students who completed the social injustice and oppression course in either of two semesters offered one year apart in the early 2000s. The total population number of participants consisted of 75 students. Of these 75 students, 66 (88%) of them were female with the other nine (12%) identifying as males. Forty-two (56%) were white and 30 (40%) identified as Black. Ages ranged from 19 years old to 53 years
old with a mean age of 23 (SD = 6). Social work majors accounted for fifty five percent of the 71 students who specified a major. The other disciplines most represented included criminal justice (7 %), psychology (5.3 %), and human development (5.3%) All of the other disciplines represented could be classified as falling under the liberal arts umbrella (e.g., public relations, human development, child development, communication studies, etc.).

Findings

A review of the bias and prejudice statements made by these students in their homework assignment indicates that there is a need for college programs to address diversity, multiculturalism, and social justice issues. Apparent in these statements is that there are still strong negative beliefs, stereotypes, and feelings that groups have toward and about one another. Some strong themes noted in a preliminary analysis of the data are the belief that racial discrimination, especially regarding Black Americans, is no longer relevant, disadvantaged groups want special treatment, awareness of ethnocentrism and White privilege, blaming the poor for their predicament, and homophobic attitudes.

The following student quotes make clear that some individuals no longer view race and gender issues as needing attention. “Blacks use race as an excuse.” Another student makes the point more clearly,

“I saw a Black man driving a car today and he had a bumper sticker that said ‘A Black Man Can.’ Whites would not dare put “ A White Man Can” on their bumper. I know a lot of people say it is because Blacks are minorities, but I do not believe that it is true anymore.”

As reflected in the following quotes, disadvantaged groups, especially women and persons of color, were seen as wanting special privileges and treatment. “Women
just complain too much about not getting equal treatment, but when it comes down to it, they want to be treated special. They need to decide.”

I think that women can’t decide what they want. If our society treats them more equal to men, they feel as if it’s not fair either. For example, they want to be treated more equally, like getting paid more, but they don’t want to lose benefits that you get from being a woman, such as, maternity leave, having doors opened for them, and getting help with heavy things.”

These feelings as applied to race are reflected in statements like “I am not biased with any ethnic group, sometime it aggravates me when people of African descent act like people of European descent owe them something.” This same sentiment is also seen in the following student quote.

I have a problem with people who think I owe them something. No one in my ancestry owned slaves and even if they did…at the time of slavery it was a Southern tradition… Slavery is over and I have no prejudice towards African Americans or any other group, but I hate to hear that some people feel that they deserve retribution for things that happened over 100 years ago.

Black students remarked on the ethnocentrism and white centered nature of society. One student stated, “Whites: They act as if they are superior. I have a problem that society lays things out on red carpet for them (whites).” Another student stated, “they think they are better than other cultural groups.” Statements like “Whites can use race as the advantage.” reflected students’ awareness of white privilege, whether they identified it as such or not.

Comments were also made by some of the students indicating that persons in lower socio-economic groups are in that economic situation due to a personal
defect of some sort. One student explicitly states…”all of them are uneducated and unclean.” Another student’s belief is made clear with the following quote. “Poor people that revel in their poorness and do nothing to pull themselves out of poorness make me mad.”

Numerous other stereotypical ideas and thoughts were identified regarding various racial/ethnic minority groups. Students made reference to the stereotypes regarding Asian Americans’ intelligence and lack of command of Standard English of some. Statements like, “Asians don’t speak English, smart” and “Asians are the most biased group because they think their races are better” are student quotes reflective of this. “Hispanics poorly educated, don’t speak English” addresses an often heard criticism of Latina groups in the United States. Toward Black Americans, one White students stated “I am prejudiced against black Americans. I feel they are disrespectful to others.” Another student stated “Black people because they are loud all of the time and very obnoxious.”

The following quotes reveal the homophobia present in some of the students. One student states “Gays try to force their beliefs on other people by making out in public by making out in the open, and trying to make advances on those who are straight.” Another says “Gays and lesbians all have STDs and they come on too strong and have to proclaim their homosexuality when no one cares about it.” Other students criticized them for their lifestyles and sexual practices.

Although this paper highlights many of the negative thoughts, ideas, and beliefs students might have against one another and others, it is important to know that many of the students expressed several disclaimers. Students quite often prefaced their remarks indicating they had shame, guilt, and disappointment for
having such thoughts. Additionally, students would remark that they knew many of the thoughts were incorrect and based on stereotypes. Although this consciousness is encouraging, it remains difficult to overlook the power of their self-expressed biases and prejudices.

Course Effectiveness

Students evaluated how useful the different components of the class were in expanding views on different issues and learning new information and knowledge. Of the course activities, students identified class discussion as most useful in expanding views on different issues. Seventy-one percent (53) of the students reported class discussions as very useful, while 21% of them (16) found class discussions to be of greater than average usefulness. Class discussions (92%) were followed by group projects in expanding students’ views. Eighty-nine percent of the students (67) reported group projects as being of more than average usefulness or very useful in expanding views. These were followed by lectures, journals, and individual papers being rated at greater than average usefulness or very useful by 88%, 76%, and 69% of the students respectively. Related to learning new information, (91%) of the students rated class discussions as being of greater than average usefulness (23%) or very useful (68%) for learning new information. The other course activities were rated in the following descending order for helping students learn new information at greater than average usefulness to very useful: group projects (89%), lectures (85%), individual papers (71%), and journal (67%).

Students also rated the usefulness of the different videos seen throughout the semester. The Color of Fear was rated the strongest in both learning new information (89%) and expanding views (95%). The National Hate Test rated equally with the Color of Fear for expanding views with 95% of the students rating
it as of greater than average usefulness or very useful. Following these two videos, students evaluated the usefulness of videos in expanding views at greater than average to very useful at the following rate: Ethnic Notions (91%) and the Oprah episode on racism (89%). In relation to learning new information, Ethnic Notions tied with Color of Fear for the most influential video with 89% of the students rating it as having greater than average usefulness to being very useful. These were followed by the National Hate Test (88%) and the Oprah episode (87%) being rated as having greater than average usefulness or very useful.

Discussion

While these data indicate that the resources and activities used in this class were useful to these students, the environment and tone of the class are important factors that will influence how the course and any related assignments are perceived and experienced by the students. The fact that class discussions were rated strongest in both learning new information and expanding views supports the need to have a classroom environment conducive to having healthy discussions. The high rating of the utility of the class discussions might also indicate that the techniques used in this course might be useful in creating an environment conducive to maintaining healthy discussions. Additionally, these results speak to the importance of being able to engage in meaningful dialogue about issues of race, gender, sexual orientation, and related topics. All of the activities were evaluated by more than 50% of the students as being of at least greater than average usefulness. This could indicate that all of the activities serve as effective techniques for expanding views and learning new information regarding subject matter relevant for social justice, diversity, anti-oppression, and/or multiculturalism courses.
The results of this study are limited in several identified ways. The convenience sample used does not allow for assumptions needed to generalize the results; thus, the results can not be generalized to other groups of students outside of those reported on in this study. Also, despite professor attempts to encourage students to be honest, there still may have been reluctance on the part of the students to negatively evaluate the course activities, especially as this was done as a graded assignment. Additionally, the author suggests the positive student/professor relationships had with most students could have also resulted in a higher rating. The author does think this limitation was countered by the history the students had with the professor over the course of the semester that included the students being encouraged to be honest and disagree openly with the professor. Despite these limitations, the results are still useful and provide those teaching such courses with learning activities and suggestions that contribute to some degree to learning by students.

Conclusion

This paper contributes to the ongoing discussion about successful classroom strategies for approaching multiculturalism, diversity, anti-oppression and social justice. These data suggest that all of the assignments used in this course are above average in their utility to students. The high value given to each course component and video evaluated suggests that these are resources that should be considered for inclusion in classes focusing on educating for social justice and multiculturalism. The author has provided a detailed description of each course component and video for those who might want to build on these in their courses. The pedagogical issues discussed provide meaningful insights into challenges common to those teaching
such courses, while providing guidelines and suggestions that appear to be helpful in structuring such courses.

Cultural Relevance and Salient Variables in Breast Cancer Screening: Explorations in the Development of Contemporary Framework

Although overall cancer mortality rates have decreased in recent years, many racial/ethnic minority groups continue to experience certain cancers disproportionately with higher mortality rates. Breast cancer is one cancer in which racial/ethnic minority women have higher mortality rates than white women (Rawl, Champion, Menon & Foster, 2000). One factor that contributes to these differential mortality rates is under use of breast cancer screening procedures (Gotay & Wilson, 1998). This calls for increased attention to finding ways to improve breast cancer screening behaviors among racially/ethnically diverse, medically underserved women. This article presents a new conceptual framework in progress that focuses on improving breast cancer screening behavior among racial/ethnic minority women.

Literature Review

Defining Diversity

As health care disparities between groups become more apparent, the health community must find ways to meet the needs of those for whom the most traditional approaches to health care do not seem to be working (Mangione & Reynolds, 2001). One barrier to this is the use of traditional race categories, which are ambiguous and socially constructed. This presents challenges to accurate interpretation and application of research results. The research community is perplexed about how to best categorize populations to have the most meaning (Institute of Medicine [IOM], 2002). The National Cancer Institute (NCI) agrees with the IOM’s recommendation that it would be more
meaningful to gather data based on ethnic and cultural groups as opposed to racial categories, but cites many obstacles to this approach. Culture can often be referred to as a collective common thread that connects individuals to one another often reflected in shared identity, beliefs, values, and behavior that is socially learned, not genetically transmitted Diller (1999). Attention to gender, socioeconomic status, age, social status, life experiences, sexual orientation, literacy, and language provide some clues to new ways of viewing diversity in healthcare. A major barrier to this change is that the current state of knowledge on cancer, including breast cancer, is based on these racial categories (Agnew, 1999). While the model presented in this paper does not solve this problem, it is based on the understanding that culture serves a more functional role in understanding breast cancer screening behavior than race. Available data suggest that breast cancer is one cancer that places a heavy burden on women from the racial/ethnic minority groups often focused on in the United States. The attention to these groups in the development of the framework neither restricts the framework’s use with other racial/ethnic or cultural groups, nor does it seek to minimize the affects of cancer on their lives. Quite to the contrary, the framework is presented as a potentially helpful tool in reframing how we view cultural groups in health promotion and behavior. It is, however, driven by an effort to better meet the needs of those racial/ethnic minority groups highlighted in the cancer literature and documented as not benefiting from the overall decreases in cancer seen in the United States as a whole (Mangione & Reynolds, 2001).

Breast Cancer Incidence and Mortality in Diverse Groups

Many racial/ethnic minority groups are disproportionately impacted by a number of cancers. A review of Table 1 documents the overall cancer and breast cancer
incidence and mortality rates for major racial/ethnic minority groups in the United States. The categorizations used represent the way data is collected and reported by national cancer reporting agencies. As acknowledged by these agencies, there are probably errors in their data because of the small numbers of individuals in some racial/ethnic groups and data collection processes (NCI, 2002).

A review of Table 1 indicates that African Americans, as a group, have the highest overall cancer incidence and cancer mortality rates of all racial/ethnic groups in the United States. Following African Americans, overall U. S. cancer incidence rates by race/ethnicity are in the following descending: White, Asian/Pacific Islander, Hispanic/Latina American, and American Indian/Native Alaskan. Breast cancer incidence in the U. S. by race occurs in the following descending order: White, African American, Asian/Pacific Islander, Hispanic/Latina, and American Indian/Alaskan Native. When we look at mortality rates, a similar but slightly different pattern emerges. Overall cancer mortality rates by race/ethnicity occur in the following descending order: African American, White, Hispanic/Latina, Asian/Pacific Islander, and American Indian/Native Alaskan. Following African American women, breast cancer mortality occurs at the highest rates in White women, Hispanic/Latina women, American Indian/Alaskan Native women, and Asian/Pacific Islander women respectively (NCI, 2002). As is always the case when discussing groups of people, there can be individual and group specific variations that should be considered.
Breast Cancer Health Promotion and Prevention among Diverse Groups

Numerous studies indicate that the use of cancer screening and early detection procedures is one component of an effective approach to cancer control. The use of early detection and screening procedures is seen as one of the primary reasons for the overall downward trend in breast cancer mortality. (Rawl et al., 2000). An all-inclusive approach to early detection involves monthly breast self-exams (BSEs), annual clinical breast exams (CBEs), and annual to bi-annual mammograms. The American Cancer Society (ACS) recommends monthly BSEs, annual CBEs and annual mammograms for women aged 50+. It is recommended that women 40-49 have annual to biannual exams based on their own history and risk factors (ACS, 2000).

Despite recent criticisms and questions regarding mammography utility (Olsen & Goatish, 2001) regular mammography screening is still recognized as the most effective method for the early detection of breast cancer. Although its utility is impacted by factors such as race, ethnicity, age, socioeconomic status, education, and geographic region, regular mammography screening is credited with reducing breast cancer mortality rates by 30% for women in their 50s and 17% for women in their 40s (Hendrick, et al., 1997 as cited in IOM, 2002). When mammograms are combined with CBEs and BSEs, the chances for early detection are increased. Despite the generally agreed upon benefits of breast cancer screening programs, many women do not participate in screening behaviors on a regular basis. There is evidence that some groups of women, particularly women belonging to racial/ethnic minority groups, have poorer utilization rates for these screening procedures (Rawl, et al., 2000).
Recognizing the unjust nature of race related health inequities, The President’s Initiative on Race has an objective to reduce race related disparities in six areas of health, one of which is cancer (Corbie-Smith, Flagg, Doyle, & O’Brien, 2002). Healthy People 2010 is a national initiative concentrated on reducing health care disparities by the year 2010 (Mangione & Reynolds, 2001). Related to breast cancer, Healthy People 2010 aims to reduce breast cancer mortality rates from 27.9 per 100,000 (1998 mortality rate) to at least 22.3 per 100,000. Another goal of Healthy People 2010 is for 70% of all eligible women aged 40 and over to have a mammogram at least every two years (McPhee et al., 1997).

There exists, however, a number of factors documented as barriers to the utilization of breast cancer early detection and screening procedures by women belonging to diverse, traditionally medically underserved populations. These barriers can be categorized as personal barriers, social environmental barriers, and system barriers. Some personal barriers include other urgent life problems, personal costs, and monetary costs (Lacey, 1993, as cited in Walker & Figgs, 1995). Examples of social environmental barriers are lack of resources for cancer prevention and early detection information, distrust of the medical community, and living in socio economically depressed communities (Lacey, 1993, as cited in Walker & Figgs, 1995; Kornfeld & Fleisher, 1998). Systems barriers include such factors as issues of access, poor follow up procedures, and physician reluctance to provide screening information or referral (Lacey, 1993, as cited in Walker & Figgs, 1995; Mickey, Durski, & Danigelis, 1995). Although many of these barriers could be said to have a relationship with culturally based factors,
others like cancer knowledge and perceived risk and benefits of breast cancer screening are directly influenced by culture and cultural norms. While there is an understanding that cultural relevance goes beyond race and ethnicity, the need to address cultural beliefs, attitudes, and knowledge in the development of breast cancer health promotion models can not be overlooked (IOM, 2002).

Lack of knowledge and culturally related beliefs and norms regarding breast cancer, breast cancer early detection, breast cancer screening procedures, and breast cancer treatment account for some of the underutilization of these procedures by racial/ethnic minority women in the United States. African American women utilize breast cancer early detection and screening procedures at a rate of 10% (Lanin et al., 1998) to 20% less than that of white women (Phillips & Wilbur, 1995). Hispanic/Latina women are also documented as underutilizing early breast cancer detection procedures (Suarez, Roche, Nichols, & Simpson, 1997). Utilization rates of Asian American/Pacific Islander women continue to be low as well. Both Korean and Vietnamese women in the United States have reported low use of breast cancer screening procedures (McPhee et al., 1997; Sarna, Tae, Kim, Brecht, & Maxwell, 2001). Additionally, of Asian Indian women aged 40 and over, 54.8% reported having a CBE in the past 12 months, while 57% reported having had a mammogram in the same time period (Sadler et al., 2001).

Increasing breast cancer deaths over the past few decades in American Indian/Alaskan Native women are partly due to underutilization of breast cancer screening procedures. Cancer is the second leading cause of death among American Indians and Native Alaskan women (Burhansstipanov & Lovato, 1999; Key & Denoon, 1997) and breast cancer rates are increasing among native women. Simon (in press) discusses the role of cultural
beliefs and norms in some detail, while providing the clinical implications of these for breast cancer screening and how they can be used to facilitate breast cancer screening behavior in racially/ethnically diverse women. Attention needs to be given to the roles of cultural attitudes, beliefs, and knowledge and their relationship to breast cancer screening at personal, environmental, and systems levels. It is also important to remember that there is a great degree of variability among these groups and thus, there could be a great degree of variability in their cultural attitudes, beliefs, knowledge, norms, and cancer experiences. Additionally, attention needs to be given to the socio-cultural compatibility between patients of diverse racial/ethnic backgrounds, health care providers, and health care systems in order to reduce health care disparities. The most widely used health education and promotion models are said to lack focus on these socio-cultural differences and are criticized for not being relevant to the cultural diversity present in contemporary society (Gotay & Cook, 1998). There is a need to have health promotion and prevention strategies that are culturally relevant and effect meaningful change in diverse population.

A solid commitment to identifying how cultural factors influence breast cancer screening behavior requires building on what’s known and developing new ways to approach breast cancer screening behavior. Theoretical models and frameworks are needed to aid in guiding culturally competent research and practice on breast cancer screening behaviors in racially/ethnically and culturally diverse women. Building on traditional health behaviors theories’ empirical foundation and the increased attention to cultural explanatory models of health behavior, a framework is presented for examining breast cancer screening behavior in racially/ethnically and culturally diverse women.
Theoretical Models and Breast Cancer Screening

Theoretical models of health behavior are used to assist in predicting and getting individuals to engage in health behaviors. Two of the most used theories for explaining breast cancer screening behaviors are the (a) Health Belief Model (HBM), and the (b) Theory of Reasoned Action (TRA) (Yarbrough & Braden, 2001). Although not used as often the HBM and TRA in breast cancer screening, Social Cognitive Theory (SCT) is also widely used to describe and predict health behaviors.

The HBM is one of the most used models for explaining health behavior in general. According to the HBM, health behavior is determined by five factors. These are: (a) perceived susceptibility to the disease, (b) perceived seriousness of the disease, (c) perceived benefits of taking actions against the disease, (d) barriers to taking action against the disease, and (e) cues to action. The HBM has been the most widely used model in breast cancer screening. In their review of the literature on breast cancer screening and use of the HBM, Yarbrough and Braden (2001) summarize concepts that interact to impact breast cancer screening behaviors. These concepts are perceived perceptibility to breast cancer, perceived seriousness of breast cancer, perceived benefit of engaging in breast cancer screening behaviors, and beliefs about their ability to master breast cancer screening behavior.

The TRA purports that health behaviors are largely influenced by individuals’ intentions and that these intentions are determined by individuals’ attitudes toward the behavior and the influence of the social environment (subjective norms) (Lammers & Fox, 1991). In terms of breast cancer screening, attitudes toward breast cancer screening involve beliefs about outcomes of performing breast cancer screening behaviors and
evaluation of the consequences or values of engaging in breast cancer screening behaviors. Social environment or subjective norms are impacted by normative beliefs (expectations of significant others) regarding breast cancer screening and the motivation to meet the expectations of others regarding breast cancer screening. To correct what was viewed as a limitation to the TRA, a third element, perceived behavioral control, was added to the TRA. The addition of this third factor to the TRA resulted in a newer version of TRA called the Theory of Planned Behavior (TPB).

Based on SCT, individuals will engage in a behavior when they feel they have the power to engage in the behavior, have goals with values that support the change and expect outcomes worth the behavior change (IOM, 2002). According to SCT, women will engage in breast cancer screening behavior when they feel like they have the power and ability to engage in breast cancer screening procedures and they have goals that support early detection. Although not used as often as the HBM or the TRA, the SCT in health behavior change is acknowledged for its focus on the socio-cultural context of behavior change (Rajaram & Rashidi, 1998).

Focusing on the growing recognition that intentions are a strong predictor of health behavior, the Institute of Medicine’s Committee on Communication for Behavior Change in the 21st Century: Improving Health of Diverse Populations has identified three key determinants of health behaviors (IOM, 2002). Building on these widely used health behavior theories, HBM, TRA, and SCT, these three key determinants of health behavior are attitudes, perceived norms and personal agency.

Attitude refers to the extent to which a behavior is liked or disliked or looked upon favorably or unfavorably. Within the context of health behavior prediction, the
“critical” attitude is the attitude that one has towards performing the health behavior. Attitudes and beliefs are intricately connected and impact the intention to perform the behavior. Intentions are strongly associated with behavior performance (IOM, 2002). Thus, within the realm of breast cancer screening, the attitudes, beliefs, and knowledge held by women impact the intention to perform breast cancer screening behaviors and their actual performance of them.

Perceived norms refer to the extent that a behavior is perceived as appropriate and supported in one’s social environment or society at large. Norms are often defined by the degree of social pressure one feels to perform or not perform a given health behavior. The two types of normative pressures include beliefs regarding what significant others in one’s life think about performing or not performing the behavior and beliefs about whether or not significant others are performing the behavior (IOM, 2002). Regarding breast cancer screening, the influences of family/friends, health care providers, and community members are all important and impact screening behavior.

Personal agency refers to the extent that one believes they are capable of performing the behavior. In determining the personal agency, self-efficacy and perceived behavioral control are two important considerations. Self-efficacy and control speaks to the belief that one can perform the behavior, even under difficult situations. Perceived behavioral control makes reference to believing the individual has control over the behavior (IOM, 2002). Self-efficacy and control in breast cancer screening are related to the belief that one can engage in the breast cancer screening behavior if they so desire and it is under their control to do so. Relevant here are issues of access, skills, knowledge, beliefs, and ability.
While widely utilized, these theories of health behavior are criticized for their overemphasis on rational thinking, overlooking social and cultural factors, their dependence on the biomedical model paradigm, and the lack of empirical investigation of socio-cultural factors. Rajaram and Rashidi (1998) present the usefulness of cultural explanatory models (CEMs) as a way to give warranted attention to the socio-cultural factors influencing health behavior.

*Cultural Explanatory Models and Breast Cancer Screening*

CEMs take into account cultural beliefs and values, personal values and beliefs, and cultural and biomedical explanations of illness (Rajaram & Rashidi, 1998). Social, cultural, and historical factors are key components of CEMs. In their work on breast cancer, Rajaram and Rashidi (1998) present cultural beliefs, socioeconomic factors, and community networks as three factors important in breast cancer screening behavior of racially/ethnically and culturally diverse women.

Cultural beliefs refer to culturally related ideas and thoughts that can impact breast cancer screening behavior. Cultural beliefs should never be blindly attributed to any one person, regardless of their racial/ethnic affiliation or membership. Individual differences and issues of acculturation should always be considered.

Socioeconomic issues refer to aspects related to monetary and other resource access issues that might impact breast cancer screening behavior. Often times there are financial access and system barriers that greatly impact breast cancer screening behaviors of women in lower socioeconomic groups. As women of color are found to be in lower socioeconomic groups more often than white women, these issues might be of more importance to women of color.
The third cultural explanatory key determinant of health is social networks. Social networks refer to the structures and cultures of neighborhoods and communities. Social networks influence the norms, beliefs, and attitudes regarding breast cancer screening behaviors. It is through social networks that information is passed on regarding health care providers and related services. “Community reputations” of health care providers can greatly impact breast cancer screening behavior of racially/ethnically and culturally diverse women. The framework presented in this article seeks to build on the empirical support for the more traditional health behavior models and the socio-cultural emphasis of CEMs.

*Framework Examining Breast Cancer Screening with Diverse Populations*

The proposed framework incorporates the well documented impact of traditional determinants of breast cancer screening behavior, while bringing to the forefront the socio-cultural determinants of breast cancer screening behaviors (See Figure 1). This has particular relevance to women of diverse racial/ethnic groups whose varying social and cultural contexts are often overlooked and inaccurately considered in the development of programs designed to improve breast cancer screening and other health related behaviors. Essential to consider in the socio-determinants of breast cancer screening behavior is the importance of cultural beliefs and norms. The framework presented illustrates cultural beliefs, attitudes, knowledge, and norms affect each of the other key determinants of health behavior, whether on an individual, socioeconomic, social, or societal level. Any efforts to increase breast cancer screening behaviors among culturally diverse women must consider the role of cultural attitudes, beliefs, and knowledge and other socio-cultural factors that serve as barriers. The framework presented allows for a more
holistic approach to developing programs for increasing breast cancer screening behaviors among culturally diverse women.

Health care providers using this framework as a guide to improving breast cancer screening utilization rates would acquire information regarding each of the six key determinants of breast cancer screening behavior. Gathering information on attitudes, knowledge, and beliefs toward breast cancer and breast cancer screening can often lead to an understanding of the extent that breast cancer screening procedures are looked upon favorably or unfavorably (attitude), the degree of support provided by significant others in one’s social networks to perform breast cancer screening (perceived norms), beliefs about one’s ability and control to engage in breast cancer screening procedures (personal agency), actual cultural beliefs about breast cancer and breast cancer screening procedures (cultural beliefs), actual resource and access issues (socio economics), and beliefs regarding how social networks encourage or discourage breast cancer screening (social networks).

In addition to looking at how cultural beliefs, attitudes, and knowledge influence the six key determinants, each of the determinants needs to be looked at within the contexts of cultural socio-environmental factors. For example, although some might argue that cultural attitudes, beliefs, and knowledge influence socio economics, more important is the likelihood that socio-economics can also influence cultural attitudes, beliefs, and knowledge. Shared life experiences, circumstances, and environments experienced by persons of similar socio economic status could very likely result in a cultural group with shared attitudes, beliefs, and knowledge regarding breast cancer screening that does not necessarily involve race. Thus, this framework allows for
defining cultural groups beyond currently used racial/ethnic groups. The framework can be used across the spectrum of systems, from individual to community.

For health care providers involved in direct service provision in cancer control, the framework provides an opportunity to holistically understand issues that may serve as both strengths and barriers to the use of early breast cancer detection procedures among culturally diverse women. As a research tool, the framework provides a set of factors to be examined in helping to predict and explain breast cancer screening behavior among culturally diverse women.

Of course, the framework is limited in that all of the factors that influence the key determinants of health need to be identified. Additionally, more research needs to be done that gathers information leading to better defining of cultural groups. The framework could be useful in this effort. An argument can be made that the same criticisms of the traditional health behavior models might be reflected in the current framework. The strong influence afforded by the cultural explanatory focus of the framework provides a strong countering force and is a strength of the framework. Logical, and built on strong empirical support of traditional and cultural explanatory models of health behavior, the framework warrants more attention and contributes to the discussion on breast cancer screening among culturally diverse, and often medically underserved, women.

Conclusion

The current paper presents a framework in progress focused on better explaining breast cancer screening behavior of the medically underserved who are predominately ethnically and culturally diverse women who are of low socio-economic status.
Admittedly, in its present form the framework needs to be further developed and validated through empirical research. As presented, the framework represents an initial step in developing a new framework that questions and challenges the inadequacies of existing health behavior models used to explain breast cancer screening behavior. It has its major potential usefulness in developing interventions that are designed to increase the breast cancer screening behavior of culturally and ethnically diverse women. Its emphasis on culture at individual, community, and systems levels contributes to its utility and use with women of various cultural and ethnic backgrounds. Despite its limitations, the framework does provide health care providers with a new tool to be used by direct care providers, program planners, and policy makers in their efforts to improve breast health and breast cancer screening behavior among women from a variety of backgrounds.

Abstract

Role of Mass Communication in prevention and control of AIDS: Mass media strategies in India

A study of AIDS awareness and mass media reach amongst school going adolescents in Delhi and Ghaziabad

Dr Archana R Singh

Introduction and Rationale

Communication and development are the major domains of human endeavour which are intimately linked with each other. The process of development calls for a strategy of communication which is aimed at altering the targeted persons from mere recipients of information to seekers of information. The main function or purpose of communication is to change or guide other people's behaviour. Communicators have to develop an understanding of the mass audiences. In such instances, audiences are usually grouped according to various characteristics— for example, language, art, culture, economic class, educational level and so on. Understanding of these audiences is usually built up over time through research and experience. There is always a need to study the role that was being played by the mass media in the process of development in general and in the various aspects of development such as agriculture, housing, education, trade, commerce, science and technology, defence, health etc. in particular. Media persons and media organisations are in the center of development and health communication. It is suggested that the overall health communication should be such that it not only empowers people but also enables them to make informed decisions on personal and delicate questions. Communication in that sense is the product of the society and also the moulder of society.

For the purpose of this study, only the mass approach of communication has been studied. This media reaches a large audience in a short time. Uniformity in message is maintained. Although selective perception and retention are hurdles in the effectiveness of this method but mass media certainly has proven value in spreading information. Mass media can create an environment, make issues out of topics, help to create a favourable social climate, counter hostile propaganda, dispel rumours and clarify doubts and misunderstandings.
Why AIDS?

Developing countries the world over are facing several deadly diseases, chief among them is Acquired Immune Deficiency Syndrome or AIDS, one of the biggest public health and developmental problems of this century, which started from mere smoke signals and swept across the globe like wildfire. AIDS is now the fourth leading cause of death globally. It is important to recognize that AIDS is not just a health problem. It has major social and economic consequences. It also has political and ethical implications. Prevention and control of this deadly pandemic which has very serious medical, social, behavioural, economic and developmental implications has now become imperative.

The increasing prevalence of HIV/AIDS in India necessitated the launch of a second phase of NACO’s National AIDS Control Program in 1999 (NACP-II). A national baseline Behavioral Surveillance Survey among the general population, was conducted in all 32 States and Union Territories of the country in March-August 2001. The findings of this baseline survey show that there are significant differences in awareness levels regarding HIV/AIDS/STDs. Significant differences were generally observed in relation to gender and to place of residence. In most instances females and rural residents were more disadvantaged compared to their counterparts in the cities. However, lack of awareness about AIDS only goes to prove that Indians are still in the denial stage of the syndrome, while the truth is that India has more than 20 million HIV infected people, the largest number in any country. It appears that India is sitting on a time bomb which has already begun exploding.

Use of Mass media in AIDS awareness:

The mass media represents the most readily available and potentially most economical means of imparting information about HIV/AIDS. Along with other forms of communication the mass media can effectively raise public awareness and concern about HIV/AIDS. Communication experts have called for the mass education of the general public, and argued that this large scale education has the potential for not only correcting misinformation, but also for creating and maintaining a more favourable environment for AIDS prevention. (Hornik R., Romer D. 1991).

Strategies have to be devised by which public is made aware and not alarmed. What is needed, therefore, is not just planned campaigns, as opposed to regular media programming, but well planned campaigns which utilize the full potential of mass media and entertainment. Research has established that mass media are most likely to change behaviour when the information is targeted at specific audiences, comes from a credible source, provides a personally relevant and engaging message. Effective use of mass media requires careful planning, audience research, message development, pre testing, dissemination strategy, evaluation, coordination with existing services, and linking mass media with interpersonal communication. (Brown WJ, Singhal A, Rogers EM, 1989). So far, the media in India have treated AIDS more as news than as a growing menace and
The scourge threatening both human lives and dignity. (Norms for journalistic conduct: Press Council of India, 1998)

The purpose of this study

This study aims at finding out the role played by mass communication in AIDS prevention and control. Different research methods have been used to fulfill this aim.

1. Content analysis of print media to find out the AIDS-related news content in Indian newspapers.
2. Study of AIDS-related messages on audiovisual media.
3. AIDS awareness and mass media reach survey of a selected target group
4. Focus Group Discussion with the sample used for the survey.

Adolescence: period of high information needs

As early as in 1992, it was estimated that about 20-25% of all the HIV infections occur among young persons. Recent studies have shown that maximum people with AIDS are young adults who are in the most productive age group. This would imply that they have acquired the disease in their teenage years considering the time span of about 10 years required for the AIDS-related complexes to turn into full blown disease. The infection rates in young people appear to be increasing everywhere. (Faustin K. Yao, 1992)

Further, in many countries it is likely that the rates will increase faster amongst girls than the boys because of cultural and social norms which subject girls to sexual experience at an earlier age. Adolescence is a crucial time of life, not only for health education and health promotion in general but also for HIV prevention and AIDS education specifically. In order to explore the readiness of the students to learn about sex, sexuality, AIDS, it is important to conduct both qualitative as well as quantitative research. It is important to find out the appropriate message format and the medium to be used. AIDS affects in terms of social and psychological development, the most vital segment of the population, the young adults. This study therefore concentrates on the target group of adolescents between the ages 13 years and 17 years.

Research Design

This study has been designed, keeping in mind the methodology being followed the world over in researches involving sensitive subjects. This procedure is known as Triangulation Method. Triangulation has been defined as the use of two or more methods of data collection in the study of some aspect of human behaviour. (Cohen and Manion, 1989). In the recent years it has been felt that any one method of data collection is insufficient. As Carley (1981) has pointed out, neither type of research, when used alone, can give us an accurate window to the world. They are best developed when used in conjunction. While quantitative research leads us to generalise on particular phenomenon, qualitative research helps us to understand the specifics. Feilding and Feilding (1986)
suggested 'there are possible points of convergence' in different approaches. It has now become more acceptable in recent years to combine quantitative and qualitative research, and the process is triangulation of data to substantiate the hypothesis. Since the topic of the study was sensitive and dealt with a target group that was impressionable and very young, the triangulation method was used.

This study concentrates on all the elements of the communication process such as the sender, the message, the channel and the receiver. In order to study the various elements, qualitative as well as quantitative tools of data collection have been used.

* Content Analysis

* Survey

* Focus Group Discussions

**In the first method**: A time series content analysis was conducted on the AIDS related messages that appear in the print and electronic media in India. Taking a sample of 5 newspapers, the AIDS messages appearing in them were studied during the years 1993, 1994, 1995 and 2000. This process has been described in detail in the following paragraphs. Similarly a study of audio visual media was conducted through Observation method. The AIDS messages broadcast or telecast by the electronic media during the same time period have been observed. This aspect of the study gave the researcher an insight into the involvement of the media with the AIDS issue.

**In the second method**: A survey was conducted amongst the school going adolescents in Delhi and Ghaziabad. This method was utilised to assess the extent of AIDS awareness in the target population and what role the mass media had played in enhancing this awareness A multi stage sampling procedure was used to select the sample for this study. A sample of 443 questionnaires was finally drawn through this sampling procedure

**Survey**

This study is based on a correlational descriptive survey. This type of survey is best suited for collecting information on audiences and readership also for the purpose of gauging the knowledge levels of a particular target groups. Since the hypotheses did not venture into finding out causal relationships, this type of survey was best suited for this research work. Being correlational in nature its purpose extends beyond merely describing the data. It tries to establish whether or not statistically significant relationship or correlation exists between variables.

**In the third method**: Focus Group Discussions were conducted with the same population to understand the needs of the group and their expectations from the mass media.
The purpose of using focus groups in this research was to interpret the previously obtained quantitative results. Since the groups used by the researcher had already passed out of their respective classes, VIII, IX, X and XI, the students who were presently studying in these classes were interviewed. A structured format was used for the purpose of this research. A pre-planned set of agenda topics were covered as the issue is relatively well understood and the previous study had already been conducted by the researcher. This study has been conducted in three stages. Each stage is complete in itself while also contributing to the overall analysis of the research questions. The tools of content analysis, survey and focus group discussions were used one by one and not simultaneously, so that the findings of each could be used in the inquiry. The method proved fruitful as the findings of the content analysis helped in designing the questionnaire and the findings of the survey helped in designing the schedule for the focus group discussions.

**Findings:**

Study of the AIDS news published during the month of November - December, reveals initially a spurt of concern for the subject which gradually changed into a more meaningful understanding. As is evident from the figures, AIDS news enjoyed maximum coverage in the year 1994 as compared to the years 1993 and 1995 and after a gap of five years, there was not much difference in the amount of reporting although the situation of HIV in the country was turning grim by the day. The year, 1993 saw a total of 36 news items measuring 5658.75 cms, sq., in the year 1994 the number more than doubled itself (85 news items) and the total space occupied by AIDS related material was 18461.6 cms.sq. However, in the year 1995, the number fell to 41 and the space covered by the AIDS related material was 14282.55 cms. sq. In the year 2000, the number of AIDS related articles was 50 with 16871.96 sq. cms coverage. The news regarding AIDS does not increase year after year although there is an overall increase in the news coverage. This increase in AIDS reporting can be attributed to growing awareness and serious concern about the subject. The media has acquired a more open stance in discussing sensitive issues such as sex, sexuality, sexually transmitted diseases and AIDS. However, the press is not consistent in its coverage. With passing time AIDS as an issue had to compete with so many other important events for coverage in our dailies. This is evident in our finding about the extent of coverage given to the issue in 2000. Despite the mounting concern for the issue displayed by the articles, the coverage in terms of space occupied still could not beat the then newfound issue in the year 1994. The Indian media, with its market orientation covers the HIV related news in a very casual manner.

**Newspaper wise coverage**

The maximum number of articles appeared in the Times of India followed by the Hindu and the Hindustan Times. The articles were mostly news reports and news analysis in the form of editorials. The Hindu published more analysis and discussions. The Times of India published the only article related to the economic aspect of AIDS. Maximum number of public health messages appeared in the Indian Express, some of them covered
the entire page of the newspaper. Maximum number of human interest stories appeared in the Statesman. During the period Nov. - Dec, 2000 the maximum number of articles appeared in The Hindu. This newspaper has given serious thought to the issue and a number of thought provoking articles on various aspects of the disease have appeared. News value of this issue was recognised by The Statesman as it had maximum number of photographs along with its stories. In the final analysis, the Times of India, was found to be the only newspaper which covered a range of subjects on AIDS. It has shown a consistent concern for the issue as it has maintained an interest in the subject during all the three years.

Analysis of audio video media

The earliest television messages appeared in the early 90s, when a socially conscious actress Shabana Azmi was chosen to deliver the message. These public service messages were designed by the National AIDS Control Organisation. Lately, film star Madhuri Dixit has appeared on endorsements messages about the inherent strength of women in not only protecting themselves from unsafe sexual practices but also taking on the responsibility of educating their teenage children about safe sex. On the similar lines of celebrity recommendations there are spots with Shah Rukh Khan, Aparna Sen, Kabir Bedi, Sarika, Jaspal Bhatti and many more. The latest spots sponsored by Cipla for social causes, shows endorsements by people with AIDS. On radio too jingles have used celebrity recommendations as the favourite method of message dissemination. However, despite the shortcomings, these jingles are the earliest attempt being made to reach the large population of people that relies on radio as a medium of information either because of illiteracy or because of its easy availability. As is evident from the above review that more research is needed before Television starts to telecast AIDS related messages in a big way and radio produces more professional jingles and hotlines that actually work.

Discussion

This study provides an analysis of AIDS related news material which appear in the 5 prominent newspapers of the country. Further it provides an analysis of audio visual messages that have been presented to the audiences since the last decade. The analysis is both qualitative as well as quantitative. It was found that the society as well as the media has yet to accept that AIDS is an issue of each person's concern. Moralistic stands, denial, prejudice, lack of research and follow up has been seen in the news reports. Some of the reports do reel out baffling statistics of people who have been infected by HIV, but on the whole AIDS is still a disease which happens to other people.

The year 2000, had always been cited as a landmark year by the experts on AIDS. All predictions were targetted at year 2000. Whenever the seriousness of the AIDS scenario had to be depicted, the year 2000 situation would form the basis of the message. By the time one arrived at the year 2000, AIDS was not an issue on the top priority list. The figures which are repeated year after year on World AIDS Day were repeated once again and they certainly painted a grim picture. All the predictions for the year 2000 have come true. India now has 3.7 million HIV positive people, the highest in the world. 80% of
these cases are from 18-40 years age group. While countries like Holland, Thailand, Uganda and Australia have managed to control the epidemic, India with its special brand of moral hypocrisy did not invest sufficiently into the prevention programmes. However, despite the growing seriousness of the situation, it does not get reflected in the columns of our newspapers, who awaken to the issue of AIDS only when the AIDS Day approaches.

**Survey: Findings**

The impact of media coverage of any subject depends on the interaction of several factors, including the previous knowledge of the readers or the audiences, the content of the message, the credibility or otherwise of the journalist, the reaction of the people with whom the reader or viewer goes on to discuss what they believe they have read, seen or heard. The aims of the mass media should be to set the agenda for the development of public policy and influence the actions of those who have the power in our society. In approaching the role of mass media in relation to AIDS, the media need an idea, of where the public interest lies, of how the public policy should evolve. Such an idea must clearly be founded on the best available medical knowledge and on social research. The main aim behind this survey was to find out the mass media access and reach status and the AIDS awareness level of adolescents from two different settings. The analysis of data has been structured according to these variables. The findings are divided into 5 different sections for clear and thorough discussion.

The sections are:

* Demographic Profile
* Mass Media Profile
* AIDS Awareness profile
* Knowledge about AIDS
* Sex Education

**Demographic Profile:**

The respondents came from four different schools from two different cities. Both girls and boys were administered the questionnaires. The total population of students was 443.04 questionnaires were disqualified at the time of analysis. A total of 439 questionnaires were analysed. Boys were more in number as compared to the girls but since all the schools visited offered co-education, the difference is not intentional (Boys 243, girls 196).

Most of the students were Hindi speaking, which was rather obvious. Most of them had educated parents. The most common qualification for fathers was found to be a professional degree (33.3%) and the mothers in most cases were graduates (33.4%). The majority of students were from nuclear families (79.2%) with average income of the majority being Rs. 5001 to Rs.10,000 (37.4%). More number of fathers were in government service as compared to any other category (65.4%). The reason could be that
two schools out of four were government schools. Most of the mothers were housewives (81.3%) and some of them were school teachers

Media Profile:

The media access study was interesting as the data showed that more students own Television sets (97.2%) than those that subscribe to any newspaper (82.9%). Radio ownership varied as 98.2% of the metropolitan public school students owned a radio, only 79% of the satellite town public school owned radios. Even amongst the government schools, 90.2% students in the metropolis owned radios whereas 88.8% of the students from satellite town owned radio sets. The media exposure findings reveal that maximum number of students are exposed to the television and only half the number read their newspaper daily. (98.8% watch television and only 40% read the paper everyday) Even when studied independently it was found that amongst the government schools, 99% students in the metropolis and 98.3% students in the satellite town watched television regularly whereas 43% in the metropolis and 38% of the government school in the satellite town read daily newspapers. From amongst the public school students 48% in the metropolis and 46% in the satellite town read the newspaper everyday.

Demographic data and AIDS awareness

It was found that the AIDS awareness profile of the metropolitan students (69.5%) was better than the satellite town students (53.25%). The girls in the metropolis scored the best with 75.9%. The metropolis boys stood next with 63.6%. The satellite town girls had a higher figure (59.8%) as compared to the satellite town boys (46.7%). This clearly shows that metropolitan students are better aware than the satellite town students although both of them exhibit similar media profile. The girls in the metropolis have scored the best and even the girls in the satellite town have scored better than their male counterparts proving better health consciousness amongst the girls. The public school boys had the best awareness score with 66.9% and the public school girls stood next with 63.44%. The government school boys scored 57.8% and girls 54.98%. This goes to prove that boys and girls in public schools are certainly better informed than the boys and girls in the government schools. In the age wise analysis of AIDS awareness scores one finds that maximum awareness is with the maximum age. Students who were 13 years had an awareness score of 57.27% amongst boys and 48.1% amongst girls. Among 14 year olds, the boys have 58.68% and girls 57.2%. Among the 15 year olds boys scored 67.26% and girls scored 66.1%. If one observes closely one finds that the girls although, initially, rather unaware, slowly catch up with the boys as they grow older. Amongst the 16 year olds boys scored 72.47% and girls 69.7%. The 17 year boys are left behind with 77.31% score by the 17 year old girls who scored 78.2%.

Correlational Analysis

Correlational analysis between variables was conducted to find out the relationships between, AIDS awareness scores, socio economic status and mass media reach and access among the target population. It has already been observed that the media profile
of this group is very high. However, neither age of the respondent nor the sex of the respondent has any direct correlation with media profile. This would mean that the mass media reach and exposure is not affected by the age and sex of the respondent. Media profile does affect the AIDS awareness scores. Since the group has a very high media profile it can be safely assumed that much of their awareness is through the mass media. We have already seen that they rate TV as the provider of maximum information about AIDS. There is no relationship between first source of information and subsequent AIDS awareness. Since in this case the first source of information happens to be television in maximum number of cases, this finding only points out towards the short term effect of the medium. This would also mean that television cannot lead to sustained behavior change or even to behavior modification. However, a definite relationship has been found between recall of message on radio and television and the AIDS awareness profile. This clearly shows that consistent messages by the mass media do have some retention in the minds of the audiences. Since our target group is of a very impressionable age messages have a high retention value and they do add to the overall increase in knowledge. It was also found that mass media has contributed largely to the AIDS awareness levels of the respondents.

Some salient findings from the above survey are:

1. Television has emerged as the most powerful medium
   a) Maximum number of students own it.
   b) Most have got their AIDS related information from TV
   c) Most of the respondents could recall the AIDS related message appearing on TV.

2. Newspaper reading was found to lag behind TV and cinema.
3. Students from the satellite town were found to have yet to develop the habit of newspaper reading
4. Music programmes on radio and TV wins hands down as most popular programme.
5. Cinema is the most popular medium and most films are watched on TV.
6. AIDS awareness profile of metropolitan students was better than satellite town.
7. Girls in metropolis as well as in the satellite town have better AIDS awareness profile.
   In the overall analysis, boys from the Public Schools had the best awareness profile and the girls from the public schools followed a close second.
8. Music programmes on television were the most watched, followed by serials and feature films
9. The AIDS awareness profile of metropolitan students was better than the satellite town students.
10. Although the media access profile was similar the metropolitan students certainly had more information.
11. Girls exhibited better awareness profile as compared to boys in both the categories.
12. While comparing public schools and government schools, public school boys and girls scored better than government schools.
13. Media availability or access could not be the sole cause of high or low AIDS awareness.
14. 97.7% students had heard about AIDS, but they did not count it as a health problem.
15. Polio and leprosy were most frequently counted as health issues.
16. Television was cited as the most efficient source of AIDS related information. Most students could recall messages from TV. 67.7% were aware of the cause of AIDS, however they were ignorant about the tests needed for HIV detection.
17. Condom was cited as a method of preventing AIDS but only 26.6% were aware of its use as a contraceptive.
18. More girls had discussed AIDS in school yet boys have better awareness.
19. Most students had never attended any seminar, workshop or lecture regarding AIDS awareness but more than half the number of students were keen to attend a programme related to AIDS.
20. Most preferred source of information regarding AIDS was medical professionals. Although the students receive all their information from TV, they would like to receive it from qualified medical professional.

Focus Group discussions were conducted in order to substantiate the findings of the survey.

**Findings of the FGD**

**Radio**

1. Boys and girls belonging to Public school in Delhi listen to the radio more than any other counterparts only for music.
2. They like to play the radio while doing something else. Active listenership was minimal.
3. Some of them could recall AIDS related messages on radio.
4. They knew that there was a help line for AIDS where their questions could be answered.
5. They had no difficulty in comprehending the message but since they were not radio enthusiasts, they were indifferent to the idea of more messages being presented on the radio.
6. Not a single candidate could recall any advertisement or message broadcast on the radio.

**Television**

1. They can vividly recall AIDS related messages appearing on television.
2. The celebrity endorsement messages (Madhuri Dixit, Shahrukh Khan) had a high recall rate.
3. They could understand the message but some of them were embarrassed while watching them.

4. Boys and girls in Delhi felt that the condoms advertisements appearing on television were so blatant that AIDS awareness messages were not at all embarrassing. They suggested that condom manufacturers should include AIDS protection as one of the advantages of condom use!

5. Most of them would not mind more advertisements about AIDS on television but boys in Public school at Delhi wanted to watch English feature films with AIDS as a theme.

**Newspapers**

1. Not many of the members could recall reading about AIDS. Actually, cognitive dissonance plays a major role in interaction with media. AIDS as an issue is not a part of the audience agenda and so when they come face to face with AIDS related messages they just look through them. Messages will have to be designed not only to set the AIDS awareness agenda but also to find a place in the audience agenda.

2. The full page AIDS messages inserted by NACO every year seemed to have missed this target group altogether.

3. Human interest stories had high recall with girl students especially when a child was somehow involved. However, no one could particularly recall any specific message.

4. Some were aware of a body called NACO, but were not sure where and how they had heard about it.

5. The target group would prefer to read more about AIDS in the newspapers. Some girls said that since newspaper reading is a solitary activity and not public activity, they could read articles about AIDS without feeling embarrassed.

**Internet**

1. Boys and girls in Delhi surfed the net more than the students in Ghaziabad.

2. The number of net savvy boys was more than the girls.

3. Those students who owned computers at home and had Internet connections were obviously more net savvy.

4. Some even mentioned going to one of the cybercafes for using the net.

5. Some boys mentioned having visited the pornographic sites on the Internet.

6. Some even mentioned the word 'cyber sex' but were shy to elaborate on it.

7. No one had hit any AIDS related web site on the Internet.
Discussion

The media profile also revealed certain interesting factors - newspaper readership is very low while television viewership is reasonably high. This is a startling finding as all the students come from educated families. The respect that the daily newspaper commands in urban homes across the country seems threatened with this behaviour of future citizens. With the inclusion of children section in the newspapers, perhaps there must have been some improvement in the readership percentage, but the point to worry about is that the sample population is not children population. These are young people who should be reading the regular newspaper. If the status quo is maintained, newspapers will have to work harder to cultivate a generation of readers who are as loyal to the medium as their grandfathers had been.

Another medium that seems to be losing ground is the radio. Two decades ago radio listeners could be found across the country with transistors glued to their ears for cricket commentaries or a family collected around the radio set for Binaca Geetmala or Inspector Eagle. Only 79% of the population in the satellite town owns radio sets, while Delhi with the onset of FM radio has a better percentage. The popularity of the radio although on a downhill can be improved with better programming. Nothing can beat this medium with its special quality of mobility. As for the AIDS awareness messages, youngsters of today rate television as the medium that has given them some information. Television with its visuals can provide a clear picture and hence an effective message. Moreover with its extensive reach in this particular group it can spread the message really far. Cinema although popular as a medium has not contributed to AIDS awareness at all.

Media profile of a group as such was quite high and this implies that there is a lot of scope for mass media to use its potential with the target group. Definite relationships have been found between the media profile and socio economic status and AIDS awareness profile and the city of residence. Keeping in mind these findings messages can be designed for different locations and for various classes of audience. Television messages hold special significance as they have shown highest recall in this study, with the best received messages being the celebrity endorsements.

Whatever they have imbibed from various media does not seem enough to give them a clear picture of the situation. While 97.7% students in the metropolis and 84.5% students in the satellite town have heard about AIDS, only 80.8% in the metropolis and 76.9% in the satellite town seemed to have heard any health related message. It is rather puzzling to see that our youngsters do not consider AIDS a health problem. For them the implications of sex and sexual matters related to AIDS stand out. Other implications of AIDS have not yet registered in their minds. The denial stage is very evident in this group. They seem almost certain that they are not at all susceptible to this disease. The obvious finding here is that metropolitan students have better AIDS awareness profile. Since most interpersonal programmes are carried out in these cities, students hear a lot about AIDS from sundry other sources and not just from television. More discussions in schools, well publicized health melas, international conferences, more hoardings on the main roads, transit messages, messages on bus stops, all this has had an impact on the
group, where as the students in the satellite town are deprived of this type of message onslaught. They seldom discuss AIDS in schools, are wary of talking about AIDS to their parents, are embarrassed when AIDS messages appear on television. This difference in the reach of the messages can prove to be disastrous for the country. India does not reside in the metropolitan cities alone. For all those who live in the far flung areas, away from any capital cities the situation can be worse. One can safely assume this, just looking at the AIDS awareness profile of the satellite town students (53.25%), who are only a stone’s throw away from the capital of India. Students belonging to public schools and higher socio economic strata with educated parents have a better AIDS awareness profile. AIDS, however does not discriminate. HIV can infect anybody and the uninformed are more susceptible. These findings reiterate the need for the messages to be taken to smaller towns, among the lower economic groups and among the uneducated.

The myth of a moralistic Indian society already lies shattered and cases of sexual abuse of young girls are on the rise. In such a scenario, this group of young people should be armed with enough knowledge to be able to tackle any unforeseen circumstances. An additional benefit of sex education classes that have been started lately, is that the mysterious changes in the body at puberty can be explained to these confused teenagers by an expert whom they can trust. They have revealed in the survey that they want to get more AIDS related information from medical professionals. The girls as they grow show better awareness levels, so much so that they surpass the boys in awareness. This fact has been proved in Delhi as well as Ghaziabad. The young boys, who are going to grow up to be husbands and fathers, need to be shown a direction which they can follow. Young people are gregarious by nature, the need of the hour is to channelise their energies towards the direction of safe sex and no use of drugs. This is not an easy task. Besides, any one agency cannot take up a responsibility as serious as this one. The ambiance of information created by the mass media can be supplemented with more focussed interpersonal communication.

The students have exhibited a desire to attend seminars, workshops or lectures regarding AIDS. This is a group that is keen to get information. They have been oscillating between peer and porn to get their sex education. The time is ripe to target this group.

Abstract
Mass tourism is an indicator of affluence brought about by modernity and its associated lifestyles. Even though tourism can be seen as a form of social activity, this activity is grounded within the “modern consumer culture that is shaped by the essential logic of capitalism, namely commodification” (Watson and Kopachevsky 1996). As in other forms of consumption, which are “sign-driven” and media-driven, tourism as a form of social activity, appears to be dictated by the changing patterns of consumption. Tourism, like other commodities, is packaged through advertising, which appeals to peoples’ desires and fantasies, and aims to, (1) serve as a discourse about objects, symbols and ideas; and (2) persuade people that only in consumption can they find satisfaction, happiness and health (Goldman & Wilson 1983; Leiss & Jhally 1986).

An important part of tourism promotion is the creation of visual images—images of rural scenes, historic sites, iconic and other images designed to attract people. “Visual tourist images are a form of text used to represent the world” (Jenkins 2003). The meaning of these images is not fixed and is dependent on the viewer’s perspective. Thus, generation of meaning/knowledge is the product of existing cultural practices and meanings. Images also reinforce ways of seeing the world, and often represent a distribution of power in society. In fact some have even argued that power is central to the analyses of tourism imagery (Morgan and Prichard 1998). In examining power relations especially between the east and west, Said (1978) had argued that the “Orient” had been managed and produced by the European culture. Morgan and Prichard add to this view by arguing that
“ideas, cultures and histories cannot be seriously understood or studied without..their configuration of power, also being studied ” (Said 1991).

Methodology: This paper draws on literature from sociology, advertising, and cultural studies, to examine the role of images in international tourism and explore specifically power relations which informs the tourism “text” in India. Images from travel brochures, in-flight magazines, travel magazines (“Travel and Leisure” and “Conde Nast Traveler”) and internet resources will be used to determine key themes. Analysis of images includes decoding of visual components, and will be done at two levels: (1) Semiotic approach— to discover meanings, and (2) Discursive approach— which examines not only “how meaning is produced but also how such meanings are linked with knowledge and power in society”.

Findings: An initial exploration of images relating to tourist destinations in India has revealed that most of the images are geared toward the creation of a new version of an old nation— a new package - where its colonial past forms the backdrop of most discourse. Images of the “Raj” are juxtaposed against the bustling streets, its colors and its teeming crowds. The elegance of the colonial past lies hidden beneath the bustling crowds. These images seem to ask the traveler to come and discover the jewel that lies hidden in the heat, dust and chaos. A further in-depth analysis is most likely to reveal the power structure inherent within the international tourism industry— which creates tourist destinations by appealing to peoples’ fantasies and desires.

Driving Simulation for Teens: Assessing Adaptation and Fidelity

Learning to drive is one of the most exciting times in a teen’s life. It is also the most deadly. In fact, automobile crashes are the leading cause of death for teens (Decina, Gish, Staplin, & Kirchner, 1996). Driving simulators hold promise as a training mechanism for exposing novice teen drivers to the scenarios that typify teen crash involvement (e.g., rear-end collisions) but that would be difficult, if not impossible, to rehearse in the real world precisely because of their inherent danger. The goal of simulated driver training is to transfer knowledge and experience gained in the simulated driving environment to the real-world driving environment. Research indicates that transfer of training from simulated environments to the real world is maximized when such training is characterized by both a high degree of physical and psychological fidelity.

There were three goals for the current study. The first goal was to assess the feasibility of quickly adapting teens to a virtual environment without inducing simulation adaptation syndrome (SAS). The second and third goals were to measure participants’ perceptions of the psychological fidelity of the simulated driving scenarios and the physical fidelity of the simulation platform respectively.

There were four measures used in the study. The motion history questionnaire (MHQ) was used to pre-screen teens for proneness to motion sickness such that those predisposed were precluded from further participation. The simulator sickness questionnaire (SSQ) was used to assess participants’ level of discomfort before and during exposure to the virtual environment. It is presumed that for simulated driver training to be effective, exposure to the virtual environment must not induce SAS. Two new self-report measures were created for use in this study. The drive face validity measure (DFVM) was created to measure participants’ self-reported ratings of the psychological fidelity of the driving scenarios. The simulator face validity measure (SFVM) was created to measure participants’ self-reported ratings of the physical fidelity of the simulation platform.

Sixty-eight teens participated in the study. Participants were subdivided into four groups based on gender and drivers’ license status resulting in four groups: male drivers; female drivers; male non-drivers; and female non-drivers. Participants were exposed to approximately 50 minutes of simulator driving once per week for three consecutive weeks.

Week one focused on adapting participants to the virtual environment. Prior to driving in the virtual environment, participants completed the MHQ and SSQ. Following each drive, participants completed a DFVM and at the end of each week’s session, participants completed a SFVM. In order to assess adaptation to increasingly complex driving scenarios over time, as well as scenario and platform fidelity, weeks two and three consisted of exposing participants to scenarios of increasing complexity in terms of both ambient traffic and required driving maneuvers. Measures collected during weeks two and three included the SSQ both prior to driving and after each drive as well as a DFVM after each drive and a SFVM at the end of each week’s session.

Results suggested that teens effectively adapted to the virtual world when exposed to a one-hour adaptation sequence (40 minutes of driving interspersed with brief rest periods). When analyzed in aggregate across groups, the SSQ data suggested that teens did not experience significant changes in their baseline comfort levels. When analyzed by gender and driving experience significant differences emerged for several physical symptoms. This same pattern held true for weeks two and three suggesting that overall teens adapted well to increasingly complex scenarios.
with no major changes in physical comfort, but that some differences may be expected based on
gender and license status.

With regard to the psychological fidelity of the scenarios and the physical fidelity of the
simulation platform, overall results indicated that participants viewed both the scenarios and the
platform as realistic. Again, several key differences emerged based on participant gender and
license status, but it is important to note that some of these differences faded with repeated
exposure.

In sum, the study supports the notion that teens were able to adapt rather quickly to the virtual
driving environment and generally found the simulation platform and the driving scenarios to be
realistic. Measures designed to assess various aspects of both scenario (psychological) and
platform (physical) fidelity revealed several key distinctions with regard to fidelity based on
gender and/or license status. One potential implication of this study is that adaptation to virtual
environments as well as scenario and platform fidelity may vary based on certain participant
demographics. As such, the present findings suggest that in order to maximize transfer of
training for teens, issues of adaptation as well as psychological and physical fidelity must be
understood in terms of their relationship to gender and driving experience.

Psychophysiological Responses of College Students during Simulated Driving:
A Preliminary Study on Measurement Feasibility
ABSTRACT

Car crashes are the leading cause of death for teens. Driving simulators can be used to train teens without exposing them to risk of injury or death. The psychological fidelity of simulators is, however, at issue. This study explored utilizing psychophysiological measures as a proxy for psychological fidelity.

INTRODUCTION

Learning to drive is one of the most exciting times in a teen’s life. It is also the most deadly. In fact, automobile crashes are the leading cause of death for teens (Decina, Gish, Staplin, & Kirchner, 1996). Driving simulators hold promise as a training mechanism for exposing novice teen drivers to the scenarios that typify teen crash involvement (e.g., rear-end collisions) but that would be difficult, if not impossible, to rehearse in the real world precisely because of their inherent danger.

The goal of simulated driver training is to transfer knowledge and experience gained in the simulated-driving environment to the real-world driving environment. Research indicates that transfer of training from simulated environments to the real world is maximized when such training is characterized by a high degree of both physical and psychological fidelity. This exploratory study investigated psychophysiological measures as a proxy for various aspects of psychological fidelity (e.g., driver’s mental workload) during simulated driving.

Psychophysiology is defined as “the study of cognitive, emotional, and behavioral phenomena as related to and revealed through physiological principles and events” (Cacioppo & Tassinary, 1990). Psychophysiological measurements can assess subtle psychological states that might not be detected from verbal reports. Furthermore, advances in bio-monitoring instruments and computer telemetry now allow continuous and simultaneous measurements of psychophysiological responses.

METHODS

Participants
Ten university students (5 female and 5 male students) were recruited from general psychology classes at Kansas State University. Students attended one experimental session individually on their assigned day. Prior to the beginning of the study, each participant signed an informed consent statement, approved by the Kansas State University Human Subject Institutional Review Board.

**Driving Simulator & Scenarios**

Experimental sessions were conducted at the Simulated Training and Assessment Research (STAR) Laboratory at Kansas State University (Fig. 1). The STAR lab’s DriveSafety Vection™ Research Simulator is built using a partial Ford Focus cab with full-width front interior and all standard driver controls and active instrumentation.

The STAR lab simulator employs an automatic transmission version of the Focus interior. The simulator presents participants with immersive driving experiences as they travel through realistic virtual roadway environments. Interactive traffic is simulated using autonomous “smart” models as well as scripted behavior models and triggered events. Advanced Windows-based authoring tools allow designers to assemble custom roadway environments from an extensive library of environment Tiles. Flexible control is provided to designers for traffic mix and density, traffic control devices, pedestrians, bicycles, animals, and a wide array of weather and environmental conditions.

Extensive data collection functions allow driver responses and control inputs and many other variables and performance measures to be collected at up to 60 Hz during simulation (over 50 standard measures plus user defined variables). An advanced multi-body vehicle dynamics model running at 2400 Hz calculates the vehicle’s performance and responses to the roadway and driver control inputs.

The system’s hybrid longitudinal/pitch motion platform provides inertial onset cues for braking and acceleration. Tactile and proprioceptive feedback cues are provided to the driver via torque feedback in the steering wheel and vibration transducers mounted under the driver’s seat and in the steering system. The simulator’s digital sound system includes four wide range speakers surrounding the driver and a powered subwoofer behind the cab’s firewall. Visual imagery is rendered at 60 frames per second and presented on a sophisticated out-the-window visual display system with a 180-degree forward field of view plus three independently configurable rear view mirrors. The STAR Lab operator’s station provides a full suite of simulation system control and monitoring functions, including repeater monitors of the out-the-window driver views and a multi-camera video system for observing participant drivers; even in full darkness of nighttime drives.
Three types of driving scenarios were used in the pilot study. Scenarios increased in complexity of driving tasks performed: a 100-s of Drive 1 (straight, no traffic), a 200-s of Drive 2 (introducing curves and mild traffic), 340-s of Drive 3 (introducing turns with moderate traffic).

**Measurements**

Skin conductance, muscle activities and heart rates were taken by using a ProComp Infiniti bio-monitoring instrument and the Biograph Infiniti data acquisition systems (Thought Technology Ltd., Montreal, Canada). Surface skin conductance (micro-siemens), sampled at 256 Hz, was recorded from the arch of each participant’s left foot. Intensities (micro-volts) of muscle activities (electromyography: EMG), sampled at 256 Hz, were recorded from the each participant’s trapezius muscles (left and right shoulders). Heart rates were measured using a Blood Volume Pulse (BVP) sensor placed on the participants’ torso. From the BVP signal, sampled at 2048 Hz, the software calculated heart rates.

Increased skin conductance and increased EMG levels are normally associated with increased physiological activation (arousal) levels (Cacioppo, Tassinary, & Fridlund, 1990; Dawson, Schell, & Filion, 2000). The heart rate response is more complex in that it can increase or decrease depending on particular situations and task demands (Papillo and Shapiro, 1990). Unlike skin conductance responses which are directly associated with sympathetic nervous system activity, heart rate responses can reflect activities of both sympathetic and parasympathetic branches of the autonomic nervous system. It is generally accepted that heart rate increases with sympathetic activations, whereas heart rate decreases with parasympathetic activations.

**Procedures For An Experimental Session**

Upon arrival at the STAR laboratory, the participant was instructed to relax while sitting in a chair and completing a series of self-report questionnaires. Then, the participant was seated in the simulator and given instructions describing the general experimental procedures and bio-monitoring instruments.

The bio-monitoring sensors were placed on the participant’s skin surface and connected to the computerized bio-monitoring system. Recording of psychophysiological measures began with the 300-s resting baseline period. The participant was asked to keep his or her eyes open, minimize overall body movements, and try to relax during the baseline period. The baseline measurements were used for standardizing measurements during simulated driving across participants to compare changes in responses. After the baseline, the student drove the 3-driving scenarios with a 120-s break between each of the drives. Thus, the sequence for each session was: Drive1–Break–Drive2–Break–Drive3. Psychophysiological measures were continuously and simultaneously recorded during the entire session.
Data Analyses

The mean responses during baseline, Drive 1, Drive 2 and Drive 3 for each participant were taken for data analyses. To compare baseline responses with responses during each of the 3-driving scenarios, Dunnett’s Test by SAS PROC MIXED (SAS Institute Inc., 1995) was used. To test for differences among the 3-driving scenarios, mean changes from baseline responses were computed. One-way ANOVA with repeated measures and LSD multiple comparisons by SAS PROC MIXED were used. Alpha level was set at 0.05.

RESULTS AND DISCUSSION

Psychophysiological Changes from Baseline

Compared with the resting baseline responses, skin conductance and EMG levels increased during the entire simulated driving session for all the participants. This indicated that the simulated driving session elicited physiological activations associated with increased driver’s mental workload. The results from Dunnett’s tests indicated that mean EMG responses during Drive 1, Drive 2, and Drive 3 were significantly different from mean baseline EMG (p=0.01, p=0.048, p=0.03, respectively). Although the trends for increased skin conductance levels during the simulated driving were consistent across the participants, mean differences between baseline and each of the 3-driving responses were not statistically significant.

The trends of heart rate changes from baseline were not consistent across the participants. Compared with baseline levels, heart rates of the 4 participants decreased during at least one of the 3-driving scenarios, whereas heart rates of the 2 participants increased during the entire driving session. The results from Dunnett’s tests indicated that mean heart rate responses during any of the three driving scenarios were not significantly different from mean baseline heart rates.

Comparisons among the 3-driving Scenarios

Means of skin conductance and EMG levels indicated that the greatest physiological activations occurred during Drive 1, which was the easiest of the three simulated driving scenarios (Fig. 2a and Fig 2b). However, it was anticipated that though Drive 1 was the easiest of the three scenarios, it would require the greatest mental workload given that it was the first time participants were ever exposed to the task of simulated driving. In contrast to skin conductance and EMG responses, mean heart rate during Drive 1 was the lowest among the 3 driving scenarios (Fig 2c).

Comparisons between Drives 2 and 3 indicated that skin conductance, EMG and heart rate levels tended to be greater during Drive 3. These results were as anticipated given that Drive 3 involved more complex driving tasks inducing greater mental workload. However, mean response differences among the 3-driving scenarios were not statistically significant.

Overall results from this pilot study showed consistent response patterns in skin conductance and EMG measures across the participants. Skin conductance and EMG levels
reflected increased physiological activations as driver’s mental workload increased. This suggests that skin conductance and EMG measures may be useful for assessing driver’s mental workload. In regard of the bio-monitoring apparatus, skin conductance recorded from the arch of the driver’s left foot seemed to be one of the most robust measurement in the driving situation, while EMG measures of the driver’s trapezius muscles may require further investigations to clearly differentiate possible confounding effects between mental states and physical activities.

The mixed response patterns in heart rate responses across the participants raised questions and suggestions for future studies involving driver’s mental workload. First, the inconsistent trends of heart rate changes from the baseline suggested that the simulated driving tasks given in this study might have induced *co-activations* of sympathetic and parasympathetic activities that could result in increase, decrease, or no changes in heart rate responses across the participants (Berntson, Cacioppo, & Quigley, 1991). However, the heart rate monitoring methods used in this study were unable to detect the role of sympathetic and parasympathetic influences. Distinguishing more clearly between parasympathetic and sympathetic influences will require more complex physiological monitoring methods (Papillo & Shapiro, 1990). Future research in driver’s psychophysiological responses to specific tasks should attempt to disentangle the influences of theses different systems.

Second, the tendency for lower heart rate during Drive 1 (even lower than baseline heart rate) raised the possibility that attention directional components (external/internal attention) might have dominantly influenced heart rate responses to the first time drive in the simulator. Tasks requiring internal attention, such as mental problem solving, produce heart acceleration. In contrast, tasks requiring attention to external stimuli usually reduce heart rate (Lacey & Lacey, 1970). In our study, therefore, it was postulated that reduced heart rates during the first time drive in the simulator might have been the result of increased external attentional demands for observing the simulated driving environments. Future research involving central nervous system measures such as EEG alpha (Ray & Cole, 1985) coupled with heart rate responses, would provide better understanding of attentional demands in simulated driving tasks.

This pilot study was not designed to compare responses to specific driving tasks (e.g., turns, curves), but focused on the feasibility of psychophysiological measures of driver’s mental workload during the adaptation module training of the simulator. Further studies on psychophysiological responses to specific task demands would advance interpretational methodology in psychophysiological research on driver’s mental workload. In view of the concerns in this pilot study with a small number of participants and a great variation in individual response patterns, it should be noted that this study did not attempt to make conclusive inferences from the results. Rather, suggestions and limitations raised from the pilot study would provide a base for further studies in psychophysiological measures of driver’s mental workload.

Strong Stereotype Threat Arousal and Reminder Cues Have Little Impact in Own-Group Settings; Surprisingly Even Minimal Out-Group Presence Damages Stereotyped Performance.

Lloyd Sloan¹, Grady Wilburn¹, Debbie Camp¹, Kellina Craig-Henderson¹ and Daniel Martin²

Qualifying the original Steele and Aronson (1995) proposal, diagnostic testing with challenging stereotype-related materials in exclusively in-group settings doesn’t produce performance decrements (Sloan, 2000), but Stereotype Threat performance decrements do occur in out-group context testing, suggesting that stereotype threat decrements additionally may require out-group presence, perhaps acting as reminders of the stereotype or cues for expected inequitable evaluation. Described “fair” tests eliminate performance decrements, therefore could anticipation of immediate, explicitly biased comparison-evaluation by out-group members produce stereotype threat decrements in in-group contexts where it is usually absent? African-American university students (n=235) received challenging verbal (SAT) tests described as individually Diagnostic or Nondiagnostic by White or Black experimenters or by Black experimenters with a White Participant present. In two other conditions, the Black experimenter told the African American students that; (1) the ethnically biased test was being collected for White professors or (2) a White professor would arrive before the session ended and score their tests before they left. White experimenter’s produced stereotype threat performance decrements while African American experimenters’ didn’t, except when White participants were present, suggesting that some out-group presence is required. None of the Black experimenter’s descriptions of; “collecting the data for a White professor” or that the professor would score their data in their presence had any decremental effect on performance (F<1 in both conditions). These findings suggest that expected evaluation bias may not be critical in Stereotype Threat Effects or more likely, may require the multiplying impact of potentially stereotyping out-group member presence for their occurrence.

There have been widespread reports of minority-majority disparities in academic performance, especially in difficult standardized testing such as the Scholastic Aptitude Test (SAT) and general aptitude measurements. The emphasis in this article is on situational influences, cognitive and motivational, that may make the test taker more aware of or concerned about a negative stereotype of their group’s ability on such tasks. Such situations often invoke a broadly applicable phenomenon, Stereotype Threat (Steele and Aronson, 1995), which is hypothesized to offer a psychological explanation for at least a part of the often observed discrepancy between majority and stereotyped minority performance on standardized, difficult, intellectual tests. Stereotype threat is an explanation hypothesized to be based in the impact of situational variables on performance related to an existing negative stereotype.

Steele and Aronson (1995) hypothesized that Stereotype Threat is aroused by taking a difficult, frustrating test in an area (e.g., intellectual) that is a component of a relevant, negative stereotype. It has been described as placing one in the possible position of confirming by one’s own behavior and performance, a negative stereotype about one’s
The fact that the test is very difficult may create additional concerns regarding fulfillment of the stereotype or perhaps of its credibility. Stereotype Threat arousal is thought to create multiple other threats for the individual’s self-evaluation and may reduce performance through several hypothesized mechanisms including increased self-consciousness, evaluation apprehension, performance anxiety or overcautiousness, distraction, or lowered performance expectations resulting in reduced task effort. Each or a combination of these hypothesized mechanisms might reduce performance under stereotype threat conditions.

Steele and Aronson (1995) observed the hypothesized performance reductions on difficult verbal ability tests administered to African American students when the test was described as being “diagnostic” of their personal ability. This performance decrement didn't occur, relative to a test taking control group, when the task was described as a "nondiagnostic" task as part of a verbal problem solving study. White students did not show this relative drop in the diagnostic condition which is consistent with the hypothesis because the stereotype related to this task did not apply to them.

In their initial series of studies, Steele and Aronson (1995) demonstrated activation of, and avoidance of, negative ethnic minority stereotypes when African American students anticipated immediately taking such a difficult verbal ability test. This happened only when the test also was described as being diagnostic of their ability. White students did not show this effect, nor did they respond in a manner suggesting avoidance of stereotype typical preferences and traits belonging to the minority group. Those findings provided strong support for the hypothesized Stereotype Threat Theory.

The broad generality of the Stereotype Threat phenomenon has been observed in many other stereotyped group situations. These include in part, Hispanic students in similar verbal testing events (Salinas, 1998), women in difficult mathematics tasks (Spencer, S.J., Steele, C.M., & Quinn, D.M.,1999; Inzlicht, M. & Ben-Zeev, T., 2000; Oswald, D. L. & Harvey, R. D., 2000), low versus high SES French students in SAT-type testing (Croizet, J.C. & Claire, T.,1998), White men in math-computer testing in the context of more successful Asia competitors (Aronson, J., Lustina, M.J., Good, C., Keough, K., Steele, C.M., & Brown, J., 1999), and White men in stereotypically less successful (than African Americans) athletic tests (Stone, J., Lynch, C.I., Sjomeling, M. & Darley, J.M., 1999).

The Stereotype Threat phenomenon is impressive in its generality of impact. What specific events or characteristics or mechanisms acting in the performance situations cause or modify the source or degree of activation of the stereotype awareness and performance reductions? Identifying the mechanisms that contribute to the Stereotype Threat phenomena continues as
a focal issue. One emphasis for researchers deals with the factors and mechanisms influencing the activation or increased awareness of the stereotype. In addition to the hypothesized notion that stereotype awareness may be increased by facing a stereotype relevant, frustratingly difficult test, other suggested factors that might increase stereotype awareness include simple reminders of race or race differences, bias and perhaps the implied comparisons that thoughts of stereotypes may suggest.

Effects of Majority Member Presence on Stereotype Awareness and Performance Decrements: Steele and Aronson (1995) conducted their research in a majority institution (Stanford University). Thus the challenging, stereotype relevant test may not be the only cue present that may contribute to the activation of the stereotype in the test-taker’s mind. It may be the case that the arousal of stereotype threat is intensified by the proximity of out-group potential stereotype holders (majority members), in addition to the taking of a self-diagnostic, difficult, test relevant to a negative stereotype. That situation is nearly always the case with research conducted within a majority institution. Minority institutions however are frequently homogeneous or nearly so. Would stereotype threat be substantial in a minority institution environment? Is it possible that some immediate racial context (e.g., the presence of majority group members) is particularly important to stereotype threat arousal?

Sloan, Gurira, Starr, Sloan and Jackson (1999) sought to address these hypotheses by examining stereotype avoidance, stereotype activation and other proposed indicators of stereotype threat in an overwhelmingly African American University. In their research Sloan, et. al. (1999) replicated the methods of Steele and Aronson’s original 1995 work but did so with the key addition to Steele and Aronson’s (1995) of the variation of the race of the experimenter. Half of the African American subjects in each condition in this homogeneously African American (in-group) environment were tested by a male African American experimenter and half were tested by a male White experimenter. The results of Sloan, et. al.’s (1999) research suggested a beneficial refinement to Stereotype Threat theorizing in that the racial environment of the research proved important in influencing the outcome.

Despite the successful manipulation of diagnosticity, the overall results were in contrast to the Steele and Aronson (1995) findings and to theoretical predictions from the stereotype threat hypothesis; interaction of experimenter race and the diagnosticity manipulation clearly emerged. Increased stereotype avoidance did occur in the Diagnostic Condition with the White Experimenter, but did not occur for the African American experimenter. This appears to indicate as suggested above, that arousing Stereotype Threat may require some additional salient stereotype related cue to accompany or intensify the expectation of a stereotype-relevant challenging test.

Subsequent studies found performance reduction results consistent with the preceding finding on Stereotype Threat arousal and awareness (Sloan, Jones, Philip, Maitland, and Starr (2000a). Black Participants show the Diagnostic condition performance decrement, relative to the Non-Diagnostic, when tested by the White Experimenter, but not when tested by the Black Experimenter in this nearly homogeneous Black environment. Inzlicht and Ben-Zeev (2000) found similar results for women taking math tests with versus without men test-takers.
present. Thus the outgroup member may be simply an additional reminder of the stereotype or may cue possible stereotype-related ethnic bias/fairness concern with performance consequences. The latter question is a part of the focus of this research.

Does Stereotype Threat require out-group member presence? These results imply that a largely African American environment may not have all the cues to stereotype salience that may be found in a majority institution and that such cues may be needed to induce stereotype threat consequences. The social context appears to contribute perhaps as an intensifier of the performance disruption or perhaps as an element in the stereotype threat activation process. Only the white experimenter conditions produced the predicted effects of diagnostisity on stereotype threat arousal. Thus stereotype treat arousal may require independent, pronounced stereotyping potential (racial) cues in addition to the diagnostisity of stereotype relevant task performance.

Research in Cultural Mistrust (Terrell & Terrell, 1981) has produced suggestively similar results. African Americans who were high in Cultural Mistrust did substantially worse on intellectual IQ measures including the Sanford-Binet and the WAIS when the assessment was administered by a White tester, as opposed to an African American (Terrell, Terrell & Taylor, 1981; Terrell & Terrell, 1983; Nickerson, Helms, & Terrell, 1994).

Reduced perceptions of trustworthiness and credibility seem likely to result from expectations of possible prejudices and negative stereotyping of the minority member by the White test-giver. This possibility finds support in Whaley’s (2001a; 2002) meta-analyses across cultural mistrust studies which show similar effects of an individual’s high level of cultural mistrust in mental health and in other areas of psychosocial research. High negative expectations are associated with the African Americans who have high levels of cultural mistrust; that is, individuals who simply are more likely to expect prejudice or adverse stereotyping from their out-group (White) test-giver.

This study focuses on intellectual performance decrements that well may be related to cultural mistrust. To the degree that African Americans feel cultural mistrust, they likely also feel concerns with being stereotyped and perhaps especially so out of the discomforting possibility that they may confirm that negative stereotype if they perform poorly. This additional intellectual test performance anxiety, as an extra burden during testing, could itself diminish performance and is the process thought to underlie Stereotype Threat. This clearly related and very powerful phenomenon suggests explanations for many of the negative perception and performance outcome findings noted in the literature on ethnic matching and cultural mistrust in the client-therapist relationship.

Exploring the Mediators of Stereotype Threat:

One approach pursued has attempted to remove one or another potential negative element from the stereotype threat producing situation. Sloan, Philip, Jones, Starr, Ridberg and Oleson (2000b; and Sloan, Maitland, Starr, Philip & Jones (2001) focused on the minority students’ perception of the fairness/ unfairness of the intellectual test being used in a
stereotype threat setting (i.e., Black test-takers with a White experimenter). The presence of the White Experimenter may simply heighten the participants’ awareness of the related stereotype, or it may more specifically suggest the possibility of biased testing or evaluation. Sloan, et. al. (2000b), informed participants that the items on their tests had been selected because they had been pre-tested and found to be “culture-fair, that is, that Blacks, Whites and Hispanic students did equally well on the items”. Under these circumstances, the White Experimenter condition no longer produced performance decrements, suggesting that the concerns underlying stereotype threat had diminished, perhaps by reducing the concern that one could confirm a negative in-group stereotype through one’s own performance. Others also have found that fairness assurances somehow disrupt the normally damaging stereotype threat situation and reduce or eliminate performance decrements usually observed in diagnostic testing of women in challenging mathematics examinations (Oswald and Harvey, 2000).

Another approach to examining Stereotype Threat has been suggested by the finding that a Black Experimenter produced no performance decrement in diagnostic conditions while a White Experimenter did cause such a decrement. This approach calls for the addition of theoretically related negative elements into the situation that does not typically produce the stereotype threat performance decrement (that is, African American test-takers with an African American experimenter within an African American environment).

Another example of this approach pursued the role of anticipated comparison to others. Comparison to other’s performance then may be a central concern within Stereotype Threat mechanisms. If one is concerned about fulfilling a negative stereotype, that appears to presuppose that there will be performance comparison to others, especially to the stereotype outgroup. Sloan, Glenn, & Craig (2002) addressed the issue of comparison by having a Black experimenter inform African American students (in both Diagnostic and Non-Diagnostic Conditions) that their scores were to be compared with those of white students at another university. While other prior findings were replicated, the Comparison manipulation had no impact on performance as hypothesized based on Stereotype Threat conceptualizations. It appears then that other mediators of Stereotype Threat phenomena, perceived fairness or bias in testing for example, may be more likely to be important.

This research employed the latter approach in attempting to identify key facets of the Stereotype Threat phenomenon by employing the Black Experimenter administering standard diagnostic-versus-non-diagnostic conditions to Black participants but including an element conceptualized to be involved in producing the stereotype threat phenomena. This research examined the impact of the Black experimenter informing the African American participants that their upcoming test was known to be ethnically biased and was being collected for a White researcher (mentioned but not present).

Research Questions Proposed:

Would expecting White, stereotype relevant, out-group members to receive and interpret the results of one’s known ethnically unfair test serve to increase Stereotype Threat performance
concern and decrements (perhaps through ethnic bias concern) even in exclusively in-group contexts where it is usually absent? An ethnically biased test may be of little concern when the results are to be employed by other in-group member-researchers.

Would this concern be increased by the expectation that the White researcher would score one’s test in one’s presence, providing immediate evaluation of performance?

In contrast, to examine mere presence of an out-group member without evaluative capacity, the Black experimenter condition included a white student in the group of test takers (as perhaps an additional reminder of the stereotype?).

**METHODOLOGY**

268 African-American women and men students at a historically African-American university participated as part of an introductory psychology course and received course credit. Students from this nearly homogeneously African-American institution participated in the research in moderate sized experimental groups, ranging from 5 to 22 persons, composed of other Black students from the same university.

Randomly assigned participants took a timed, 15-minute test described as a difficult-to-complete, 28-item, SAT-type verbal abilities test composed of one “analytic” read-and-interpret passage with seven questions, followed by 21 verbal analogies problems (this was similar to Steele and Aronson’s, 1995 test). Scores on this difficult test could range from 0 to 28. A White male experimenter or a Black male experimenter described this SAT-type verbal test as “diagnostic” of their personal abilities, that is, “to provide a genuine test of your verbal abilities and limitations”, or as a “non-diagnostic”, non-evaluative study of the verbal problem solving process. In both conditions, participants were strongly encouraged to try as hard as they could to perform well on the problems.

To examine the impact of perceived test unfairness in two other conditions, the Black experimenter also told the African American students that; (1) the test was ethnically biased and that the data was being collected for use by a White professor or (2) that the White professor would arrive before the end of the session and score their tests before they left, to investigate whether expected out-group involvement would enhance any impacts of perceived test bias on performance. In the final condition, the Black Experimenter presented only the standard instructions to groups that also included a White woman participant in order to examine the impact of the mere presence of an out-group member for the possible stereotype reminder or anticipated unfair comparison that the situation might imply. Following the performance test, participants completed a series of items including measures of distraction, performance concern, academic engagement, stereotype avoidance, self-handicapping, manipulation checks and ethnic group identity. The entire procedure required about 40 minutes, after which participants received explanations, credit and thanks.
RESULTS

Diagnostisity was successfully manipulated in subjects’ perceptions ($X^2=8.8$ (1), $p<.001$). As expected, African American participants tested in exclusively minority contexts (Black experimenter) showed no performance decrement in the standard “diagnostic” compared to “non-diagnostic” testing ($F<1$), but participants did show significant performance decrements when tested by a White experimenter ($F(1,75)=6.28, p<.02$; see Figure 1).

Figure 1: Percent Correct on SAT Verbal Task (African American Subjects)

The Black experimenter’s description of the test as ethnically biased and that White researchers would be the recipients of the biased test data caused no performance decrement effect ($F<1$; see Figure 2). Similarly, indicating that the White professor would score their data in their presence had no decremental effect on performance ($F<1$; see Figure 3).
In contrast, when a White woman participant was included as another test-taker with minority students and the Black Experimenter (employing only standard instructions), minority students’ performance was lower in the Diagnostic Condition (F(1, 45)=4.19, p<.05).
CONCLUSIONS

Perceiving tests to be ethnically fair eliminates performance decrements in out-group contexts, but immediate or future potentially unfair comparisons by out-group researchers did not lead conversely to performance decrements within in-group settings. In strong contrast, the mere presence of a non-evaluative White participant in the test taking group does lead to stereotyped minority members’ performance decrements. These findings suggest that while perceived or expected bias in evaluation may be a significant part of the concerns that drive the Stereotype Threat Effect but that these factors may require the multiplying impact of the presence of potentially stereotyping out-group members to create Stereotype Threat’s negative consequences on the performance of those stereotyped.

One testing condition attempted to add the evaluative involvement of a stereotype relevant out-group member (the White professor who is to receive the test results) to the participant’s knowledge that the test is biased and ethnically unfair. This was done to approximate (without a White person actually being present) one set of notions of the critically different features of the experimental conditions represented by the White, as opposed to, the Black experimenters. These multiple factors still produced no indication of the diagnosticity effect so prevalent in majority contexts for African Americans. It may be that substantial levels of cultural mistrust (Terrell & Terrell, 1981; 1983; Whaley, 2001a), perhaps necessarily emphasized by out-group presence or majority social setting context, may be needed for test bias or stereotype awareness concerns in general, to become a substantial concern for those stereotyped.
These results, like earlier findings, may suggest that a uniformly minority environment may not have all the cues to stereotype salience that may be found in a majority institution or environment, and that such cues may be needed to induce stereotype threat consequences. Only with the White test-giver or the White experimental participant did the diagnostic-nondiagnostic manipulation have the predicted performance decrement effects for African Americans. Stereotype Threat concerns and performance consequences appear to be increased by the presence of out-group members (here, White experimenters), acting as cues perhaps of stereotyping, or of unfair evaluation.

These findings imply that it may be some other factor than simple comparison concerns accompanying the presence of an out-group member in the testing setting that leads to the Stereotype Threat phenomenon and its consequences. In particular, the live presence of an out-group member may provide the performer with a stronger reminder of the stereotype and thereby increase the Stereotype Threat impact. Alternately, Stereotype Threat consequences might be invoked by other aspects of test-takers’ testing bias or comparison concerns than those created in the settings or manipulations employed in this and prior research.

It seems likely that some aspect of inter-culturally based mistrust is centrally involved. Recall that the simple presence of the White test-giver produced performance decrements but that when the White test-giver proclaimed the assessment itself to be unbiased and culture-fair, that the performance decrements disappeared (Sloan, et. al., 2000b). Thus, even if the test-giver may be suspected of prejudice or stereotyping, the assessment’s own culture-fairness would serve to negate the adverse impact of the tester’s personal motives.

**Out-group Men or Women Induce Equivalent Stereotype Threat Performance Decrements In Spite of the Genders’ Qualitatively Contradictory Stereotype-Relevant Characteristics.**

Lloyd Sloan¹, Grady Wilburn¹, Debbie Camp¹, Stefanie Gilbert¹ and Daniel Martin²

African American students are often reported to perform lower than white students on standardized intellectual tests. Stereotype Threat Theory suggests that part of this phenomenon could be a result of arousal, by specific situational factors, of one’s awareness of a known, negative stereotype of one’s group’s performance. This Stereotype Threat performance decrement generally does not happen within exclusively in-group settings, but does occur if there is a White experimenter present, suggesting that increased expectations of biased evaluation or judgment may play a part in the performance decrements. Other recent work has found that African Americans have substantially different and less favorable evaluations of, and expectations of, White American men than they do of White American women. This research seeks to determine therefore whether men and women experimenters, especially White men and women, produce different levels of Stereotype Threat influenced performance decrements. Two hundred and fourteen students from an historically African American University took brief SAT achievement-type tests after hearing the tests described as either measures of their personal ability (diagnostic) or simply as part of a study on verbal problem solving (non-diagnostic). Experimenters were men or women and Black or White. Replicating prior research, Stereotype Threat performance decrements in the Diagnostic Condition occurred for Black students in this almost homogeneous Black environment when they were tested by a White experimenter but not when they were tested by a Black experimenter. White males’ versus females’ impacts did not differ despite having notably different evaluations and personal traits seemingly related to their probability of stereotyping African Americans, suggesting that simple out-group presence has central impact on Stereotype Threat and seems little influenced by gender of the potential stereotyper present.

This study investigated stereotype threat and its effect on the academic performance of African American college students. Stereotype threat focuses on a social-psychological predicament (performance drops) that can arise from being diagnostically tested in a performance area containing negative stereotypes about one’s group’s performance (Steele & Aronson, 1995). Steele and Aronson (1995), demonstrated their hypothesized performance degradation on a difficult verbal ability test administered to negatively stereotyped minority students (African Americans) when the test was described as being “diagnostic” of their personal ability. This performance drop didn't occur, relative to a control group taking the same test, when that task was described as a "nondiagnostic" task in the service of a verbal problem solving study.

In addition, those researchers (Steele and Aronson, 1995) also presented powerful evidence of the hypothesized mediators of stereotype threat phenomena. They demonstrated activation of, and attempted avoidance of, a negative ethnic minority stereotype when African American students anticipated immediately taking such a difficult verbal ability test, but only when the test also was described as “diagnostic” of their ability. Majority group (White) students did not show evidence of heightened awareness or activation of the related stereotype, nor did they respond in a manner suggesting avoidance of stereotype typical preferences and traits belonging to the minority group. Taken together these findings provide a great deal of support for the hypothesized Stereotype Threat Theory.

The specific performance mediating mechanisms of Stereotype Threat are not the focus of this study but are of concern. It is generally hypothesized that when stereotype threat is aroused it can create additional self-evaluation threats for the individual, possibly because of the need to maintain or enhance one’s status (Josephs, Newman, Brown & Beer, 2003) and may degrade performance through several hypothesized mechanisms. Among others, these mechanisms may include increased self-consciousness, evaluation apprehension, performance anxiety or overcautiousness, lowered performance expectations resulting in reduced task effort, or distraction that draws away attention that is needed for task success. Recent findings indicate that stereotype threat reduces the affected individual’s working memory capacity which in turn interferes with test performance (Schmader & Johns, 2003). Any of these hypothesized mechanisms alone or in multiples, may predict similar performance deficits under stereotype threat invoking conditions.

Stereotype Threat is hypothesized to be activated by taking a frustrating, challenging, self-diagnostic test that is related to negative stereotypes of one’s in-group (Steele and Aronson, 1995). It has been described as placing one in the possible position of confirming by one’s own behavior and performance, a negative stereotype about one’s group. The fact that the test is very difficult may create additional concerns regarding fulfillment of the stereotype or perhaps of the stereotypes’ credibility. Consequently as expected, majority group (White) students did not show this relative performance decrement in the diagnostic condition and of course, the negative stereotype related to this task did not apply to them.

As a possibly very widespread phenomenon, Stereotype Threat now has been demonstrated in many other stereotyped group situations since Steele and Aronson’s (1995) original studies. These include for example; Hispanic students in similar verbal testing events (Salinas, 1998), women in difficult mathematics tasks (Spencer, S.J., Steele, C.M., & Quinn, D.M., 1999; Inzlicht, M. & Ben-Zeev, T., 2000 and 2003; Smith...
Out-group Men or Women Induce Equivalent Stereotype Threat

(2005) Vol. 5

Recent Stereotype Threat findings in atypical cultural settings has indicated that while diagnostic testing increases minorities’ stereotype awareness and performance decrements in out-group (majority) contexts, it doesn’t do so in exclusively minority settings (cf., Sloan, 2000, Sloan, et. al., 2002). These findings suggest that out-group member or context presence may be needed to produce Stereotype Threat performance decrements and may qualify or limit the original Steele and Aronson (1995) proposal as a necessary addition to, or major impact as, required antecedent conditions for the occurrence of Stereotype Threat.

What may cause the out-group presence effect? An overwhelmingly African American environment may not have all the cues to stereotype salience that may be found in a majority institution and those missing cues may be needed to induce stereotype threat motives and their consequences. It appears that it is not just diagnosticity (expectations of being evaluated) in a stereotype-relevant, difficult task that produces stereotype threat performance decrements. The presence of the white experimenter was the only condition to produce the predicted diagnosticity effects on stereotype threat arousal. Thus stereotype threat arousal appears to require independent, salient out-group (here, racial) cues in addition to the simple threat of failure in a stereotype relevant task performance. These findings suggest the possibility of relatively simple situational or descriptive changes in the testing setting that may help to reduce or eliminate the stereotype threat induced decrease in performance in perceived stereotype relevant challenging intellectual tests. It may be possible that this can be accomplished by removing reminders or by altering perceptions of stereotypes in the testing context. Perhaps relatedly, research in Cultural Mistrust (Terrell & Terrell, 1981) has produced very similar results. African Americans who were high in Cultural Mistrust did substantially worse on intellectual IQ measures including the Sanford-Binet and the WAIS when the assessment was administered by a White tester, as opposed to an African American (Terrell, Terrell & Taylor, 1981; Terrell & Terrell, 1983).

African American’s cultural mistrust levels are directly related to lower perceptions and expectations of outgroup (e.g., White) trustworthiness and interpersonal credibility. (Nickerson, Helms, & Terrell, 1994; Terrell & Terrell, 1984; Watkins & Terrell, 1988; Watkins, Terrell, Miller & Terrell, 1989; Poston, Craine & Atkinson, 1991). These lower perceptions of trustworthiness and credibility seem likely to result from expectations of possible prejudices and negative stereotyping of the minority member by the White test-giver. If perceived (un)fairness is an important feature of the Stereotype Threat phenomenon, then its removal could be beneficial. Sloan, Philip, Jones, Starr, Ridberg and Oleson (2000b) focused on the minority students’ perception of the fairness of the intellectual test being taken in a stereotype threat potential setting (i.e., Black test-takers...
Considerable prior research has shown that men and women do not always display stereotype threat type performance decrements in the same settings, possibly depending upon the nature of the applicability of the setting-related stereotype to each gender (cf., Sloan, L. R., Glenn, M., Lockett, C., Danridge, Y. and Starr, B. J., 2001; Brown and Josephs, 1999). Further, Sloan et. al. (2001) found results suggesting that African-American men and women responded differently to Black versus White experimenters.

The present study builds on that work by asking whether male and female experimenters, of in-group versus out-group ethnicity, will have different impacts upon African-American test takers’ experience of Stereotype Threat. If White test-givers produce Stereotype Threat performance decrements, possibly due to expected bias or unfairness in evaluation, do White men and women share the same degree of perceived bias in African American test-takers’ views? For example, prior research has shown that increasing participants’ perceptions of a diagnostic test’s fairness eliminated the stereotype threat performance drops normally seen in out-group contexts (Sloan, L. R., Wilburn, G., Martin, D. E., Fenton, T., Starr, B. J., Craig, K. M., Gilbert, S. and Glenn, M., 2003; Sloan, Maitland, Starr, Philip & Jones, 2001).

In addition, recent work has shown that the stereotypes held by African-Americans about White men and women are substantially different (Glover, Blair and Sloan, 2002; Sloan and Glover, 2005); see Table 1 below. Further, Sloan and Glover (2005) and Glover and Sloan (2005; this volume) found that on simple evaluative ratings, African Americans perceive White American Women relatively neutrally but that African Americans judge White American Men significantly more negatively than they do White American Women.

### Table 1: High Frequency, Non-shared, Traits Endorsed by African Americans in Rating White Americans

Research Question and Hypothesis: Increased perceived fairness by White experimenters has reduced or eliminated Stereotype Threat performance decrements (Sloan, et. al. (2000b). If White women are seen as more fair or less biased than White men, then Stereotype Threat performance decrements could be diminished for White women test-givers compared to White men.

METHODOLOGY

214 African-American women and men students at a historically African-American university participated in this research as part of an introductory psychology course and received course credit. Randomly assigned participants took a timed, 15-minute test described as a difficult-to-complete, 28-item, SAT-type verbal abilities test composed of one “analytic” read-and-interpret passage with seven questions, followed by 21 verbal analogies problems (this was similar to Steele and Aronson's (1995) tests). Scores on this difficult test could range from 0 to 28. This SAT-type verbal test was described as “diagnostic” of their personal abilities, that is, “to provide a genuine test of your verbal abilities and limitations”, or as a “non-diagnostic”, non-evaluative study of the verbal problem solving process. In both conditions, participants were encouraged to try as hard as they could to perform well on the problems. Students from this nearly homogeneously African-American institution participated in the research in moderate sized experimental groups, ranging from 5 to 22 persons, composed of other Black students from the same university.

The participants were randomly assigned to one of the following conditions in a 2 (experimenter race) by 2 (experimenter sex) by 2 (Diagnostic versus Nondiagnostic Condition) design. Thus there were four experimenters; (1) a White male experimenter, (2) a White female experimenter (3) a Black male experimenter or (4) a Black female experimenter. Participants then completed a series of items measuring distraction, performance concern, academic engagement, stereotype avoidance, self-handicapping, manipulation checks, ethnic group identity and experienced feelings when associating with White people. The entire procedure required about 40 minutes, after which participants received explanations, credit and thanks.

RESULTS

Diacnosticity was successfully manipulated in subjects’ perceptions (X2=7.2 (1), p<.008). As expected, African American participants tested in exclusively minority contexts showed no performance decrement in the standard “diagnostic” compared to
“non-diagnostic” testing (F<1; see Figure 1). Results indicated that typical significant Stereotype Threat performance decrements occurred in the Diagnostic condition versus the Nondiagnostic condition for White Experimenters but not for Black Experimenters (Race by Diagnosticity interaction: F(1/206)=5.43, p<.02; Figure 1), replicating typical findings for male experimenters (Sloan, et.al., 2000).

**Figure 1: Percent Correct on SAT Verbal Task (African American Subjects)**

Importantly and contrary to some notions of stereotype impact, results from female experimenters did not differ from males (the Experimenter Sex by Experimenter Race by Diagnostic Condition interaction was not significant (F<1).
Examining the White experimenter conditions alone revealed that male and female White test-givers did not differ significantly in their impact on African-American test-takers. Participants showed significant performance decrements when tested by a White experimenter in the Diagnostic versus the Nondiagnostic condition ($F(1,130)=5.40, p<.05$; see Figure 2). The Experimenter Sex by Diagnosticity Condition interaction for White experimenters was not significant ($F<1$) nor was that interaction significant for Black experimenters examined alone ($F<1$).

**CONCLUSIONS**

Prior findings replicated here suggest that Stereotype Threat concerns and performance decrements, minimal in exclusively minority environments, are increased by the presence of out-group members. Suggestions that the different stereotypes held about White men versus White women (test-givers in this research) would lead to differential impact of Stereotype Threat type decrements in test-takers’ performances were not supported. These findings suggest that while perceived or expected bias may be a significant part of concerns that drive the Stereotype Threat Effect, that the perceived differences between White men and woman may not be great enough on this dimension to show a differential impact on performance or that both gender’s stereotypes surpass the level of perceived potential bias needed to invoke the concerns underlying the Stereotype Threat phenomenon.

Alternatively, the key factor may be simply the presence of a stereotype relevant out-group member. It may be that substantial levels of cultural mistrust (Terrell & Terrell, 1981; 1983; Whaley, 2001), perhaps emphasized by out-group presence or social setting context, may be needed for test bias or stereotype awareness concerns in general to
become a substantial concern for those stereotyped. Taken together, the findings suggest that Stereotype Threat concerns and consequences may be invoked simply by outgroup presence cues. Such cues may act perhaps as reminders of the relevant stereotype itself or of the possibility of stereotyping by others or even more generally to change the context of the performer’s judgment. Thus understanding and predicting Stereotype Threat phenomena may indeed require knowledge of all the performer’s perceived contextual stereotypes. Understanding the factors contributing to the arousal of Stereotype Threat may then allow educators, employers and researchers the tools to reduce or eliminate its negative and misrepresentative impact on minority (stereotyped) students’ performance on intellectual and standardized tests.

Jeffrey Staser and Patricia M. DeMarco, Ph.D.  The Buckland/Kotzebue Power Utility Case Study: Comprehensive, community based, regionally supported, sustainable public infrastructure development in remote Alaska.

Abstract

Issues related to democracy and citizenship at the community level in Native communities and villages have been the subject of increasing interest and debate among scholars and development practitioners in recent years. This study investigates how multi-dimensional community development through effective collaboration among tribal, non-profit, municipal, state and federal governments may facilitate enhanced citizen participation in local-level decision making through examination of a specific public infrastructure development project involving the communities of Buckland and Kotzebue in Northwest Alaska. The study presents a relatively optimistic account of the role which innovations transferred as a result of this project have played in enhancing citizen involvement in local government throughout Alaska.
At the same time, it suggests that any such gains may be limited and must be viewed within the larger politico-administrative context of indigenous (tribal) and constitutional (state/federal) government considerations, and other attendant factors restricting or encouraging the establishment of a broad democratic culture at the community level.

We explore and discuss how Buckland's power utility turned itself around from failing to relative success by using traditional, tribal decision making within the context of somewhat conflicting state and federal relationships. Today, Buckland is more sustainable as a result of partnering with Kotzebue Electric - a local solution recognized and supported by both state and federal agencies. The data from this project illustrate valuable lessons about self determination in an Alaskan Native community enabled by collaboration.
Relation Between Order of Finishing and Grade on Statistics Tests

Abstract

Analysis of test scores from three undergraduate statistics classes revealed a positive relation between speed of completing the test and grade on the test. When grouped into deciles, each successive decile of delay in test completion was associated with a mean loss in percent correct score of .57 for all tests and classes combined. For all tests and classes combined, the decrease in mean percent correct score with decile of delay was quite consistent ($r_S = -.88$). Other findings of interest were that speed of test completion was negatively related to grade variability and that within each class during the quarter, students exhibited a significant degree of consistency in their order of completing tests as indexed by values of Kendall's coefficient of concordance that ranged between .67 and .73. The finding of a monotonic relation between order of test completion and test grade contradicts some previously published findings that these two variables are weakly related (Paul & Rosenkoeller, 1980) or not related (Bridges, 1985).
Relation Between Order of Finishing and Grade on Statistics Tests

Do students who are among the first to hand in an exam do better on the test than others? A number of researchers (e.g., Bridges, 1985; Burack, 1967; Paul & Rosenkoetter, 1980) have proposed that such an outcome is reasonable, possibly because more capable students read, make inferences, and recognize correct answers faster than less capable students (Paul & Rosenkoetter, 1980). Other variables may exert different effects on the relation between speed of completing a test and test score. Burack (1967), for example, suggests that strategies adopted by test takers of disparate abilities may obscure an underlying linear relation between these variables; that is, some high achievers who finish quickly may devote extra time to reviewing their answers and attempting to remember material related to difficult questions, and some low achievers may skip questions and finish early.

As Table 1 shows, published data obtained in classroom settings has provided scant support for a linear relation between measures of test completion speed and test performance. It should be noted that although Table 1 lists one study as providing support for a linear relation, that relation approached, but did not achieve, statistical significance.
Test completion speed has been examined in relation not only to level of test performance, but also to variability of test performance. Johnston (1977) for example, found significantly higher variances among early (first 20%) and late (last 20%) finishers vs. those finishing in the middle. Paul and Rosenkoetter (1980), however, found no variance differences among quartiles of finishers in five large sections of an introductory psychology college-level class.

Attempts to resolve these inconsistent findings have included such approaches as using test completion time rather order (Bridges, 1985), multiple rather than single tests (Johnston, 1977), and recall/essay rather than recognition/multiple-choice tests (Foos, 1989). As evident in Table 1, these manipulations do not appear to have been effective. The approach adopted in the study described here is to use data from multiple tests in multiple sections of a course and to look for a relation in the combined data between
order of finishing (grouped into deciles for each class) and both mean percent correct test score and standard deviation in percent correct test score within each decile.

Three issues are explored: a) whether there’s a monotonic relation between order of test completion and level of performance on the test, b) whether there is an effect of order of test completion on variability of test scores, and c) the degree to which a student’s order of test completion is consistent within each class.

Method

Data Source

Archival data used in this study were generated by undergraduate students enrolled in three recently offered introductory statistics classes (referred to here as classes A-C) taught by the author in the Department of Psychology at Eastern Washington University. Enrolment in classes A, B, and C were 42, 31, and 40, respectively; however, not all students took exams during class time. Furthermore, the number of tests recorded from each class differed because either some data were missing (class A), or some terms (e.g., summer quarter, class B) were briefer than others (8 vs. 10 weeks). The resulting number of tests available for classes A-C was 6, 7, and 9, respectively. The data that were available consisted of a record of each student’s name and their percent correct score on a test. Because tests were corrected and recorded in the order they were handed in, information about order of test completion was available. Tests consisted of questions that required making calculations, often with the aid of a hand calculator, or providing short written answers. Each test presented 6-10 questions that could be completed by capable students within 20-30 minutes during class periods that ranged between 50 mins.
(10-week classes) to 65 mins. (8-week classes). In no test were there more than 2-3 students still working on a test at the end of a scheduled class period.

Data Analysis

To allow comparisons to be made among classes of different sizes, for each test in each class, order of finishing was grouped into deciles. For each decile, the mean percent correct score and standard deviation of the percent correct scores (calculated using the formula for population standard deviation) were obtained.

Results

A mean class percent correct score was calculated for each decile of order of test completion in each of the three classes. Panel a in Figure 1 shows the mean class percent correct data as a function of decile of test completion order. Panel b in Figure 1 shows these same variables for the three classes combined. Each data point in panel b represents the results of approximately 76 individual tests. The $r_s$ value for the data in panel b is -.88, a value indicating that in the combined data, there is a generally consistent decreasing monotonic relation between percent correct test performance and order of test completion.

Figure 2 shows the corresponding data for standard deviation scores. The $r_s$ value for the data in panel b of Figure 2 is .73, indicating that in the combined data, test performance becomes increasing more variable within groups of students who take longer to turn in their tests.
Figure 1. Mean percent correct test score as a function of decile of test completion order plotted separately by class (left panel) and for the three classes combined (right panel).

Figure 2. Mean standard deviation in test score as a function of decile of test completion order plotted separately by class (left panel) and for the three classes combined (right panel).
To examine the degree to which students were consistent in their order of handing in tests over the duration of a quarter, a value of $W$, the Kendall coefficient of concordance (Siegel & Castellan, 1988) was calculated for each of the three statistics classes. Any student whose data indicated they missed more than two exams during the quarter was removed from the analysis (N=5, all from class C) and for the remaining students, those who missed one (N=15) or two (N=10) tests, missing scores were replaced with the mean of the student’s order of finishing non-missing tests. For classes A, B, and C, the values of $W$ were .73 (df = 41), .67 (df = 30), and .68 (df = 34), respectively, all $p$’s < .001.

Because $W$ can take on values from 0 to 1 with 0 indicating no correspondence among rankings and 1 indicating perfect correspondence, the obtained values indicate there was a high degree of correspondence in the order that students hand in tests over multiple testing sessions.

Discussion

There has previously been little empirical support for a relation between speed or order of test completion and test score. Explanations have included proposals that a relation—either linear or curvilinear—does not exist (e.g., Terranova, 1972) or that the relation is obscured by other variables (Burack, 1967). The approach used here has been to reduce the influence of extraneous variables by combining the data from multiple tests in multiple classes.

Although others have gathered data from multiple tests, the tendency has been to assess the relation between indices of test completion speed and test score separately by class (perhaps to assure that the assumption of independence of observations is met). Bridges (1985) for example, analyzed data from three tests administered to each of five
sections of an introductory psychology class. Fifteen $r$ and $r_s$ values were calculated, one for each test; only one $r$ and one $r_s$ was found to be statistically significant. When Bridges combined data by calculating each student’s mean order of finishing three exams and total score on the exams, none of the $r$ or $r_s$ values in each of the five sections was significant. Paul & Rosenkoetter (1980) tested students in five sections of introductory psychology using two test forms in each section. After finishing order was grouped into quartiles, $t$-tests were performed separately on each section’s data to determine if mean score was significantly higher in the first quartile than in other quartiles. Only one difference was found to be statistically significant.

When the data in the present study were analyzed separately by test, values of $r_s$ between decile of test completion order and mean percent correct test score ranged from -.95 to .70 and only six were statistically significant ($p < .05$, 2-tailed). Of these, five were negative, all from class C. Further analysis revealed that there were differences among mean $r_s$ values for classes A, B, and C (-.36, -.07, and -.55, respectively), $F(2,19) = 3.74$, $p < .05$. This outcome, together with visual inspection of panel a of Figure 1 indicates that relation between a measure of test completion speed and test score may conform to somewhat different patterns in different classes. This possibility is made more plausible by the finding in the present study that students exhibit considerable consistency in their order of completing tests. Thus, each class may have a characteristic form for the relation between speed of test completion and test score and the pattern may differ from class to class. A consistent underlying linear form may only become evident when the data from several classes are combined.

6. Abstract:
Education policy is one of most politicized fields of all, and education in Japan is no exception to this rule; Japanese policy today is in an extreme state of flux as the Ministry of Education tries to respond to conflicting demands and perceived trends.

Many of the forces driving education policy in Japan are socioeconomic, prime among them being the “greying” population phenomenon, in which the confluent demographic trends of later marriages, declining birthrate, and greater longevity portend serious fiscal and social problems in the coming decades. With a ten-year economic slump spurring continually greater efforts to streamline organizations across all sectors of society, including the privatization of government functions -- and with the information technology revolution providing the means to do so -- related social forces are the decade-long paucity of entry-level employment opportunities, even for the graduates of elite universities, and concomitant attitudinal shift in the younger generation’s work ethic and sense of purpose. In the short run, the combined effect of the annually declining teenage population and the official privatization of hitherto public universities has been an irresistible impetus for many tertiary institutions to broaden their admissions procedures while also countenancing lower admissions standards.

Reorganizational strategies are also a high priority, as increasingly educators are being called upon to inspire flexible and imaginative thinkers rather than merely mass-produce
a compliant and well-socialized work-force. At the tertiary level, such a transformation may be less difficult for the students themselves than for their hidebound professors and institutions, but faculties all over the country are struggling over these modernization goals in full knowledge that failure may literally entail the collapse of their institutions. Indeed, some of the more vulnerable schools have already closed their doors, and the Ministry expects others to follow over the next few years. As colleges and universities across the nation position themselves to compete in the new educational marketplace, curriculum reform has been a perpetual process. Lifelong education programs have begun to develop and on-line or distance education has rapidly grown in importance. Corporate ties with research institutions are now becoming as common in Japan as they are in the US, and Japanese schools are now actively encouraging student and faculty entrepreneurship.

After decades under rigorous nationally-established curricula, during which time Japan rose to worldwide eminence, in recent years -- under the rubric of “YUTORI KYOU-IKU” (“unpressured education”) -- elementary and secondary school policies have been amended to eliminate Saturday classes, provide for more unstructured time at local discretion, and reduce the amount of foreign language instruction at the junior and senior high school levels. In recognition of a perceived need for more Japanese who can conduct themselves in English, a complementary initiative is the promotion of foreign language instruction at the elementary school level, with a greater emphasis on modern language teaching methods. However, the Ministry has provided minimal implementation guidelines, leaving the ultimate realization of its directive largely to the discretion of perplexed local boards of education across the nation. The relaxation of policies has been under way for only a few years, but from the outset there have been calls for its reversal and the most recently installed Minister of Education is on record as favoring its reconsideration.

Commercial providers of supplementary education services have not wavered, however, and -- whether foreseen or not -- one major byproduct of these public policy shifts has been to create more opportunities for enterprising businesses taking up the slack, with the net result of leaving the children as pressured as ever and the parents paying more than before for private educational services. Some universities have begun contracting the supplemental providers for language instruction and entrance exam writing, and in restructuring Tokyo’s municipal university system, the Governor -- to the great consternation of the faculties -- contracted out even the redesign of the curriculum itself to one of the largest commercial educational firms.

The presenter is most familiar with English language teaching at the tertiary level in Japan, but this presentation will be an attempt to address the changes in English language education in Japan within the context of these broader (and often contradictory) trends. Audience input on the challenges facing ELT in other countries is welcome; participants interested in collaborating with the presenter on a volume overviewing current ELT conditions worldwide are warmly encouraged to join in the discussion.
REFERENCES:

The purpose of this study is to examine how the situations of gay and transgender people have been changed in Japan, focusing on educational policies and settings. The situations include the position of gays as deviant or sexually delinquent, biased educational policies, and the change of these policies, especially to transgender people. Through examining written materials such as governmental guidelines and regulations, the above situations will be discussed on the bases of the four periods: (1) medical guidance and/or medical treatment (1950~1969), (2) educational guidance (1970~1989), (3) educational invisibility (1990~1999), and (4) educational protection for human rights (2000~present).

In the 1950~1969, homosexuality was recognized as ill and immoral. In the 1970~1989, drop-outs of school increased, and sexual minority was defined as delinquency. In the 1990~1999, the media treated gays more positively and gay people themselves started thinking about and acting out for their human rights. However, the educational field ignored the existence of homosexual people. Since 2000, policies regarding transgender tremendously changed, but for homosexuals it remains same.

My presentation illustrates that the views sexual minorities have changed for the better. Yet this does not that that minorities are accepted because traditional gender norms are still maintained.

Lastly, I will conclude with suggestions for the inclusion of sexual minorities within the educational system.

Abstract China is the largest foreign direct investment (FDI) recipient country in the world, which aggravates concerns over the impact of FDI on rising inter-region income inequality in China. This paper examines the relationship between FDI inflows and regional income inequality from 1978 to 2002 by estimating three inequality models of national, rural and urban separately. It is found that FDI inflows as one of the main factors have led to increasing of regional income inequality in national level, rural and urban of China. Apart from FDI, the empirical evidence suggests that the level of economic development, education, trade, the economic reform in the State-Owned-Enterprises (SOE), the agricultural transformation, the level of domestic investment and the direct role of government in China are crucial determinants of regional income inequality.

* Email: Sumei.Tang@gmail.com, S.M.Tang@Griffith.Edu.Au

1. INTRODUCTION

Foreign direct investment (FDI) in China has set a new record high reaching US$52743 million dollars in 2002. This leads to China becoming the largest FDI recipient country in the world replace of the United States of America, which enjoyed such status until China took over. The annual growth rate of utilized FDI in China has also showed a remarkable achievement at 21% over the last quarter of century. Accompanied with this persistent strong growth of FDI inflows, China has achieved a highest average annual economic growth rate approximate to 10% but with an extremely skewed one. This is, the average annual growth rate of GDP in the coastal region of China, where most FDI inflows flowed in, has been traditionally always higher than the inland region. Has FDI influenced China’s regional inequality? If it does, how FDI and regional inequality are related? The relationship between FDI and inequality is under hot debate and has been an important subject of interest in the field of international economics and economic development. On the one hand, some researchers argued that FDI in general should not cause any significant variance in income inequality and even reduces income inequalities in developing countries in particular (Mundell 1957). On the other hand, some other researchers also argued that FDI does attribute to rise in income inequality (Tsai 1995). In this paper under a regression analytical framework, we seek answers to the above two questions by employing time series cross-regional Chinese data for the period 1978 to 2002. While, we identify the principal forces that affect regional income inequality, we also explore alternative policies that may promote more rapid economic growth in China’s poorer regions. Such an analysis on FDI and the regional income inequality in China is important because china is not only the largest FDI recipient country in the world and as a developing country China also needs to feed 13 billion people - one quarter of world’s population. Therefore, an increase in regional income inequality could not only undermine social stability but also disrupt political stability, spur secessionist
activities, which would eventually destroy the very foundations of China’s emergence as a major world economic power and consequently the excellent economic growth that China currently enjoys.

The remainder of this paper is organized as follows. Section 2 reviews a number of theoretical and empirical studies on FDI and income inequality. Section 3 presents an overview of the FDI inflows and regional income inequality in China. The following section applies econometric methodology to investigate the causality between FDI and regional income inequality in China and determines the other forces which influence China’s regional income inequality and how these forces effect the regional income inequality. The last section of the paper presents the implication and conclusion.

2. A REVIEW OF STUDIES ON FDI AND INCOME INEQUALITY

Most FDI theories are fairly straightforward, from multinational enterprises (MNEs) aspect, focusing on determinants of FDI. This is to seek analytical framework addressing the questions of why firms engage in international production. The well-known FDI theories include the classical industrial organization theory, the product cycle theory, the internationalization theory, the dynamic comparative advantage theory and the eclectic theory etc. Most of these theories by no means directly and logically discussed the macroeconomic effects of FDI on both investing and host countries, especially on developing host countries. However, by analyzing these theories, the major impacts of FDI on host countries economic development can be concluded: (1) technology transfer and management know-how; (2) foreign capital investment; (3) increase openness and economic activities; (4) increase export (trade-oriented FDI, only), or destroys the balance of economic development in developing countries and international trade balance (anti-trade-oriented FDI); (5) employment creation, upgrade of the labor force and increase productivities; (6) GDP contribution and increase tax revenues; (7) repatriation of profit and pricing transfer.
In contrast to the above well-known FDI theories, dependency and modernization theories addressed macroeconomic effects of FDI on developing host countries. Dependency theorists viewed that the predatory behavior of MNEs creates a neo-colonial economy through FDI, more FDI in a country means more foreign control in that country and as a consequence the greater the degree of income inequality in that country (Bornschier and Chase-Dunn 1985, Gowan 1999). It is also argued that FDI not only creates employment opportunities for “local labor elites” with higher wages, as well as it leads to production that are more capital-intensive. As a consequence unemployment rate increases in the traditional sectors and income inequality becomes greater (Tsai 1995). However, modernization theorists describe FDI as an ideal mechanism for the diffusion of capital, markets and knowledge that would lead to development for the newly independent countries of the world (King and Varadi 2002). Although modernization hypothesis rarely directly and explicitly addresses the relationship between FDI and income inequality, but the implication was extended - as FDI stimulates economic growth and its benefits eventually spread throughout the whole economy, thus, in the long run more even income distribution would be achieved. It is like dependency theorists that modernization theorists also acknowledged that FDI does creates local employment with higher wages, but once the labor share rises the size of income distribution would be improved.

Obviously, the theories regarding the impact of FDI on income inequality are different in principal, as well as the empirical findings of FDI effects on income distributions are divided. Using cross-country data, Tsai (1995) examined the relationship between FDI and income inequality in 33 less-developed countries (LDCs) and found that FDI does give rise to more unequal income distribution in the host LDCs. The findings of Tsai (1995) are generally consistent with the argument of the dependency theorists. Apart from FDI, the study supports Kuznets hypothesis but suggested that trade has no correlation with inequality, an improvement in human capital does not help achieve greater equality while high proportion of agricultural labor force is positively correlated with higher inequality. However, the study may have a several defects, for instance, the large number of countries may be too diverse to be pooled together so that the
comparison of data on inequality in different countries is doubted, as well as the different countries’ culture and legal system may interacts with FDI and openness. In the case of China, Fu (2004) investigated the spillover and migration effects of exports and FDI and their impacts on regional income inequalities in China by applying panel data covering the years of 1990s to a log-liner dynamic panel model. This study also produced a result supporting dependency theorists that FDI does increase the inequality between the inland and the coastal regions in China. In addition, this study also found that while exports and interstate labor migration from the inland to the coastal regions have played an important role in increasing regional disparities, urbanization in the inland regions help to reduce the regional income inequalities and leads to more balanced regional growth. The limitations of this study is that a number of most important variables such as the role of the Chinese government and the economic growth are omitted from the analysis. Such variables may have significant effects on income distribution as China has had remarkable rapid economic growth during 1990s and the Chinese government indeed has heavily intervened the foreign and domestic investment markets in order to reduce regional income inequality.

In contrast to the studies of FU (2004) and Tsai (1995), the study of Wan, Lu and Chen (2003) provided the empirical evidence from China in support of the modernization hypothesis after estimating an income generating function and incorporating trade and FDI variables. The study found that while capital input and infrastructure are the largest contributors to regional inequality, FDI, trade exert a decreasing impact on regional inequality in China and privatization helps equalize incomes across regions. As similar to Fu (2004), this study also has a number of shortages which may cast doubts on the results presented in the study: the failure to convert values of trade and FDI from US dollars into the Chinese currency to maintain consistency with other variables; the measurement of a few variables such as human capital and reform are not appropriately defined and omitting the important GDP determinant of income distribution. Feenstra and Hanson (1997) also reported findings in favor of the modernization theory that FDI does not induce income inequality in developing countries. However, it is worth pointing out that
their findings is merely based on Mexican data and failed to compare the explanatory powers of the competing hypotheses (Mah 2003).

3. OVERVIEW OF THE FDI INFLOWS AND THE REGIONAL INCOME INEQUALITY

In 1978, China finally opened its door to the world economy after almost 30 years self-imposed isolation. Attracting FDI has been a key pillar of China’s “opening up” policies and economic reforms. The policies adopted to attract FDI were basically preferential ones, which provide tax concessions and special privileges to foreign investors. In Table 1, we present the timeline of China’s FDI and regional preferential policies during 1979 to 2002. The experiment of economic and social reforms, as indicated in Table 1, started with the establishment of 3 Special Economic Zones (SEZs) in southeast coast province Guangdong, next to Hongkong and Macao; subsequently 1 additional SEZs in Fujian, next to Taiwan; during 1984 and 1986, there were 27 additional FDI zones established in Shanghai, Tianjin, Liaoning, Hebei, Shandong, Jiangsu, Zhejiang, Fujian, Guangdong and Guangxi. However, the amount of FDI in China was small during this period and obviously the most FDI was located in the coastal region. Also, the Chinese government during this period promulgated FDI legislations and policies such as “Equity Joint Venture Law” and moved China’s FDI regulatory regime from “permitting” to “encouraging” FDI. Further, in 1990 the Chinese government provided a more complete legal structure to facilitate the operations of foreign-invested enterprises (FIEs) by issuing “Amendments to the Equity Joint Venture Law and Wholly Foreign-Invested Enterprise Implementing Rules.” Figure 1 shows the FDI inflows in China during the years 1978 to 2002. FDI inflows continuously grew in China, as indicated in Figure 1, as more and more economic zones and opened cities developed. FDI inflows were quite low ranked from 0.03 to 0.64 billion US dollars per year from 1978 to 1983, but from 1984 till early 1990’s, FDI increased at an average rate over 30% per annum. However, the total amount of FDI was still small lower than US$5 billions before 1992.
In 1992, the famous “South Tour” by president Deng Xiaoping pushed ahead further economic reforms in China and led to a new phase of FDI liberalization. In the same year, after 14 years opening up in the coastal region, China finally extended economic zones to some selective inland provinces and open cities to all capital cities of inland region. Meantime FDI and ownership laws, property rights and contract laws were developed during this period to improve investment condition and business environment in order to attract more FDI. As a result, clearly seen in Figure 1, FDI entered into a stage of high-speed growth during the period and placed China to be a largest FDI hosting destination.

country in the developing world since 1993. While new economic zones were created across the country, the distribution of FDI was continued to be favored into the coastal region. During 1996, the Chinese government encouraged foreign investors to invest in western areas of China in order to facilitate the economic development in the inland region so that the income inequality between the coastal and the inland regions can be reduced. In 1998, during the Asian financial crisis period, the Chinese government further liberalized FDI policy. One of such liberalized policy is to abolish the FDI project approval requirement. However, these new liberalized policies did not make a significant improvement as the impact of the Asian financial crisis was strong and hence the FDI inflows into China during the years of 1999 and 2000 has fallen below the previous year’s level (see Figure 1). In December 2001, China joined the World Trade Organization (WTO), which marked FDI liberalization entering into a new era. In the same year, China’s FDI inflows have increased dramatically, as indicated in Figure 1, from U$40.72 billions in year 2000 to U$46.88 billions in 2001 and by 2002 China became the largest FDI host country in the world attracting US $52.74 billions of FDI. Indeed, China has successfully attracted the enormous amount of FDI inflows but the FDI inflows have been highly geographically distributed unevenly. Table 2 presents the regional distribution of FDI inflows into China in 1984 and 2002. The column 1 shows the regions and sub-regions; the column 2 and 4 show the amount of FDI in 1984 and
2002, respectively; the column 3 and 5 give the FDI in percentages. As indicated in Table 2 that FDI inflows in the coastal region were much higher than the inland region in both years of 1984 and 2002. The amount of FDI inflows were US$2576 millions and

US$45363 millions into the coastal regions comparing with US$137 millions and US$6597 millions of FDI into the inland regions, in 1984 and 2002, respectively. In percentages, the FDI inflows into the coastal regions were 95% and 87% against to 5% and 13% into the inland region in 1984 and 2002, respectively.

FDI, as expected by the Chinese government, has played a great role in China’s economic development. It has transferred technologies and management know-how. It also has expanded China’s export sector, improved total factor productivities and contributed to GDP growth significantly through the establishment of FIEs and the spillover effects on domestic enterprises. Table 3 presents varies form of significant contribution of FDI to China’s exceptional economic performance during 1985, 1990 and 2002. The column 1 shows the year, the number 2 and 3 columns provide the shares of FDI inflows in the total domestic investment and the percentages of FDI stocks in GDP, respectively. The column 4 and 5 show the exports by FIEs and the share of their exports in the total exports, respectively. The last two columns 6 and 7 give the share of the industrial output by FIEs in the total industrial output and the number of employees in FIEs, respectively.

Sources: World Investment Report, varies issues; Almanac of China’s Economy, varies issues; China Statistical Yearbook, varies issues
The FDI inflows have provided sufficient foreign capital investment flows and were accounted over 10% of total domestic investment per year since 1993. The ratio of FDI stocks to GDP in 1985 was 1.5% and has increased to 23.5% in 1997. FDI has assisted China to access new export markets. The exports by FIEs was 0.3 billion US dollars accounted for 1.1% of China’s total exports in 1985 while in 1997 it increased to $75 billion US dollars and accounted for 41% of China’s total exports (see column 4 and 5). The share of industrial output by FIEs in total industrial output also demonstrated great strength. This share has increased from 5% in 1991 to 29% in 2002 (see column 6). With 208056 FIEs operating in China’s battlefield of almost every single sector, FDI has created local employment opportunities and the number of employees in FIEs have reached 7.58 million in 2002 (see column 7).

While FDI has had strong impacts on China’s overall economic development, the unbalanced distribution of FDI among different regions has undoubtedly created a skewed regional economic development. This can be clearly evidenced by Table 4 where we saw the impact of FDI on the regional economy of China. Table 4 demonstrates that FDI has had much greater contributions to economic development in the coastal region than the inland provinces in 2001. The Exports by FIEs in the coastal region was about US$130 billion accounted for 53% in the region’s total exports, where the inland provinces only had $3.3US billion dollars accounted for 16% in the region’s total export. The exports of the coastal and the inland regions in 2001 were US$244 billion and US$21 billion, respectively. These exports were accounted for 92% and 8% in the national total exports, respectively. However, the 4th row of Table 4 shows the overall total exports average annual growth rate between 1978 and 2002 is about the same, 13%. These two average annual growth rates in the inland and the coastal regions were about the same, despite the fact that the export induced by FIEs was much higher in the coastal
region than in the inland region. Undoubtedly, opening up to the world economy does not only benefit the coastal region, it also indeed stimulates the demand for increasing export in the inland region through the enhanced competition in whole China. This occurs despite the fact that the FDI policies have been in favor of the coastal region that resulted in much more of FDI flowed into the coastal region. Similarly, the industrial output by FIEs in the coastal and the inland regions, respectively, were RMB 2469 billions and RMB 249 billions and accounted for 36% and 9% in the respective regions’ total industrial output. This led to the share of industrial output of the coastal and the inland regions in national total industrial output to be 71% and 28%, respectively (see row 9). Moreover, FDI also has created much higher local employment in the coastal region than

in the inland region. The number of employees in the FIEs, as shown in the Table 4 (row 10) in the coastal region reached to 5.83 million comparing with only 0.85 million in the inland region. In terms of earnings, it is widely observed, that the employees in FIEs are much better off than in the comparable domestic sectors, especially, in the state-owned enterprises. Thus, the average wage in all sectors in the coastal region was pulled up. As a consequence of the extremely unbalanced economic development in the two regions, the regional income inequality has been widening with the deepening of economic reform and FDI movements in the regions became more and more pronounced. Figure 2 shows the per capita income in the coastal and the inland regions from 1970 to 2002. As can be seen, the income inequality between the two regions increased gradually since 1978 and then in the mid 1980s, a visible widening surged and the two upward inequality drifts became more and more divergent.

![Regional Income Inequality in China: 1970 - 2002](image)

Figure 2. Regional Income Inequality in China: 1970-2002

Facing the issue of growing regional inequality in the country, the Chinese government has taken steps to bridge the spiraling gap between the inland and the coastal regions throughout the economic reform period. In the middle of 1980s, a new emphasis on
economic development plan in the poor area was introduced, adopted in the 7th Five Year Plan (1986 – 1990) and further strengthened in 8th Five Year Plan (1991 – 1995) (World Bank, 1992). The whole plan includes special programs to improve the education and health status; a Food-for-Work-Program to assist with the building of roads, irrigation works and other capital constructions; price reform to decontrol of distorted raw material and agricultural prices and subsidized bank loans for development (World Bank, 1992). Also, as the Chinese government viewed that the widening gap between the coastal and the inland regions mainly was a result of the decline in the performance of the rural enterprises, thus, a domestic investment plan to support the rural enterprises of inland region (excluding of northeast provinces) was particularly emphasized. This is, a large amount additional bank loans and a special state council loan, RMB 10 billion, were planed for year 1993 – 2000 for the growth and development of the inland region9. In addition, a three-year exemption from income tax for all newly established rural enterprises in central provinces, as well as the new tax policy of exemption of all items of export from value-added tax and consumer tax were introduced.

The Chinese government, in 2000, further addressed the concern about the widening of regional inequalities and planed to narrow regional inequalities as one of its principal objectives. In 2001, RMB 205.4 billion was transferred to poor provinces and cities to finance social security cash-flow10. Meanwhile, the social security system was under reform by transferring the social security responsibility from enterprises to the state at the provincial and municipal prefecture levels. Beside the social security reform, in the 10th Five-Year Plan (2001–2005), the Chinese government aimed at increasing productivity in agriculture and industrial state-owned enterprises, developing collective, private and individual businesses, promoting labor-intensive activities in service sectors, investing in human capital and protecting natural capital. Moreover, the Chinese government also emphasized the need of establishing economic development zones in the inland provinces by attracting foreign investors to invest in strategic physical infrastructure for transport, water resources management, energy and mining.
4. THE MODEL AND EMPIRICAL RESULTS

In this section, we use regression framework to empirically analyze the relationship between FDI and regional income inequality in China. We specifically attempt to find answers to the following questions: (1) Has FDI influenced China’s regional inequality? (2) If yes, how FDI and regional inequality are related? (3) What are the other principal forces affecting regional income inequality in china?

The conceptual framework adopted to analyze the causality between FDI and regional income inequality is based on the argument between the modernization and dependency theories developed in section 2 of this paper. The Kuznets hypothesis will be used to guide the study on the relationship between economic development and regional income inequality. Other variables are used to explain regional income inequality including the ones that the Chinese government used for intervention of regional income inequalities or the variables only commonly deemed in past income inequality studies and could be defined and measured. Thus, the following three basic models are considered for national, urban and rural studies, respectively:

\[
\text{GINI}_{tn} = a_1 + b_1 FDI_{tn} + c_1 \text{PCG}_t + d_1 \text{PCG2}_{tn} + e_1 \text{AGR}_{tn} + f_1 \text{HCAP}_{tn} + g_1 \text{GOV}_{tn} + h_1 \text{TRADE}_{tn} + j_1 \text{DINV}_{tn} + u_{tn}
\]

(1)

\[
\text{GINI}_{tu} = a_2 + b_2 FDI_{tu} + c_2 \text{PCG}_t + d_2 \text{PCG2}_{tu} + e_2 \text{SOE}_{tu} + f_2 \text{HCAP}_{tn} + g_2 \text{GOVU}_{tu} + h_2 \text{TRADE}_{tu} + j_2 \text{DINV}_{tu} + u_{tu}
\]

(2)

\[

(3)
Where the variables denote:

- **GINI**: Gini coefficient
- **FDI**: Share of FDI inflows in GDP
- **PCG**: Logarithm of real per capita GDP
- **PCG2**: Squared PCG
- **AGR**: Ratio of the agricultural labor force of the total labor force
- **SOE**: Ratio of the employment of State-Owned Enterprises (SOE) of the total urban employment
- **RUE**: Ratio of the rural enterprises employment of the total rural employment
- **HCAP**: Human capital
- **GOV**: Share of total government expenditure in GDP
- **GOVU**: Share of government expenditure for urban in GDP
- **GOVR**: Share of government expenditure for agriculture in GDP
- **TRADE**: Share of trade in GDP
- **DINV**: Share of domestic investment in GDP
- **u**: Normally distributed disturbance term.

Gini coefficient is used as the dependent variable because it is the most popular measure for income inequality. In this study, a newly developed method by Wan (2001) was used to decompose the aggregate value of the Gini coefficient for rural, urban and national. In brief, the Gini ratio, denoted by $G_k$, can be obtained via simple matrix manipulation:

$$G_k = P_k Q I_k$$

where $P_k$ is a row vector of the shares of income-receiving units, and $I$ is a column vector of income shares based on the k-th income data. Both are ranked by increasing values of per capita income $Y_k$. $Y$ is total income composed of K sources or components, i.e., $Y = Y_1 + Y_2 + \ldots + Y_k$. $Q$ is a square matrix with appropriate dimensions whose elements $q_{ij}$ are equal to 0 if $i=j$, to +1 if $i<j$ and to -1 if $i>j$. 

Table 5 presents such calculated Gini ratio for rural, urban and national from 1978 to 2002. The decomposition for rural, urban and national Gini coefficient is based on the data of rural, urban and national household disposable income in terms of Chinese currency RMB, respectively. Thus, the provincial level time series panel data and the national time series data for 1978 – 2002 are needed and these data are compiled from *Comprehensive Statistical Data and Materials for 50 years of New China* and various issues of China Statistical Yearbook, both published by the National Bureau of Statistics (NBS). Also, in this study, the independent variables, a time series data set from 1978 –

Sources: Calculated from various China Statistical Yearbook.
2002, are all collected from the same resources just mentioned and all variables are measured in Chinese currency RMB.

The view on the expected sign of the coefficient $b_i$ is divided. Dependency theorists believe that greater regional income inequalities associated with increasing FDI inflows, thus, the expected sign of the coefficient $b_i$ should be positive. However, if modernization hypothesis holds, that is, FDI does not cause any significant variance in income inequality, the expected sign of the coefficient $b_i$ would be negative. According to the Kuznets hypothesis, PCG and PCG2 are used to measure economic development and the coefficients $c_i$ and $d_i$ are expected to be positive and negative, respectively.

Agricultural transformation has been widely acknowledged and practically recommended by many researchers and developing countries as a force of convergence toward regional income equality. Thus, AGR has been used to estimate the national regional income inequality. In general, a high ratio of agricultural labor force of total labor force indicates divergence toward regional income equality. In the urban regional income inequality estimation, SOE is used to measure the changes of economic structure as SOE is a well reflection of economic reforms in urban areas and any changes in SOE would significantly affect income distributions in urban areas. According to dependency theory, a low ratio of the employment of SOE of the total urban employment is regarded as divergence of regional income equality. However, the opposite result will occur if modernization hypothesis holds. In the estimation of rural income inequality, RUE is used to measure agricultural transformation in the rural areas. The rural enterprises have played a great role in China’s rural economic development and the Chinese government viewed that the successful development of the rural enterprises could effectively reduce regional income inequality. More people are employed in the sectors other than in the agriculture sector means better income prospects. Thus, a high ratio of the rural enterprises employment of the total rural employment indicates an even income distribution in the rural regions.
Human capital (HCAP) is measured by ratio of secondary school enrolment of the population, which was commonly used in income inequality studies (e.g. Tsai 1995 and Sylwester 2000). It is widely believed that improvement of education could effectively reduce regional income inequality. The Chinese government has attempted to narrow regional income inequality throughout the whole economic reform period. The role of government in income redistribution certainly is crucial. Thus, it is expected a high share of government expenditure in GDP would narrow regional income disparities. Trade is generally used to measure the degree of openness of an economy. According to modernization hypothesis, trade enhances competition, fosters economic growth and leads to better income distribution. Thereby, a negative sign of $h_i$ is expected if modernization hypothesis holds. One of the important strategies used by the Chinese government to narrow regional income inequality is domestic investment through bank and state loans as discussed in section 3, and consequently, the expected sign of $j_i$ is negative.

Table 6 provides a summary on the expected signs of all the coefficients on the variables for national, urban and rural equations, respectively. The actual signs of all the coefficients on the variables for the three equations also are summarized and given in Table 6.

The econometric results corresponding to the equations of national, urban and rural are contained in Table 7, which were estimated by using ordinary least squares (OLS). Overall, the results are encouraging with 97%, 96% and 98% of the variation in the Gini Coefficient is explained by the right-hand side independent variables. The Duban-Wason Statistics for the three equations indicates no serial correlation in the error terms.

With the estimated positive coefficient of FDI which are statistical significant at the 1% level, the results in the equations of national, rural and urban indicate that increasing FDI inflows in China has accelerated regional income inequality. The findings lend some supports to the dependency hypothesis and are consistent with what were obtained by Tsai (1995) and FU (2004), whereas, the study by Tsai is about the impact of FDI on

* If dependency theory holds, the expected sign of bi is “+”, if modernization hypothesis holds, the expected sign is “−.”

Income inequality in 33 less-developed countries and used panel data of China only covering the years of 1990s. Positive sign of PCG and negative sign of PCG2, both revealed to be significant at 1% level in the three models of national, rural and urban, the signs are all consistent with an inverted U-shaped curve. That is, the Kuznets hypothesis is generally supported by the empirical analysis. The result in the national estimation also shows that at 1% significant level, the positive sign of AGR coefficient confirms that agricultural transformation toward industrialization can effectively narrow the regional income inequality. This also confirms the findings in Tsai (1995) and Fu (2004). However, at 1% significant level, a negative sign is associated with the coefficient of SOE which confirms that dependency hypothesis holds for the urban areas and is consistent with those obtained in other research on the Chinese economy (e.g. Xu and Zou, 2000). This finding also supports the argument that the continuing collapse of SOE in the recent decades has forced considerable increasing number of XIA GANG (layoff) workers, which significantly worsens income inequality in the urban areas. Similarly, the RUE coefficient is negative and significant at 1% level confirms

that transformation of rural agricultural labor force to manufacturing and service industries is an effective strategy to narrow income inequality.

Surprisingly, the coefficients of HCAP in all three national, rural and urban equations are all associated with a wrong positive sign. This is obviously in contradiction to the wide believes that improvement in education could effectively reduce income inequality (Wan, Lu and Chen, 2003; Tsai, 1995). However, this could be an indication that the educated “labor elites” from the inland region have been attracted to the high income coastal
region which has led to worsening of regional income inequality (FU, 2004). It is well-known that interstate labor migration from the inland region to the coastal region has been an important phenomenon in China over the last two decades. Another striking result from Table 6 is that the great commitments of Chinese government on narrowing regional income inequality at national, urban and rural level have not had any influences on regional income inequalities, as the three coefficients are all negative and statistically insignificant. Perhaps, this would be due to the fact that given the large population and the massive areas of the inland provinces are still underdeveloped and the efforts of the Chinese government to narrow the regional income inequality may not be strong enough.

Interestingly, the coefficient estimations of TRADE variable are negative and statistically significant for national and rural regions, which indicate a negative relationship between openness and regional income inequality as expected. This lends some supports to the modernization theory that openness to the world economy could enhance competition and improve efficiency in resource allocation hence leading to economic development with better income distribution. Indeed, the rich resources of the inland provinces have been well explored for trade, which, no doubt, has helped the poor, especially, those in the rural regions, to gain power fighting for a better income distribution. However, the urban coefficient for TRADE is statistically insignificant. This may reflect the facts that the inland provinces relatively have weak comparative advantages in production of manufactured and finished goods, whereas, the manufacture enterprises mainly are located in urban areas, thus, trade in the urban areas did not play a significant role to narrow income inequality.

Similarly, the sign of the coefficient for DINV variable, at national level and rural region, are negative and statistically insignificant but the coefficient for urban is significant at 1% level indicating that more domestic investment would reduce the differential between the coastal and the inland regions. This result, in fact, is not surprising despite the great effort that the Chinese government attempted to invest in the rural enterprises in the inland provinces. The courses of increasing regional inequality are not only the continuing decline of the rural industries in the inland provinces, some other factors such
as the preferential FDI policies and appropriate long term economic development policies could play a great role in influencing regional income inequality.

5. IMPLICATIONS AND CONCLUSIONS

In this paper we attempted to analyze the impact of FDI on regional income inequality in China by estimating three separate equations for national, urban and rural and using time series & cross-sectional data from 1978 to 2002. The results show that the FDI inflows are one of the major factors that have led to an increase in regional income inequality at national, rural and urban levels in China. Other factors have caused increasing of regional inequality include the level of economic development, human capital and the economic reforms in SOE industries. In the opposite site, the factors have narrowed the regional income inequality are agriculture transformation toward industrialization in the case of rural and urban, trade for achieving a better income distribution in the rural areas and at national level and domestic investment in the urban areas. The Chinese government has failed to influence income distributions in rural, urban and at national level. Trade and domestic investment have had no significant impact on urban and rural income distributions, respectively.

Concerning the impacts of FDI on the host developing countries economy, the result of this study evidently demonstrated that FDI does come with both benefits and costs. It is clear from the analysis, while FDI has fostered Chinese economic rapid growth, it is also true that FDI has also led to increase China’s regional income inequality. Thus, in order to reduce income inequality a sustainable long-term geographical dispersion and selective FDI policy should be implemented to encourage foreign investors investing in the inland region of China, and to promote FDI inflows into export-oriented, high technology, agriculture, and infrastructure sectors.

Our analysis also showed that the unbalanced economic development in the regions has increased income inequality. Consequently, to promote economic development in the
inland regions, as important as FDI, further liberalization and reforms on domestic sectors are urged. The following recommendations may provide helpful hints:

(1). Reforms and development in domestic manufacturing and tertiary industries to produce manufactured and finished goods in the inland regions are urged. It enables trade and improves efficiency in using rich and cheap production resources.

(2). While encourage domestic investors invest in the inland regions, any discrimination and unfair policies against its own domestic enterprises, especially, the Non-State-Owned Enterprises (NSOE) must be abandoned.

(3). Further research and development for appropriate government policies are one of the important keys to narrow regional income inequality. In particular, the policy of exemption of all items of export from value-added tax and consumer tax must be reviewed as this tax policy further increases regional income inequality. Because the export in the coastal region has been much higher than the export in the inland region, the larger export, the greater is the benefits.

As far as human capital and the reforms in the SOE industries concerned, effective support programs and preferential policies in the inland regions are required. For instance, education programs could be designed with incentives to encourage educated “local elites” to contribute to the local economic development. With the increasing number of XIA GANG (layoff) workers, an integrated set of fiscal reforms of the Chinese security system is urged which should be linked with re-education and re-training programs.

Finally, it must be admitted that there are a few restrictions in this study. First, the difference in price levels across regions and inflation effects are problems remaining unresolved, although a very few studies have paid the attention. Second, the relatively poor quality and inconsistency of the Chinese data, despite analytical technique was attempted for improvement, may result in an incorrect conclusion in this study. Third, some important variables, for instance, political democracy and geography variables, are not included. Overall, further researches on income distribution effects from different types of FDI, the impacts of FDI on income inequality – not by regions but based on
average incomes of different percentiles for urban and rural residents in different provinces would be interesting and helpful for China’s economic development.

NOTES
1. Calculated from varies China Statistical yearbook.

2. Estimated from China’s official publication figures and varies China Statistical yearbook.

4. Kuznets (1955) hypothesis describes that the relationship between income inequality and the level of economic development is just like an inverted -U-shaped curve.

5. In this study, the geographical regions of China were divided into two major regions, the coastal and inland regions, for comparison. The coastal region includes the metro cities (Beijing, Tianjin and Shanghai) and the eight coastal provinces (Hebei, Liaoning, Jiangsu, Zhejiang, Fujian, Guangdong, Guangxi and Shandong). The inland region includes six central provinces (Shanxi, Anhui, Jiangxi, Henan, Hubei and Hunan), two northeast provinces (Jilin and Heilongjiang), six northwest provinces (Inner Mongolia, Shanxi, Gansu, Qinghai, Ningxia and Xinjiang) and three southwest provinces (Sichuan, Guizhou and Yunnan). Hainan and Tibet provinces are excluded from the study due to incomplete data issue while the newly established metro city, Chongqing was combined with Sichuan where it was originally separated from. This design is in accordance with the Chinese experiment economic reform geographical plan.

6. Calculated from varies China Statistical yearbook.

8. The statement is based on the calculation from China Statistical Yearbook 2003. For instance, the average annual wage in the richest metro city Shanghai was 2.52 times higher than in the poorest province Guizhou.

9. The State Statistical Bureau of China (SSBC) online information in Chinese.

11. The trade in the inland regions mainly is primary goods and services as the inland provinces are rich of resources, whereas, those natural resources mainly are located in rural area. This may well explain why the rural area can gain from trade hence achieving a better income distribution (sources: Almanac of China’s Economy and The China Internet Information Centre: www.org.cn).

Abstract

Children (ages 5-8 years) completed a classification activity in which they sorted pictures of faces into groups that they believed were similar. Key features associated with racial categories (i.e., skin tone, lip size, and nose size) were crossed over the set of pictures. Results show unambiguously that children use skin tone as a primary categorization criterion (across other facial features). Moreover, the use of skin tone was not related to age or racial identity of the children. The implications of these findings on racial categorization processes and race bias in children’s social cognition are discussed.
Direct Evidence for the Primacy of Skin Tone in Children’s Racial Categorizations

Social science literature on the idea of “race”\(^1\) as a social category has hitherto employed two competing emphases: (a) that the most important criterion for people’s racial categorizations is skin tone—often called skin color\(^2\)—and (b) that racial categorizations rely on a combination of facial features (e.g., nose size, lip size, and eye shape) including, but not limited to, skin tone. The emphasis on skin tone as paramount can be traced from the earliest social science studies of race (e.g., K. B, Clark & M. P. Clark, 1947) and theories about color bias (e.g., Williams, Best, & Boswell, 1975; Williams & Edwards, 1969; Williams & Morland, 1975). The emphasis on race as a combination of features is seen in most present research in the adult and child social cognition literature. For instance, many current adult social psychological studies on racial categorization confound the features of full lips, broad noses, and dark skin tone to constitute a so-called Black person or use such features to create “prototypical African-American” faces (e.g., Blair, Judd, Sadler, & Jenkins, 2002). Morphing studies in the adult social cognition literature also evince this confounding of features. Eberhardt, Dasgupta, and Banaszynski (2003) used so-called prototypical African American faces (which consisted of dark skin, broad noses, and full lips) and prototypical European American faces (which consisted of light skin, thin noses, and thin lips) and averaged them to create “racially ambiguous” faces, which were presented to research participants. Similarly, in the Corneille, Huart, Becquart and Brédart (2004) study, faces were morphed from European to North African or Asian by simultaneously changing a variety of features, such as lip size, nose size, eye shape, and skin tone.

A portion of developmental research on the racial categorization shows the same emphasis on race as a combination of features found in the adult literature. In Hirschfeld’s (1995a, 1995b, 1996) work with children, participants are routinely presented with pictures of
people of different races, and this manipulation is explicitly accomplished through the confounding of physical features such as lip size, nose size, and skin tone in an arrangement that resembles the prototypical African American or European American faces described above (see Enesco, Navarro, Giménez & Olmo, 1999; Hirschfeld, 1995a, p. 222). Interestingly, most other developmental studies emphasize skin tone by providing stimuli in which only skin tone varies. These studies then ask children to make various judgments about similarity (see Aboud, 1988, for a review) or attitudes (Williams & Edwards, 1969). Consequently, virtually no study in the adult or child literature allows researchers to easily examine whether children focus on other facial features (e.g., nose size, lip size, or eye shape) in addition to or in place of skin tone to make racial categorizations.

Problems with Past Approaches

Why is this confounding of facial features and skin tone or focusing exclusively on skin tone problematic? It might seem reasonable, given the prevalent social ideas concerning race, that what distinguishes human races is a complex set of physical features. Accordingly, if one wants to study racial categorization, then one should use stimuli which reflect these aspects of human phenotypic diversity (cf. Aboud, 1988; Bernstein, Zimmerman, Werner-Wilson, & Voburg, 2000; Lemaine, Santolini, Bonnet, & Ben Brika, 1985). While this argument might seem *prima facie* valid, it is not. Even forty years ago, Barnicot (1964) showed that there is as much phenotype variability in facial features and skin tone *within* so-called racial groups as there is *between* them. Similarly, one only need carefully examine the variability in facial features and skin tone that exists between any two people who describe themselves as part of the same race to understand that the categorization criteria for race are not standardized or well defined at all. In fact, recent genetic (e.g., Marks, 1995) and philosophical (e.g., Zack, 2003) analyses, in addition
to anthropological statements (American Anthropological Association, 1998), explicitly argue that race, as a system of categorization, does not make sense from either the genetic, phenotypic, or logical standpoints (see Tate & Audette, 2001, for a review).

Given that both the claims about phenotypic difference among races and the idea of races themselves do not make biological or logical sense, how should one approach the topic of ‘race’ and racial categorization within social science? Tate and Audette (2001) provide a useful framework by orienting theorists’ attention toward a focus on how individuals cognitively represent the concept of race. Tate and Audette’s (2001) position is explicitly concerned with the kinds of experiential data people use to construct their understandings of race, recognizing that there can be individual differences therein. At the same time, Tate and Audette’s (2001) analysis allows for the existence and exploration of experiential data that are largely similar across people’s representations, which presumably support the continued use of race as a conceptual system (and the belief that race is thought about similarly across people). Historically, such an experiential datum has been skin tone. Since the inception of race as scientific concept, human races have been distinguished in part by their supposed different colors (see Gould, 1981; Jones, 1997; Stephan, 1982; Tate & Audette, 2001). In fact, the existence of de jure color standards as one method by which to enforce racial segregation in America during the post-Civil War era is another illustration of how skin tone was believed to be and used as the differentiating factor for human races.

Yet, it is possible that, in the absence of legally mandated color standards in America since the 1960s, skin tone has become less primary in its role in racial categorizations. As ideas about multiculturalism become more prevalent in American society, as colorblind ideology (e.g., D’Souza, 1995; Sniderman & Carmines, 1997) continues to proliferate, and as social scientists
argue that race is a formative process that is historical and socio-economically contingent (e.g., Omi & Winant, 1994), skin tone itself might become de-emphasized in discourse about race. Moreover, skin tone might be taking a less central role in people’s racial categorizations because within the psychology literature some theorists argue that race is more than skin tone; it is a complex interaction of several physical features (e.g., Hirschfeld, 1995a; Phinney, 1996). Consequently, the question of whether skin tone is truly a primary focus of racial categorization cannot be effectively answered if research does not conceptually and empirically disentangle it from other physical features in order to examine the relative contributions of different physical features to the racial categorization process. If features are continually confounded, uncovering their relative importance in the categorization process becomes virtually impossible. In short, research until now appears to have assumed either a primary or secondary role of skin tone in racial categorization based on historical and social convention, rather than rigorous empirical examination of the issue.

The Significance of Children’s Cognition

Building on Hirschfeld’s arguments that children acquire a theory of race, we wanted to examine whether there are aspects of children’s theories of race that are more salient than others for this age group. Research to date has not examined this question. Instead, some theorists (Aboud, 1988; Lemaine et al., 1985) suggest that children’s racial discriminations are based on a broader set of features which include, but are not limited to, skin tone. Hirschfeld’s (1995b) research explores the heritability of color (viz. skin tone) in humans (i.e., a child resembling one parent more than other [Study 1] and the inheritability of color in humans and non-human animals [Study 3], not whether skin tone is used as a criterion for differentiating individuals.
Although a portion of developmentalists (e.g., Berstein et al., 2000; Bigler & Liben, 1993; Sorce, 1979) “follow what has become common practice by depicting racial differences with variations in skin tone, facial features (lips, nose, and overall shape), and hair color and texture” (Hirschfeld, 1995a, p. 222), this common practice does not allow one to examine whether the features assumed to be used in adults’ racial classifications —namely, some combination of facial features and skin tone—develop all at once for children, or whether children acquire certain parts of the racial theory before others. Answering this question will provide insights into the acquisition of race as a social concept and clarify whether a focus on skin tone by some theories (e.g., color bias; Williams & Morland, 1975) is appropriate at ages 5-8.

Overview of this Study

The present research sought to empirically uncover the relationship between skin tone and other facial features often related to racial categorization using a study design that was able to reveal the relative contributions of each to children’s categorizations. Briefly, children were presented with 16 faces that fully crossed the variables of interest—skin tone, lip size, and nose size—and then asked to sort these pictures into groups.

From this full crossing, we were able to examine a broad range of possibilities within the categorizations. Specifically, the design of this research allowed for the uncovering of not only whether skin tone is primary in children’s categorization systems, but also whether this variable interacts with other facial features. In essence, we were able to examine the particular constellations of features provided by children when they made their categorizations, rather than having to observe what judgments children made when presented with particular constellations.
Method

Participants

Participants were 32 children in kindergarten to third grade (aged 5 years to 8 years) at different elementary schools in Eugene and Portland, Oregon. Participants were identified as both “White” \( n = 14 \) and “non-White” \( n = 16 \) by their parents.\(^4\)

Materials and Procedure

Stimuli. Stimulus materials were a set of sixteen 3.25 in. by 2.5 in. pictures. We created 16 pictures of children from an initial set of 4 children. The stimuli crossed the three main variables of interest—skin tone, lip size, and nose size—with gender. There were two levels of each variable: skin tone (light, dark), lip size (thin, full), nose size (narrow, broad), and gender (male, female). Each level appeared at least once with each other level for a total of 16 photos (see Appendix).

Procedure. Half the children completed this task individually while the other half completed the task in a room with other children, but each child tested in a group was seated with dividers so that any child could not see what another was doing. All children were given an envelope with the stimuli inside. The experimenter told the children that she would like them to sort the pictures into as many groups as they wanted of pictures that they think “go together.” We did not mention the term race because many children do not understand what the concept means (see, e.g., Hirschfeld, 1995b, 1996). The experimenter then informed the children of two restrictions on their groupings: (a) the groupings must include both boys and girls (i.e., one cannot sort by gender), and (b) that each group has to have at least two pictures in it. Children were then allowed to create their groupings while the experimenter did not watch. Once the child
was finished making groupings, the experimenter clipped groups together after checking with the child to assure the accuracy of the groupings.

**Exclusions.** Groupings from 6 participants could not be used. Three of the participants received faulty stimuli and another 3 of the participants created groupings based without discernable patterns. Accordingly, the data were analyzed for 26 participants.

**Results and Discussion**

*Skin Tone as a Categorization Dimension*

We examined whether skin tone was used as a categorization dimension (i.e., whether children made light skinned and dark skinned groups) by itself or in combination with other features (e.g., lips size, and/or nose size). Skin tone was used as a categorization dimension in 85% of the sample. The other 15% of the sample made categorizations across the dimension of skin tone (e.g., by nose size and/or lip size). This difference is significant, $\chi^2 (1, n = 26) = 12.46$, $p < .001$, see Table 1. Moreover, the use of skin tone as a categorization dimension was not related to whether the children were identified as White or non-White, nor was it related to age group (5-6 years vs. 7-8 years), both Fisher’s exact $p$’s = 1.00, two-tailed (see Table 1).

*Skin Tone as the Sole Categorization Dimension*

The above analysis shows that sorting by skin tone (either by itself or in combination with another facial feature) occurred significantly more often than would be expected by chance. Nonetheless, the question remains: Is skin tone used as the sole dimension for categorizing the pictures? Or does sorting by skin tone regularly co-occur with other features? To answer this question, we examined the 22 participants who used skin tone as a part of their categorization schemes to assess whether the use of skin tone by itself occurred equally with the use of skin tone in combination with some other facial feature. This analysis is a direct test of whether
children are cued to skin tone alone or a combination of physical features when making groupings.

Of the 22 participants who used skin tone as categorization criterion, 72% used skin tone as the only dimension of sorting, while 27% used skin tone and another facial feature as the dimensions of sorting. This difference was significant, $\chi^2 (1, n = 22) = 4.54, p = .03$, suggesting that skin tone by itself is the primary focus of children’s racial categorizations, see Table 2. There were no relationships of age group or racial identity to these results, both Fisher’s exact $ps = 1.00$, two-tailed (see Table 2).

**General Discussion**

As stated at the outset of this paper, previous research in the child literature has either: (a) assumed that skin tone is the primary focus of children’s racial classifications or (b) consistently confounded several racialized factors in the creation and use of stimuli, assuming that ‘race’ is a combination of facial features and skin tone. Our research has been able to identify that when the racialized features of skin tone, nose size, and lip size are crossed within the experimental design, most children used only skin tone information to create their groupings of faces. These findings therefore provide clarity to the developmental literature on racial categorizations by arguing that in studies like Hirschfeld’s, where features like nose size and lip size are confounded with skin tone, most children are probably focusing on skin tone, not the other features. Our results provide such an interpretation because the design allows us to see that if a child used skin tone as the only dimension for categorization, then s/he necessarily had to collapse other features. That is, faces in a dark skin tone grouping will necessarily have different nose sizes and different lip sizes, showing that the latter two features cannot be the basis for the grouping.
Our findings are also interesting to consider in a larger developmental context. Sorce (1979; as cited in Hirschfeld, 1995a) argues that for preschoolers (approximate age 4-5 years) skin tone is not the most salient cue when considering race. Nevertheless, we have shown that it is the most salient cue for kindergarten through third graders. The juxtaposition of these two findings suggests that there may be a developmental shift toward a focus on skin tone around ages 5-6, further showcasing the development of a racial theory in children.

*Implications for the Child’s Theory of Race*

Despite the fact that our findings are contrary to one of Hirschfeld’s assumptions, our findings do not challenge the idea that children acquire a theory-like understanding of race. In fact, we believe that our findings clarify one specific element of the theory-like understanding. The idea that skin tone is used as the primary categorization criterion suggests that children are learning to focus on an aspect of their immediate world that has been racialized by adults in various contexts (e.g., home, school, and peer groups). It is interesting to note that in our task, in order for children to sort by skin tone, they necessarily had to overlook other facial features that were similar among the pictures. This finding provides strong evidence against the idea that children simply calculate average similarities across sets of features and individuals in order to develop racial groupings. If such a calculus were operating, then the pattern of sorting in our task would be by some combination of skin tone, lip size, and nose size. In terms of our results, the pattern in Table 2 would be reversed. The fact that such a pattern did not emerge across children cannot be explained by a simple calculation account. Instead, it seems plausible that children used a theory of race which emphasizes certain differences among people over other differences. In short, skin tone might be the foundation of the child’s theory of race upon which other information can be built.
Future Directions

Above we have argued that these results inform current categorization studies, but they also suggest areas of future focus. For instance, when researching children, investigators will have a better understanding of the features that are important for children when grouping aspects of human variation. Consistent with previous arguments, and now empirically verified, children do focus on skin tone as the major categorization criterion for other humans. Accordingly, research on color bias (e.g., Williams & Moreland, 1976) has an empirical justification in that we have shown unambiguously that children do categorize people by this dimension when asked to spontaneously create groupings of “pictures that go together.” Other theories which argue that race is a perceived relying on a combination of facial features and skin tone (e.g., Aboud, 1988; Katz, 1982) can be revised to emphasize skin tone relative to the other features at ages 5-8. Moreover, the results suggest that focusing on skin tone as a method of teaching children about human variation is prudent because it is a salient aspect of how humans differ for children in this age group.

Implications for adult research are less clear. It could be adults show the same pattern as children, or it could be that the adult’s theory of race is more consistent with Hirschfeld’s assumption and relies on a combination of facial features and skin tone. In any case, research on adults using this procedure will offer useful insights into other developmental processes related to racial categorizations.

Caveat

It is important to note that idea of race exists differently within different cultural contexts. In Brazil, for instance, race is seen more as a socio-economic category than a biological or physical one (Davis, 1991). Thus, our results might speak well to the primacy of skin tone as
categorization criterion for race for children in America (and culturally similar societies), but these results should be empirically examined in the context of how other cultures might represent race in different ways. In sum, additional research in other cultures is needed to appropriately extend or qualify the present findings.
References

Footnotes

1 The term “race” is referred to with scare quotes here in order to underscore the idea that the categorization system is not meaningful for biological science (e.g., Marks, 1995) but is used by lay people with the belief that it has valid biological underpinnings (Goldberg, 1993).

2 The term “skin tone” is used throughout the paper in order to underscore the reality that differences in surface complexion between humans exist on a continuum rather than as discrete categories, as the term “skin color” implies.

3 We chose not to include eye shape because we were interested in providing a manageable set of stimuli for children to sort. Including eye shape (and fully crossing two levels of it with our existing variables) would have expanded our stimuli set to 24 pictures.

4 Specifically, these children were identified as: African American (n= 3), Asian (n=2), Latino/a (n=1), multiracial (n=9), and Native Hawaiian/Pacific Islander (n=1)

5 This position is generally true, but see Twine’s (1998) work for a dissenting commentary which argues that there is some color-based social hierarchy in Brazilian society.

3. Research Abstract
   Visible signs of social, economic, and environmental change can be seen around almost every turn in rural Japan. New residential subdivisions cover hillsides and spread across former fields and rice paddies. Commercial developments leapfrog along increasingly busy roadways and create visual blight in the form of garish illuminated signs that compete for motorists’ attention. Road construction continues apace, bringing commuters, day trippers, and parking lots into even the most quiet and secluded rural mountain hamlets and seaside villages. Such changes to the rural landscape are putting enormous economic pressure on farmers and other large landowners to subdivide their property and sell off a portion or all of it to the highest bidder. Many elderly farmers, lacking a willing heir to take over their estates, are eager to convert their land into cash for retirement, and most young Japanese people are happy to leave their rural hometowns in search of greater opportunities for education and jobs elsewhere.

Meanwhile, new development inevitably brings new residents and new interest groups to rural communities, and conflicts may occur between natives and move-ins. For example, local decision-making in rural Japan has traditionally been accomplished through informal channels, with important discussion and negotiations occurring ‘behind-the-scenes’ and the opinions of prominent local residents often carrying the most weight. But when this way of reaching consensus does not address the needs and views of new people in the community, who may even make up a majority of residents, they will demand a departure from such traditions. As these kinds of changes occur, the simple ways of rural Japanese residents and the structure of their social relations, which have been developed over generations, are altered forever. In their stead, laws, regulations, and customs that originated in urban environments are imported and established where the unwritten rules of custom and tradition once mattered most. As a result, changes to the rural landscape will increasingly reflect urban sensibilities rather than the carefully crafted balance between man and nature that was an integral part of traditional society.
This research examines the social, economic, and environmental changes occurring in Shima-town, a rural Japanese community located on the border of metropolitan Fukuoka, and explores how those changes are transforming the rural landscape and endangering an important regional asset. Current initiatives by local leaders and concerned citizens to formulate an effective plan for protecting important historic, scenic, cultural, and natural resources in their community are discussed as well as similar efforts in Kobe, Japan, another major city. The argument is made for a stronger, comprehensive regional approach to growth management and natural resource conservation to protect rural landscapes and sustain traditional communities on the urban fringe. The benefits of such an approach, both locally and to the entire region, will be a healthier, more diverse environment and an improved quality of life for all.

ABSTRACT

Bill Tsang

Many studies have sought to uncover the reasons behind the high academic achievements of Chinese migrants compared with migrants of other ethnic backgrounds. Most have highlighted cultural and socioeconomic factors, citing these as the principal reasons.

The picture is complicated by other factors, however, including, importantly, the impact of the migration process itself. Isolating this migration factor may help to resolve many of the unanswered questions about motivation among migrants. Post-colonial Hong Kong provides the ideal setting for such an attempt, because there are minimal differences of ethnicity, culture, dialect, or socioeconomic background between newly arrived migrants from the Chinese Mainland and the majority of working-class Hong Kong locals. Both groups have similar beliefs about schooling, and both are residentially and educationally integrated. Additionally, these new arrivals mostly come to Hong Kong to be reunited with their families, reducing the self-selection factor that exists among migrants with stronger economic motivation.

This study investigates the impact of migration on the academic motivation of the adolescents from these newly arrived migrant families in Hong Kong, and uncovers the contextual and familial factors that might have contributed to any difference in the motivation among adolescents in the migrant and local families. A multidisciplinary approach is used, involving ethnographic study, in-depth interview and survey. The results from all three parts of the study consistently show that migrant children are more motivated. Their higher motivation is associated with their sense of crisis, their ability to compare and contrast their current resources and experiences with those in their community of origin, and their interaction patterns with their parents’ strategies in engaging them in their study.
Residents’ Energy Saving Behaviors in Amphoe Muang: A Case Study of Nakhon Rachasima, Khon Kaen, Ubon Rajathanee, and Udon Thani Provinces, Thailand

Abstract

The purpose of this research were to study the residents’ energy saving behaviors and factors influencing residents’ energy saving behaviors of those living in Amphoe Muang, Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani Provinces, Thailand. The 1,558 people were sampled by systematic random sampling method. The tool to do this research was questionnaire made by the researcher that was composed of fundamental data such as age, occupation, education level, household income, household electricity expense, number of household members, number of electrical appliances, receiving information, knowledge and behavior tests of electricity saving. The statistics applied in data analysis were percentage,
arithmetic mean and chi-square test. The research findings were as follow:

1. The majority of residents’ energy saving behaviors were at moderate level. Among these residents, most of them were female at higher than 46 years of age, had bachelor degree or higher. Most of them were government officials. Their monthly average household income was more than 30,000 Bahts. Their monthly average electricity bills were higher than 400 Bahts. The average number of household members were 1-4 persons. On the average, they have less than 7 items of basic electrical appliances.

2. Most residents gained information on how to use energy effectively and economically through television, newspaper, and radio programmes respectively. The sample residents had moderate level of knowledge and behaviors on electrical energy saving.

3. The results of chi-square test on the association between some factor and energy saving behaviors showed that energy saving behavior depended on age, occupation, education level, household income, and information on energy saving at 0.05 level of significance.
1. Introduction

Electrical energy is an important element in people’s living. Daily activities in personal life and at work require electrical energy at all time. Developing countries consume high level of electrical power. Thailand’s electrical energy consumption in 2003 was 106,138 GWh, an increase of 7.1% comparing to 2002, while business and industrial sectors growing at 7.0% and 7.9% respectively. During the same period, residential sector saw an increase of 5.8% and agricultural sector 18.7%. Thailand’s upcountry regions consumed 8.6% more electrical energy comparing to 2002. Business and industrial sectors consumed 12,605 and 33,872 GWh respectively, while residential sector used up 15,331 GWh, an increased of 5.6% comparing to 2002 [1]. Obviously, Thailand’s electrical power consumption in various sectors is increasing each year especially in the residential sector which is going on an upward trend year by year. With such an upward direction of electrical energy consumption in the residential sector, if the consumers especially those in urban areas of high level of power consumption, know how to use it economically, they could help reducing the country’s power consumption considerably. In addition to the reduction of electrical power consumption, conservation of electrical power would help resolving of environmental pollution problems. People should have proper economical behavior in power consumption.
This research was carried out to study power conserving behaviors in residential areas of Nakhon Ratchasima, Khon Kaen, Ubon Rajathane, and Udon Thani provinces. These provinces are located in the Northeastern region of the country and are having rapid growth especially in the Amphoe Muang (provincial principal district) of each province which is business area highly populated with very high level of power consumption. The research results can be used as guidelines for knowledge dissemination, and enhancement and planning for optimum electrical energy consumption in residential sector. This would help save the country’s expenditure on energy.

1.1 Research objectives

The objectives of this research were to study the residential electrical energy saving behaviors and to study factors influencing the same in Amphoe Muang areas of Nakhon Ratchasima, Khon Kaen, Ubon Rajathane, and Udon Thani provinces.

1.2 Scope of the research

The study of residential electrical energy saving behaviors was carried out on people residing in Amphoe Muang areas of Nakhon Ratchasima, Khon Kaen, Ubon Ratchathani, and Udon Thani provinces. Two types of variable were studied. Independent variables were age, level of education, occupation,
household average monthly income, average monthly electricity expense, members of household, number of household appliances, information awareness, and electrical energy saving knowledge, which were related to a dependent variable: electrical energy saving behavior.

1.3 Expected benefits of the research

To have knowledge in various behaviors and factors influencing residential electrical energy saving behavior in Amphoe Muang areas of Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces, and to use the information in the planning and enhancement of residential electrical energy saving campaigns.

1.4 Research hypothesis

Factors such as age, level of education, occupation, household average monthly income, average monthly electricity expense, members of household, number of household appliances, information awareness, and electrical energy saving knowledge were related to residential electrical energy saving behavior in Amphoe Muang areas of Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces.

2. Methodology

2.1 Population and samples
The population of this research was the people whose names appeared as customers applying for electricity with the Provincial Electricity Authority who resided in Amphoe Muang areas of the following provinces: 90,904 people in Nakhon Ratchasima, 90,114 in Khon Kaen, 85,655 in Ubon Rajathanee, and 84,059 in Udon Thani. Sample selection was made from targeted group population using lists of customers applying for electricity with the Provincial Electricity Authority. Calculation for the size of samples was based on Taro Yamane’s method with 0.05 level of error, resulting in a group of 398 samples for each province. Systematic random sampling was used by randomly sampling names from the lists of customers applying for electricity with the Provincial Electricity Authority in Amphoe Muang areas of Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces. 398 names from each province were obtained by picking 1 household from every 228, 226, 211, and 215 households respectively.

2.2 Research tools

The questionnaire used as tool in this research was divided into 4 parts. Part One contained questions on general information of the samples: age, occupation, level of education,
average monthly household income, average monthly electricity expense, and number of household members. Part Two dealt with information awareness: awareness of information concerning general situation of electrical energy, awareness of information about government’s policy concerning electricity consumption in Thailand, including how to buy, use, and maintain electrical appliances properly and with economization on power consumption. Part Three was an electrical energy saving knowledge test such as knowledge concerning electrical energy situation, state policy on management of electrical energy consumption, and knowledge about the use and maintenance of electrical appliances. Part Four, the final part, comprised questions regarding behaviors in electrical energy consumption in connection with making purchasing choices, use, and maintenance of electrical appliances.

2.3 Collection of data

Data were collected from samples through questionnaires mailed to them by post requesting the same to be returned by mail. Unreturned questionnaires were followed up by telephone calls. The number of returned questionnaires from Nakhon Ratchasima, Khon Kaen, Ubon Rajathane, and Udon Thani provinces were 385 (96.73%), 390 (97.99%), 388 (97.49%), and 395 (99.25%) respectively.
2.4 Analysis and interpretation of data

1. Answers to questions on general information of the samples contained choices as well as open-ended type in the event the answer was not given in the choices provided. Data collected were analyzed by percentage value then presented with conclusion.

2. Answers to questions on awareness of information contained choices and open-ended type in the event the answer was not given in the choices provided. Data collected were analyzed by percentage.

3. Electrical energy saving knowledge test contained 19 questions. Correct answers were given 1 point each and wrong answers 0 point. Points were arranged into groups according to the following criteria. High level of knowledge: higher than 75% (15-19 points); Medium level of knowledge: between 50% - 75% (10-14 points); and Low level of knowledge: less than 50% (less than 10 points).

4. Electrical energy saving knowledge test contained 15 questions with choice and open-ended types of answer provided. Data were analyzed collectively and points given according to choices selected for answer. For instance, 1 point would be given for electrical energy saving behavior, and 0 point for non-saving behavior. Analysis was carried out by percentage value. Points were arranged into groups according to the following criteria. High electrical energy saving behavior: higher than 75%
correct answer (12-15 points); Medium electrical energy saving behavior: between 50% - 75% (8-11 points); Low electrical energy saving behavior: less than 50% (0-7 points).

5. Analysis of independence between energy saving variables and variables of age, level of education, occupation, household average monthly income, average monthly electricity expense, members of household, number of household appliances, information awareness, and electrical energy saving knowledge, was carried out using statistical value of chi-square test.

3. Results and discussion

1. General information on samples -- the study revealed that the majority of the samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces, were female, with age of older than 46 years, at the percentage of 47.01, 60.51, 63.40, and 53.42 respectively. Next in importance were the age groups of 36-45, and 26-35 while the age group of less than 26 had the least number of samples. Most of the samples had bachelor degree or higher at the percentage of 43.12, 50.00, 51.81, and 67.08 respectively, followed by vocational/diploma, secondary, and primary levels of education. Besides, the occupation of the majority of the samples was government official, at the percentage of 38.96, 46.14, 40.46, and 54.43 respectively. Next in importance were private business,
state enterprise employee, private sector employee, housewife, and agriculturalist, in that order.

2. Economic and social information -- the study revealed that the majority of the samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces, had high level of household average income. Those having household average income higher than 30,000 baht were 37.14%, 48.46%, 46.13% and 48.09% respectively. Next in importance were the groups having household average income between 10,000 – 20,000 baht and 20,001 – 30,000 baht. The group having income of less than 10,000 was the least. In addition, it was found that the majority of the households having 1 – 4 members, at the percentage of 70.65, 75.90, 63.40, and 63.30 respectively. The number of households paying more than 400 baht for average monthly electricity expense was the highest in importance, at the percentage of, 72.47, 86.15, 88.40, and 79.49 respectively.

3. Awareness of information -- the study revealed that most of the samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces were at high level of awareness of information on general situation of electrical energy, state policy on management of electrical power consumption, and electrical energy saving, i.e., higher than 90%.

4. Sources of information -- the study revealed that samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and
Udon Thani provinces mostly acquired information on electrical energy from television medium at the percentage of 99.74, 96.67, 98.20, and 98.73 respectively. With regard to frequency of information awareness from television medium, the highest importance was daily, at the percentage of 56.88, 58.72, 59.79, and 58.73 respectively. Next in importance were once to twice a week, once to twice a month, and once in longer than a month, in that order. With regard to type of medium, next in importance were newspaper, radio, and magazine, in that order. The medium with least importance was exhibition. The level of information awareness of the samples from the 4 provinces through personnel medium was at high level. The highest importance was information obtained from colleagues, at the percentage of 35.32, 32.82, 26.80, and 30.13 respectively. Next in importance were family relatives, neighbors, and electricity authority personnel, in that order.

5. Dissemination of knowledge concerning electrical energy saving -- the study revealed that the samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces, needed more dissemination in order to have more knowledge on electrical power saving, to reduce household expense, to reduce the country’s purchase of fuel from foreign countries. The medium the samples needed most in knowledge dissemination was television, at the percentage of 62.34, 60.26,
60.05, and 69.62 respectively. Next in importance were training, magazine, journal, radio, newspaper, and leaflets, in that order.

6. Knowledge in electrical energy saving -- the study revealed that the samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces, had medium level of general knowledge in electrical energy and economy power consumption, at the percentage of 60.78, 70.77, 57.73, and 57.72, respectively. Next in importance were the groups of samples with high level and medium level of such knowledge, in that order.

7. Electrical energy saving behaviors -- the study revealed that the majority of the samples from Nakhon Ratchasima, Khon Kaen, Ubon Rajathanee, and Udon Thani provinces, had medium level of electrical energy saving, at the percentage of 74.29, 79.23, 52.06, and 57.72, respectively. Next in importance were the groups with high level and low level of electrical energy saving behavior, in that order.

8. The test for relationship between variables of age, level of education, occupation, household average monthly income, average monthly electricity expense, members of household, number of household appliances, information awareness, and electrical energy saving knowledge, and the variable of electrical energy saving behavior by statistical value of chi-square revealed that age, education level, occupation, household average monthly income, and knowledge in electrical energy saving
related to the people’s behavior of electrical energy saving at the 0.05 level of significance. This went along the same line as the study of A. Raksitanont [2] which indicated that age and household average monthly income related to electrical energy saving behaviors at the 0.05 level of significance. In addition, it was in concordance with the study of C. Saengthong [3] which indicated that employees in private organizations with different educational level would differ in opinion regarding electrical energy saving in daily life, as well as with the work of W. Therawongsakul [4] which pointed out that people with different level of education and different occupation would differ in their electrical energy saving behaviors at the 0.05 level of significance, and that knowledge concerning electrical energy saving positively related to electrical energy conserving behavior at the 0.01 level of significance.

4. Conclusion

This research concluded that the majority of the people in the Amphoe Muang areas of Nakhon Ratchasima, Khon Kaen, Ubon Rajathane, Udon Thani, had medium level of knowledge in making purchasing choices, use, and maintenance of electrical appliances. Next in importance were electrical energy saving behavior at high level and low level, in that order. In addition, they had medium level of knowledge in electrical energy saving in all four areas, i.e., knowledge in electricity situation and the
government’s policy in management of electrical consumption, knowledge in making purchasing choices of electrical appliances, knowledge in using electrical appliances, and knowledge in maintenance of electrical appliances. With regard to dissemination of knowledge concerning electrical energy saving, the majority of people required it to be more extensive for them to be better informed. Their most preferred medium was television and next in importance were training, magazine, radio, newspaper, and leaflets, in that order. Chi-square test revealed that age, education level, occupation, household average monthly income, and knowledge in electrical energy saving related at the 0.05 level of significance to electrical energy saving behaviors.

Most of the people had medium level of electrical energy saving behavior. It is therefore necessary to encourage more electrical energy saving behavior by public relations and dissemination of electrical energy saving knowledge which can be summarized as follows:

1. Knowledge concerning making purchasing choices of electrical appliances and in maintaining them should be disseminated especially that of refrigerator which is an appliance people lack knowledge of and understanding in its use and maintenance.
2. Knowledge dissemination should be enhanced via all kinds of mass media especially television, radio, and newspaper which are most accessible for awareness by the public.

3. Knowledge dissemination should be made to primary school age group through adult age group as electrical energy consumption is an important activity in daily life. It is necessary for everyone to have knowledge and understanding concerning economical and safe use of electrical energy.

4. Knowledge in electrical energy saving should be disseminated in simple form for easy understanding by seriously taking into account level of education, age, gender, and economic status of the recipient of the information.

5. Enhancement and campaigns for energy saving by the public should be carried out continually and regularly including organization of various activities to make them realize the importance of energy saving.

ABSTRACT

In the Middle Ages, with the advent of the Inquisition, there was a need for subterfuge. Some elements were quietly incorporated into Greek and Latin texts, but there were some items that needed to be visible to the readers. The question was: How does one put secret information in plain sight without giving that same information to the "enemy"?

Abraham Zacuto, the royal astronomer of Spain, used longitude and latitude tables for his message to the Mani in Greece. Ridicule was his vehicle. Cartographers had a more difficult problem. They needed to put accurate longitudes and latitudes, so that people who fled the Inquisition would land safely. They could not afford to use Zacuto's methods.

They, instead, used the cordiform map projection, then carefully placed that projection on the opposite side of 0 degrees at precisely the correct latitude and longitude. In order to preserve the information, they used Claudius Ptolemy of 150 AD as their vehicle, precisely as we, today, use Webster's dictionary. By pre-dating the information, the censor would not question the information. They would instead ridicule the visible distortions as created by those "ignorant" cartographers. The 50 degrees difference extended China into the Pacific Ocean is still considered an grave error by C. Ptolemy. This paper will correct that error.
Subterfuge during the Middle Ages took on many forms. The Waldseemüller map of Ptolemy, done in 1460, was just one form that was able to pass the censors of the Inquisition. I discovered this map towards the end of the 90’s. A magnifying glass helped with other less prominent details. From there I searched out what little was known of its history.

This particular map was in the possession of a special family. Their surname was di Ricci and they lived in Florence, Italy. Their most famous relative was Saint Catherine de Ricci, also known as Alexandrina de Ricci. She became a nun and was 67 (or 68) when she died. She could have been a mother, a grandmother, or an elderly aunt in the di Ricci family. Two encyclopedias give conflicting information about her.

The typical *Catholic Encyclopedia* version of her life is a text geared for children, for the faithful or for new converts. It does not have much in the way of facts, but when one reads the version found in the more practical-minded *Italian Encyclopedia* one can understand why the Church was reluctant to publish that version of the saint.
St. Catherine’s family came from a long line of Ghibellinos, who favored the German Emperor's rule, instead of the mandates of the Italian Pope. This may be one small clue as to why the family might have been called in by the Inquisition. The Atlas that contained this map may have been another reason.

During the time of the Inquisition, as in any state of oppression, there was a need for subterfuge. There were number ciphers, symbols described, not as a written description, but in the translation of the word for the symbol. The cartographers had a more difficult time. They had to make an extremely accurate map, so that those fleeing could escape safely, but they could not give the same information to those persecuting them.

On this particular map of Claudius Ptolemy, the land called Arabia Felix was very visible with a small cordiform projection inserted near the Oman Peninsula. But as usual, the Red Sea area, so faithfully colored in so many earlier maps, (here in the area where the red and white islands are located) was now in a new location, south of the Arabian Sea or Sinus Arabicus.

There was no red color that accompanied the change-over; it is just a text written in the middle of the sea made darker by the addition of a violet/blue color that seems to have been added, but only seen as a possible addition when the colors were lightened with Photoshop. To those pouring over this map, it is not even noticeable. Even though I had discovered the 1460 map twenty years ago. I had never before now noticed these new words.
Since the First Crusade, an effort had been made to find the “Center of Power” in the Middle East at Damietta, on the Nile River (The “Blue” River). They did not find it on the First Crusade and did not try again until before the Eighth Crusade. Between the two crusades and afterwards, there were many people who were tortured for information about the Hidden World of Ptolemy, called Arabia Felix. At first the accused were called heretics, then later, others were said to have dealt in necromancy, or “speaking with those who had died.”

It was in this era of oppression that the Ptolemy maps found in Europe were collected and revised by the King of Castile, Alfonso X, El Sabio. As his main workshop, he used the University of Toledo. Books of Wisdom of Astronomy were edited by Alfonso X, El Sabio, when he revised the Ptolemy astronomical system. Alfonso was never able to spend long periods of time in Toledo, but he must have often consulted his scholars and translators [there] when they were working on Libro del Saber de Astronomia. Alfonso “. . . caused diagrams and charts to be placed in some of his books and described in great detail how these were to appear as to form and color . . . the King’s instructions were carried out to the letter.” The university was later accused of teaching the “Black Arts” of necromancy and witchcraft.

Probably those who fled by ship were able to triangulate their new location and send the coordinates to Alfonso for his work. Because they had already been certified by the Inquisition as “having died on a pilgrimage,” when their correspondence was found in the universities with their names and dated AFTER their deaths, the schools got into very serious trouble, being accused of necromancy.

When the monastic prisons were filled to overflowing with heretics, they were renamed “witches.” In this way, they were incarcerated (and interrogated) in the civil prisons instead of the over-stuffed monasteries. Apparently, St. Catherine de Ricci was caught up in the search for Arabia Felix, a place proven (through the Crusades) to be somewhere else.

However, the 1460 version of the Ptolemy Atlas was in her home, possibly as a relic of bygone days. She was said to be a seven year old child when, from October, 1529 to August, 1530, Florence was besieged by Imperial army under direction of the Pope. Alexandrina appears to be the mother. It is said that the young daughter entered
the convent in 1535 when St. Catherine was thirteen. Then, even though she was horribly burned according to one account, she died as an old lady in 1589 or 1590 when she was 67 or 68 years old.\textsuperscript{10}

In the Middle Ages, when a blameless person died because of an Inquisition proceedings, the Church had to guard against any public outcry. They accomplished this by claiming that person was a saint. However, as a saint, she was also supposed to have had an incorruptible body. According to the records, this person was burned on a grid. The result was her burns were so severe that the fever they produced could be felt by the any one who passed by her cell.\textsuperscript{11} It is unlikely that the person burned was the same as the saint with the incorruptible body. In addition, the slight change in the spelling of her name would never connect her to the above map.

An incorruptible body after death is usually attributed to a “foreign elixir of longevity,” a euphemism for the poison arsenic. Those who ingest arsenic in very small doses over a long period of time such a Napoleon,\textsuperscript{12} Charlemagne\textsuperscript{13} and the emperors of the T’ang dynasty\textsuperscript{14} in China retained their youthful smooth skin and normal hair color for years longer than usual. Napoleon and the boy-emperors of China did not live very long because they, being young and impetuous, refused to do what the benefactors who brought them the “elixir” told them to do. Only Charlemagne listened to the advice of the travelers and lived to be an old man. The exhumed bodies remain intact, except for the soft tissue of the nose and they give off a sweet odor of almonds. In this manner, it proves to be is an excellent case for a miraculous event.

The information given between the two encyclopedias, actually infers that two different women were involved. The first, the mother, probably a postwar victim who was a foreigner and ingested arsenic as a beauty aid for many years. She would have later become the recluse in the Dominican convent, and the person who actually died of old age. The other, the young daughter, probably tortured according to the Inquisition procedures,\textsuperscript{15} in order to obtain information from her mother, the remaining parent.

At the moment, however, it is all supposition based on the fact that the 1460 map of Ptolemy was probably in the possession of the di Ricci family before the siege of Florence. The Pope probably attacked Florence looking for something that was known in the Florentine merchant communities. Since it was around 1530, and Columbus had already discovered the Americas without finding the fabled land of gold, the search by torture continued.
A cordiform projection of the Of theeast coast USA

Let us suppose a bit longer. Anyone under torture could use the available maps (similar to the 1414 map or that of 1460) and point directly to the area in question— the cordiform insertion (shown here) on the Arabian and Persian coastlines. If they had been asked about the Rivers of Cities of Gold they would not have lied. They died telling the truth as they knew it.

The di Ricci family may not have known about the secret configuration of the map. When asked about Arabia Felix, the family members (father, mother, or daughter) could only point to the location on the map. Possibly, the father and mother may have been questioned. But since they knew no more; torture of the child would have been the next step.\(^{16}\) Apparently, the daughter was burned over a grid. The father could have died either from his own tortures or from stress. That would have left the mother and daughter. The mother, being unable to say anything more about the map than was already known, was imprisoned in a convent with the burned child. It was probably hoped that the mother would break down under the stress of watching her child suffer from the burns.

The burns that festered, producing a burning fever that could be felt outside of the cell, had to be fatal, even though the child was strong and survived longer than was thought possible. After she died, the mother, in her sorrow, had little recourse except to spend the rest of her life in the Dominican convent. It is claimed by the Church version that St. Catherine received the stigmata—the wounds of Christ on her hands and her feet.\(^{179}\) Did she receive the stigmata—the same wounds that Christ suffered on the cross? Or were they created? Such visible signs are no longer easy to forge. The last known saint to have such attributes was Padre Pio in Italy,\(^ {18}\) but they were discounted as blood from a chicken.\(^ {19}\) But enough of suppositions.

The 1460 Ptolemy world map by Waldseemüller was a special map with extra information embedded in it. It has the same type information as the other Ptolemy maps—the cordiform projection of the east coast of North America, but it does not show the Red Sea in color as some of them do. One thing positive, is that anyone who had any kind of experience with the maps and manuscripts from the Middle Ages and the Renaissance Period, had to have strained their eyes to the extent that any reading of small letters would have been a problem.
The monks and prelates, who poured over the di Ricci manuscript, probably had such a problem since glasses were not readily available during those years. Nevertheless, there was nothing found, even with good eyesight. Eventually, it was collected for the archives of cartography and was called the *Ptolemy Atlas of the World*, one of many that were “incorrectly” drawn, according to those who probe into such details. The *Atlas* and all its enlarged sections gave no new information. Since the Inquisition was already in the New World, the monks would not have been overly enthusiastic about these maps of the Middle East. What they needed to know was the location of the seven cities of gold, or other fabulous places that by that time was known to be somewhere in the Americas.

The area around Arabia created an extra-long-extension of the country of China. Both were the two main problems noted by cartographic researchers. Ridiculed for its mistakes, the *Atlas* was kept as a complete set of exceptional map-making art when such skills were considered to be very crude and inaccurate.

The actual configuration of the Persian Gulf

Then, recently, an author who wrote about Africa included the 1460 map of the Arabia Felix peninsula from the *Ptolemy Atlas* in his own book. It was to show the faults of ancient cartography and praise the imagination of those who drew them so badly. Years passed. Then, someone asked a question, “What did Columbus know about Ptolemy?” I did not know the answer.

I came across the book with its enlarged two-page spread of Ptolemy’s *Arabia Felix*. Pretty dull stuff, and, having read the book, I knew it had no real information about Ptolemy himself. What was shocking to me, was that
the eastern coast of North America was recognizable. But only because I had just visited my daughter in Maine that year. That was the first part of the map I had recognized.

I immediately sent off to the New York Library where the manuscript was stored and asked for a transparency of the Arabia Felix segment. I did not need the whole map of the world to know what I had found. Even so, the magnifying glass told me even more about the map. There are two words in black ink with a longer text painted in white or cream color on top of the very dark blue of the sea, at first glance, could have related to little waves in the sea. However, it was not to be. The magnifying glass told a very different story.

The map of Arabia Felix, at the beginning of this chapter, is supposed to be a map of the land west of India that is located west of the Pacific Ocean. The segment shown here contains a corner of the larger map with a four-line notation about the area near seven small islands, three of which are painted red. Her, it harks back to Zacuto's backward three in his inaccurate list of longitudes and latitudes.

As stated above, the notation was written on a deep blue sea in a cream colored paint and contains two words written in black. Was it supposed to represent waves lapping at the shore? Unlikely.

Yet why the difference in colored inks? The Sea here is called “Sinus Farhalites” which apparently refers to the Persian “Far” “Phar” or “Glory.” The two words were a bit difficult to read because of the dark blue water. The censors were probably not looking for anything referring to Persia they already
knew about that area so there was no reason to translate the rest of the text. Even if one does not know any other language than English the text is easy enough to translate assuming there are some misspellings there. The text reads:

**Sinus Farhalites in quo Colymbusis primer super utribus navigatat.**

Now, it is well known that Columbus never sailed to India. He never crossed the continent of North America into the Pacific Ocean. But here is a statement that tells anyone reading it, that Columbus made his first voyage into this area, near the Persian Sea where the Phar (Glory) fell near the Red Sea. It appears to legitimize the Persian coastline.

Because Colymbusis was spelled differently, it could have been a reference to another person or place in Persia or Arabia, now unknown. Yet, the configuration of that section of the Arabian peninsula of Oman and Persia was also in agreement with Martin Behaim’s globe of 1492; a projection that apparently was known to Columbus before he sailed that year.

The map projection on Martin Behaim’s globe can only be legitimate if the area in question is the Yucatan and Columbus had sailed into the Caribbean Sea on his first voyage. It is known that Portugal was to be offered the Indian Ocean trade after lengthy negotiations in 1494, before Columbus was reported to have set foot on the continent of the Americas. The Red Sea or *Mar Vermejo* upon which Ulloa and Hernan de Cortés sailed in 1539 is just around the corner on the west coast of Mexico. This is all well and good. But it does not really tell us anything, except that Columbus made his very first voyage into the Caribbean, nowhere near Santo Domingo.
A text that stated the Friars, in a different ship during that same voyage, made landfall first: “And because the caravel Pinta, was the best sailor and was going ahead of the Admiral, land was discovered by her people and the signs which the Admiral had ordered were made.” Nevertheless, if it was the Friars that made the first landfall, and since Columbus carried the Green Cross of the Inquisition on all his ships, the Church would have declared they were the very first to touch land, even though Columbus was allowed the privilege of having discovered it. Even so, the monks, were probably also sailor/prisoners of the Inquisition who volunteered to go on the other ships.

Investigating the Catholic Encyclopedia, again online, I read the story of Christopher Columbus. It said all the right things, except for one small detail: It is written: “Hence the admiral brought the news of the existence of the American continent to Europe as early as 1493.” This may confirm the Pope knew that Church envoys, not Columbus first set foot in the Americas! What an interesting notion. It may be the reason that the Pirrus de Noha map of 1414 was also online from the Vatican Library.
Yet, the Church seems to have even more information than that which I found in a 1515 French book called *S'ensuyt le Nouveau Monde* It is a book full of *le dit's* (translated “it was said” or “he said”). It contains all voyages from Vespucci and Cadamosto to Columbus and Prejoseph. There are little tidbits of information in the text that could only have come from a joint effort, that all sailed together in this the first voyage to the Americas. More than one letter was written after the voyage to impress the King and Queen that they had indeed, gone straight to the strange land that was not to be spoken about nor identified. The information found there are part of the New World findings and the myriad misconceptions of the known world.

First: it predisposes an obvious change in the calendar, especially since Vespucci returned home in 1455 and Columbus, in 1493. I did not have to look far for that confirmation. Both Richard Major in his book about *Prince Henry the Navigator of Portugal* and John Esten Keller in his book, *Alfonso X, El Sabo*, both described the Spanish Era as 1314 which was according to the Christian computation, was the year 1276. The year difference (38 years) added to 1455 equals 1493, the same year that Columbus's first voyage was thought to be ended. So, with that for a beginning, the next segment has other details from *S'ensuyt*.

Topic area: Social work, psychology  
Presentation format: Paper Session
Asperger’s Syndrome: A family affair

Asperger’s Syndrome (AS) is a pervasive developmental disorder on the autism spectrum. Children with AS often do not look any different than neurotypical children although AS is characterized by a host of social, behavioral, and linguistic abnormalities making it difficult for these children to negotiate social interactions. Anecdotal evidence suggests that the impact on the family system of raising a child with AS is profound but there is little research available that examines this impact. The purpose of this qualitative study is to explore the perceptions, coping strategies, and family functioning of parents of children with AS, and how existing support systems impact their family functioning. A purposive sample of thirty parents of children with AS drawn from community-based organizations participated in focus group discussions. Common themes in the focus groups were: (1) A profound sense of isolation, ostracizism, sadness and fatigue; (2) A hyper-vigilance surrounding their children’s behavior and safety; and (3) Deep worries concerning their children’s future. This session will examine how parents coped with these issues, what interventions they found helpful, and what services they wished were available to them.
Privatization process in Mexico: prospects and effects in economic development

Abstract

This paper is aimed to analyze historical development and background of privatization in Mexico, prospects of the privatization program in Mexico and effects of the Mexican privatization program. It is safe to conclude that changes of ownership through the privatization process in Mexico has led to the foreign investors to own the most profitable former state owned enterprises which under the spirit of globalisation of business has terminated any sentiment of national capitalism. Also, it is concluded that the policy of privatization in Mexico has not achieved the aims related to increase economic growth and development, but has contributed significantly to become a subsidiary economy owned and managed by transnational and multinational corporations. However, this aim is politically neither desirable nor feasible for the economic development of Mexico. If good performance of privatization is required, actually it is successful only if state-owned companies are so well managed that there is no need to privatise.

The political economy of privatization and regulation

The international wave of privatizations in the last twenty two has been reflected in the Mexican economy. In the broadest sense, privatisation refers to the introduction of market oriented institutional reforms, which includes the sale of publicly owned assets as well as the deregulation of product markets. Privatization is when the ownership of production units changes from public to private. The question to any privatization is how it affects competition as the key to efficiency.

Therefore, ownership matter for efficiency. The argument that literature favours private ownership over public ownership (Megginson and Netter, 2001) is not consistent. Willner (2001, 2003a) finds not difference and concludes that public ownership may even be superior in water, electricity and insurances, whereas some labour intensive industries such as refuse collection and bus transport tend to be cheaper under private ownership.

Economic theory sustains that changes in ownership lead to performance improvements where there are appropriate changes in the competitive or regulatory environments (Parker, 2004). A state owned company that have good financial performance become more likely to be privatised An economic appraisal of privatisation demonstrates that the
roles of competition and regulation may be crucial if ownership change is to have reliable
efficiency results (Kay and Thompson, 1986; Vickers and Yarrow, 1988; Martin and
Parker, 1997)

State enterprises ownership is associated with cross-subsidies and ‘no undue
discrimination’ clauses that lead to uniform pricing (Parker, 2004). Where markets
become more competitive after privatisation, it might be expected that prices would move
closer to marginal costs, implying higher allocative efficiency. Privatization, when
coupled with competition, is expected to lead to prices more closely related to the
marginal costs of supplying different user groups. However, this depends upon the
pricing strategy followed under state ownership (Parker, 2004:10).

Principal-agent theory and public choice theory provide a powerful theoretical rationale
for privatisation (Boycko, Shleifer and Vishny, 1996). Privatisation often requires
regulation and hence an additional agency problem (Shapiro and Willig, 1990/2000;
Laffont and Tirole, 1991). Principal-agent theory suggests that in privately-owned
enterprises management faces higher incentives to maximize productivity and to drive
out waste (De Alessi, 1980; Bös, 1991; Boycko et al., 1996). The theory of incentives
critics the state ownership of firms behaving as “a weak and erratic
“shareholder”, hesitating between the maximization of short-term financial or political
benefits and a “laissez-faire” approach supposed to let the state firms develop as they
wished, in spite of the bureaucratic control of their activities” (Berne and Pogorel,
2004:4).

Under the principal agent framework in order that investments materialize it is necessary
the development of safeguarding institutions and regulatory agencies to prevent the
engagement of opportunistic behaviors. Public choice theory maintains that within
government, as elsewhere in the economy, self-interest is the dominant motive, with the
result that state ownership is associated with empire building, gold plating of public
investments, over-manning and, in general, economic waste (Niskanen, 1971; Tullock,

The design of regulation has two choice variables or components for governments
undertaking public sector reforms which are limited by institutional endowments of the
Mexican country. Heller and McCubbins (1997) called these two variables as political
stability and price risk. Levy and Spiller,(1996) denominated as regulatory governance and
regulatory incentives Political stability is defined as a situation with minimum risk that
government would introduce changes to the way it treats investment. Regulatory governance
refers to “all the mechanisms that a society uses to restrain government discretionary
moves and to solve conflicts between firms and regulators” (Abdala, 1999:3). Price risk
is considered in same terms as the structure of regulatory incentives which “involves the
specific norms related to price regime, subsidies, competition policy, barriers of entry,
interconnection rules, etc.” (Abdala, 1999:3).

The reform of regulatory governance include the institutionalized framework of
regulatory agencies, the delimitation of their independent powers and mechanisms of
financial autonomy, arbitration of controversies, access to competition in liberalized markets, etc. As factor closely related to governance culture to explain growth and success of state owned companies, experimental research emphasises fairness, reciprocity and intrinsic motivation in explaining individual behaviour, collective action and cooperation (Fehr and Schmidt, 1999; Fehr and Fishbacher, 2002). Also experimental research emphasizes organizational design supportive of intrinsic motivation (Fehr and Fishbacher, 2002). Kaufmann et al. (2003) compares observable governance indicators to explain growth, such as accountability, political stability, government effectiveness, regulatory quality, rule of law, and control of corruption, (Jalilian et al., 2003).

Development of safeguarding institutions must accompany the regulatory reform and privatization of utilities because asset’s specificity and the nature of tradability of services supplied.

Transaction costs political economy are the result of institutional design and have some applications in privatization processes. Privatization reduces the structure of costs through more flexible mechanisms of labor management, production and distribution. Economies of scale and fixed costs in the production of public services have become a more important factor in the cost function. Privatisation has relatively minor impacts on R&D costs and taxes and deregulation has a major impact on marketing and commercial costs (Berne and Pogorel, 2004).

The welfare benefits of transferring ownership from state owned enterprises to private investors of some utilities that have natural monopoly components, such as telecommunications, may not be large.

**Historical development and background of privatization in Mexico**

Mexican economic nationalism emerged as a result of promoting public and private Mexican capital to avoid unwelcome foreign investment, mainly by the United States. Nationalisation was ruled out for ideological and practical reasons. State-owned companies in Mexico were offshoots of political nationalism. Nationalised companies were at the core of the Mexican state enterprise model based on economic nationalism. The Mexican State was characterized by an historical distrust of capitalism and a belief in the ability of the government to intervene and regulate economic affairs through its explicit constitutional mandate (Grier and Grier, 2000: p. 245).

Public ownership can be a substitute when capital markets are underdeveloped, or investors too short-termist or risk-averse (Rees, 1984) but public ownership has been criticised for dynamic inefficiency and high costs. In Mexico, public ownership has dominated public utilities sector, infrastructure industries manufacturing and banking as well, although the Mexican state found opportunities of expanding to sectors where public ownership was not the only alternative. Mexican industry became a rent seeking culture protectionist and depending on tariffs, quotas, state purchasing and other forms of
state aid. This dependency on the state and on politicians was institutionalised for economic benefits during the thirties.

However, from the 1930s and until the 1970s a model of import substitution industrialization (ISI) favored private Mexican investments and was also believed to benefit the people. Industrialisation process of Mexico was an economic policy to create and protect new born industries of needed goods and services through the promotion of benefits such as fiscal and tax exemptions, subsidies, providing access to credits and loans with reduced interest rates, etc.

The Mexican state owned enterprises sector was larger because it was established to contribute to the industrialization process due to scarcity of domestic private venture capital and the unwelcome foreign investors always ready to take over the most profitable manufacturing sectors, as it was established the limits in Constitutional provisions. The system of political patronage of appointments to state owned enterprise boards was based more on political loyalty rather than commercial ability, increased the political clientalism and reduced the independence of the state owned commercial enterprises which with politically appointed boards and weak management were heavily unionised by public sector trade unions.

State owned enterprises in Mexico became over time identified with dependency culture, subsidy rent seeking, regulatory capture, high costs, producer dominance and indifference to consumers. The Mexican public sector enlarged the number of publicly owned corporations. In 1982 state owned enterprises produced 14 percent of gross national product (GNP), received net transfers and equal subsidies of 12.7 percent of GNP and represented 38 percent of investment in fixed capital. There was no provision to regulate the market of state owned enterprises which were treated as an end in themselves to provide jobs for an increasing work force but faced conflicting roles of owning the company and regulating the market. Higher social benefits, considerations of social welfare and public service rather than private returns on investments and slow enterprise formation despite good profit opportunities might also explain why state-ownership was included among the growth strategies (Miettinen, 2000; Geroski, 1995).

The new market orientation is a response to the increasing economic pressure on the welfare state in late 1970’s. The 1980s was also a decade of reassessment in Mexican national economic policies. State spending was not anymore considered as an engine of economic growth but to have a negative impact of competitiveness. Therefore, the Mexican economic model of development changed from the closed economy to an open economy with emphasis on competitiveness in the global economy during the 80s.

The Mexican privatization process began in the wake of the Mexican debt crisis in 1982 as a response to pressures from creditors, but since then, there has not been any specific privatisation program in Mexico, in such a way that each case has been treated according to contingencies. Therefore, after the 1982 crisis, Mexico entered into a painful, distressful, and controversial period of state restructuring when the government signed a Letter of Intent with the International Monetary Fund (IMF), which conditioned IMF
lending on privatization and other economic measures of austerity in public spending and market liberalization, aimed to offer better terms for foreign investors and to promote exports. Neoliberal economic reforms, also known as the "Washington consensus", entail public policies that are directed toward tight fiscal discipline, privatization of public sector organizations in order to downsize and achieve balanced budgets, deregulation and lowering of trade barriers...

The most important structural changes experienced by the Mexican State were linked to economic policies congruent with the new global environment. Some of these changes include the restructuring of productive plants, privatization of the *ejido* (communal property), improvement of public finances, modernization of education, privatization of state enterprises, negotiation of external debt, deregulation of the economy, commercial and financial liberalization and greater foreign investment. The changes included: economic reorganization; national market openness; elimination of commercial barriers; elimination of price controls and subsidies; privatization of public enterprises and state property; reduction of social policy expenses; free money exchange, and also wide political reforms and administrative modernization. It abandoned the import substitution model and called economic intervention in the state into question.

Since 1982, nearly 1,000 state-owned enterprises out of around 1,2000 have been sold off, since. The reasons for the privatizations seem to have been largely fiscal. International Financial Institutions used the leverage of foreign debt to require among other changes in the Mexican economy designed to encourage foreign investment, the privatization of state-owned enterprises which include, airlines, airports, ports, railroads, banks, telephone services, oil and electric industries and so on. The wave of privatization in Mexico implied transfers of property rights, control, profits and liability of state owned enterprises from the state to private shareholders. Ownership of state owned companies by taxpayers was a theoretical rather than negotiable property right. The Mexican government has gradually reduced state intervention and its role in the management of the economy over the last 22 years with the shift from a policy of import substitution to the implementation of policies of trade liberalization and export promotion.

Since then, the Mexican government has pursued a policy of privatisation, selling off Telmex, the national telephone company, the banks, steel companies, and numerous other industrial and agricultural enterprises. Mexico also has pursued a policy of deregulation, reducing or eliminating bureaucratic red tape for numerous processes. As Berne and Pogorel (2004) contend, the existence of competition makes public management very complicated.

The Mexican privatization and divestiture process of more than 1,000 state owned enterprises in Mexico started in the wake of the debt crisis in 1982. The implementation of the privatization program was part of the arrangements that the government of Mexico had to obtain loans from both the World Bank (WB) and the International Monetary Fund (IMF) with the specific goal to earn foreign exchange through the promotion of exports and foreign investments. In a sense, no specific privatisation program or plan was settled...
down rather than a policy evolved in terms of the government’s ability to sell off the state owned enterprises.

In 1979, the technocrats in cooperation with Dow Chemical envisioned a North American Energy Project that would connect the electrical grids of Mexico, the US and Canada.

The main thrust of the reforms encouraged in Mexico was the development of a competitive, broad-based export sector of nontraditional goods. Mexico joined the General Agreement on Trade and Tariffs (GATT) in 1986 and became an exporter of manufactured goods. The strategies adopted for the design of the Mexican State, as it was for other states, was reduction of state structures and facilities, privatization of state owned enterprises, and economic deregulation.

The decision to privatize Telmex was made in 1988 presidential campaign, a profitable and wealthy state-owned company. "Telmex was chosen partly for its symbolic importance and partly as a potential source of a sizable amount of revenue. The privatization of Telmex would dramatically serve notice that Mexico was serious about privatization and the development of the private sector." (Tandon, Ch. 16, p. 3).

Vast programs for the privatization of public enterprises in Mexico had been successful, to a certain point, in ameliorating the economic intervention of the State. Mexico ranked second in privatization in Latin America during the decade of the nineties when the government transferred to private corporations assets that amounted to 31,458 million dollars, which represented 20.4 percent of the total sales of state owned enterprises in Latin America. Privatization reached 3,160 million dollars in 1990, increased to 11,289 million in 1991, and totaled 6,924 million dollars in 1992.

Before the privatization of Telmex, the government drastically raised the prices of telephone services to consumers.

According to two annual reports of The World Bank (1989:150, 1990:150) the provision of a US$ 500 million loan to Mexico was made in 1989 to reduce the “heavy burden Pes (public enterprises) impose on the economy” through their privatization and deregulation program. In 1990 the government eliminated the indirect tax on telephone services and the remained taxes were absorbed into the prices and transferred to the consumers. (Tandon, p. 23-24)

After the Mexican government official announcement to sell 51 percent of voting stock of Telmex, in December 1990 was sold for a total price of US$ 1.67 billion to the winning bidder Grupo Carso who bought 51 percent of the stock sold. France Telecom purchased 24.5 per cent and Southwestern Bell the remaining 24.5 percent. Additional shares owned by the government were sold in 1991 and 1992. The Mexican government owned 56 percent of total Telmex’s stock which was sold on the total amount of US$ 6.2 billion. The remaining 44 percent was publicly traded. Another loan of US$ 22 million in technical assistance from the World Bank was provided to the privatization of Telmex according to The World Bank (1989:150, 1990:150).
After privatization of the Mexican state-owned telephone company in 1990, the price of Telmex’ stock increased due in part to the increment of consumer prices and to a questionable improved efficiency. A report from The World Bank in 1992 "the privatization of Telmex, along with its attendant price-tax regulatory regime, has the result of ‘taxing’ consumers -- a rather diffuse, unorganized group --and then distributing the gains among more well-defined groups, [foreign] shareholders, employees and the government.” (Tandon, p. 39) The report estimated that the consumers were worse off by 92 US$ 33 billion, although the analysts of the report predicted that consumers would benefit from reduced prices in the long run, projection that has not been accomplished until today.

Foreign investors captured 90 per cent of the net benefits from privatization and gained 67 trillion pesos while domestic shareholders 43 trillion pesos, employees 23.5 and government gained 16 trillion pesos. A 10-15 per cent dropping in prices in international long distance service mainly due to competition of foreign telephone companies abroad México, Telmex increased the prices of national long distance in the same percentage in 1996. This trend has continued and it is likely to continue. Telmex’s monopoly in telephone long distance services ended in January 1997 with the attraction of the interest of USA based telephone companies to form alliances with Mexican investors setting their own prices while entering to the national market. Rural telephone services will continue subsidizing by the government despite the pressure to keep down public expenditures from the international financial institutions.

In 1991 took place the Mexican bank privatization. It has been described as a successful program of privatization because its clear objectives, transparent and credible procedures adopted (Barnes, 1992). However, lack of legal and regulatory framework that shadowed the technical process were, among other, causes of the banking crisis that had to deal the financial system in 1994, and needed to re-privatize at a greater cost to the taxpayers. as Unal and Navarro (1999) contend. In order to increase and broaden the quality of the financial services available to the public, Mexican banks were re-privatised

The privatization model adopted by the Mexican government was to sell the banks one at a time to maximize returns, expecting increasing interests and thus, higher prices. Although the program designed was transparent and effective to privatize the banking system in México, it was not sufficient to ensure a sound and safe financial system. The buyers of the banks and other financial institutions were mainly stock brokerage houses. Privatization and regulation of the Mexican banking system resulted in the creation of financial conglomerates with banking, insurance, leasing, factoring, money exchange, stock brokerage, mutual and pension fund operations. Husted and Serrano contend that the financial and marketing synergies were rather high since the banks acted as holding companies and were a sure source of low-cost capital for the other financial entities.

The newly privatized banking system operated under outdated regulatory system already dysfunctional, as well as the set of supervisory agencies incapable to implement and enforce new regulations and rules. The privatisation of the banking system brought mixed
results for the Mexican economy. According to Husted and Serrano (2001) returning private ownership and management to the banking industry was the good news, but unfortunately, very high prices were paid for the banks, which inherited problems from uncollected loans. The already private banks needed significant infusions of financial resources to cope with their problems of bad debt and with the financial crisis of 1994, when the federal government intervened, but without renationalising the banking and financial system.

In reality, the privatization of the banking system into financial groups emerged from the “steam” and complicity among investors and politicians who took advantage of international organizational finances channeled to rescue Mexico from the debt crisis. However, their differences in crisis management took them into highly indebted economies, which had the opportunity of transferring charges to society. Still now a days, taxpayers are supporting the burden of the financial crisis of 1994 caused for the lack of a well designed legal and regulatory framework to be enforced during the privatization process of the banking system.

In 1992 foreign companies were allowed to build and operate energy plants in México so long as they exported the energy produced or sold it to the Federal Electricity Commission. The same year, the Federal Electricity Commission and the Power and Light Company halted new construction of power plants.

In 1992, Labour organizations opposed and delayed the privatisation program for both pensions and health care, but in 1995 were only able to partially stop or delay such reforms.

The government of President Zedillo privatized airports and railways between other important sectors. In 1996, labor unions, new social movements and civil society joined together to protest the privatization of the Mexican state-owned oil company Petróleos Mexicanos. Oil and electrical industries were not included in negotiations of NAFTA.

In 1995, it was partially privatised the Mexican public pension system provided by the IMSS for private sector workers, but the actual implementation was delayed. On July 1997 the pension and retirement system in Mexico was privatized and workers were allowed to deposit their pensions along with employer contributions in their own accounts. Privatisation of the public pension system included a shift from a defined benefit to a fully funded, defined-contribution market-based pillar and based upon privately administered individual accounts. This new system is based on individual sovereignty as a notion opposed to solidarity, notions that get lost in rhetoric and ordinary Mexicans do not understand how this affect their lives. The shift toward privatisation of pensions may also perpetuate stratification if only certain public pension schemes are included in reforms.

The Mexican pension reform have entailed a shift of pension and retirement responsibilities from the state to the market. Under this new system, individuals’ private accounts are managed by private pension fund companies know as “afores” which invests
the money in capital markets. The privatization of the pension fund system, motivated Mexican financial institutions to develop strategic alliances with their counterparts from all over the world in order to acquire managerial expertise and capital. (Husted and Serrano, 2001).

According to Vásques, Director of the Project on Global Economic Liberty at the conservative Cato Institute, this privatization “differs from previous Mexican privatizations because, at least in theory, it does not intend to generate revenue for the state. Instead, it seeks a laudable goal, admittedly one that politics already appear to be compromising: turning Mexico into a country of property-owning workers.” (Vásquez, 1997). He argues that this is revolutionary concept in Mexico, a concept that again gets lost in rhetoric.

On the other hand, Dion () concluded that the pension reform never addressed the gender impacts and further erodes social citizenship rights, especially those of women. The reform resulted in a net deterioration in the welfare of women in Mexico at retirement and predicted that the reform likely increased the dependence of elderly women upon family networks for their welfare. Since women generally have a disadvantaged position in the labour market in terms of participation and wages, this shift in emphasis to market provision of pensions is unlikely to benefit women.

In the case of the electrical sector, the first time that the privatization scheme not succeeded was when Zedillo proposed in 1999 privatization of electricity, the labor union formed the National Front of Resistance to the Privatization of the Electrical Industry which confronted the neoliberal reforms. The formed movement hosted an international conference and brought delegations, non governmental organizations, union representatives, political parties and academics from other countries, the National Association of democratic Lawyers (ANAD), the Worker’s University of Mexico (UOM), the Party of the Democratic Revolution (PDR) a leftwing party, among others. Finally the movement of resistance defeated the privatization scheme of the electrical industry.

The year in which the state recorded most privatization was 1991 with a total of 11,289 million dollars, while in 1998 Mexico the lowest was 999 million dollars. By June of 1992, the Mexican government had privatized 361 out of approximately 1,200 enterprises owned by the state. Privatization during 1993 represented 2,131 million dollars. In 1996 it increased to 1,526 million dollars, in 1997 to 4, 496 million, and in 1998 decreased to 999 million dollars. A report from the World Bank states that between 1990 and 1998 privatization of public enterprises reached a total amount of 154,225 million dollars, an amount only less than the balance of the total external debt of Mexico which in 1998 was of 159,959 million dollars.

Still more, there is a connection between Mexican government’s scheme of privatization with Enron. 64 subsidiaries of Enron to operate in the Mexican power market, from which some executives are advises on energy policy. On April 4, 2002, Enron Energia Industrial de Mexico in partnership with Vidrieria Monterrey and Vidrieria Guadalajara
(two big glassmakers), Grupo IMSA, (a steel and autoparts giant), Industrias Whirlpool and other big Mexican companies received a license from Mexico's Electricity Regulatory Commission to build a plant. Intergen Aztec Energy is a partnership between Bechtel Enterprises and Shell Generating Ltd, built a plant near Mexicali. Sempra Energy Resources is an energy maquiladora that built another power station near Mexicali. Its 600 megawatts will all be sent to the US, and the gas for its boilers will come from the US in a Sempra-built pipeline. "These are the same companies that robbed and defrauded people in the US," Bob Filner, San Diego Congressman, told the daily La Jornada being critical of the Sempra and InterGen border plants. "The question, therefore, is why should Mexicans trust them not to do the same here?"

Carl Wood, member of the California Public Utilities Commission also warned of another danger -- that the swings of the market could bring about manipulated shortages and periods of extremely high prices, as they did in California. "Mexican industry might not be able to absorb those price increases, nor raise prices on its own products in the world market," he explained. "Price spikes in electricity might therefore cause industrial activity to stall." He called the US companies behind the proposal "the same old gang of thieves." (Bacon, 2003)

In May 2002, the Mexican Congress has passed a resolution opposing any changes in the Constitution to make privatization possible, One of the principal arguments for the privatization plan is that there is necessary to make amendments to articles 27 and 28 of the Mexican Constitution to legalize foreign investments that already exists in the energy sector, although it is clear that industry of the energy sector can be self-financing if it weren’t for the government’s policy of disinvestment. An introduction of a bill ban the increasing 10 per cent of current generation done by private companies.

In a comparative perspective of privatization programs advancement between Mena countries and Latino American countries during have been developed by Godstein (2003) where can be inferred several points. First, latin American countries have advanced more in privatization than the five MENA (Mediterranean partners) countries. Second, during the same period of time, among the Latin American countries compared, Argentina and Brazil had advanced faster than México who is lagging behind. Third, the sectors where Mexican program has not privatize are those politically sensitive, such as the case of oil and electricity.

Prospects of the privatization program in Mexico

By 2004 there are less than 200 public owned enterprises out of more than 1,200 to privatise, and the model of welfare state in Mexico is under attack by privatisation of public services, mainly public education, public health-care services, public transportation, housing, etc. The new government of Mexico under the Fox administration, plans to privatize the energy sector, oil and electrical industries, water, education, health-care services and the list goes on and on.

In education, there are public and private schools at all levels, including graduate and postgraduate studies. In health care services, also exist public funded and private ownership. Both, public education and public health care, are increasingly underfunded and the fees are raising every year, to promote consciously the use of private services. This is more relevant in public universities and hospitals managed by the Secretariat of Salubrity and Welfare, but also it includes the health care systems supported by contributions of workers, employers and government, the Mexican Institute of Social Security (Instituto Mexicano del Seguro Social, IMSS) and the Institute of Security and Social Services for State Workers (Instituto de Seguridad y Servicios Sociales para los Trabajadores del Estado, ISSSTE).

The World Bank has worked closely with global water corporations to push privatization of water in México and numerous loans have contained conditions mandating water privatization and full cost recovery through increasing consumer fees for water. Conditions to meet to be eligible for the loans are such as economically efficient pricing, self-sufficiency of the project through cost recovery, appropriate competition and regulatory framework, and enhancing the participation of the private sector.
Privatization and opening the energy sector to competition, especially the electric and petrochemical industries, won’t work according to the same managers. Efforts at privatization of the Mexican petroleum company, Petróleos Mexicanos (Pemex), the World’s third largest producer of crude oil and to the Comisión Federal de Electricidad (CFE) have been opposed by labor unions, political parties from the left, new social movements and the civil society.

The privatization program of these two state owned companies has long been a sensitive matter in politics since the nationalization of all oil properties and assets of all foreign oil and gas companies in 1938. School children all over the country contributed pennies to the national fund established to compensate foreign investors. In 1960, the electrical industry was nationalized as well. Nationalization of oil industry and nationalization of electric industry are the symbol of Mexican national sovereignty. Foreign investments and participation in the energy sector were proscribed by the Mexican Constitution that prevented foreign investments in oil and gas industry in exploration, production and refining and only allows Pemex to engage in these operations. Even legislators have rejected the draft of the amendments to the Constitution that will allow to be more attractive the opening of energy sector to foreign investors.

“The country functions well… entrepreneurs don’t want to buy Pemex or CFE. As a private sector what we want is to be allowed to compete, to participate in certain areas of production, to make them competitive at the international level… it is not necessary to put padlocks on foreign investment so that it intrudes in the electricity and hydrocarbon industries. The only rules for national capital and foreigners should be a free market economy, open commercial prices set by international competition” (Becerril, 2000).

However, there have been sold some petrochemical industries and contracted drilling operations to foreign investors, undertaken joint ventures abroad. Foreign companies as Amoco, Chevron, Mobil, Occidental, Royal Dutch/Shell, and Texaco are optimistic in investing in the oil industry sector in México. Shell oil’s Deer Park, Texas has an equity investment in refinery operations that allowed Pemex to replace the domestic shortfall.

The Electric Workers Union (SME) accuses the government to subsidize large users of electrical power instead to benefit the poor and draining resources from the Power and Light Company, the other state owned electrical enterprise by forcing it to buy power from the Federal Electricity Commission (CFE) undermining modernization of equipment. The government scheme of privatization is to provoke bankruptcy of both state-owned electric companies or to be replaced by foreign-owned companies. For the SME the prospects are doomsday according to the bitter experience of privatizations in México: rates will increase for small users, workers will be fired, and so forth.

Cutting social expenditure in education and public health would reduce the weight of bureaucracy gradually by transferring these functions from the State to the private sector. Fox has said that they will reduce the cost of government in the next six years by subjecting it to a rigorous but gradual diet of federal public administration. Changes were needed to eliminate the lock on 51 percent of national investment to give a bigger
opening to private and foreign investment and to invigorate the financial system. The neoliberal model not only weakens the political autonomy of the State; it also diminishes the capacity of the state to formulate social policies. The adoption of economic neoliberalism has led to an anti-statist ideology. As such, the state’s structure and functions have been transformed, allowing for greater assumption of responsibility by the private sector.

Until now, the neoliberal state model seemed to be the only course, with privatization, deregulation, tight fiscal discipline and slashing of social benefits and taxes, a formula which promised a dollop of austerity and little else for the time being. Some important economic issues on which the three main parties agree, are the acceptance of North American Free Trade Agreement; defense, support and stimulation of domestic private initiative, and acceptance of foreign investments as a complement of domestic savings. Although PRI and PAN have the same thesis and agree on privatizations, the PRD criticizes it arguing that it has favored a small group of investors.

The National Action Party (PAN) stresses that the reform to the State implies increasing its efficiency and not necessarily downsizing, although traditionally, the State had activated the economy with full charges and burden, now it should be looking for to leave these responsibilities to the private sector. Similarly, the Institutional Revolutionary Party (PRI), according to its economic platform, has stated there is no optimum government size or ratio of spending to GDP and supports existing privatizations. Democratic Revolution Party (PRD) points out the need of public participation in strategic, priority, and/or natural resources areas. It implicitly acknowledges the reduced role of the government and does not propose either nationalizations or the reversal of previous divestitures. It only wants to avoid them in the future and in fact it explains its platform would only marginally increase the GDP participation of public expenditure.

**Effects of the Mexican privatization program**

Any word on the effects and impact of privatisation process in Mexico may be premature, because the turbulent macroeconomic environment since the 80s. The precise economic effects of Mexican state owned companies privatisation remain uncertain and controversial. In terms of its scope, the privatisation process has been dramatic. Undoubtedly, the large number of firms sold off and their size make privatisation a profitable operation for the Mexican government. Thus, the public unprofitable firms forces the Mexican government to make them profitable through different mechanisms such as restructuring, reduction and fresh capital.

Empirical research about the effects of privatisation on the Mexican economic growth and on former Mexican state-owned companies are very limited. Privatization in Mexico has not been the expected economic miracle needed to increase economic GDP growth and lowering the rate of unemployment, although to a some extent it has contributed to reduce the burden of the state in the economy.
The former state owned companies that have been fairly successful, after privatisation there is not evidence of improved financial performance or cost efficiency despite stronger focus on profits, due to lack of mechanisms of regulation and governance rules and information transparency. However, it is clear that prices of goods and services of these already private companies have increased and overall their privatisation have resulted in concentration of wealth and profound disparities of income distribution.

Under the influence of the PRI, the Mexican State initiated economic modernization and participation in the globalization processes, as a response to the trends of the economic globalization of markets, and the technological revolution that began during the last two decades of the past century. Under the pretext of cleaning up the economy, the Mexican State privatized strategic enterprises of the public sector, most of which were acquired by foreign investors, who had already penetrated all economic sectors.

The program of privatizations in Mexico has been carried out both through strategies of direct sale and public offerings. Privatisation of some owned-state companies were used to give back previously nationalised firms to the private sector, such as the banking and financial institutions. However, the sale of the largest and most profitable state-owned enterprises known as the ‘crown jewels’, TELMEX AND CFE has been opposed by labor unions, civil society, leftwing political parties and even legislators. The process of decision making about privatisation of public utilities was more centralized in Mexico than in Argentina for example (Abdala, 1999). The high concentration of capital in a few corporations through the privatization process of public enterprises unleashed the phenomena of political privatization.

The benefits of privatization have not yet been evident to the Mexican people even though defenders try to demonstrate the opposite. According to data provided by the former President of Mexico, advocator and implementer of the privatization program, Salinas de Gortari (1988-94), privatization reduced budget expenditures to finance social programs thus preventing a fiscal deficit. It is said that Salinas has also privatized politics in Mexico. However, it might appear to be cynical when we state that the privatisation process has been subject to the electoral agenda and to economic opportunism of decision makers and political actors, acting out of conviction and for personal gains in terms of corruption, more than to achieve social welfare and benefits.

Also, the effects have not been satisfactory over all. An analysis of the welfare gains from privatisation addressing the distribution of them economic net benefits, have been regressive in terms of impact on income and wealth Mexican privatisations may have some improvement effects on productivity but negative and regressive effects on the distribution of income and wealth. Some privatizations programs, after transferring the property of state-owned companies to private companies that get caught by the financial crisis of 1994, reflects the socialization of losses and privatization of profits such as the financial and banking system and not to mention the privatization of motor ways and roads.
The impact of privatization and deregulation on workers has been devastating not confirming the principle of Berne and Pogorel (2004) which states that strong union presence hinders privatization, as it has not being the case of Mexico. In 1986, Aeroméxico, one of the two main Mexican airlines was the government’s response to a strike while firing more than 12,000 workers and selling off the company in 1988. On the other hand, during the privatization process of Teléfonos de México, or Telmex, the national telephone company, organized labor had little subsequent opposition and remained quiet after receiving 4.4 percent share of ownership of the company (Tandon, 1992: 6-13) and also because there has been little pressure for job or wage cuts so far. During the process of privatization of the Port of Veracruz, soldiers had to occupy it and the workforce had to be fired. Similar actions were taken in the privatization of the copper company in the late 1990s, when the miners at Cananea fought against job reductions but firing the workers of the state-owned cooper company was also a response of labor opposition to the privatization process. The railroads labor union had wildcat strikes to hit the company services when they were sold to Grupo Mexico and the private owners reduced workers from 90,000 at around 36,000 during the last decade. The labor union of drivers of Ruta-100 in Mexico City fought the sell off of the company although the leaders were imprisoned. These actions are the cause that organized labor have had little subsequent opposition to the privatization process. When the National Autónomous University of México, a public university, had the intention to increase enrolment fees, students did not allow it having a strike that lasted one calendar term. However, some other public universities in the states have been more successful in slowly but steadily increasing the fees every term.

Employment in the Mexican public companies has declined rapidly due to privatization and employment reductions in the remaining enterprises. Programs of privatization in Mexico have reduced employment by half, while production has increased 54.3 percent with a significant reduction in investment. A study by Galal et al (1992) analyzed the after-privatization performance of twelve companies in different countries, including Mexico, and documented an increase of 26 percent in profits in eleven cases but an increase of benefits to workers in only three of the cases.

Resistance by labor unions, social movements and social society groups to privatization has often been fierce, but most of them have defeated. However, the Mexican government have not achieved the sell off of PEMEX and the CFE. unions and civil-society groups joined together in 1996 to protest the sale of Petróleos de México, the state-owned oil company. The political strength to reject the privatization program is bound up with changes in the labor unions movements in Mexico. When collateral petrochemical industry was privatized during the last decade, union membership fell to 7% while PEMEX still hovers at around 70 per cent. In the electrical sector at least, the labor movement began to change with the announcement to put the electrical system up for sale after the election of President Zedillo in 1994. Although the privatization of the pension system was achieved in 1997, the opposition of state employees labor unions and of the Mexican Institute of Social Security (IMSS)
employee union prevented the privatization of both health care provided by the IMSS system and any overhaul of the state employees’ social insurance system (ISSSTE). The pension reform erodes social citizenship rights, and in the overall, the pension privatization will have a negative impact on women’s welfare in Mexico (Dion, )

At the Union for Electrical Workers of the Mexican Republic (SUTERM) at the Federal Electricity Commission (CFE), the government seized control of it in such a way that the leader headed the Congreso del Trabajo, the main government affiliated labor federation. When the Union refused any defense against the privatization of the CFE, the workers that resisted formed a new union federation, the National Union of Workers, and declared open opposition to the sale of the Federal Electricity Commission. On May 22, 1999, 3000 of SUTERM members defied their national leaders and allied themselves with the SME, well respected for its internal democracy and gained legitimacy.

Another demonstration on August 28, the formation of a national coordinating committee and an alliance with national Union of Workers, the leftwing Party of the Democratic Revolution, and nationalist elements in the PRI have all vowed to cooperate in mass protest. More recently, at the end of September 2003, the Mexican Electric Workers Union (SME) and allies mobilized more than 50,000 people to the Zocalo the main central square in México City in opposition and protest over privatization plans and distributed 10 million leaflets across the country to urge actions against the government proposal to provide incentives to private companies to build generating plants financed with national pension funds. A statement signed by leaders of both Mexican electrical unions argues that "In Mexico, the people rightly think that the electrical industry and the petroleum industry should be public property and that such public property is the fundamental basis for their nation's existence and of their national sovereignty." (Bacon, 2003)

The controversial Mexican privatization program has led to a high concentration of capitals and income of local and foreign investors who have penetrated the strategic sectors of the Mexican economy. One major concern in the privatization process of Mexico is that the new owners of privatized companies are foreign investors as it is the case of the bank and financial institutions where less that 10 percent is in the hands of Mexicans and for some other firms, the percentage of foreign ownership has grown to very high levels.

Privatisation in banking and financial services is associated with mergers and acquisitions done by larger international banking groups and only a limited domestic investors remain in control of less that 10 percent of banks. City group from USA has bought BANAMEX, BBVA from Spain has acquired BANCOMER, HSBC from Honk Kong and Shanghai is the owner of BITAL, Santander from Spain has SERFIN, Nova Scotia Bank bought COMERMEX and the list continues. Prices for services have increased in such a way that last year’s profits came mainly for the sale of services.

These acquisitions and mergers make it difficult to distinguish the effects of ownership and reorganisation. The possible benefits of privatisation can be overshadowed by higher
profit margins, in particular if there is also higher concentration because of mergers (Willner, 2003b). Mergers may also aim at offsetting the competition that integration was meant to achieve (Neumann et al., 1985; Sugden, 1983). We agree with the conclusive statement of Willner (2003b: 19) that mergers in manufacturing as well as in banking “may be a reason for concern in the future, and a return to non-commercial objectives might require renationalisation”.

The World Bank has admitted that privatization of state-owned companies in Mexico has contributed to an increase in private monopolies with the consequent concentration of wealth acknowledging that "there has been a worsening of the already skewed and concentrated pattern of ownership distribution in the economy and an increase in vertical integration. Only a small group of local conglomerates have been involved in purchasing public enterprises" According to the 1991 Internal Audit Report (Heredia, and Purcell, 1994: 5). In Mexico, the number of billionaires rose from 2 to 24 in only six year period, from 1988 to 1994.

Two years after the privatization of its banking system, in December 1994, Mexico was forced to devalue its peso which set off a macroeconomic crisis characterized by increased exchange rate volatility, further devaluation of the peso and was followed by a financial sector crisis and bailout. The meltdown of the Mexican stock exchanges resulted in the loss of half of the stocks value and share prices, for major Mexican companies quoted on Wall Street, dropped 75 percent within a few months. However, after this situation was resolved a deeper crisis in financial markets came in the form of the devaluation of the peso and the sovereign-default crises. The majority of the governmental crises, without a degree of investment (as is the case of Mexico), were caused by characteristic weakness in governance. Concerns about corporate governance in Mexico has increased due in large part to the demands of international investors and the pressures faced by newly privatised companies (Husted and Serrano, 2001). If local people and foreign investors fear the Mexican peso will be devalued, they may convert pesos into dollars.

The privatization process in Mexico has not been used to increase competition by eliminating the former public monopolies. Rather than leading to increased competition and economic efficiency, the privatization process has led to a increasing concentration of income and wealth, while at the same time in the penetration of strategic sectors of the Mexican economy by foreign investors, such as in the electricity and oil industries.

Some state owned companies referred to as ‘public utilities’ considered unsuitable for private ownership because they operated in natural monopoly markets, reflecting their economies of scale and scope, such us the Mexican Telephone Company (TELMEX) and Ferrocarriles Nacionales de Mexico, the Mexican rail transport, nevertheless, were privatised without any market regulations and fatal consequences for the consumers. Further more, prices of these services conceal disparities in the distribution of the welfare gains between different consumer groups affecting the ones with lower income. In most of the privatised public utilities companies, prices have risen, such as the case of the increasing toll of roads, transport and telecommunications. Prices are market-oriented
with very limited controls, as for example in the case of toll roads and bank and financial services, prices have gone up to become one of the most expensive in the world and had been the main source of profits.

After the transferring property from public to private ownership monopoly positions still exist such as the case of TELMEX. From a normative perspective, consequences of competition in the markets for network telephone services are the abolishment of monopoly rents with a subsequent reduction of tariff levels, increasing incentives for cost efficiency, optimization of telephone service networks, more rapid reaction of prices to changes in the costs and demand structure, increasing price-quality options. Changes in service quality considered as a multi-dimensional variable, are difficult to measure since privatisation, but there are some evidences that service quality is at the expense of prices.

The privatisation of Telmex was a landmark which established the antecedent that in spite of their size, the public utilities could be sold off to a large investors, opposing the principle of creating a share-owning democracy. Until today, as a private company, Telmex has manipulated the political and economic environment to remain as a monopoly demonstrating that the privatization program in Mexico has not led to the expected increase of competition and economic efficiency. The total assets of the new owner of Telmex are more than the annual income of the combined poorest 17 million Mexicans. Although it had been projected by some analysts, that consumers would benefit in the long run, consumers have not received any benefits on improvement of cost and quality of telephone services. For privatised companies operating in non competitive markets reducing service quality to the disadvantage of consumers not necessarily leads to a loss of market share.

There is not any specific regulatory agency to protect the telephone consumer services from monopoly abuses until real competition will develop. The weak competition on the market has caused prices to go up. In the utilities sector, the high households’ prices for telephone is maintained by the privatized monopoly TELMEX. Since the privatization of the TELMEX, the infrastructure for long distance telephone services are monopolistic bottlenecks, with the need for adequate access regulation and a massive private investments in alternative long distance infrastructures is needed to be both more active and potential competition

Some concluding remarks

The state owned enterprises were created to promote growth and industrialization and consequently, their performance must be assessed according to these objectives in such a way that their success or failure is to a large extent a question of weather the aims have been reached at reasonable costs. State owned companies were downsized during the deep crisis of 82 and 94 despite some rescue operations. Today, the remaining state owned companies become more oriented to customers and to achieve growth through higher output, productivity and profitability share holder value oriented, more conscious about technological development and environmental considerations and still are
responsible to take social welfare, support private firms at the expense of their own profitability such as the case of CFE supplying low prices of energy to the private manufacturing and services sectors.

Furthermore, still supply income revenue from their profits to the federal government representing a substantial part of the budget. The distributional effects on income have an impact on social welfare and consumer welfare. This is consistent with the finding of Wilner (2003b:17) who contends that “Social welfare can be reduced despite lower costs and vice versa. But it can also increase despite a fall in consumer welfare, so it may make sense to analyse distributional effects and quality as well”. Social welfare has been severely damaged with privatisation process because the distributional effects on income and the concentration of ownership in private hands, affecting more the poor people with lower income per cápita, As Willner (2003b:19) concludes “social welfare has hardly changed because of privatisation in manufacturing and banking, because of the absence of a change in objectives and the lack of evidence of an ownership effect on financial performance and cost efficiency."

Therefore, public and state owned companies are in good health despite the campaign against their prestigious while some privatisations have resulted in an economic mess. For historical and ideological reasons, privatisation has been a large and hot political issue in Mexico as there has been more then 1,200 state owned companies to privatise. Nationalised public enterprises were at the core of Mexican economic nationalism and have faded as Mexico became part of the North American Free Trade Agreement. To summarise which sectors privatisation in Mexico has failed or was successful could be very often ambiguous and subject to qualitative judgements in particular cases.

The privatization policy in Mexico has not achieved the expected economic growth and developed promised. The success of privatization process is partly a question of its objectives. Regarding prices to sell of public companies these have not always been sold at a satisfactory price which means sales revenues for the State. If the aim was to achieve divestiture and widespread share-ownership which are not ends in themselves, until now the results have being disappointing with high concentration of private ownership in only few investors. Only part of the sales proceeds had been used to reduce public debt and not for public investment in infrastructure required for the development of the country. Unfortunately, most of the sales revenues have been mismanaged.

Unfortunately, the lessons from Mexican privatisations, deregulations and movement to free trade and away from state protectionism are not always positive. Deregulation and privatisation of state owned firms are factors in changing the competitive situation while the state owned enterprises can also promote competition with private companies. Some of these privatisations have resulted in private monopolies or quasi monopolies, such as privatisation of TELMEX, the Mexican Telephone Company. Privatizations of utility monopolies led to meet higher investors expectations on returns and profits becoming the main gainers rather than the consumers.
To develop regulatory governance of privatized companies with market dominance activities not only takes time but also a new culture. Mexico does not have a long tradition of independent regulatory agencies while monopolies are regulated through: direct intervention as the case of the oil company, the two electrical firms and the privatised telephone company. Therefore, regulation of competition is necessarily a pressure on time and culture to establish a new economic policy with fairer environment for investors and consumers at large.

It is often unclear to what extent privatisation rather than other factors is responsible of higher competitiveness and economic efficiency. Parker (2004) contends that empirical studies often proves difficult to separate out the effects of ownership, competition, regulation and technological change on efficiency. Ownership change does not appear “to have a significant effect in terms of improving economic performance where there is market dominance, especially in terms of welfare gains to consumers.” (Parker, 2004: 21).

In terms of the effects and impact of privatisation on firms’ efficiency, available the evidence available is not conclusive and suggests that there are other factors more important than ownership change, namely competition, the buyer type and the firm’s size and capital intensity. These factors can do that privatisation always would play a complementary and reinforcing role (Villalonga, 2002). Therefore it is often unclear how far privatisation rather than other factors is responsible for any economic efficiency gains achieved.

Nevertheless, the lessons from the Mexico’ privatisation are far away from the lessons of UK’s privatisation which, according to Parker (2004:21) are that “the empirical evidence is consistent with economic theory and suggests that competition and in the absence of competition effective state regulation are important if privatisation is to lead to performance improvements, including lower prices and improved services”.

Two different deep ideas about economic development and workers rights have emerged in Mexico after the implementation of the privatization plan. These two ideas are separated by over whose priorities of workers or investor will prevail. Wages and working conditions were better in state owned enterprises in comparison with privatised companies bus companies often because of different collective agreements.

The neoliberals behave in a two-way strategy: on one side, destroying the activities of the social society and in the other side, destroying the traditional functions of the State, and assigning a new role under the principles of liberal democracy and policies of free market relations... as it were another private enterprise. All this destruction is done in name of a more slim State and privatizing its functions, but the State do not disappear or diminish and what is really wanted, is to impose a distinct State capable of destroying the capacity of civil society to exercise resistance and opposition in front of the State policies, inspired on total market policy, which responds to interests of globalization and allows the instauration of a “New International Order”, where collective security rests on general acceptation of principles of free market.
From this perspective, it is the same Mexican State who assumes the anti-State ideology promoted by government, entrepreneurs, bankers and entities of the neoliberal model who assign an active role to the State as propulsion of its own reduction to allow a major protagonist to the private sector of the economy in such a way that do not compete each other for financial resources. But at the same time, upon oppositions emerging from the breaking down of social equilibrium and consensus require that the Mexican State may be the most strong possible to fulfill its functions within the economic model and guarantee the macroeconomic equilibrium.

State owned enterprises are privatized when they are profitable and the government stuck with the unprofitable ones, except few like the “crown jewels” PEMEX AND CFE that belong to the energy sector. Specifically, these enterprises were nationalized in the last Century and remain public because the privatization process is heavily loaded in terms of ideological reasons and for being considered in provisions of the Mexican Constitution for public ownership for being strategic for development of Mexico, although have been serious intents to sell them off. To push over the selling off of these state owned companies, neoliberals strategize for achieving an Energy Reform to make Constitutional amendments favorable to remove ideological arguments to finally achieve privatization plans.

If the energy sector privatization plan succeeds, the nationalist development policy will be buried. However, if the privatization plan is defeated could be possible to recover national economic sovereignty and independence. The privatization program can not be defeated without having an alternative project of development based on a strong internal market with well paid workers to oppose to the neoliberal economic development project.

Trough mechanisms of cooperation, trade unions, new social movements and civil society have resisted and fought to oppose privatisations plans, with a limited success, because they consider that results are unfair. Thus, today privatisations are not widely accepted in principle due to the reluctance to fulfil requirements of transparency information and governance rules during the promotion of the privatisation process.

However, it is safely to conclude that changes of ownership through the privatisation process in Mexico has led to the foreign investors to own the most profitable former state owned enterprises which under the spirit of globalisation of business has terminated any sentiment of national capitalism.

Finally, we can conclude that the policy of privatization in Mexico has not achieved the aims related to increase economic growth and development, but has contributed significantly to become a subsidiary economy owned and managed by transnational and multinational corporations. However, this aim is politically neither desirable nor feasible for the economic development of Mexico. If good performance of privatisation is required, actually it is successful only if state-owned companies are so well managed that there is no need to privatise. As Berne and Pogorel (2004;15) contend, “it is always easier
to privatise profitable companies... But at the same time, it is more difficult to explain why well-run entities need to be privatised"

The Nature of the International Models of Reading

Minoo Varzegar, Ph.D.

Rutgers University
Newark, New Jersey

Abstract

Reading is a complex activity which entails the reader to be involved in a series of linguistic, psycholinguistic, socio-linguistic as well as pragmatic interactions. Reading is not a simple act of visual perception and meaning derivation. Reading initiates from the text and goes beyond the page, while interacting with the mind of the reader. Comprehension requires the reader to interact with the printed page and bring his complicated and implicated network of schemata, scripts, proposition, psychological entities, sociological properties, conceptual parameters, pragmatic dimensions, and content and procedural knowledge into the reading act. (Varzegar, 2004) “The lower-level and higher-level processes work together interactively as parts of the reading processes.” (Grabes, 1980) “An important point about top-down and bottom-up processing is that both should be occurring at all levels interactively.” (Rumelhart, 1977) All these interaction knowledge sources available to the reader interact with each other and the interaction among the elements is of a compensatory nature. (Stanovich, 1980)

Models of reading hypothesize the mental operations of the reading processes from the time the eyes are exposed to the script to the time the written information is decoded and “demessaged.” The purpose of this paper is to discuss the nature of the interactive models of reading to enable the reader to understand the multi-dimensional aspects of the reading act in order to read more efficiently, effectively and proficiently.

Participation of the Aged in the Promotion of Socio-Economic Development

Dr. R.B.S. Verma*

Old people were widely respected in ancient societies and in India also, old age evoked deep respect and honour in the traditional society. In the joint family system a sort of gerontocracy prevailed. It was customary to obey the directions of the eldest member of the family. Even today, the elderly persons are respected and well looked after in the Indian Joint families. They are considered to be the best source of social education, social service and social cohesion. Their experience and perceptive ideas are invaluable assets for the development of community. But, with the passage of time, the position is gradually undergoing a change due to the process of industrialization, urbanization, social mobility, easy communication facilities and individualism. The wind of change brought about by modernization and technological advances has affected the traditional ties and earlier emotional links. The younger people migrate to urban areas leaving behind their congenial rural habitats. They are virtually thrown into a life of uncertainty and anonymity. Under such predicament, the old people who stay behind can not be taken care of nor do they have the same prestige and honour as they used to enjoy earlier (Bhattacharya: 1989:1). But, due to rise of number of aged persons in every society, their participation in the Socio-economic development must be ensured because these persons have experience, which can be utilized in constructive manner.

* Professor & Head, Department of Social Work, Lucknow University, Lucknow
Why Participation?

Participation is important because it expresses not only the will of the majority of people, but also it is the only way for them to ensure that the important moral, humanitarian, social, cultural and economic objectives of a more humane and effective development can be peacefully attained. In this way, participation strengths the capacities of individuals and communities to mobilize and held themselves (Midgley and others; 1986:8) and furthers the goals of empowerment, equity and democratic governance.

What is Participation?

It is difficult to give a single definition of ‘participation’ because the dimension and direction of participation of people in any given situation vary according to the contents and contexts of the task (Rehman and Rehman, 1998:5).

For the Oxford English Dictionary, participation is the action or act of partaking, having or forming a part of. In that sense, participation could be either transitive and intransitive, either moral, a moral, or immoral, either forced or free, either manipulative or spontaneous. According to Wolfe, participation designates the organized efforts to increase control over resources and regulative institutions in given situations, on the part of groups and movements hither to be excluded from such control (Goulet, 1986:165). For Baetz (1975:3), participation in development means how community members can be assured the opportunity for contributing to the creation of the communities goods and services. WHO (1982) defines participation as the process by which individuals, families or communities assume responsibility for their own health and welfare and the community’s development. While explaining the concept of participation, Human Development Report, 1993 says that participation means that people are closely involved in the economic, social, cultural and political processes that affect their lives. Oakley (1991: 8-9) has described (i) participation as other forms of contributions which implies voluntary or other forms of contributions by people to pre-determined programmes/projects; (ii) participation as organization which puts forth
that organization is a fundamental instrument of participation; and (iii) participation as empowering which recognizes that there exists relationship between participation and power.

In this way, in a nutshell it can be concluded that by participation, it can be meant that it is a process through which human beings will realize their full potential in all areas of life and solve their own problems and initiate struggle for them resulting into desired socio-economic development.

How to Participate?

Aged persons can participate in socio-economic development as contributors, institution builders as well as an agents of empowerment.

As Contributors

Aged persons can contribute both socially as well as economically. Socially they can contribute by:

(i) establishing good relations with family members and neighbourhood by changing their authoritarian attitude and inculcating in them a sense of tolerance, patience, non interference and cooperation;

(ii) Maintaining their health through exercise, cooperation with doctor, if necessary, taking necessary prescribed meals and imbibe in them a positive attitude towards day-to-day happiness;

(iii) Utilizing their leisure time in a constructive manner such as engaging themselves in different hobbies such as painting, music, reading books, playing cards, chess, etc., telling stories and experiences to younger, engaging in religious activities such as kirtan (religious songs), pravachans (religious discourses), etc.; playing with grand children; performing household chores; giving support to younger in solving their emotional, educational and social problems;

(iv) Attending and participating is social functions and helping family members in maintaining social contacts;
(v) Transferring responsibilities with authority to younger generation with a sense of cooperation and faith; and always remain ready to give them proper guidance, if asked for;

(vi) Showing non-resistant attitude towards change and cooperate with pro-changers by sharing the experiences and mobilizing other aged persons to respect such change;

(vii) Sorting out problems of family, neighbourhood and community by offering constructive suggestions;

(viii) Understanding and respecting needs, hopes, aspirations and capacities of younger generation and expecting accordingly from this generation which would certainly save them from expecting too much from this generation;

(ix) Managing or sharing the responsibility of managing or participating or showing positive attitude towards community functions such as organization of fairs and festivals, as well as organization of functions in educational, health and other social service institutions;

(x) Developing, maintaining and managing community assets such as community buildings, community entertainment gadgets, community gardens, lands, groves, ponds, schools, etc.

(xi) Helping community members, particularly in rural areas, in maintaining land records which will certainly reduce litigation;

(xii) Acting as contact person between governmental and non-governmental officials working for the development of whole community or for certain section of community;

(xiii) Following scientific and rational approach in dealing things instead of rigid and dogmatic approaches;

(xiv) Not imposing fulfilment of their needs on family or community members rather than trying to balance between fulfilment of needs of younger generation and older one;

(xv) Not suffering from the feeling of rolelessness, worthlessness, powerlessness, depression, social alienation, cultural deprivation, humiliation, physical insecurity, emotional instability, social maladjustment etc.;
(xvi) Not finding faults with the behaviour and belief of the younger generations;

(xvii) Giving opportunity to young generation to express their views and participate in decision making;

(xviii) Not indulging in such activities which give rise to social evils such as dowry, corruption etc.;

(xix) Developing a sense of respect among younger generations towards accepted values of society by acting as role model as well as awareness among them against social evils like dowry, corruption, etc.;

(xx) Taking active part in cultural activities of community so that cultural customs of the community remain intact;

(xxii) Developing companionship with younger persons and students;

(xxii) acting as councillors to hospital, wards and neighbourhood to meet patients and families who need their help and support (Gurumurthy, 1988:166);

(xxiii) undertaking study and inquiries concerning the life and living conditions of fellow aged which will provide them an opportunity to meet and express their viewpoints and relieve them of their stress and tension;

(xxiv) not interfering in the personal and private life of youngers for showing their superiority;

(xxv) engaging themselves in discussing social, economic and political issues through group discussions, seminars, symposia, etc.; and

(xxvi) understanding problems of weaker and vulnerable sections of community and cooperating with governmental and non-governmental agencies working for them.

Economically, they contribute by:

(i) engaging themselves in occupations like teaching, writing, doing light jobs or business like poultry farming, looking after nursery, running a preparatory school or working as consultant;
(ii) engaging themselves in producing things specially needed for aged such as spectacles, dentures, walking sticks, foot wear, warm dresses, bedding, etc.;

(iii) organizing training and counselling programmes for aged who are interested in self-employment;

(iv) investing life-time savings, if any at right places;

(v) securing social security benefits available to them;

(vi) helping young persons in expressing choice regarding their occupations;

(vii) keeping ancestral property intact and trying to add in it as well as properly distributing it fairly and timely among family members in order to avoid mutual acrimony among family members.

As Institution Builders

Aged persons can contribute towards strengthening of existing institutions and build new institutions/organizations for the development of people:

(i) The institution of family can be strengthened by providing emotional support involving the provision of moral and psychological support through sympathetic and caring relationship, informational support which assists the family members with the problem solving and decision making and finally instrumental support which takes the form of help with the practical tasks of every day life (Antonucci:1990: 205-216);

(ii) Neighbourhood and community relations can be maintained and strengthened through establishment of old age clubs. These clubs may take up the work of redressal of the grievances of any family through mutual help and support as well as organize educational, recreational and developmental activities in community;

(iii) Aged persons should take active part in the activities of Panchayat through participation in various committees and utilizing their
experiences in guiding and supporting office bearers and officials of Panchayati Raj resulting into its strengthening.

(iv) Utilization of the services of non-governmental organizations is another area through which older persons can benefit the community for its socio-economic development. Here, they can act as facilitator for the services of non-governmental organizations;

(v) They can also accept patronship or membership or the position of advisor in the existing non-governmental organization or form their own organizations such as aged clubs, recreational clubs, religious clubs, bhajan mandi, etc. or take active part in these organizations.

As Empowering Agents

Empowerment is an emotional and mental process, in which the understanding of individual and social identity develops. The contemporary relevance of empowerment is closely linked to social change. While it is the role of every individual to strive towards the building of an egalitarian society, this process can only take place through their active participation. The basis of this pro-active role is the internalization of empowerment.

As an empowering agent, aged persons can contribute by:

(i) organizing themselves for getting services both governmental as well as non-governmental organizations;

(ii) organizing marginalised sections, comparising mainly of women and dalits as well as tribals who have limited access to education and economic resources; and

(iii) developing awareness among members of community so that they may get space to move away from bureaucracy, politicians and middlemen towards collective self-reliance.

To conclude, it can be said that time and skills of aged persons can be utilized by giving them proper care at family and for this programmes and policies should be focussed on fostering and strengthening
relationship within families such as public education for the young and recreational activities to bring the family together that incorporate both young and old persons (Chadha, 1997:201).

Marginalization, Subordination, and Justification: A Gender Perspective of the Peñafrancia Tradition

Jon Michael R. Villaseñor
Deputy Director, Ateneo Social Science Research Center
Faculty, Social Sciences Department
Ateneo de Naga University

The paper is a gender analysis of the Peñafrancia devotion as exercised in the annual celebration of the feast of Our Lady of Peñafrancia in Naga City. The analysis locates men and women in their differing roles in the festivities and situates their participation in gender power relations. Through a symbolic approach, it argues that the rituals in the Peñafrancia fiesta signify and legitimize male dominance. In turn, the dominance of men has resulted in the marginalization of Jesus Christ, the subordination of women, and legitimization of male-power in Bikol society. Furthermore, the paper directs attention to the gender dimension of the Bicol Region’s underdevelopment, as reflected in and justified by the Peñafrancia tradition.
Marginalization, Subordination, and Justification: A Gender Perspective of the Peñafrancia Tradition

In the early 1990s, the sight of the naked icon of Our Lady of Peñafrancia during the Traslacion appalled the Catholic brethren of the Bicol Region in Southern Philippines. The voyadores, in the guise of religious fervor, had stripped the icon of its vestments and ornaments as they carried the icon through the procession. For Catholics, that incident was an erosion of discipline and respect for the religious icon following decades of degeneration of the voya tradition. From a gender perspective, however, that incident was a culmination of the history of male-domination of the Peñafrancia fiesta celebrations. More than disrespect for the Virgin of Peñafrancia, it was a blatant signification of the macho values that have pervaded the devotion and the male-biased culture that legitimizes them.

This essay does not offer any new historical facts on Bikol history or the Peñafrancia tradition. Rather, it provides another perspective through which to understand the emergence of the Peñafrancia as a regional symbol, the actual and symbolic value of the icon, and its implications on Bikol socio-economic life. Through gender analysis, the essay locates men and women in their differing roles in the festivities and situates their participation in gender power relations. Through a symbolic approach, it argues that the dominance of men in the celebration has led to the marginalization of Jesus Christ, reinforced the subordination of women, and legitimized male-power in Bikol society. Furthermore, the essay directs attention to the gender dimension of the Bicol Region’s underdevelopment, as reflected in and justified by the Peñafrancia tradition.

1 Held in the third week of September in the City of Naga, the feast of Our Lady of Peñafrancia is the biggest and most popular festival in the Bicol Region in the Philippines. The fiesta attracts thousands of local and foreign devotees, pilgrims, and tourists. The icon has been attributed with many miraculous events. It is regarded as a regional symbol of Bicol, one of the poorest regions of the Philippines.

2 Two rowdy processions highlight the celebrations of the Our Lady of Peñafrancia in Naga City: the Traslacion and the Fluvial Procession. The Traslacion transfers, on land, the image of Our Lady of Peñafrancia and the icon of the Divino Rostro (Jesus’ battered face imprinted on the cloth Veronica used to wipe His face on His way to Calvary) the Peñafrancia Shrine to the Naga Metropolitan Cathedral. Held on the second Friday of September, it marks the beginning of nine-day novenary leading to the feast day itself on the third Saturday of the same month. The Fluvial Procession signifies the return the image to the Shrine, marking the end of the fiesta celebrations. It begins with a short procession on land to a part of the Bicol River in downtown Naga. From there, the image is loaded on the pagoda (an ornate barge) for the river procession to the Basilica Minore of Our Lady of Peñafrancia, for the ceremonial ending of the fiesta.

3 In both the Traslacion and the Fluvial Procession, hordes of men, reeking of alcohol, bare-footed, and ruggedly clad, swarm on the image, grappling, hustling, and clawing for a chance to carry the andas (palanquin) bearing the image, touch the image, or grab a piece of the ornaments on the andas or image itself. This practice of the men is called voya and the men voyadores. With the voya as main spectacle of the processions, the fiesta, for tourism purposes, has been dubbed the Voyadores Festival.
The Voya as symbolic action

The voya, as highlight of the celebrations, is a symbolic ritual action. Ritual action is a “generalized medium of social interaction in which the vehicles for constructing messages are iconic symbols (e.g. acts, words, or things) that convert a load of significance or complex socio-cultural meanings embedded in and generated by the ongoing processes of social existence into communication currency” (Munn 1973). In the same way, the voya is a medium of social interaction that generates and signifies meanings. These meanings, in turn, provide the basis for social relationships between the actors. The meanings released by the ritual action “work back” upon the individual imagination of reality, thus legitimizing the meanings and social relationships (Munn 1973). Viewed, thus, from a gender perspective, the voya signifies and legitimizes male dominance, as transacted within gender power relations that is characterized by male domination and female subordination.

The Peñafrancia fiesta as male-domination

With the voya as main attraction of the whole celebration, the Peñafrancia fiesta is a stage virtually exclusive for men – macho values and male power. As it is the men taking to the center, the women are relegated to the periphery. The whole fiesta, thus, unfolds as signification and legitimization of man’s power over woman and his preeminent claim to salvation.

Signification and legitimization of male power. The voya is a signification of brute force, aggression, cunning, and violence – the ways men have subjugated women and nature – unfolded in religious ritual. The object of the competition and struggle among the voyadores is touching or getting a piece of (the image of) Our Lady of Peñafrancia. The Blessed Virgin Mary is reduced to an object of conquest. Touching or getting a piece of the image or the trimmings of the andas is the culmination of the conquest: it is an act of possessing Mary. As Mary is the embodiment of “the woman,” being the “most blessed of all,” her conquest by men is a legitimization of men’s power over women.

Preeminent claim to salvation. As it was the practice of getting amulets or anting-anting to empower the men with supernatural capabilities (an issue further discussed later in the paper) in the early times, the voya is the male experience of the divine and the contact with the image his claim to salvation. Caught up in his machismo and in social expectations, the struggle through the voya is his (limited) substitute for prayer. Thus, at reaching the image, he assumes a glorified state of one who has been rewarded or redeemed by God (but not Jesus, as will be explained later).

Subordination of women. Where are the women in the celebration? The irony is that the women are in the margins even as it is a woman that is the focus of the whole celebration. But, as explained earlier, the role of Mary in the center (of attention) is only as object of conquest, an instrument for the signification and legitimization of male power. Consequent to the legitimization of male claim to the center (and the heavens) is women’s marginal participation in the celebrations.

The women’s processions, called Aurora, at dawn in the two days prior to the feast day are significant of male-dominated gender power relations. Under cover of darkness, the procession is illustrative of the invisibility of women in social life. It also underlines the public and private divide between men and women. The participation of women can only be at dawn, prior to the start of their day engaged in domestic chores and, in this particular occasion, preparations for the festivities. The procession is conducted in the wake of men’s drunkenness in the previous evening’s celebration and in anticipation of the men’s bigger activities in the ensuing day. The practice of going barefoot is a feeble imitation of the men’s struggles, an attempt to approximate the meaning of the men’s voya; it is an imposition by males (The women do not need to feel pain further, as their daily lives are already crosses).

Another signification of men’s claim to the center and women’s relegation to the margins is the exclusion of women from the pagoda (ornate barge bearing the image) during the Fluvial Procession. The traditional reason given is that Mary would be jealous of any woman with her in that esteemed place and,
consequently, delay the progress of the procession. The tragic collapse of the Colgante Bridge during the 
1972 Fluvial Procession was even explained as Mary’s retribution for a woman’s transgression in the 
pagoda. There cannot be anything more misogynic. This is pure myth, but, for lack of any other plausible 
explanation, the male-determined knowledge system reified it into a truism.

Socialization into Macho Values: The Voya as rite of passage

For adolescent Bicolano men, the voya is a rite of passage from boyhood to manhood. However, it
is not so much a passage into adult status as it is an assumption of macho status. The young man who
participates in the voya does not gain the position of an adult male with its roles and responsibilities;
rather he earns a higher form of masculinity – being macho.

Initiation into machismo. For a sixteen year-old, the voya is commonly the first occasion for
which drinking alcohol is justified and necessary. Alcohol is believed to numb the nose and muscles in
order to bear the overpowering stench and the crush of bodies hustling tooth and nail, sweat and blood to
get to the andas. It also suppresses inhibitions, thus numbing the sense of propriety and loosening the
norms of decency. When there is alcohol, tobacco is not far away. True enough, the anticipation for the
arrival of the andas and the exhilaration after the voya is vented as a smoke of tobacco. The voya is thus a
young man’s formal initiation to vice and wantonness. It, thus, forms a major platform in the socialization
of young men into machismo.

Test of bravado. The struggle to get to the andas is the test of a young man’s physique and drive.
Getting to the andas requires brute force, aggression, cunning, and violence. Throughout, one is measured
against the elder men and fellow novices in terms of the above values. The passage culminates at the
point when one is nearest to the image until he is forced out of the crush. Although the ultimate end of
the struggle is reaching the top of the andas and touching the image, the passage is not deemed a failure if
one does not do so. It is going through the struggle that measures machismo. Reaching the andas and
touching the image is only the stage for recognition. Thus, one raises his arms, beats his chest, and hollers
in triumph – a public display of bravado.

Affirmation of macho status. But the recognition and affirmation does not end nor is fully
consummated in that public display. The affirmation of ones machismo comes best from the closest of
social relations, which, in this case, the family and the peer group. Within these circles, the stories of one’s
struggles and “triumphs” are exchanged as if these were the lore of ancient expeditions. It is the male
peer group and the male -figures in the family that can best bestow the affirmation of one’s machismo and
assumption of macho status.

Marginalization of Jesus

Male values vs. Christ’s values. Although the Divino Rostro is an integral element of the
Peñafrancia tradition, it is only a secondary devotion, a far one at that, among Bicolanos. At the fiesta
celebration, it receives only passing attention from the devotees – almost an afterthought. The minimal
attention to the Divino Rostro in the fiesta has stoked the centuries-old criticism that the devotion
marginalizes Jesus. But, contrary to popular accusation, it is not Mary or the devotion to her that
dominates Jesus and renders Him almost invisible in the celebration. It is the domination of men that has
marginalized Jesus. It is the macho values of brute force, aggression, cunning, and violence that have
supplanted Jesus’ values of gentleness, compassion, humility, and peace, among others.

The Divino Rostro as the “Un-macho.” The battered face of Christ is the last thing that can
qualify as a macho symbol. Instead, the Divino Rostro is a depiction of Christ as the “Un-macho.” The face

4 Holy Face of (the bloodied) Christ imprinted on the cloth Veronica used to wipe His face as He carried His
cross to Calvary.
is that of a man who has lost without any attempt to fight – the anti-thesis to the leering voyador on the andas collaring the image of Mary on one hand and beating his chest with the other.

**Not Mary, not Jesus.** In the *voya*, Mary, as pointed out earlier, is only an instrument of the exercise of male power. In this light, the Peñafrancia fiesta is not even a celebration of Mary; it is, more precisely, a celebration of machismo. The celebration, thus, defies the tenet of “to Jesus through Mary” for she is not even seen in the light of her role in salvation history. There is no mediatory role for Mary, as there is no Jesus to mediate with. Instead, Mary or, more precisely, that piece of her image’s cape is the ticket to joining God. And I say “God,” not Jesus, because Jesus’ persona is not at all reflected in the person of the Supreme Being regarded as God.

The reason behind the exclusion of women from the *pagoda* has caricatured Mary as jealous, attention-hungry, self-centered, and power-playing woman - a total opposite of her image in traditional interpretation of the Scriptures and in contemporary and alternative perspectives of her persona and role in salvation history.

**Reflection in Bicol Religious and Social Life**

The Peñafrancia tradition, as ritual, is a symbolic reflection of realities in gender relations in Bicol society. Its symbolic value provides the pattern upon which the fabric of Bicol religious and social life is woven and worn. This section discusses male aggression, spirituality, and salvation.

**Male aggression.** The values exemplified in the Peñafrancia tradition profess male aggression against both fellow men and women. There is, however, a difference between how aggression is dealt to men and women. The aggression against males is competition. Aggression against females, on the other hand, is domination and conquest. The challenge of other males makes the process of conquering worthwhile – may siram (exciting). The ultimate end is the possessing of the woman – getting a piece of her – and the exploitation of that ensues.

The above exercise of male aggression has been observed among male college students in a local sectarian university (Villaseñor 2001). Sexually aggressive behavior, as minor as peeping and *tsansing*, are acts of possession and domination. For these seemingly individual acts, the peer group is the platform both for the commission and the affirmation. The piece of the woman is the trophy, while the stories are the affirmation of macho status.

**Male spirituality.** On the basis of the *voya*, the Peñafrancia devotion is “spirituality” bounded in the physical rather than the spiritual. Like self-flagellation, the experience of the divine is in the physical struggle. But unlike self-flagellation, the *voya* has a physical fulfillment in the end – the possession of an object from the divine. As it was among early Bicolanos, the *voya* makes sense as a search for anting-ating. The anting-ating is the possessor’s link to the divine. The *orasyon* (incantation) for the anting-ating is the possessor’s prayers. The anting-ating thus bestows power on the possessor. This is macho spirituality.

**Salvation as seasonal.** The male’s preeminent claim to salvation, as signified by the *voya*, sets the example for most of the Catholic brethren. Salvation, rather than a continuing process of conversion, is largely believed as a seasonal or occasional penance. Thus, it is no wonder that many settle for one-time penitence to cleanse the soul as the way to salvation.

**Emergence of Male Dominance in the Peñafrancia Devotion**

**Margins to the center.** Aguilar (2004) posits that the emergence of Our Lady of Peñafrancia and the annual fiesta celebrations as prominent symbols of the Region was a movement from the margins to the center. The devotion began in and had been limited to the visita of Pena de francia, a settlement of outcasts, the remontados (and cimarrones [Obias 2003]), in the fringes of the Isarog foothills. Initiated in
1710 by a secular priest, Miguel Robles de Covarrubias, the devotion was indicative of the quarrel between the marginalized secular order that administered the visita and the regulars, the Franciscan order ensconced in the center of power in the pueblo of Naga.

The processions were not rowdy, as these facilitated the way for the marginalized groups in local society to assert their social presence and claim respectability (Aguilar 2004). Among these marginalized groups were the Chinese who provided the money for the building and decoration of the barge for the Fluvial Procession (thus, the barge is called the “pagoda”). The movement to the center culminated in the declaration of the Virgin of Peñafrancia as Queen of Bicolandia in 1924.

By the 1950s, however, the orderly “civilized” festival had been eclipsed by the prehispanic styles of celebration – revelry, drunkenness among men, and the incessant search for anting-anting. The emergence of the prehispanic elements, according to Aguilar, signified the triumph of the marginalized people over the dominant group. As it is celebrated now, the festival is symbolic of marginality entering and captivating the center, but which the center has been unable to fully control. Aguilar, thus, asks why and how the fiesta became mainstream, and then taken over by the masses.

Usurpation by the center. This paper’s position on the question is a modification of Aguilar’s margins-to-center thesis. It argues that the mainstreaming of the Peñafrancia devotion and fiesta, instead of a movement and triumph of the masses, was the usurpation by the center of “something big” in the margins. The Peñafrancia devotion had emerged as a potent symbol and, thus, tool for the consolidation of the Catholic brethren in Bicol, not to mention that it attracted the patronage and the wealth of the Chinese community. It cannot be left to the enjoyment of the marginalized groups. Obias (1999) notes this process as the dispossession of the cimarrones of their Ina (Mother). As the religious fervor around the Nuestra Senora de Peñafrancia increased, the friars and regulars slowly took over the supervision of the chapel in the settlement. The rich, famous, and mestizo also slowly took over the care of the icon, embellishing the once crude wooden image with jewelry and perfume.

The usurpation is best illustrated by the Traslacion from the Peñafrancia Shrine, the margins, to the Metropolitan Cathedral, the center (of church political authority). For one hundred fifty years, the fiesta had been limited to the visita of Peña de Francia, until, in 1849, Bishop Manuel Grijalvo decreed the transfer of the novenary to the Virgin to the Naga Cathedral (Gerona 2003). Through the Traslacion, the dominant group practically took over the rights over the Peñafrancia celebration and all the potencies it embodied. Right of ownership means the power to give (back), thus the Fluvial Procession returning the image to the Peñafrancia Shrine.

Mainstreaming of Male Values. How did prehispanic culture take over the fiesta celebration? Alongside the usurpation by the Catholic center was an even bigger process – that of men taking-over the celebration. More than a return of prehispanic culture, the rowdiness, drunkenness, and exploitation of the image were male values finding signification and legitimization in the fiesta celebration. Ironically, the emergence of prehispanic culture in the fiesta celebration was the male-dominated church taking control of the whole devotion – that is, putting males in the center of the celebrations. The male-dominated church had no need to control the erosion of civility in the processions, as the signification and legitimization male values in the celebrations also justified the same values and, consequently, the rule of the clergy.

On one hand, for the benefit of the festival and its main host, the clergy, the dominance of men legitimized a division of labor that is necessary for holding large-scale and protracted fiesta celebration. The women have to be kept in the margins of the celebration in order for them to accomplish the many chores for the fiesta. On the extreme, the dominance of male values in a religious celebration shielded the clergy from questions over its own macho excesses. The clergy created a sea of macho values on which it could swim freely. Noted Bikol historian Gerona (2005) points out that, although living austerely in material terms, the Franciscans that administered the Catholic Church in Bikol during the Spanish colonization were not at all sexually deprived and sterile.
Why did the rowdiness and the exploitation of the image not emerge earlier, prior to the mainstreaming of the celebration? Aside from being an assertion of social presence and claim to respectability, the celebration was relatively small-scale, certainly not the stage for the exercise of male dominance (A contemporary reflection is that of males shunning of micro-finance or micro-enterprise projects because these are small-scale, both financially and operationally). Male participation surged and dominated the celebrations as the stage moved to the center, expanded, and gained prestige.

Reflection of Bicol Underdevelopment

The landmark book *Ina and the Bikol People: A Journey of Faith* (Tria, ed. 2002) identifies dirty politics as cause of the underdevelopment of the Region, implying the corruption and incompetence of local leaders that has bedeviled local governance. Poor local governance has left the people powerless, helpless, and, consequently, resigned (Tria 2002). To further this analysis, a gender perspective directs our attention to the men who have led the Bikol Region to its moribund state, and to the symbols that have provide meaning to the Bikol people's resignation to poverty. The Peñafrancia celebrations reflect quite poignantly the underdevelopment led by male agenda and the system of meanings that justify Bikolanos' resignation.

**Underdevelopment reflected in the Traslacion and Fluvial Procession.** Governance in the region is reflected in the Traslacion and the Fluvial Procession--slow, chaotic, a competition among males to possess power and its spoils, and exclusionary of women. Like the Peñafrancia processions, local governance has been historically exclusionary of women and other marginalized sectors. Men have led the Region for all of its history of underdevelopment. Local governance reflects male values and preoccupations - resource exploitation, power-play, corruption, violence, and moral degradation, among many others.

The populace's attitude towards the above type of male leadership is similarly reflected and affirmed in the Traslacion. When public officials are given a free way to the andas, people frown in disapproval; they say, “Mayong siram” (No excitement). The disapproval is not for their using position to have a privileged share in our treasures, but for the “un-macho” manner that they do so. Thus, observers shake their heads, “Mayong siram.”

**Chaos vs. efficiency, exclusion vs. solidarity.** It is not the love for Mary that fuels the fervor of men in the Traslacion; it is the desire for power, prestige, and property. It is not Mary’s jealousy over a woman in the pagoda that slows down the Fluvial Procession; it is the load of men on the pagoda and those on the water clinging to it that bogs down the barge. In contrast, the cooperation, efficiency, and openness of women facilitate a smoother and more orderly and prayerful procession of the image. In contrast to the spectacle of exclusion and chaos in the pagoda, the solemn dance of lighted candles on the banks of the river enlivens the spirit of solidarity among a greater number. However, like the women’s procession under cover of darkness, this bigger expression of oneness in spirit of a people with God goes unrecognized.

**Underdevelopment as structural.** The gender-dimension of underdevelopment in the Bicol Region and its legitimization in ritual exposes the structural nature of deprivation. “Dirty politics” is not a matter of personality. Rather, in considering the values brought into such politics as male-oriented, underdevelopment is an issue of structure – that is, the structures that have marginalized women’s role in society and excluded them from local governance.

Local governance, both in terms of leadership and citizen participation, is dominated by males. Women’s participation in elections, both as candidates and, much less, winners, is very limited. Policy-making and program implementation remains not just male-dominated but more so macho-culture influenced.

---

5 The Bicol Region has a poverty incidence of 48.4 percent, fourth poorest in the Philippines (NSCB 2005).
Traditional gender norms continue to limit women to the domestic sphere and prevent equal recognition for women’s capabilities and contributions to society. Male power gives rise to violence against women – a crime Bikol is notorious for. In turn, these cultural structures find legitimacy in the social rituals as the Peñafrancia celebrations.

### Justification of Bikol Underdevelopment

**Ina and poverty.** The resignation of Bikolanos to poverty owes much to the ingrained mindset that poverty is nature-caused or Moro-wrought. For so long, the sufferings of Bikolanos have been attributed to natural calamities and, up to the nineteenth century, Moro raids, so much so that man-made structures of oppression have been largely ignored. This mindset is signed and legitimized by the popular regard for the Virgin of Peñafrancia as Ina, tagapagligtas sa pag-alaman, parasurog kan Kabikolam (Mother, savior from disaster, protector of Bikol), justifying the historical poverty of Bikolanos as borne by nature or marauders. Ina, as she has been imagined, does not have the potency as symbol against social structural oppression.

**Guadalupe and independence.** In contrast to the Peñafrancia, the Lady of Guadalupe symbolizes independence from oppression to the Mexicans (Wolf 1965). Guadalupe is important to the Mexicans because she embodies their major political and religious aspirations. The apparition of Guadalupe to an Indian commoner signified that Indians, long in the periphery of the church, were as much capable of receiving Christianity and being saved as the Spaniards. Guadalupe validated the Indians’ legal and political rights in Mexican society. To those dismembered, impoverished, and displaced by Spain’s conquest, the Guadalupe myth assured them not only a place in heaven but also in Mexican society. The myth also represents the aspiration to drive out the Spanish overlords, who never quite cared for Mexico, and claim the land for their rightful heirs. As an ultimate signification of the symbolism, the banner of Guadalupe led the insurgents in the Mexican War of Independence, marking the realization of the promise of the myth.

In as far as the Virgin of Guadalupe has meant the mainstreaming of marginalized groups, the Virgin of Peñafrancia has signified the marginalization of half the population. Whereas the Virgin of Guadalupe has been a banner of independence, the Virgin of Peñafrancia has been a marker of (male) domination. While the Virgin of Guadalupe has agitated against oppressive structures, the Virgin of Peñafrancia has justified deprivation.

### Search for an Alternative Symbol: Retracing the “Journey of Faith,” Rethinking Mary’s Persona

Is there a symbol potent enough to rally Bikolanos against the structures of poverty? A search for this symbol should lead back to the origins of the Bikolanos’ “journey of faith” with the Blessed Virgin Mary and to her role in salvation history.

**Ina of the marginalized.** Before the wealthy embellished her with ornaments and jewelry, the original icon was only a crude wooden image (Obias 1999). Very similar to the Guadalupe, the crude wooden icon that embodied the devotion to the Virgin of Peñafrancia was the Cimarrones’ claim to salvation, even as they waged their resistance to the Spanish colonizers. On a lower political level, the devotion was, as cited earlier, a claim to respectability in society by the outcasts and the marginalized Chinese. This symbolic value of the Peñafrancia that was overran by the ostentatiousness of the rich and powerful in Bikol society needs to be recovered.

---

6 The Bikol Region is in the typhoon belt of the Philippines and is home to Mt. Mayon, one of the most active and destructive volcanoes in the Philippines, if not the world. Aside from natural disasters, the raids of Moros from Southern Philippines were also the scourge of the Bikol people up to the 19th century.
Mary as social force. A re-interpretation of the Scriptures and re-examination of Mary’s role in salvation history within the context of her particular period shows her as a social force defying the structures of oppression in Jewish society. A little exegesis should show that Mary, unlike the meek and subordinate woman that she has been portrayed, must have been a very strong woman to defy the pharisaical norms and mores of Judaism. She proceeded to carry the child Jesus in her womb even without the assurance of a wedded husband and at the great risk of being stoned to death. As a widow, she was among the most marginalized in Jewish society. Yet, her survival during and after Jesus’ public ministry indicates she possessed the economic and political skills to fend for herself in a male-dominated society. These strength and capabilities brought the Savior into the world and provided guidance to the early Church.

Faith Experience as Social Liberation. What potency does her persona have as a symbol against oppression? Buhay (1998) explains that Mary’s obedience to God’s will was not powerlessness, rather was the “creative submission of the fully liberated human being who – not being subject to any other human being or human law – is free to serve God.” Her obedience was active: it involved responsibility, courage, and capabilities to face the struggles in being the mother of Christ. Mary was a “woman for others,” as indicated by the Wedding at Cana and her Visit on to Elizabeth. She had the competence to see the problem and contribute to its solution. Moreover, Mary was not a secluded Jewish girl, ignorant of the national and historical struggles of her people. Her awareness of the struggles of her nation and her patriotic aspirations for liberation are expressed in the Magnificat (Luke 1:46-55), which hearkens as a “song bursting out of the heartstrings of an oppressed people, the anawim” (Buhay 1998). In the Magnificat, Mary related her faith experience to her people’s liberation from oppression and injustice.

It is in the light of the above origins of the Bikolanos’ “journey of faith” that the discontent with oppressive structures becomes plausible and salient. It is in the light of the above model that Mary’s role in salvation history that Christ’s message of liberation from oppression becomes necessary, urgent, and attainable.

The Way Forward

The Bikol people cannot proceed towards improving local governance and alleviating poverty if they are gender-blind – that is, lacking the gender perspective to understand and navigate through the differing experiences of deprivation and oppression of men and women. The three R’s, Re-create, Re-evangelize, and Re-make, proposed by the book Ina and the Bikol People (2002) as steps to development, need to be fitted with gender lenses to see through the structural nature of underdevelopment of Bikol.

Thus, Re-creating the youth means re-socializing them into egalitarian norms and relationships between men and women. This entails providing the youth, at large scale, gender-sensitive, Christ-centered alternatives to observing the Peñafrancia tradition. Re-evangelization means empowering women to stand up for what is right – their rights – and question the male-values brought into decision-making. This does not mean allowing women into the pagoda and creating the same racket as men. That would simply be reaffirming the same male-values. Instead, this entails making visible and equally recognizing the role of women in the Peñafrancia tradition and of Mary’s role in salvation history. Re-making means mainstreaming the participation of marginalized sectors, particularly women, in local governance. The process and measure of self-determination are effective and valid only in their impact on the most marginalized, in this case, women. This entails re-making the symbolic value of the Virgin of Peñafrancia to see her strength and resistance to oppression.

In doing the above, the Peñafrancia celebration is re-focused on Christ – his message of liberation from oppression and the values by which that liberation is attained. After all, it is in the light of Christ’s salvific message that the real value of Mary can be fully celebrated.

Urban Governance in the Unplanned City: Houston

Igor Vojnovic
Department of Geography
Michigan State University
315 Natural Science Building
East Lansing, MI
48824-1115
vojnovic@msu.edu

Abstract:

The paper explores the planning and local governance of Houston, the archetype laissez-faire city in the U.S.. The research examines the complexity of Houston’s minimal government rhetoric, which in practice involves extensive federal, state, and local government involvement in economic development while maintaining a disinterest in social service and income maintenance programs. In fact, with a population of over 1.9 million people and an area of over 620 square miles, Houston is the largest city in North America without zoning or a plan.

The analysis illustrates that Houston’s local governance has historically been based on a management approach that actively attempts to minimize costs for potential investors to locate in the City, through public intervention, while at the same time as generating an unattractive urban environment for the socially marginalized. Thus, despite the local laissez-faire rhetoric, government intervention in Houston’s growth has been vital and has produced the extraordinary impacts usually expected from public involvement in local economic development.

Abstract

Chronic Fatigue Syndrome as Biopsychosocial Phenomenon

Sergiy Volovik*, Konstantin Loganovsky#, Dimitry Bazyka#, Volodymyr Bebeshko#

* Duke University, Center for Demographic Studies (Durham, USA),
# Research Centre for Radiation Medicine (Kyiv, Ukraine)

Chronic Fatigue Syndrome (CFS), a modern epidemic with “thousand” different faces and names, the complex cluster fluctuant clinical symptomatology of chronic illnesses affecting a quarter of population, remains a poorly understood disease with various theories of its elusive etiology, fuzzy pathophysiology and strange vague conventional general case definition - “fatigue must be unexplained, debilitating, and present for at least 6 months…” Several possible causation-illustrations factors have been incriminated with a particular emphasis on various chemical agents (including even sarin), multiple vaccines, viruses, neurotoxins, low level radioactive (especially, depleted uranium) substances, and others, contributing to the broad scope of clinical manifestations. Polarized views of different approach and interest groups maintain CFS as area of sustained controversy, especially in connection with Gulf War (and similar Afghanistan and Iraq War) Syndrome, and also with Balkan Syndrome overlapping with CFS in multiple ways and accompanying symptoms.

Evidence is accumulated that CFS appears to be often induced by a relatively short-term strong (sudden CFS onset) or permanent environmental stress (gradual onset) which is followed by multidimensional chronic pathology, reflected in neuroimmunology, neuroendocrinology, metabolic, cardiovascular, and neuropsychiatric spheres disorder at multiple organism system hierarchy levels including physiological, neurobehavioral, cognitive, information processing, etc, components, connected with characteristics of generalized aging/senescence and neurodevelopment/neurodegeneration processes at macro- and micro-level and differing from them only by threshold phenomena corresponding to the stages of resistance and exhaustion of stress response.

In this context CFS is multidimensional biopsychosocial phenomenon and complex medical, scientific and political paradox presenting a challenge for patients, clinicians, scientists, health care providers, insurance groups, and government agencies (e.g., the Department of Veterans Affairs), because of its incapacity nature, and vague etiogenesis, pathophysiological mechanisms, and prognosis.

This challenge require novel integrated multidisciplinary insights at the gene-environment interaction level with coherent analysis of pertinent environmental stressors, genomic, proteomic, metabolomic, and molecular free-radical/redox biomarkers data.

In given generalized conceptual framework unique Chernobyl accident and “Sarcophagus-II” data, including epidemiologic, clinical, molecular genetic, biomarkers, etc, reflecting different exposures to multiple environmental stresses (acute and chronic, exogenous and endogenous (radionuclides) irradiation, various chemical agents, including Pb, viruses, extreme psychological stress, etc) allow to investigate conceptualize, and illustrate the nature and fundamental aspects of CFS phenomenon, its health impairment perspectives and possible ways for intervention. This is important for clinical medicine, including psychology, neuroscience, and prognosis of consequences of possible nuclear and chemical terrorist attack and technogenic accident.
Anti-Corruption Policies in China: Corrupted Policies in China?

Political Science

Paper Session

Abstract:

The Chinese government in the past decade had highly publicized and launched a series of anti-corruption policies to deter the tendency rise of the corruption cases brought by the result of the economic reform. But first of all, what is corruption based on the Chinese definition? In this essay I will first try to present the major conceptual differences of the term 'corruption' in both western and eastern sense. Then I will focus on explaining why corruption is the by-product of the Chinese culture. While corruption seems to be solely destructive to the society and economy as a whole, sometimes it will also have positive side effect to certain players. Therefore, it is still uncertain whether the Chinese leaders are willing to establish the anti-corruption policies movement, as there has been a joke going around in Beijing asking that: should one fight the corruption to save the country or not fight the corruption to save the party? Major anti-corruption policies will then be evaluated, either as a tool for the Chinese communist party to sustain its legitimacy of ruling or the political struggle among leaders.
In recent decades, Chinese leaders have often claimed that anti-corruption is their major political task. For the past year, Jiang Zemin repeatedly has called the fight against corruption “a matter of life and death for the party and the state.”\(^1\) Hence, anti-corruption policy seems to be the only remedy for the Chinese state. However, a joke has been circulating in Beijing: should one fight the corruption to save the country or not fight the corruption to save the party?\(^2\) Neither direction is easy. Therefore, this dilemma leads to a basic question about whether Chinese leaders are willing to establish an anti-corruption policy. If so, how effective would this policy be? In the reform era, corruption is a channel for stabilizing the party-state apparatus via rent-seeking; that is, bureaucratic agents conspire with outsiders to block free trade and establish exclusive rights over lessened aggregate (but increased personal) gains from trade,\(^3\) and thus do not fight against it. At the same time, the corruption is a force that destabilizes the political authority and threatens the survival of the regime as a whole. The fight, therefore, is necessary.

In fact, the only remedy that can minimize corruption is to promote both economic and political reform simultaneously, that is, to open of the economic markets and institutionalizes the rules of law at the same time. While economic reform creates opportunities for making profits, political reform serves to protect people’s rights against abuses. Furthermore, the political reform would make the party accountable to outside institutions and groups and limit the power of the party officials by further loosening their control in governance, so that corruption through the rent-seeking method would also be

---

reduced. Such political reforms would lead the party to lose its dominant position in China. Hence, the leaders are not willing to open up to political reform that would let the party ‘die’. Since 1978, the Chinese Communist Party (CCP) has launched only the economic reform. Without any political institutionalization, there would be a rise in corruption. This explains an aeronym why the leaders compelled to establish an anti-corruption policy, but yet implementing the policy itself is not enough to reduce corruption. Therefore, economic reform without any political reform is termed “incomplete of reform”.

Since there are many ways to participate in corruption, this essay is not intended to provide definition of what “corruption” means. Instead, it attempts to evaluate the PRC’s anti-corruption policy as an illegitimate use of resources by public or private parties.  

The party centre has used two methods to carry out its anti-corruption policy since the beginning of the reform era: the campaign method and the institutionalized method. The latter involves state and party supervisory institutions such as the National People’s Congress (NPC) and judiciary institutions like renmin fayuan and renmin jianchayuan. Specifically, the Chinese government implemented four anti-corruption campaigns during 1982, 1983-87, 1988-91, and 1993-97. Take the recent campaign as an example; the goals of this campaign were to address the issue of self-regulating senior officials, to strengthen the investigation and prosecution of large-scale (according to the official definition) and major corruption cases, and to forcefully curb unhealthy tendencies within

---

4 Michael Johnston and Yufan Hao, “China’s Surge of Corruption,” p. 82.
the government departments, such as the collection of illegal and quasi-legal fees. In order for this campaign to win the public’s trust, its main focus was the types of corruption about which ordinary citizens had expressed dissatisfaction. The party centre holds that this campaign has achieved great results through increasing the quantity of cases and the severity of their punishment, but the increases may simply be due to an increase in corruption. This campaign also focused on the ‘types’ of corruption, but its main targets were not specified. Thus, the campaign could not be organized well enough because of the lack of specific targets. Large-scale corruption cases could not be found or prosecuted, and thus the ‘big mouse’ was still not being caught. In the pre-reform era the central government imposed its central policy on the local government. Now, the local government can negotiate with the central government in implementing the policy, an opportunity that is brought about by the decentralization process. Thus, the local government has become the key figure in determining the results of the implementation.

If the campaign is ambiguous and inconsistent, the local leaders then tend to arbitrary interpret and implement the centre’s policies in a way that furthers their own interests. Subsequently, due to the fact that most of the corrupted officials are at the local level, the campaign cannot be implemented well. Since the campaign has its weakness in the policy implementation process, the anti-corruption campaign method cannot be institutionalized. Virtually every year, the anti-corruption campaign can only mobilize itself to national and local authorities for a few months. Only a few portions of the corrupted officials will be charged as ‘samples’ of the government to the public, in order to emphasize the leaders’ efforts in anti-corruption.

---

6 He Zengke, “Corruption and Anti-Corruption in Reform China,” p. 268.
While the launch of anti-corruption campaigns cannot reduce the corruption effectively, the incompleteness of the reform and the weakness of the current political system further undermine the anti-corruption effort. First of all, the lack of an effective mechanism of checks and balances of powers makes it very difficult to supervise the senior officials. The relationship between the Chinese Communist Party (CCP) and the existing democratic parties is a co-operative relationship; therefore there is no real political opposition that can challenge the leadership of the CCP. Secondly, the lack of independent anti-corruption agencies undermines the leaders’ anti-corruption efforts, since both the party and the provincial government direct the supervisory department. This dual-leadership system of supervisory apparatuses will weaken the independence and hindered the efforts to resolutely implement policy.\(^8\) The Anti-Corruption Work Bureau, for example, is under the control of the Supreme People’s Procuratorate to serve as the major anti-corruption agency. More often, these agencies accept orders from the leadership of the Politburo or the local party committee on issues of significant political decisions. These hierarchical orders from the top-down level seriously restrict the ability of the anti-corruption to investigate independently.\(^9\) Also, the Central Commissions for Discipline Inspection of CCP is the party’s internal institutions in supervising the party members and leaders in various political organizations, that is, still it is under the CCP control. Therefore, both agencies act like the self-regulatory systems in the party, and it is expected that without a clearly defined set of norms and an independent agency that is free of party centre’s control, the self-discipline effort is meaningless.

During this transition period, many laws and regulations become increasingly irrelevant to the current situation changes. Now, cash is not necessary the only form of bribery, but also it can be the consumer goods or stocks. Even some of the fees are not easily recognizable by the public as the illegal fees. For example, the charges of the ‘Road Construction Fee’ from some of the highway management, or the fault permits and licenses that are well-printed. Therefore, the Chinese government has to make frequent revisions of its policies and laws, and update its information about the methods in involving corruption regularly.

Moreover, the prosecution against the corrupt officials is still not effective, and thus undermining the anti-corruption efforts. From the perspective of procuratorates, a case filed and investigated concludes in one of three ways: the case is dropped for the lack of sufficient grounds to prosecute; the case is prosecuted; the case is exempted from prosecution. More often the corrupt officials are just punished outside the criminal justice system with milder party or administrative disciplinary action. Not be considered serious enough to merit criminal punishment, such violations do not constitute crimes, and thus exempted from prosecution. From 1989 to 1994, the average proportion exempted from prosecution is about 43 percent of the total cases being investigated. Since there are lots of cases of corruption in China, then in order to shorten the time to go through the court system, some of the corruption cases were dropped. Therefore, even some of the officials are found corrupted, they might not be prosecuted. Moreover, Li Jinhua, the Auditor-General of the NPC, attacked the Ministry of Finance of the State Council for the wrong implementation of the 1998 central budget; some of the public funds were

---

10 He Zengke, “Corruption and Anti-Corruption in Reform China,” p. 258.
misappropriated or allocated with delays. A total of 16.4 billion yuan was found by Li’s office to have been illegally used by 53 departments of the State Council. However, Li just ‘heavily criticized’ the Ministry of Finance and urged the ministry to be stricter with itself and set a good example for others. Therefore, the corrupt officials were just criticized or disciplined, but not charged or imprisoned.

In sum, the party remains firmly in control of the legal system and the law-enforcement agencies, so that some of the corrupt officials are avoided being prosecuted. As former NPC chairman Qiaosh said, ‘We must readjust the power relations between departments and between centre and the regions. We must also set up ways to constrain and supervise bureaucratic power. Unbridled power is easily corrupted.’

Rising corruption has led to significant public outrage. Like the functioning of the important force in the student demonstration in 1986-87 and the Tiananmen protest in 1989. The ordinary people are dissatisfied with the contemporary environment, and they are afraid that the corruption will have negative impact towards them. Since political legitimacy derives from the public support, while public support is based on the government’s ability to provide public goods and improve its citizens’ lives. Once, if corruption spreads into all institutions and levels of the government, the public’s image of the government will be damaged. In turn, leading to a loss of public support for the authority. The image of the average bureaucrat in the pre-reform era was that of an honest man of modest habits whose sole objective is to “serve the people”. However, now one gets the impression that it is only an opportunity or the lack of it in which determines whether an official is honest or corrupt; in a social system that assimilates corruption as

---

one of its mechanism. The public outrage is still at a minimal level if the citizens have a fair standard of living. However, once China enters into a period of recession and rising unemployment, corruption will be more sensitive and more explosive issues that can threaten the political stability.  

What makes the most public dissatisfaction is the ‘rent-seeking’ nature of the officials in using their authorities to maximize their own personal gains. The market reform has created decentralized exchange that depends heavily on the ‘middlemen’ who gather information about trade opportunities and act as go-betweens in actual exchange. This systemic reform also involves re-distribution of economic power. Thus, reforms have to create a corps of entrepreneurial market-makers, and these middlemen are the officials themselves. Since the officials have the monopoly power to block the access of other competitors from getting resources and information, without any control to the powers of the officials, the competition that is created by the market reform is indeed unfair. Moreover, the dual-price economy is the cause for an increase in corruption. That is, producers sometimes produce more than the quotas that the government has set. In turn, they try to buy the products at a planned price and sell them at the market price, which are about two to three times the planned prices. More often, the local government acts as this brokerage role between the state planning agencies and the market. Since there is a huge income difference between the planned price and the market price, the corrupt officials therefore earn it as illegal money.

---

16 He Zengke, “Corruption and Anti-Corruption in Reform China,” p. 248.
18 He Zengke, “Corruption and Anti-Corruption in Reform China,” p. 249.
Furthermore, the decentralization of the central government has not suppressed its power monopolies, but has multiplied them.\textsuperscript{19} Therefore, unlike the pre-reform era in which the central government gets its monopolistic and centralized control over the economy, the local government also has access now to this system of control. Hence, the problem facing by the central government is the maintenance of its own capacity to regulate the process of corruption as practised by decentralised communities. At a minimal level, the central state apparatus cannot be totally corrupted, for this will lay its legitimacy open to challenges from local authorities with organized corruption connections.\textsuperscript{20} In addition, the central leadership is concerned that corruption will cause political instability and damage the party’s legitimacy. Local cadres are giving priority to their private interests and local economic development. With the decentralization of the power to the local government and its bargaining power in implementing the central policy, the lower levels may pay only lip service to anticorruption policy implementation, and more likely to resist it.\textsuperscript{21} Thus, the government lacks the ability to mobilize the implementing agencies, which are the bureaucrats and local officials, to follow the central policy.

While some scholars like populist writer, Liang Xiaosheng, appeals to argue that economic reform has made corrupt petty officials wealthy, and thus market reform is in fact a failure towards the anti-corruption policy.\textsuperscript{22} It is quite true that without a set of norms to bind the officials, the unlimited nature of power will easily permit the officials in involving more corruptions. Although, contemporary regulation is set to prohibit all

\textsuperscript{19} Guilhem Fabre, “State, Corruption, and Criminalisation in China,” p. 461.
\textsuperscript{22} Susan V Lawrence, “Excising the Cancer,” p. 11.
public institutions from engaging in business activities or establishing satellite companies. Yet, it allows the trade unions to engage in such activities, and thus opening a door for these activities because all such institutions have their own trade unions. The regime also creates a grey area for the corruption – the unclear distinction between what is public and what is private. At the same time, corruption may hamper the capital accumulation and productive investment. Since state assets are the major targets of a wide range of corrupt practices, the corrupt officials may directly seize public assets for their own benefits. In addition, the corrupt officials have no structural incentives to work hard to implement developmental plans. They tend to put their efforts in extracting personal gains, and thus the implementation of plans is highly selective. Likewise, low basic salaries of the officials may also lead to corruption. Sometimes even an increase of the salary cannot catch up with inflation. At the same time, these officials are those that make decisions of the projects that involve hundreds of millions of yuan. Since the punishments are often lenient for some party members, the penalty may be simply expulsion from the party and removal from office. For a mid-level functionary making 300 yuan a month, one corrupt deal may bring 100,000 yuan – nearly 30 years of salary. Penalties may only be stiffer at the peak of anti-corruption campaigns and in times of political tension. On the other hand, since some civil servants are recruited or promoted on the basis of favouritism or bribes, the efficiency and the ability of the public administration will be undermined. These types of bureaucrats will focus on the personal gain, and as a result, they will mismanage the bureaucracy.

23 He Zengke, “Corruption and Anti-Corruption in Reform China,” p. 252.
24 He Zengke, “Corruption and Anti-Corruption in Reform China,” p. 262.
While it is the characteristics of the market reform that leads to the failure of the anti-corruption policy, the openness of the market reform itself is not the cause of this failure. It is true that this transition from planned to market economy has created more channels for corruption. However, the corruption phenomenon can also be observed in the pre-reform era. Moreover, other societies with mixed or market economies have managed to keep corruption within relatively low to moderate ranges, such as Britain and the United States. Hong Kong and Singapore are thought to have successfully reduced corruption, even though they share Chinese culture and are not considered democratic in the Western sense. Therefore, international practices are good routes for learning how to implement regulations of the market economies in order to reduce corruption. Not only so, economic marketization alone without institutionalization cannot effectively bind the power of the officials. In contrast, as seen in the above cases, the institutionalized method with NPC and judiciary as the supervisory agencies cannot effectively prosecute the offenders.

The issue of corruption is not only a matter of legal enforcement and norms in China, but also an instrument in the political settlement between various ruling factions. The former Beijing party secretary and politburo member, Chen Xitong, was accused to be responsible for the illegal acts of his colleague, former vice mayor of Beijing, Wang Baosen. Despite calls from the law scholars for an open trial, the proceedings were held in secret, and lasted just one day. This lack of transparency of the judicial procedures has been wondered that it is rather a political affair than the usual corrupted case. Due to

---

the fact that factionalism plays a significant role in Chinese politics, the Chen’s Beijing faction had directly challenged the dominance of Jiang Zemin’s Shanghai faction, and with this exposure of corruption that provided opportunity for Jiang to officially purge Chen. Therefore, Chen was brought down simply because he lost in the political struggle against Jiang Zemin. Even Young Nam Cho suggests this as the result of cooperation between the Jiang faction and the Qiao Shi faction to exclude the Beijing faction.\textsuperscript{29} In addition, the chief investigator of Chen’s wrongdoings was another Politburo member named Wei Jianxing, who is an ally of Jiang. Later on, he has taken up Chen’s position as the Communist secretary in Beijing. Thus, corrupt party officials are not necessarily afraid to be charged because of their violations against laws, but they have to pay attention in building \textit{guanxi} with the top party leaders. On the other hand, some senior officials serve in a position for too long. Like Chen who stayed in Beijing for more than 15 years. This led Chen to establish a Beijing network in which this network was ready to protect one another in case of being found corrupted.\textsuperscript{30} The issue of corruption, therefore, is an instrument for playing the political game, and not an exhibit of the enactment of law against violations.

In recent years, moral education has been re-emphasized by the party to the officials and public. Moral figures that have not involved in corruption are often cited as examples to promote anti-corruption. However, their images are so unrealistically perfect and hard to follow. Due to this, the education lost its popular support. Nevertheless, it is necessary to let the people know what is the moral and legal standard of the government in defining the term corruption. The promotion of ‘getting rich first is glorious’ from the

\textsuperscript{29} Young Nam Cho, \textit{“Implementation of Anticorruption Policies in Reform-Era China: The Case of the 1993-97 “Anticorruption Struggle”},” p. 70.
\textsuperscript{30} Bo Zhiyue, \textit{“Economic Development and Corruption: Beijing beyond ‘Beijing’,”} p. 482.
state since 1978 had caused the decline in moral standard. People ignored the moral values and tried to earn fast money through corruption. Secondly, as long as the amount of the bribery is huge and attractive, there is always a temptation for the people to get involved, in which this phenomenon is quite general in all the nations. However, the only distinction between China and other nations is that the corruption is more limited in these developed countries. Without a set of legal norms and regulations, the corruption will be increased. As Michael Johnston and Hao Yufan note about corruption: “reforms have created incentives for people to enrich themselves, decentralization has given many more people the means with which to do so, and privatization has legitimized personal wealth.”

Rather than blaming on the start of market reform and the moral decline that lead to corruption, it is the incompleteness of this reform package -- economic reform without political reform that leads to the rise of corruption.

The better way to fight for the corruption is to take some preventive measure before the occurrence of corruption. For example, the strengthening of the collective leadership and teamwork; the increase in overlapping duties and the reduction of the power of individual officials; the increase in additional mechanism for internal control of institutional power; all are important institutional limitation on the abuse of power by party leaders. In addition, the role of the NPC and the judiciary has to be increased, so that it can supervise the work of the government, and avoid to be called a ‘rubber stamp’ legislature. Independent agencies of anti-corruption has to be established.

In conclusion, the Chinese leaders are not willing to institutionalize the anti-corruption policy, since in doing so will lessen their authoritative power in governing. On the other hand, the rise of the public upsurge in anti-corruption indeed has forced the

---

31 Michael Johnston and Yufan Hao, “China’s Surge of Corruption,” p. 86.
government to implement or launch some of the policies and campaigns, yet those policies and campaigns are seemed to be ineffective. While the Chinese conservatives propose the recentralization of the state, it is also seemed to be unrealistic, since the market has already been opened. Therefore, the completeness of the reform of both economically and politically is the only remedy to reduce the corruption in China. For example, in 1999 Premier Zhu Rongji has formulated his anti-corruption plan for the cabinet members and local administrative bodies across China. This plan included the restructuring of the State Council and local government, self-discipline of the officials, government supervisory departments should intensify crackdown, special campaigns, and the local government should severed their ties with business operations (no more guanxi or houmen). However, the essay has been shown that the restructuring of the government and the special campaigns cannot reduce the corruption. Self-discipline is meaningless without a defined set of norms. The supervisory departments are still dependent on the orders of the central leaders, and thus it loses its autonomy in enacting the prosecution. The officials still have personal ties with the business operations. Overall, the anti-corruption policy cannot effectively reduce the amount of corruption, due to the incompleteness of the reform, the lack of the willingness of leaders in institutionalization, and the diminishing role of moral education in China. Thus, the contemporary Chinese anti-corruption policy is ineffective.

REVIEW OF THE RESEARCH AND RESEARCH PROPOSAL

MISTY L. WALL

UNIVERSITY OF TEXAS AT ARLINGTON
Lesbian Parenting: Review of the Research and Research Proposal

Problem statement

Lesbian families have always existed, however, there has been a shift in how these families are created. Throughout history lesbian headed families were generally created (or assumed to be created) after a woman living in a heterosexual marriage was divorced. After the divorce, she began to identify herself as a lesbian, and eventually came out to her family. Currently there are a growing number of lesbian couples that are planning to begin families via adoption, foster care, or donor insemination. Patterson (1995) has even coined this revolution as the “lesbian baby boom.” This shift in the lesbian population creates new dynamics that should be explored via social science research.

Parenting is difficult without question. Lesbians choosing motherhood are faced with additional challenges. For instance, lesbian mothers are more likely to be fearful of losing custody or visitation rights if their sexual orientation is discovered (Falk, 1989). Lesbian headed families also struggle with the lack of legislation protecting their marriages, the right for their children to inherit property from both lesbian parents, and an inability for both lesbian parents to adopt their children. Given the social and legal oppression faced by lesbian parents the need for accurate empirical evidence that dispels myths that society and the judicial system have relied on is imperative.

Research on lesbian parenting has largely been aimed at proving fitness of lesbian parents (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Falk, 1989, Green, Mandel,
Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). Courts across the country have traditionally used three assumptions to remove or restrict the rights of lesbian mothers. These judicial assumptions include the potential negative impact of maternal gender role orientation on child development, effects of maternal sexual orientation on peer and social development, and the presumption that children raised by homosexual parents will be more likely to adopt a homosexual orientation in the likeness of their parents (Flak, 1989).

Since its conception, social work has focused on aiding oppressed groups. Jane Adams and Mary Richmond claimed roots in the feminist movement and fought to promote equal rights regardless of gender or race. Seeking equality among all parents, without regard for sexual orientation, is grounded in fundamental social work values. In this situation, fear and myth must be dispelled with empirically sound facts that will create a clear picture of the dynamics of planned lesbian families.

**Research review**

**Methods**

This author used various databases to accumulate data. Primarily of interest was the American Psychological Association (APA) website, which cited all empirical studies that were used to formulate their position on gay and lesbian parents. The *Journal of Homosexuality* was the next source providing the majority of research studies on the topic of gay and lesbian parenting.

A noteworthy fact was the lack of research in social work journals devoted to this topic. The NASW has adopted the position of supporting gay and lesbian families and equality,
but has not produced any empirical research to aid that cause. Gay and lesbian families are growing rapidly. Social workers should make this a topic of interest rather than relying on information supported within other disciplines.

Results

Review of literature searching with the word lesbian produced less than 50 matches. Using lesbian and parenting to narrow those results produced only five matches. Broadening the search to gay and lesbian parenting and families produced only 17 results. Of those 17 studies, 14 were chosen for their relevance to this text. All of the studies were non-experimental in nature. All of the sample sizes were small. In fact, only one of the studies (Green, Mandel, Hotvedt, Gray, & Smith, 1986) utilized a sample size of more than 30. With the exception of one study (Crawford, Isiaah, Sambonu, Jordan, 1999), all researchers utilized non-random sampling methods. The 14 studies utilized were chosen based on their review of child development in lesbian headed families, parenting capability of lesbians, and social and community support available to gay families. The findings of the research reviewed for this text will be organized into those three areas. A table has also been added for easy comparison of research reviewed.

Findings

Children

Flaks, Ficher, Masterpasqua, and Joseph (1995) studied children of lesbian couples and children of heterosexual couples. Their research revealed no significant differences in the two groups of children in the areas of cognitive functioning and behavioral adjustment. Moreover, they evaluated differences in parents’ relationship and parenting skills. Flaks, Ficher, Masterpasqua, and Joseph found that lesbian couples exhibited more parenting awareness skills than did heterosexual couples.

Green, Mandel, Hotvedt, Gray, and Smith (1986) conducted a study to assess psychosexual and psychosocial development of children living with lesbian mothers or heterosexual single mothers. Their findings showed no differences between the groups of child in IQ, self-concept, or social adjustment. There was no evidence of conflict in gender identity in the children of lesbian mothers and no psychopathology related to the mothers’ sexual orientation. Daughters of lesbians preferred traditionally masculine job roles significantly more often than the daughters of heterosexual mothers and were less traditionally feminine in current dress and in activity preferences at school and home, but these differences were not beyond the normal range. No difference was found for boys, with 95% of both groups choosing traditionally masculine jobs.

Golombock, Spencer, and Rutter (1983) also conducted research to compare psychosexual and psychosocial development of children living with lesbian mothers and heterosexual parents. The study found no differences between the children of lesbian and heterosexual mothers in gender identity or sex role behavior. No evidence of
inappropriate gender identity among children of lesbian mothers, and age and
developmentally appropriate friendships and good peer relationships were observed in
both groups. Psychiatric problems among children were infrequent in both groups but
higher in the heterosexual single parents group. Limitations of the study were short
follow up period and that the children were not old enough for sexual orientation to be
documented behaviorally.

Kirkpatrick, Smith, and Roy (1981) explored the differences in children raised by
lesbians and single heterosexual women. Results showed that lesbians are more likely to
have only one child. This may be because lesbian families require more planning, and
monetary investment in fertility assistance and/or adoption. However, the conclusions on
this topic are not clear. Kirkpatrick, Smith, and Roy also found no evidence of conflict in
gender identity in the children of lesbian mothers and no psychopathology related to the
mothers’ sexual orientation. They also failed to find evidence of differences between
children of lesbian mothers when compared to heterosexual mothers in toy preferences,
activities, or occupational choices.

Patterson, (1994) explored behavioral adjustment, sex role identity, and self
concepts of children raised by lesbians as compared to children raised by heterosexual
single mothers. Differences within lesbian raised children included greater symptoms of
stress, but also a greater sense of well being.

Parents

Gottschalk (2003) used a snowball method to conduct interviews with the purpose
of establishing the relationship between society’s dominant belief systems about
homosexuality and women’s perceptions and understanding about how they became
Lesbians, women’s experience of forming a lesbian identity, and gender to explore whether understanding of feminist challenges to essentialist constructions of gender and sexuality empowers women to feel that they can reject heterosexual relationships and choose lesbian relationships. Her findings add weight to arguments that women are influenced by popular ideas about homosexuality in terms of their experiences during the process of becoming a lesbian.

Harris and Turner (1985) explored the nature of gay and lesbian parents’ relationships with their children. All respondents reported positive relationships with their children and few serious problems. Among the differences noted by Harris and Turner, were that homosexual parents made more efforts to provide an opposite sex role model for their children; and that lesbians perceived greater benefits to their children relating to their homosexuality than gay men. However, gay men reported fewer disagreements with partners over discipline, more encouragement of play with sex typed toys, and more satisfaction with their first child than lesbians. One weakness within Harris and Turner’s study was that they did not make independent observations of the children’s behavior or adjustment. Rather, they relied strictly on survey style data gathered from the parents and teachers of the children.

Huggins (1989) examines the psychological construct of self-esteem using a comparative survey design with adolescent children of divorced lesbian mothers and divorced heterosexual mothers. Huggins found no differences in self-esteem scores of children raised by divorced heterosexual and lesbian mothers. Huggins did not discuss cultural, ethnic minorities, or other issues of diversity. Huggins has provided a solid
foundation describing no impairment on self-esteem based on a parents’ sexual orientation. This is certainly an area on which to expand.

**Treatment, society, and support**

Crawford, Isiaah, Zambonu, Brian, Jodan, and Michael (1999) used a randomly selected list of therapists registered with the APA to examine the attributions and interpersonal descriptions psychologists ascribe to gay and lesbian candidates seeking to adopt a child. They found that most therapists did not find sexual orientation itself to be a negative determent for recommendation of adoption. However, most respondents were more concerned with a potential lack of community support for gay/lesbian parents. Crawford, Isiaah, Zambonu, Brian, Jodan, and Michael’s results are telling of a society that needs to respond with equal services for this growing number of families.

Neisen (1987) conducted a survey style research project to determine what sources of support are available to families with gay and lesbian members. Neisen concluded that therapists need to be better informed about gay and lesbian lifestyles in order to help such families. Neisen also found that families with gay or lesbian members generally get their support and information from newspapers, books, and acquaintances rather than local or community based support groups. It is possible to speculate that these families choose the most anonymous approach to get support because it yields the most safety.

**Conclusions of research review**

Research has failed to produce evidence that children raised by lesbian parents are psychosocially or psychologically damaged due to their parents’ sexual orientation. Further, although being gay is not considered pathology by this author, the APA, or
NASW, this fear continues to be cited as a possible malady suffered by children raised by lesbian mothers. After reviewing the research, there is no evidence that children raised by lesbians are more likely to be gay (Flak, 1989). After reviewing research aimed at parenting effectiveness of lesbians, no evidence was found to show that lesbians are less capable to parent than heterosexual women (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Falk, 1989, Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). An area of interest is the support available to lesbian parents and their children, including the attitudes of therapists toward treating this group. Research indicates that therapists are less likely to be concerned with a parents’ sexual orientation, than the amount of societal support (or lack thereof) for these families (Crawford, Isiah, Zambonu, Brian, Jodan, and Michael, 1999). That lack of support warrants further investigation.

Gaps in Methodology

One criticism of this body of research is that it lacks external validity. Specifically, it may not be representative of the larger population of lesbian parents (Patterson, 1995). However, no one actually knows the composition of the entire theoretical lesbian parent population because many choose to remain hidden for fear of loss of custody of their children, hate crimes, or the like.

Research has also been criticized for using poorly matched, or no control groups in designs that call for such controls. For instance, several comparative studies have been conducted in which lesbian headed families and their children were compared to single heterosexual mothers and their children (Kirkpatrick, Mandel & Hotvedt, Golombok, Spence, & Rutter). Research designed to ensure that children raised by lesbian families
should aim to include comparison groups of children in two parent heterosexual families when studying lesbian couples. In addition, variables such as reasons for parental separation, length of separation, and paternal involvement should be controlled for when using heterosexual single mothers and their children as a comparison group.

Another issue is that sample sizes are generally small, and include mostly Caucasian, upper middle class respondents (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). Snowball appears to be the most chosen sampling plan. This is most likely due to the specific and hidden nature of the population. While these are methodological concerns, it is still essential that research continue in this area. However, researchers and social workers should use caution when generalizing this information.

**Gaps in knowledge**

Findings in all research reviewed suggested no psychological trauma to children raised lesbians (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Falk, 1989, Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). Of these studies only one (Vanfraussen, 2003) controlled for the method in which participant families were created. Specifically of interest to Vanfraussen was the impact of planning a family using artificial insemination with sperm chosen from an anonymous donor. This creates special circumstances that warrant further exploration including the lack of involvement from a biological father, emotional effects of not knowing one’s birth parent, etc. This
method of planning a family is especially interesting in its potential effects on children and warrants further exploration.

There appears to be a lack of available support to lesbian parents and their children (Neisen, 1987). Although interest in this area is gaining ground within groups such as PFLAG and various alternative family groups, the issue still deserves exploration. This researcher was unable to locate a needs assessment conducted within this population. Neisen (1987) found that families with gay or lesbian members generally get their support and information from newspapers, books, and acquaintances rather than local or community based support groups. A needs assessment would be interesting to review areas in which these families perceive a lack of support. Also, following Neisen’s (1987) observations, the reasons for unstructured support system choices are of interest.

Research thus far has only captured a small portion of lesbian parents and their children. Samples generally targeted families attending parenting and support groups, families of upper socioeconomic status, and predominately Caucasian parents. Research should be aimed at meeting those families still unidentified with the goal of assessing their needs, designing, and implementing programs to meet those needs.

**Ideas for future research**

Several studies to date have focused on proving the fitness of gay and lesbian parents (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Falk, 1989, Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). The sample sizes of these studies have been small for various reasons, including limited population size and
availability and willingness of gays and lesbians to identify themselves. Future research should aim to have larger sample sizes to allow for generalization when appropriate.

Studies to date have primarily consisted of Caucasian, well educated, lesbians (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). Researchers should strive to include racial minorities and various socioeconomic groups.

Also of note is that almost all available studies have recruited gay and lesbian participants via parenting groups or gay and lesbian support groups (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). Certainly, this technique was chosen because of the specific nature of the population. However, it is possible to see how individuals attending such groups may not be representative of all gay and lesbian families. Future researchers should consider other avenues of gaining participants.

The dynamics of the gay and lesbian family are still largely unknown. Some research has been done to assess the parenting style and division of labor in lesbian relationships (Patterson, 1995), however, this is an area that warrants further investigation. Future research should strive to derive an association between parenting success in lesbian families and variables such as socioeconomic status, partner relationship satisfaction, community, and family social support. For instance, one area that should be further expanded is what makes lesbian families successful? What services do lesbian families utilize? What is the association between social support and
Lesbian family success? What is the impact of lesbian divorce or separation on children? Are children of gay and lesbian families aware of the legal bias toward their families? What psychological benefits would gay marriage have on children?

**Research proposal**

**Research Method**

The method proposed by this author is a non-experimental, associational design. The study will be driven by the following research question: What is the impact of socioeconomic status and parental relationship satisfaction in psychosocial adjustment of children raised in lesbian headed families? Information would be gained using a survey administered to 100 lesbian families attending various groups geared toward gay and lesbian families. The hope is that those families will also refer the researcher to other lesbian headed families within the metroplex that are not participating in parenting or support groups, indicating a broader, more inclusive sample. Information will be compared to determine the relationship between socioeconomic status of lesbian headed families and the level of relationship satisfaction in their children’s psychosocial adjustment.

A non-experimental method was chosen for two main reasons. First, random selection of this group is impossible. Second, the intent of the given study is not aimed at proving a specific intervention effective. Rather, as this field remains relatively new to social science research, the scope of the research is still aimed at finding relations among variables and gaining detailed descriptions of lesbian headed family dynamics.

**Discussion of External Validity**
Threats to external validity that can not be controlled within this design are selection, setting, and multiple treatment interactions. These threats affect our ability to generalize across the theoretical population, time, settings, and different populations. Specific threats, given this population, will be described beginning with selection.

Lesbians attending support groups (which is where participants will initially be approached) may be more comfortable with their sexuality, family structure, and open to assistance, than those families who do not seek assistance from outside groups. This may threaten validity in that the sample may not be representative of the entire theoretical population. Due to the non-experimental design of this study, generalization outside of the study population would be inappropriate.

Setting concerns stem from the interview location and method of delivery. All subjects will be interviewed and administered questionnaires in a face-to-face manner at the group site. Additional home interviews will be conducted as the need arises.

The threat to validity specifically due to setting is limited because the setting of the interview is largely irrelevant and was chosen due to feasibility. Participants will be chosen based on their willingness to participate and will not be requested to perform any tasks or assignments that may be performed differently outside of the clinical setting.

Discussion of internal validity

The four levels of internal validity addressed include face, content, criterion-related, and construct validity. Each of these issues will be discussed separately to ensure clarity.
Face validity is achieved following an in depth review of previous studies and discussion with experts. It appears that this was achieved because it does appear that on the surface all possible elements have been included.

Content validity was established by using similar operationalization of variables as previous studies in the same domain.

Criterion validity is established by using various methods of measurement that have already established validity and reliability.

Construct validity is achieved in the following three ways. First, lesbian headed families and psychosocial development was defined within the existing symantic net accepted within social science research. Second, the author is able to provide direct evidence that operationalization of the construct has been controlled. Third, the reasons for operationalization are clear. They are clearly related to the definitions adopted by previous researchers within the same field of study, and include all of the elements of the population studied. Threats to construct validity that are controlled for include mono-operational bias, mono-method bias, and restricted generalizability. Mono-operational bias and mono-method bias are controlled by using multiple measures. Generalizability remains an issue due to the limited sample size and sampling method.

**Operationalization**

Socioeconomic status and partner relationship satisfaction are the predictor variables within this study. Socioeconomic status will be defined as ability to meet financial obligations without outside assistance. It will be measured using a series of ratio level questions.
Parental relationship satisfaction will be measured using the Parenting Stress Index (Abidin, 1990), Trait Anxiety Inventory (Speilberger, 1983), the Beck Depression Inventory (Beck & Steer, 1987), and the Golombok Rust Inventory of Martial State (Rust, Bennum, Crowe, & Golombok, 1988). These are all standardized instruments that have been tested for reliability and validity. Correlating high scores will indicate consistency among testing methods and lend itself to validity.

Psychosocial adjustment is the criterion variable. The construct has been defined for the purpose of this study to include peer relationships, self esteem, and the parent-child relationship. Psychosocial adjustment will be measured using several previously proven valid and reliable standardized measures. Correlation of these scores will also lend itself to proving the gained measures to be valid.

Self esteem will be measured using the Coopersmith Self Esteem Inventory (SEI). The SEI measures five categories including feelings about general self, social or peer relationships, relationships at home and with parents, lying, and school performance. Validity of the SEI has been well established since 1971 (Coopersmith, 1967).

The parent-child relationship will be measured using the PACHIQ or Parent-Child Interaction Questionnaire (Lange, Blon, & Wiers, 1998). The PACHIQ is designed to assess how each parent and each child perceives the quality of their relationship (Vanfraussen, 2003). The PACHIQ has been proven valid and reliable through test-retest and split half methods.

**Measurement**

**Reliability**
Reliability will be established largely by using standardized measures that have previously been tested and validated. Interobserver reliability will be addressed by providing education to all researchers prior to actual data collection. Each observer will be required to review the sample families to ensure they are all getting the same information respectively. Any variations will be addressed via additional education prior to actual data collection. Additionally, researchers will be randomly observed during actual data collection as well.

Validity

Care will be taken to avoid issues of systematic errors of interviewer, role-dependant effects, and role-independent effects. Interviewer error will be addressed via education on potential issues related to interviewer effects on subjects, and ways to avoid interviewer bias in interpreting information gained from subjects. Additionally, alternate, equally trained interviewers will be available in the event such a modification becomes necessary to preserve validity. Role-dependant effect will be minimized via clear instructions to participants about the role of the researcher. Observation will be made by alternate researchers randomly throughout the process as well. Role-independent effect will be monitored throughout the data collection process as well. Alternate research assistants will be utilized in this situation if necessary to preserve validity.

Sample (content, unit, extent, time)

The theoretical population is all lesbian headed families. The sample population is 100 lesbian couples and their children ages 3 – 17. The proposed sampling plan is snowballing. Specifically, families within the Dallas-Fort Worth metroplex will be sought via various advertised gay and lesbian groups. Identified lesbian headed families
will be asked to refer researchers to families also within the Dallas-Fort Worth metroplex who are not attending support or parenting groups. A nonprobability, snowball, sampling plan was chosen due to the limited and specific nature of the studied population. There are a growing number of lesbian headed families within the general population, however, they remain largely unidentified. Word of mouth will be essential in locating a sufficient number of participants. The proposed sample size will be 100 lesbian headed families.

Other considerations regarding the sample include the prescribed unit of analysis, extent, and time. The unit of analysis is children, in that the study aims to understand the impact between parental/partner relationship and children’s well-being. The extent of this study is restricted to lesbian couples and their children interviewed within the Dallas-Fort Worth metroplex. The temporal period adopted for the proposed study is a cross sectional study of lesbian headed families that have at least one child age 3 – 17.

**Data Analysis**

This is an association research design. Associational statistics will be used to explore the relationships between the variables. All possible variables will be controlled for statistically.

**Plan to protect human subjects**

The proposed study deals with children, a population defined as vulnerable by the IRB. Also, this study involves families and children that have a more than minimal risk of discrimination if identified as homosexual. Thus, the researcher has taken steps to ensure the protection of all participants. Especially of concern are privacy, confidentiality, and informed consent.
Privacy and confidentiality will be protected by having all participants and researchers sign a statement of confidentiality. Once information is gathered from participants, their responses will be coded with a number. No identifying information will be released in any completed or tentative public reports. Despite the emphasis on confidentiality, limits of confidentiality, including a participant being a danger to self or others, will be explained as well.

Informed consent will be obtained from each individual over 5 years of age, as required by the Institutional Review Board. Informed consent paperwork will be prepared in a fashion that is easily understood by participants according to age and development. Risks will be clearly defined as well as steps to ensure confidentiality and potential benefits. All participants will be offered the chance to decline participation at any time during the study.

**Strengths and limitations**

The chosen method is a non-experimental, associational, survey design. The method limits generalization outside of the study population. Also, due to the design of this study, causation will not be explored; rather relationships between socioeconomic status and parental relationship satisfaction on their children’s psychosocial adjustment will be explored. This is not to say that one causes the other.

**Statement of the overall vigor of this study compared to previous studies in this area.**

Ample research has been conducted to prove that being raised by lesbians does not in and of itself cause lasting psychological trauma to children (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Falk, 1989; Green, Mandel, Hotvedt, Gray, & Smith,
1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981). In fact, the growing opinion within the helping profession, which is supported by empirical research to date, is that homosexuals are capable parents and children raised by homosexual parents are not negatively impacted due to their parents’ sexual orientation (Flaks, Ficher, Masterpasqua, & Joseph, 1995; Falk, 1989, Green, Mandel, Hotvedt, Gray, & Smith, 1986; Golombock, Spencer, & Rutter, 1983, Harris & Turner 1985, Huggins, 1989; Kirkpatrick, Smith & Roy, 1981).

The goal of this design is to move beyond description of parenting style and comparison of lesbians’ parenting abilities and toward an understanding of the key elements that allow lesbian headed families to raise well adjusted children.

This study will also more than triple the sample sizes of existing research on lesbian families. By using larger sample sizes, that are more reflective of the larger population, accurate generalizations will be possible. Also, this will be a landmark study using comparison groups of lesbian mothers respectively. To date research has largely used heterosexual single mothers as the population for their comparisons. This study will move beyond the premise that we are somehow still trying to prove that lesbian families exist and are as capable parents as their heterosexual counter parents, thus using heterosexual families as the group which comparisons are conducted. This will move the body of knowledge toward working on a model of intervention within gay and lesbian families.

Conclusion

There is no dispute that lesbian mothers have always existed. However, there has been a shift in how these families are created. Previously lesbian headed families were
created after a woman living in a heterosexual marriage was divorced. After the divorce, she began to identify herself as a lesbian, and eventually came out to her family. There are a growing number of lesbian couples that are planning to begin families via adoption, foster care, or donor insemination. This shift in the lesbian population creates new dynamics that should be explored via social science research.

Those lesbian couples that are planning families have largely been neglected in social science research. Previous research is primarily focused on the impact of parental sexuality on children. The proposed research study aims to move beyond those results stating that lesbians can raise children successfully and toward a more in-depth understanding of the dynamics of lesbian headed planned families and the impact on their children.

A Study of New Preschoolers’ Environmental Adjustment

Increasing with more maternal workers in the labor market and less children in the family, it is prevail to have young children to attend preschool in Taiwan. Undoubtedly, children face challenges when they attempt to adjust to new school environments. The available literature suggests that children’s adjustment may be affected by the internal and organismic characteristics of the child. In addition, research findings have reported that older children adapted better than younger children during the period from kindergarten to second grade. Thus, the purpose of this study is to explore new preschoolers’ environmental adjustment where children's variables, parental expectancy, and teaching behavior were examined.

Four hundred children and their parents and teachers in southern Taiwan were involved in this study. Questionnaires including “New Preschoolers’ Environmental Adjustment Questionnaire”, “Parental Expectancy and Participation Questionnaire”, and “Teaching Behavior Questionnaire” developed by the researcher and “Children's Behavior Questionnaire” by Rothbart (2000) were used to collect data. Statistical methods including descriptive statistics, One-Way ANOVA, t-test and
multiple regression were conducted to analyze data.

The findings are stated as follows:

1. There were significant differences at total preschool environmental adjustment and specific dimensions between new preschoolers of different age.

2. There were significant differences at total preschool environmental adjustment and specific dimensions between 3-6 year-old children on negative affectivity, effortful control. There were no significant differences at total preschoolers environmental and specific dimensions between 3-6 year-old children on extraversion.

3. Children's negative affectivity and extraversion, parental expectancy and participation, parent-teacher communication and teaching behavior were found to be predictive of preschoolers' environmental adjustment.

4. There was path analysis at children's temperament, parental expectancy and participation, teaching behavior for preschoolers' environmental adjustment.

Finally, based on research results, suggestions were provided to parents, preschool administrators and future researchers.

Topic: Social Work/Innovative Teaching

Format: Paper Session
Abstract
Creating a Learning Environment in the Workplace:
Taking the Graduate Classroom to the Field

Universities are increasingly challenged to expand educational opportunity and access to non-traditional students. In order to meet this challenge, university faculty and administration must look beyond traditional methods of course delivery. The Credit for Learning Program (CFL) is an innovative educational outreach partnership among the University of Kentucky, University of Louisville, Western Kentucky University, Eastern Kentucky University and the Kentucky Cabinet for Health and Family Services designed to enhance the professional development of public child welfare workers in the Commonwealth of Kentucky. This program offers new and tenured child protection workers the opportunity to take graduate social work courses and earn graduate-level credit as non-degree graduate students while fulfilling the professional development requirements for employment. The universities and the training division of the agency jointly develop the curriculum and a teaching team consisting of a university instructor and an agency trainer collaborate to ensure that both university and agency requirements are met. The program utilizes distributed education models, and courses are taught off-campus at workplace sites throughout the state to improve accessibility to higher education.

This presentation will demonstrate how instructors in the Credit For Learning partnership have implemented graduate courses in the field using a combination of face-to-face classroom sessions (lecture, group discussion, exercises, video and audiotapes) and online sessions (Blackboard) to deliver the courses. Coursework has been offered specific to child welfare practice, research, and policy knowledge necessary for understanding, assessing, and intervening in various forms of family violence. This mixture of intensive face-to-face sessions and online sessions has shown to be quite helpful for workers that need and want information on best practice in a format that is current, useful, and easily accessible. Agreements between the public agency and the universities allow workers to attend classes during regular work hours, and establish a career track for workers to pursue graduate education. The credit hours earned through the CFL Program can be applied as elective credits in any of the three participating universities offering the Master of Social Work degree if the participant is admitted to the graduate program.

Encouraging workers to take advantage of these courses, and providing the opportunity to do so, helps better prepare them for the difficult and challenging work in public child welfare. The research suggests that a sense of competency and job preparedness increases worker retention thus reducing the amount of worker turnover experienced by the families they serve. More importantly, workers are empowered to pursue advanced education to develop the critical thinking and casework skills necessary to effectively assess and intervene in family violence.
ABSTRACT

If the goal of classical rhetoric is to teach, to delight and to move, certainly the rhetoric of the 21st century is digitally-mastered mass communication, complete with its full complement of advertising expertly designed to “persuade” (that is, effect a behavioral change) consumers to buy. Accounting for theories of selected exposure, the techniques of modern persuasion, be they print or electronic, are not equally effective as contributors to the persuasion of consumers in the global marketplace. Persuasion, as an end result of the advertising effort, is not reoccurring and thus, by definition, is inherently limited. This is because all advertising is not created equal. There is no parity in the advertising game and there never was. Therefore, the larger question deals with which of the two advertising formats (print or electronic) is the most efficient in affecting consumer behavior with the least amount of “waste.” The
communication value of each of these forms is quite different in nature. Of these two forms of communication, electronic arguably produces the most measurable gain with the least amount of waste. And, once noted, this indelible, electronic impression becomes only one of the many variables influencing consumer buying decisions and may not even be the most important variable at play in the race to persuade ever-elusive potential customers to ante the dollars that constitute a multi-trillion dollar economy.

Kathleen Hall Jamieson and Karlyn Campbell in their book Interplay and Influence, point out that the Romans identified three goals of rhetoric: to teach, to delight and to move. In modern day parlance, the rhetoric of the 21st century is digitally-mastered mass communication and the parallel term for to move would reference the advertising that supports and drives today’s mass communication enterprises, whose main charge is to ultimately move (that is, persuade) potential consumers into action via this advertising. Although one can argue that advertising effectiveness is measured by recall and not by persuading consumers to action (sales), it cannot not be denied that advertisers buy advertising only if they foresee a result from that advertising in the form of increased sales which ultimately emanate from those shoppers who recall an advertiser’s message.

This recall is made possible by repetitive exposure (at least three times in a given week) of an advertiser’s message both during the pre-experience phase of consumerism (anticipating the benefits of buying and then using a product prior to purchase), the experiencial phase when one is actually using the purchased product (or engaging in a certain shopping experience) as well as the post-experience phase when the user is reminded of the benefits of having used the product. This final phase occurs when the brand is imprinted in the mind and Top of Mind Awareness occurs, creating brand recall. (This concept will be more fully developed when the P/E/M model is discussed on page five of this paper.)

That this (advertising) is attempted to the tune of some $150 billion dollars per year is a matter of record. (Vanden Bergh & Katz, 1999). What is not on the record and subject to debate is the variation in the persuasive power of the populous mass media forms in relation to the billions of dollars actually being spent on consumer oriented advertising. That a correlation does exist between the advertising message and the end result of persuasion is beyond debate. What is subject to academic inquiry is the ability of any one advertising form to compel more effectively than other forms of advertising. Simply stated, the discussion asks are all forms of advertising equally effective as contributors to the persuasion of consumers in a global marketplace?

Persuasion as a rhetorical device

Perhaps a good place to begin the inquiry would be to examine the limits of persuasion as a rhetorical device in advertising. The limits begin when one examines the theories of selective exposure which postulate that people (consumers) tend to avoid information (whether from commercials or news stories) that is inconsistent with their personal value system or set of beliefs. Hence, if a lifelong Republican living in a “red” state is presented with a political commercial featuring a liberal Democrat, that person will tend to avoid the information presented in that commercial, just as a non beer drinker will tend to see nothing useful in the rhetoric of a beer commercial.

However, if one is persuaded by either an advertisement or a news story to enter a particular store or try a certain product, this persuasion, which is the desired end result of the advertising effort, is not reoccurring. Persuasion can only occur once, since advertising, as a form of persuasion, can only cause a potential consumer to try a product or service one time and one time only. From that point on, persuasion is rendered neutral, superseded by the attributes of the product or service tried on that one-time basis. One does not return, for example, to a restaurant after a negative experience simply because the advertising is attractive or memorable. Advertising, whether print or electronic,

can only persuade once. (To clarify, the operative word “persuade” is used as an all-encompassing term that identifies the element in advertising that triggers a response in the mind of a consumer that causes that consumer to either switch brands/stores or try a new product altogether. In a word, “persuasion” causes a behavioral change.)

Such persuasion, then, set in motion by the influences of advertising is not set in motion equally. This is because not advertising is not created equal. There is no parity in the advertising game and there never was. There exist distinct and measurable differences in the forms of advertising available to America’s corporations, businesses and retailers. That demand responds equally to all media is a hypothesis objectively rejected (Kinnucan and Miao, 1999) by many who struggle to measure responses using recall or similar methodology. The purpose of this paper, then, is to adopt the point of view that the gains realized from electronic media advertising are greater than those realized by the more ineffectual print media, despite the placing of millions of advertising dollars into the print media (newspapers and direct mail) by regional and local businesses, such spending far surpassing the combined revenues for radio and television at that level. (Larger corporate entities tend to gravitate to network television due to the larger ad budgets not enjoyed by regional and local companies.)

Advertising Waste

A major concern facing the planners who purchase and evaluate advertising space and media schedules should be (but, often is not) the concern of overall waste. That is, how much of a company’s or store’s advertising is going unnoticed, is not being consumed by the appropriate demographic group or intended target customer, or is not producing results even when it is placed or targeted correctly? That waste does occur in all forms of advertising is beyond dispute. (The higher the waste, the less the persuasive appeal.)

This waste occurs not only in the delivery of the message itself (being
targeted to the wrong demographic or not being properly impressed upon the right demographic), but in the copy and/or strategy that is used to impress or reach the intended target group (the right message targeted to the right market segment is ineffective with the wrong copy or copy that says the wrong thing. Bad ideas written well do not make memorable advertising).

Reducing actual waste inherent in the advertising process and hence, increasing the level of persuasiveness, may be argued from many perspectives. However, the corporate/business advertising budget itself may be a logical place to begin simply because these budgets often finance other projects outside of the realm of pure advertising. Pure being that effort designed to elicit a direct consumer response (again, with the right idea or strategy written the right way) to a product or a business.

As an example, consumers certainly cannot respond to off-media promotions (below-the-line) costs such as trade shows, the cost of which is invariably borne by the advertising budget. Trade shows are designed to move merchandise from manufacturer to retailer, thus enabling stores to be stocked with goods that can then move with the assistance of advertising. If consumers are out of the loop, waste certainly does occur; in this case, however, it occurs because the budget was used improperly - not because what was done was improper. Separate promotional budgets to differentiate promotional efforts from advertising efforts may be advisable for companies that roll both off-media promotions like trade shows and direct retail advertising efforts into one.

And what about the so-called above the line or pure budgetary costs designed to elicit direct consumer response through the persuasive and (hopefully) effective use of advertising like radio, television and newspaper? Certainly, waste does occur in even these above-the-line efforts, as advertisers and academics alike insist in classifying inefficient media, like the Yellow Pages for example, as an above-the-line expense. Yellow pages are not equally efficient in delivering potential customers as are radio, television and newspaper, as the Yellow Pages cannot make available an advertising message in any meaningful way. (It could also be argued that all forms of advertising outside of radio, TV and newspaper are below-the-line costs fraught with waste and unable to produce meaningful

consumer response.)

However, the example being used here is yellow page advertising and as a reference medium, the Yellow Pages is a directory that is referred to after the consumer's mind has been directed or franchised by the traditional forms of mass media, mainly radio or television. As such, Yellow Page advertising space for any business is mere courtesy display, not advertising in the pure sense of above-the-line expenditures. Hence, the persuasive appeal of advertising can be argued to be limited to only the above-the-line efforts of radio, television and newspaper.

The concept of waste in this paper will concern itself only with budgeted above-the-line media expenditures or those designed to produce, through advertising recall, direct retail results. Naturally, there will exist a correlation between what can be considered high waste and the correspondingly low levels of persuasive success. The vast amount of waste that does become apparent in corporate/business advertising actually occurs when advertising is placed with the least effective of the above-the line mass media, specifically the daily newspaper in each market. Since newspaper represents a one-time only impression (any medium actively used only once in a 24 hour timeframe is not a multiple-impression medium where the rule of "three" exposures affecting cognition comes into play), inherent waste is minimized (and the ability to persuade enhanced) when advertising is placed on an educational/intrusive medium (radio or television) where consumers have no choice but to receive the impression and usually multiple times over a select time period.

The Correlation Between Dollars Invested and Measurable Advertising Results

Since the topic of "waste" and "budgets" is on the table, the next level of discussion should focus on the results that advertising expenditures should be expected to produce. In other words, is there actually a measurable return (ROI) that correlates to the number of dollars actually being spent on advertising, regardless of medium? (ROI is easily calculated by dividing sales by advertising costs.) Much

Information is available on this topic, but in general terms, there seems to be little correlation between dollars invested and results gained. What “results” can be measured seem to be linked to the advertising copy itself or the message delivered to the consumer by the advertising.

If this message is non-believable, predictable or boring, it will receive little attention. If the copy evokes positive memories and taps into human emotions, it will likely remain in the consumer’s mind until point-of-purchase. Using the P/E/M model (Hall, 2002), advertising does more than just “get the name out.” Effective advertising creates a perception (P) prior to pre-experience where a consumer anticipates certain feelings and experiences while trust and relationships are being built. This phase improves the odds of a first-timetrial when the consumer actually decides to try the product or service being advertised. The consumer (target audience) then experiences the product (E) during which time the advertising should enhance the quality of the actual experience. Post-experience advertising should then enhance the quality of the remembrance (M). This model enhances brand-related recall if the copy directly impacts our sensory and social experiences, that is, causes us to correlate product usage with a past, positive experience.

McDonald’s advertising does exactly that. Consumers remember earlier childhood experiences of wanting to go to that fast-food chain and current advertising reminds them that they have always loved the experience – “I’m Lovin’ It.” Beer advertising reminds us of past parties with friends and that Miller Lite is still “less filling and tastes great.” Soft drink advertisers play to that part of our brain by reminding us that Coke is still the “real thing” or how much fun is associated with doing the “Dew.”

All of these referenced examples enhancing brand-related recall are electronic by nature, as imagery through frequency on an intrusive medium is the only valid instrument for shaping perceptions and attitudes. Newspaper’s effect is minimal in this regard, as it provides only a “one-time” impression to the consumer, meaning that a reader has only one opportunity during a 24 hour cycle to notice any one particular advertisement.
**One-time impressions vs. Intrusiveness**

More simply stated, a one-time impression medium (newspaper) has little overall effect on cognition (even if an ad is run over an extended time period) when compared to the intrusive nature of the electronic media where cognition is enhanced by the consumer receiving the message passively, that is, without choice multiple times throughout the day. Waste is therefore minimized (and persuasion is enhanced) in cases where advertising budgets favor the electronic media. This is simply due to the nature of the consumer. One hears or sees an ad on radio or TV and some cognition occurs, even if that consumer is not in the market for what is being advertised. One who is not in the market for a product, business or service being advertised in the newspaper will choose to pass that ad over (passover effect) and no cognition will occur.

The evidence in this regard is compelling. To make a point, surely no one consciously intends to memorize the many popular songs from past decades that are carried around for a lifetime inside of our heads. But, those songs are there. (No one memorized these lyrics from sheet music purchased, then read and put to memory.) Therein may lie some insight into how proper mass media selection may reduce advertising waste and enhance the persuasive nature of the advertising effort. A business should simply use the media whose function is unconsciously educational, that is, the electronic media. This mind-education leads to Top of Mind Awareness or Brand Recall, terms familiar to all who work for and with the mass media.

**The Electronic Media - The Intrusive Rhetoric of Persuasion**

The electronic media, defined simply as either the medium of radio or television and its many systems of delivery, is different from print in its ability to deliver advertising messages to potential consumers as the invisible sine wave that delivers the

electronic signal is from its tangible cousin, the printed page. Understanding those differences can have a profound impact on the longevity of a business and the way in which it chooses to invest its advertising dollars.

The argument that entertainment programs on both radio as well as television exist only as vehicles to deliver rhetorical commercial messages intended to persuade large numbers of potential consumers into action has been advanced by numerous media critics over the years. It would be hard to argue such a point, for it is precisely that commercial system, self-supporting that it is, that gives us a government-free information and entertainment system whose only cost to the consumer is the price of a receiver set and the electricity to run it.

The concept of programming, then, is to run the information and/or the entertainment concurrent with the commercials that make such programming possible. Commercials are interwoven together in a tapestry of entertainment programs, news, sports, weather, public service announcements and commercials, a mosaic where all becomes one and the consumption of the advertising is as natural as consuming the program, be it radio or television.

Electronic media commercials are a part of the programming, where the listener or viewer consumes them whether they wish to or not because they are one with the program. Unlike the active medium of newspaper that requires an attentive involvement, the consumer of radio or TV has no choice but to attend to the advertisements (or, of course, leave the room or engage in other activities). There is no “passover” choice to be made with a media whose advertisements are intrusive by nature and viewed or listened to on a passive medium that takes no effort on the part of the consumer other than to turn the set on.

Industry Research on Passive Media

These distinctions have been noted in advertising research for the past several decades. (David W. Finn, 1984) noted the passive nature of print that requires an active audience that selectively passes over content of no interest. Naturally,
information that is skipped, not attended to or is unseen does not present a learning opportunity because it is invisible to the mind. Conversely, the intrusiveness of the electronic media allows the consumer little freedom to pass over low or no interest advertisements with the end result being that some cognition will occur and the consumer will learn something about the message. Thus, any advertisement that is at least noted will influence cognition. Two of Finn’s propositions are that television (radio was not included in his study) has a higher probability of influencing awareness than print advertising and that the repetitive nature of television will lead to more learning of brand claims than print advertising.

(Krugman, 1965) noted the differences in the consumer’s processing of print versus broadcast advertising and the demanding cognitive task required to consume the print media. Low involvement consumers simply will not read printed material. They will, however, be exposed to the intrusiveness of television (or radio) advertisements.

The developing theme of this paper, noted by researchers like (Holbrook, 1984) and (Greenwald and Leavitt, 1984), essentially marks the inability of the print media to elicit a response from uninvolved readers who are not motivated to note or read the message, simply due to the fact that they are not in the market to buy what is being advertised. These very consumers, however, can be influenced by a broadcast media providing verbal messages which are noted even by involved consumers who are not in the market, simply because they cannot avoid the intrusiveness of the spectrum delivered signal.

Other studies (Murdock, 1967-1969), (Edell and Keller, 1989) reiterate how consumers extract more information and exhibit heightened retention from radio and TV than from the printed medium. It should also be noted that the more the consumer is involved (in the market for what is being advertised), the more attentive he or she will be to the electronic message. In other words, a logical or hot prospect will pay attention at a heightened level. As noted by (Buchholz and Smith, 1991), the level of consumer involvement plays a significant role in how a consumer personally connects to an advertising message and subsequently processes brand and copy points leading to top-of-mind

awareness.

Despite the greater attentiveness given to media messages by those in a high state of involvement, the message here is that the intrusive nature of the electronic media affects cognition even when a consumer is in a low or no involvement state. Hence, the rhetoric that is inherent in the persuasive efforts of 21st century communication forms can only be said to be efficient where that communication form is electronic as opposed to print. This efficiency stems from the concept of intrusiveness, paramount to the understanding of how powerful a social and educational force radio and TV are given the fact that commercial messages (as well as news-information) intrude into the lives of consumers not once or twice, but multiple times over the life cycle of a commercial campaign. Such multiplicity provides repetition, a key ingredient in the psychology of learning. Such repeated or successive exposures over time leave an indelible imprint in the mind that one or two exposures provided by an active medium like print cannot provide.

Regardless of perceived broadcast media strengths, however, neither radio or television is a panacea. Additional research on broadcast media testifies to the limitations of radio as a form of persuasion, that is showing radio to harbor inherent limitations. In researching the correlation between broadcast media use and political attitudes (Johnson, Braima and Sothirajah, 2000) conclude that few people today list radio as a primary source of information and that radio use contributes little to knowledge gain. Attention to television news, however, was correlated to high levels of political interest. Several factors can account for both of these findings (methodology, campaign-related factors or lack of voter interest), but the study addresses only how consumers respond to and process political rhetoric, not how creative broadcast advertising intrudes via thirty or sixty second jingles and copy.

The Non-Reoccurring Nature of Advertising/Persuasion

It was earlier noted that persuasion can only occur once and that it is rendered neutral after a potential consumer’s one-time experience. Hence, there are rhetorical limits to what the electronic media can actually accomplish, the
experience at the consumer level being the determining factor as to whether or not that first-time experience becomes actualized into subsequent visits or purchases. All advertising can do is to persuade first-time customers to try the product or business being advertised. In other words, provide communication to a logical prospect that is sufficient to cause that person to get to the front door of the business or to examine a product found on a shelf. From that point on, advertising has little to no influence on customer behavior and, therefore, the persuasive power of that message is inherently limited. The end result of consumer behavior has always been and always will be the responsibility of the store or the business on whose doorstep the potential customer is now standing.

Communicating with a potential customer via advertising, then, is only one variable of many that influence consumer buying behavior. Such advertising does not ultimately cause or actually initiate buying behavior. Advertising triggers the response needed to motivate the consumer to go into a particular store or place of business to look at and consider the purchase of a product or of a service. Since the product or service will be accepted or rejected on its own merits, advertising plays no role in ultimate consumer behavior other than that of reinforcement.

Once in a store, a consumer who has a favorable disposition toward a particular product may be more inclined to buy than a consumer whose attitude is neutral. But certainly, no one enters a store and buys what they don’t want merely because the advertising is good. Hence, the limits of advertising and persuasion in 21st century rhetoric.

What does trigger the buying decision on the part of the consumer is a complex matrix of variables, including advertising. But, advertising is but one variable. Since it may be considered the most noticeable of the variables, it is usually the one to receive the “blame” when corporations and businesses fail in their sales efforts.

**Variables Influencing Consumer Buying Decisions**
Advertising, by definition, is a communication form and a variable that impacts consumer decision making. However, there are multiple marketing variables, both external (the factors that exist in the environment outside of the immediate store or business) and internal (the variables or factors that are a part of the interior environment within the store or business) that ultimately determine whether a potential customer actually is converted into a paying customer. Both the internal and the external variables may be influenced directly or indirectly by store management, but both most certainly contribute to consumer behavior within the complex marketplace of choice.

Simply stated, all things being equal, potential customers that advertising delivers will usually not shop in a store they may feel uncomfortable entering (location), that they feel looks shabby or out-dated (store appearance), where they may have to walk what they feel is a considerable distance (adequate parking), where inadequate lighting does not present a safe or secure environment or where they perceive the overall store reputation within the community to be questionable for whatever reason. These are the external variables that may work for or against a particular business regardless of the advertising done, which may have very positive or high communication value.

Once in the store itself, a budding consumer will not become a customer if he/she is not treated well or is overly pressured by floor salespeople (trained/friendly floor personnel), if the price of the item sought is not within the shopper’s budget or he/she feels it can be purchased for less elsewhere (price related to benefit/competition), if the desired item is not presented well (packaging/floor display), if there is disappointment with product quality or features or if the business is not perceived as being hygienic, as in having clean restrooms. Lastly, consumers are creatures of fashion and trend. They enjoy having what others desire or covet, so likely will not seek to own what is out of the mainstream of consumer taste.

Simply stated, if a business knows what its customers want and then provides
for those needs with good service and competitive prices, nothing will keep customers away. Poorly run businesses, however, will have difficulty maintaining a customer base no matter how creative or clever any advertising effort might be.

These are the internal variables over which the retailer has more direct control since the consumer is actually in the store and can be spoken with one-on-one about product price and quality, consumer benefits from paying that price, product features that separate the product from its competition, delivery schedule, service after the sale or other internal variables.

Advertising, then, cannot create what is not there- that is, a favorable shopping environment for the consumer. Once enveloped with this environment, the end-result is positive word-of-mouth (or negative, if the environment is disappointing), a phenomenon that works better than does any form of print or electronic advertising. What a consumer experiences is far greater than what that consumer sees or hears via advertising. In actuality, advertising of any kind can only do one thing, that one thing being the result of deciphering the lowest common denominator in advertising.

**The Lowest Common Denominator**

Ask any group of media professionals or retail clients to define the one thing that advertising can do, if it could theoretically be broken down to a lowest common denominator, and you'll receive multiple answers like "create awareness," "stimulate demand," or "enhance overall image." Each answer, of course, contains a bit of truth about how advertising functions in our society, but it is rare that the one "correct" answer (the lowest common denominator) ever surfaces.

Yes, advertising can create images, motivate consumers, create desire or do any number of things claimed by advertising people, but Hank Seiden (1976) was absolutely correct with his assertion that advertising can only bring a logical prospect or a potential consumer into a place of business or cause them to use a particular service one time and one time only. From that point on, of course, the
product or service stands on its own, a recurrent theme running throughout this paper. Advertising has done all it can do when it convinces someone to try or experience something for the first time. Consequently, advertising does not make customers. Only well-run stores and good products make customers. Hence, the communication value of any advertising rests, not on the advertising itself, but rather on other variables outside of the advertising such as whether or not the logical prospect is actually in the market for what is being advertised and the overall buying experience encountered when shopping for that product or service. If the store or business is rejected at that point, such rejection has nothing to do with advertising but with the store or business itself.

Logical Prospects

At this point, it is essential to understand just who a logical prospect or a potential customer of any business engaged in advertising is, in order to expand the customer base of that business. A logical prospect for any corporation, business or retail group is one who must meet certain criteria; such criteria must be understood by advertisers who often tend to believe that "everyone" in their marketing area desires what they have to sell or what they are advertising on any given media. In fact, very few people in any given market are actually potential customers for any products or services being offered by any retail establishment during a typical business day. A person who does enter a store and agrees to make or does make a purchase is one who:

* Is in the market for that product or service. In other words, possesses a demonstrated need that has to be filled.

* Can afford to buy the product/service or can afford to finance the product or service being advertised.

Knowing this, one can then state that advertising communication to the general public or to a defined demographic, in and of itself, cannot sell a product or a service to someone who has no need for such, is out of the market for any reason (someone who buys a new car today will be out of the automotive market for an average of 24 - 36 months) or who cannot afford it. And, as has been
established, advertising does not make a satisfied customer. Only good products and well-run stores create customer satisfaction and if those variables are not present, a business cannot be saved from market extinction.

Advertising -- Planning for the Long Term

When done correctly, advertising is a courting ritual that does woo with intended long-term results. Checking how much advertising was done for this weekend's sale with the actual sales volume for the weekend is myopic management at best. The general influence of this weekend's advertising may not be felt for weeks; no correlation exists between short-term sales volume and current advertising. Today's customers providing those immediate sales are consumers who have been communicated to and, hence, educated over the past several months or longer by the store's advertising.

To be long-term, advertising must necessarily be consistent - that is, run without interruption for a measured period of time (usually a minimum of 13 weeks). Hall (2002) has noted that for a product (or a business or service) to succeed in the marketplace based solely on product superiority, that product must be, not equal to, but substantially better than its advertised alternatives. Communicating that one has a superior product commands consistent advertising attention over the long run in order to compete with the massive advertising budgets of the market leaders in the applicable business category.

This point is also well made in advertising journal research. Anthony I. Margan, senior vice president and research director at Backer & Spielvogel, Inc. (Margan, 1985) notes that few would deny that advertising's role is to help sell the product; however, he concludes that most testing systems evaluate a commercial's success or worth on the basis of a single exposure's ability to produce immediate results, that is to sell today, an over-simplification at best.

(Jones, 1992) has shown the long-term effect of advertising working in conjunction with the added values of the brand. Over time, these added values translate to repeat purchases. In other words, the more familiar the brand, the more popular it remains in the marketplace. Brands become familiar over time as

they are advertised over time, thus making advertising long-term by definition.

Conclusions

The question that has been addressed throughout this paper is, of the two distinct types of media, print media (newspaper, magazines, billboards, flyers, etc.) and electronic media (radio and television), which type is designed to produce consumer results for the long term?

(Although long-term by definition, some short-term results do indeed occur as there are always a percentage of consumers in the now market.) The conclusion is that the electronic media is far more efficient than is print advertising and will produce long-term results with the least amount of waste for advertisers. This efficiency enhances persuasion and positions radio and television as the medium of choice, if 21st century rhetoric is truly to be painted with the brush of the classical rhetorical intent of teaching, delighting and moving.

Further, of the variables involved in consumer intent-to-purchase, advertising may be the least efficient variable of the many impacting consumers in a 21st century multi-media environment. Stores and products make customers. Advertising merely brings them in, thus giving the businessperson the opportunity to convert the prospect into a customer. Although advertising is trumped by consumer reaction and feeling about their shopping experience, the efficiency of intrusive broadcast advertising creates word of mouth, which has routinely been shown to produce better overall results than any form of advertising, print or electronic. Thus, we have come full-circle from the classical rhetoric of the early philosophers, whose spoken words motivated generations to examine their own behavior, to modern day electronic rhetoric driven by the intrusive nature of commercials that shape and define self-behavior in a modern and complex marketplace of goods and services.

Gender Differences in an Aviation Flight Science Degree Program: A Study of Population and Performance

Purpose

The primary purpose of this research study is to examine and compare the academic performance of female and male students enrolled in the Aviation Flight Science degree program in the College of Aviation at Western Michigan University. The hypothesis is that the academic performance of female students at the College of Aviation will be equal to or greater than the performance of male students as measured by GPA and ACT scores indicating that their aptitude is equal to or greater than males.

Importance of proposed study

Although female students make up only 10% of the student population at the College of Aviation (“Enrollment retention”, 2005), this female to male ratio is typical in the field of aviation (FAA, 2003). In fact, this ratio is typical of women in male-dominated fields, including science, technology, engineering, and math (hereafter referred to as STEM) (Atkinson, 1990; Department of Labor, 2004; Frehill, 1997).

It is important to understand the reason for such ratios. The under representation of women in traditionally male-dominated areas of study and work is the reason for an increased focus on sex-related differences in performance, especially in math and science (Kahl, 1982).

The study of academic performance is an important factor in our understanding of the low population of women in aviation. An examination and comparison of the college entrance exams and college GPAs of male and female students can easily be conducted using available data. If the GPAs of women are equal to or higher than those of men, then the study’s results can be used to encourage women to pursue aviation and discourage others from believing that women do not have the aptitude for aviation related
studies. If the GPAs of female students are lower than male students, then existing body of research on gender differences in performance might help explain the reasons. Studies, such as this one, need to be conducted within the aviation field to validate or refute theories and even contribute to the findings of prior related research.

Background

Aviation is a male dominated field consisting of only 11.5% of aerospace engineers (U.S. Bureau of Labor Statistics, 2002), approximately 1.5% of aviation technicians, and 3% of airline transport pilots (Federal Aviation Administration, 2003) who are women.

While there has been extensive research explaining the reasons for the low numbers of women in the male dominated fields of STEM (Atkinson, 1990; Ayalon, 2003; Becker, 1990; Brush, 1991; Burton, 1990; Frehill, 1997; Healy, 1992; Widnall, 1988), research of gender differences within aviation is less prolific (Karp, Turney, Green, Sitler, Bishop & Niemczyk, 2002; Turney & Maxant, 2004). Since aviation flight science has so much in common with STEM programs, it is important to make use of existing research in order to understand the performance issues regarding women.

Elizabeth Johnson conducted a model case study in 1993 of college women’s performance in a college math-science curriculum. Within this study, several outcome based measures were analyzed, including SAT scores, class standing, and GPA. Results revealed that although women had lower average SAT math scores, there was little difference between the men’s and women’s grade point averages even within the same majors. Johnson’s study provides a foundation for the methodology in which to conduct a similar study of women in a collegiate aviation flight science program.
Gender Differences in an Aviation Flight Science Degree Program:  
A Study of Population and Performance

Extensive documentation has been published regarding the lower participation rate of women in science, technology, engineering and math (Becker, 2000; Brush, 1991; Hayes and Tariq, 2000; Heller and Ziegler, 1996; Principe, 2001). The number of women getting degrees in math, science and engineering peaked at 37% in 1984, but is currently down to about 28% (“Women equal,” 2002). The participation rate has reached a plateau (Atkinson, 1990; Brush, 1991). The employment rate is not equivalent either. There are few women working in science that are educated in the field (Hayes and Tariq, 2000). This study examines gender differences in performance and also indicates the reasons for the low population of women in male dominated fields.

Theoretical Framework

Gender Differences in an Aviation Flight Science Degree Program: A Study of Population and Performance

Achievement Motivation Theories

In the expectancy-value model, achievement behaviors, persistence, selection, and the performance level are interpreted as the result of a multiple networked causal system. How much a student is attracted to a subject or the outcome is predictable and affects their achievement (Heller & Ziegler, 1996). The causal attribution model relates prejudicial knowledge about female’s ability to the female’s actual potential ability in that subject. Women tend to be pessimistic and blame themselves for failure in academics, whereas men are more optimistic (Campbell & Henry, 1999). Women show less interest in science and achieve poorer grades in physics and math than male students. Heller hypothesized that these gender differences are a result of the female student’s false and low self concept of their own ability and involvement in physics and math. In other words, girls believe they are less talented in physics and math than boys, and adjust their own behavior to fit this belief (Heller & Ziegler, 1996).

Other studies have reiterated this finding. Empirical studies have shown that females are more competent in math and science than what is assumed (Weiner, 1985). If females hear that differences in their brains cause them to be poorer in math, then they may exhibit poorer performance in mathematics and less tendency to choose careers, such as science, that require math skills (Trankina, 1993). Reasons for success and
failure in science vary according to gender. But in essence, women attribute external factors to their success, such as luck, and attribute internal factors to their failures, such as lack of ability (Brownlow, Jacobi, & Rogers, 2000).

**Nature-Nurture Debate**

In this hypothesis, aptitude is a product of our hereditary makeup and our environment (Heller & Ziegler, 1996). A person’s aptitude for math and science may depend on their genetic intellect as well as their experiences in grade school, and both will influence the desire and ability to perform at higher levels. For example, parents and/or teachers may discourage a female from pursuit of higher level math classes by saying the women do not belong in that field.

**Cognitive Ability**

The actual aptitude and abilities of women are questioned in studies done during the 1970s and 1980s. Many studies state or imply that women are inferior to men in spatial visualization and mathematical skills (Brush, 1991; Trankina, 1993). The literature is filled with inconsistent findings, contradictory theories and emotional claims; however, there are clear differences in cognitive ability between the sexes (Halpern, 2000). A study of mathematically talented youth concluded that sex differences in science achievement are found relative to mathematical reasoning ability and males excel in this area (Benbow & Minor, 1986). Scholastic Aptitude Tests (SAT) results indicate that women have consistently scored lower on the math portion of SATs (Cleary, 1976; Johnson, 1993); however, the argument is that SAT scores are not an accurate predictor of successful performance in college, especially for women (Brush, 1991). Studies have shown that females received better course grades in math than males even though they
Gender Differences in an Aviation Flight Science Degree Program: A Study of Population and Performance

felt less successful (Becker; 1990; Benbow & Stanley, 1982). Such research findings may have had a significant negative effect on performance of females in the manner of a self fulfilling prophecy (Halpern, 2000; Trankina, 1993). Women’s low level of confidence and self-esteem could be the reason for low performance, low participation, and the public perception of women’s lack of aptitude for the sciences.

Classroom and Work Environment

Other scholars have explored the environment. Women select degree programs that they perceive as having a more supportive environment (Becker, 1990), for example. Reports indicate that during college and graduate school, female students who are well qualified and motivated “lose their self-esteem, are harassed by male professors and other students, are excluded from discussions and social interactions, and in general are made to feel that they do not belong” (Brush, 1991, p. 404). Women describe American college classrooms as chilly or unfriendly and overly competitive. According to the National Council for Research on Women, many women still feel that labs and other technology workplaces are unfriendly or hostile environments (Frehill, 1997; Principe, 2001). Rather than figuring out how to make women fit in to the program, these studies focus on the classroom climate.

Social Environment

Obviously, girls are influenced by their family in their education and various studies explore family influence. For example, a mother’s profession, especially in a non-traditional science or technical field, influences her daughter’s decision to study in a similar field. Prior experiences in technical problem solving, games or learning experience also influence students, and girls are not typically encouraged to develop
interest in these areas. According to research by Yee and Eccles (1988), parents attribute their children’s successes differently; daughter’s successes are attributed to diligence and effort, while boys’ successes were attributed to special abilities or talents. Girls also react more to the influence of social models than boys. The lack of female role models for traditional male activities or studies affects girls negatively compared to boys (Heller & Zeigler, 1996) and therefore negatively influences their decision to pursue such studies.

**Preparation for Math and Science**

In a major study done on sex-related differences in pre-college science, the lack of preparation for math and science is explored. The importance of pre-college science and mathematics education, especially for disadvantaged groups, has been stressed (Widnall, 1988). Students who do not start preparing for a technical career even in high school will limit their opportunities. Teaching methods and systems were examined as well as student characteristics such as science course background, spatial skills, cognitive level, age, sex, socio-economic status (Kahl, 1982). Although significant differences between the sexes in science achievement and attitudes have not been revealed, this study concluded that in order to increase performance and participation of women, direct encouragement by parents and teachers improves female student’s attitudes and self-confidence and increase their awareness of the usefulness of such training. Although institutions have increased their effort to attract women into the engineering degree programs, the female population remains low. Explanations for the low percentage of females in “quantitative fields” include high school preparation in math and science (Frehill, 1997).
Math Anxiety

Anxiety toward math and science also seems to be a factor in performance. Anxiety toward math is not unusual, but female students and women report higher levels than males. However, female performance in math courses is superior, indicating a lack of self confidence (Brownlow et al., 2000; Levine, 1995). Beliefs about abilities may be more important than performance in reducing anxiety.

Teaching Methods

Certain teaching methods in the sciences are not always favorable to women’s learning styles. Gender differences in learning styles include the style of interactions, level of independence, relations among students, achievement goals, level of confidence, mentorship, and family concerns. Teaching methods could have an impact in the achievement and enrollment levels especially in male-dominated programs (Brush, 1990; Karp, et al., 2002).

Gender Preference

Other research suggests that there are fewer female students in science, math and technology because women have a natural tendency to gravitate toward ‘soft sciences’ that include the arts, languages, social sciences and humanities rather than the ‘hard sciences’ such as, physics, engineering and math (Ayalon, 2003; Burton, 1990). In some cases, males may receive greater support for a decision to pursue education in the subjects such as engineering, while females are encouraged to pursue a less masculine field (Frehill, 1997). Neoclassical economic theory suggests that in some cases, women, more often than men, choose careers based on values other than economics. Males and females anticipate different family work roles, such as men as breadwinners and women
as caregivers. And gender role socialization theory suggests that women often select jobs based on social significance and the level of interest for that type of work, rather than for the occupations’ monetary prospects (Frehill, 1997).

**Masculine versus Feminine Fields**

Additionally, other research suggests that certain fields are perceived as ‘masculine’ or ‘feminine’, including science, engineering, technology and math (Brush, 1991). Women are often portrayed as “atypical women” by entering a male-dominated field, such as science or aviation. Personality traits associated with scientists are typically male traits; however females and males in the same fields tend to be similar (Benbow & Minor, 1986). Although physics is considered a masculine subject, there is no convincing evidence that girls have less ability to excel in physics, in fact there are women achieving at very high levels in physics courses (Benbow & Arjmand, 1990). Considering this fact, gender differences in ability alone can not explain the low numbers of women in science. A different explanation is provided by research that shows that parents tend to encourage gender consistent activities. School subjects and activities are gender-labeled, and parents may consequently consider their male and female children as capable only in certain domains. Few parents see daughters as capable in masculine domains (including science and math), but do consider humanities more appropriate (Brownlow et al., 2000). Perhaps if more female students take more “masculine” courses in high school, they will major in “masculine fields of study in higher education and eventually join “masculine occupations” (Ayalon, 2003).
Stereotyping

While society perceives certain fields as having a masculine or feminine identity, other studies indicate that society has preconceived notions and expectations of the sexes. Two stereotypical traits emerge from the research; the male stereotypical trait suggests competence and task orientations; whereas female stereotypical traits suggest warmth and expressiveness (Halpern, 2000). Additionally, women are also seen as incompetent and passive (Becker, 1990). Male academic performance is perceived as being higher than females, especially for “masculine” majors (Beyer, 1999). Many recent studies of gender stereotype accuracy were generally found to be exaggerated (Grant et al., 1997). The under representation of women in most scientific fields leads to the assumption that women lack interest in the hard sciences (Hayes & Tariq, 2000). Also assumed was that an increasing parity in scientific knowledge among men and women would reduce the gender gap in attitudes toward science. Society’s view, even today, of females’ roles in society as homemakers and child bearers may contribute to parents and teachers attitudes that science is an inappropriate career choice. A stereotypical characterization of women in science is that they are aggressive, adversarial, cold and analytical…typically masculine characteristics and unflattering to women (Trankina, 1993).

Population

Interestingly, females have higher academic achievement within single-sex programs than in mixed-sex educational programs. “Surely a change in social groupings does not affect women’s abilities although there is ample evidence that it does affect their achievement” (Burton, 1990). The proportion of students is likely to influence students after they experience being “one of the few” (Frehill, 1997). Females may not be
deterred from entering a male dominated program; however, once in the program, their experiences related to being one of few females may cause them to feel negatively about the program. Female students in male dominated programs reported lower academic self-concept, lower career commitment and less sensitivity to family issues (Ulku-Steiner & Kurtz-Costes, 2000). Mentor support relates to self-concept and there are not as many female mentors available in STEM and aviation fields. Children are more likely to pursue activities at which people of their own gender succeed (Brownlow, 2000; Principe, 2001; Ulku-Steiner & Kurtz-Costes, 2000). “A lack of women in the field tends to perpetuate a lack of women in the field” (Brush, 1991). Significantly lower participation rates for women compared to men are found in all countries.

Hypothesis

I argue that women have as high or higher grades than the men who are enrolled in the Flight Science Degree Program at Western Michigan University, indicating their aptitude for aviation is as high or higher. If women earn lower grades than the men, women cannot perform as well as men in sciences and technology.

Method

Performance of students enrolled in aviation flight science program is first examined. A quantitative study will use performance metrics that include ACT scores and GPAs. The independent variable is the gender of the participants, and the dependent variables are ACT scores and GPAs in college. The study will describe sample data (descriptive statistics), and associate the two types of variables (bivariate analysis) to determine gender differences in performance.
Sampling

The cohort group or population will be all of the students who were enrolled in the aviation flight science degree program in the College of Aviation at WMU during the spring 2004 semester, a total of 700 students. The class of 2004 was chosen since they attended all four years within the newly formed College of Aviation, which was established in 1999.

Data Collection

Data will be collected using the WMU registrar’s faculty services web site. From this site, information can be collected about the students’ majors, GPAs, ACT scores, and gender. The population will be divided into two groups, freshmen and sophomores / juniors and seniors. The reason is that the four year flight science degree program was organized such that students would take general education and prerequisite courses during the first two years on the main campus, and then take flight courses and complete degree requirements at the airport campus during the last two years. There was a significant decrease in student population during the last two years.

Description of instruments

The information needed include student ID, gender, ACT scores, GPA, and gender, were obtained from the Western Michigan University registrar. These metrics are transferred to an Excel spreadsheet.

Data analysis procedures

Descriptive statistics using a 2 x 2 ANOVA or F test will be used to test differences between the two independent variables (freshman / sophomore males and females) and the two dependent variables (ACT scores, GPAs). The ANOVA will be
used again to test the difference between junior / senior males and females using ACT scores and GPAs. The mean and standard deviation of each pairing will be calculated. The F test will determine if we can reject the null hypothesis (that female students have lower grades than male students). In order to determine the significance level, a follow-up test such as Newman-Keuls will be conducted. The table will be organized like this example:

<table>
<thead>
<tr>
<th></th>
<th>Male freshmen / sophomores (MFS)</th>
<th>Female freshmen / sophomores (FFS)</th>
<th>F value</th>
<th>Male juniors / seniors (MJS)</th>
<th>Female juniors / seniors (FJS)</th>
<th>F value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACT scores</td>
<td>Mean SD</td>
<td>Mean SD</td>
<td>x.xx</td>
<td>Mean SD</td>
<td>Mean SD</td>
<td>x.xx</td>
</tr>
<tr>
<td>GPAs</td>
<td>Mean SD</td>
<td>Mean SD</td>
<td>x.xx</td>
<td>Mean SD</td>
<td>Mean SD</td>
<td>x.xx</td>
</tr>
</tbody>
</table>

Conclusion

The reason this study is important is that women are a necessary and vital part of the industrialized 21st century, which is which heavily dependent upon science and technology. Because of the growth of technical industry positions, enrollments in colleges increased. In order to remain a leader in technological development, financial and human resources are needed to meet our many domestic and global challenges (Atkinson, 1990, Trankina, 1993). It was predicted that by year 2000, almost 70% of the labor force will be women and minorities (Healy, 1992). According to the U.S. Department of Labor, women comprised 47 percent of the total labor force (male and female) in 2003. The labor-market participation rate for women 25 to 44 years of age (child-bearing years) has risen to more than 75%, earning in aggregate a yearly $1 trillion. Of working married women, 48% provide at least half of the household income (Workforce trends, 2004). Therefore, understanding the reason for so few women in science and technology education and training programs is critical. The Office of
Technology Assessment concluded that the “principal reason for the slowdown in women’s interest in science and engineering careers is that women continue to experience higher unemployment, lower pay and fewer promotion opportunities than their male counterparts” (Atkinson, 1990, p. 431). Science and engineering will become less inhospitable only when there are more women participating. At a senate hearing on Title IX, women suggested that schools do more to support women by increasing scholarships, making the environment more supportive, creating better work-family policies and extending time for earning tenure (“Women equal,” 2002). Intervention aimed at enhancing women’s self-concept might be particularly instrumental in lowering their attrition rate (Ulku-Steiner & Kurtz-Costes, 2000).

Abstract

What people eat influences their susceptibility to disease, yet many consumers within the Western World are consuming inappropriate diets. One approach to facilitating the consumption of a healthy diet has been the development of so-called “Functional Foods” (foods that provide a health benefit beyond the traditional nutrients they contain). The ultimate aim of this research was to model current psychological predictors of intention to consume functional foods.

A mixed method approach was utilised. Qualitative (one-to-one interviews) and quantitative (questionnaire) exploratory studies were used to inform a larger qualitative study (focus groups). Emergent key information was then used to inform a large-scale questionnaire and structural equation modelling was used to identify the predictors of intention.

The interview study highlighted the important issues surrounding functional foods. The small questionnaire determined the further research on a) conditions important to consumers and b) conditions that varied along a perceived genetic scale (Alzheimer’s disease, Cardio Vascular Disease and Stress). The focus groups highlighted four design rules for the successful development of functional food (‘inversion’, ‘subterfuge’, ‘inclusiveness’ and ‘authenticity’) and three key segments of the population (‘pro-science’, ‘conditionalists’, and ‘negatives’). The final study modelled the three health conditions (Alzheimer’s disease, Cardio Vascular Disease and Stress) and three preventative health behaviours (eating functional food, a healthy diet or doing more exercise). Multi-dimensional Health Locus of Control and perceived hazard characteristics were modelled as predictors of risk perception. The main predictors of risk perception differed significantly by health condition. Intentions for the three preventative health behaviours were modelled using a Theory of Planned Behaviour framework. Good predictive utility was demonstrated, which was further improved by expansion of the model.

Output from the research could be used to inform both psychological theory and the design of future communication initiatives. Findings are discussed with respect to practical and methodological implications and directions for future research.
From Artemis to Xena: The Image of the Amazon in Western Art and Popular Culture

Amazons belong to the very earliest period of Western mythology, mentioned even in the Homeric epics. Representations of Amazons have existed in the art and popular culture of Western civilization for more than 2500 years, longer than any other recognizable female image. Ancient Greeks and Romans employed the Amazon image to represent worthy foes or barbaric outsiders. Post-Renaissance art used the Amazon as part of the European reclamation of Greco-Roman culture. Contemporary American representations have constructed romantic and valiant Amazon heroine images, but have also hyper-sexualized and trivialized the Amazon, often remolding or completely removing the original mythological underpinnings. Alternately flouting and pandering to shifting norms of femininity, a source of inspiration to women, titillation to many men, the Amazon continues to fascinate. In this paper I trace the various permutations of Western civilization's representation of the Amazon and the degree to which it has both challenged and been subsumed by patriarchal hegemony.
Chemical Dependent Pregnant Women: Best Treatment Options and Legal Issues for This Population

Abstract

The use of drugs and alcohol by pregnant women is a widespread problem that not only causes harm to themselves, but also to the fetus. The debate over whether treatment or punishment is best for this population continues. State legislation involvement includes passing laws that encourage pregnant women to seek treatment and also passing laws that support prosecution of drug abusing women, thus deterring pregnant women from seeking treatment. This paper will present a background on drug abusing women, prevalence and also effects to the fetus. The best treatments for this special population are reviewed as well as the legal issues mentioned above.
Chemical Dependent Pregnant Women

Best Treatment Options for Chemical Dependent Pregnant Women

-Introduction-

Chemical dependency has always been a legal, social and moral issue. Instances of drug and alcohol use among pregnant women are in the millions. Use of drugs and alcohol during pregnancy not only has negative effects for the women but also the fetus; maternal drug use complicates pregnancies and damages the health of the newborns (Steinberg and Gehshan 2000).

According to Cosden, Merith, Peerson, and Stacy (1997), substance abuse amongst women was given little public attention until the late 1980s when national interest was drawn to the impact of prenatal drug exposure on children. Steinberg and Gehshan (2000) agree but were more specific in mentioning the “crack-baby” phenomena, which occurred in the mid-1980s having created much of the concern. Although the initial effects of drug-exposed infants have been studied extensively, there is a lack of research on long-term effects. Most studies on the long-term impact of drug-exposed infants don’t go beyond the ages of two or three (Cosden, Merith, Peerson, and Stacy, 1997). Research on long-term effects of drug exposed infant’s needs to be done to see the true effects of drug exposure to infants.

The estimates of drug and alcohol use differ among pregnant women (Steinberg and Gehshan, 2000) due to the fear of their losing custody of their child (children) and also punishment by law (Weber, 2002). The Child Welfare League of America (1999) estimates that one of every five pregnant women uses
drugs, drinks or smokes. The Washington State Department of Social and Health Services and the Department of health (2002), estimate that one in ten pregnant woman use drugs during pregnancy. Use of drugs or alcohol by pregnant women is correlated with home instability, which has been shown to be a significant factor for the development of the drug-expose infant. Therefore, other research has found that the development of the drug exposed infant to be more progressive for those whose mother discontinued drug use (Cosden, Merith, Peerson, and Stacy, 1997).

Alcohol Use

Alcohol is the number one addictive drug in the United States. Use of alcohol among pregnant women is estimated to be 2.6 million out of 4 million women. Also, an estimated 22,0000 children per year experience mild, moderate or severe adverse effects due to their mothers use of alcohol (Steinberg and Gehshan, 2000). According to Abel (1984), out of the approximate 3,598,000 children born in 1980, the number born with Fetal Alcohol Syndrome was 3,958, (1.1 cases per 1,000).

Fetal Alcohol Syndrome is considered the extreme side effect of alcohol use amongst pregnant women. Effects to the child include slowed growth, damage to the nervous system, facial abnormalities and mental retardation. Fetal Alcohol Effects cause much more milder problems such as mental and behavioral problems, which may include short attention spans, and memory problems and disorganization (Steinberg and Gehshan, 2000). Abel (1984)
estimates Fetal Alcohol Effects cases to be 6,550 to 11,000 annually and Fetal Alcohol Syndrome to be 1,800 to 4,000 annually.

Illegal Drug Use

Steinberg and Gehshan’s (2000) estimates of illegal drug use by pregnant women in the United States differ, ranging from 221,000 to 739,000 births per year (5.5 percent to 18 percent). According to The Child Welfare League of America (1999), approximately 2.9 percent (119,000) of pregnant women smoke marijuana, 1.1 percent (45,000) use cocaine and 1.5 percent (61,000) use prescription drugs improperly. Use of illegal drugs during pregnancy has been shown to cause shortened gestational periods, miscarriages, infants to be born with low birth weight, smaller than normal head size, genital and urinary tract deformities and nervous system damage (Steinberg and Gehshan, 2000). Although infants that have been exposed to crack or cocaine are initially smaller, these children usually catch up by the age of two (Cosden, Merith, Peerson, and Stacy, 1997).

Infants exposed to opioids have been found to go through neurobehavioral characteristics during their first months of life: withdrawal symptoms which include irritability, tremors, high pitched crying and feeding problems. It is also mentioned that neurobehavioral problems and the limited parenting skills of women with drug use history may inhibit early attachments, which may account for the later social and behavioral problems of the child (Cosden, Merith, Peerson, and Stacy, 1997).
So many factors have to be included when doing research of this kind. With drug and alcohol use, there are always other factors, like genetics, that have to be considered that influences how healthy a child is going to be (Cosden, Merith, Peerson, and Stacy, 1997). It has also been acknowledged that drug and alcohol use among pregnant women is an issue that has to be dealt with. Treatment for this special population and legal issues will now be reviewed.

-Treatment-

Chemical dependency treatment for women was not addressed until the 1970’s when Federal legislation (Public Law 94-371) mandated the development of specialized drug treatment programs for women. At this time research was then done on the needs of this special population during treatment (Brown, 1992). Before the legislation only few studies covered the topic of women and drug treatment.

The most important treatment issue for pregnant women is finding a treatment program that meets the needs of the individual (Inciardi, Surratt and Saum, 1997). According to Brown (1992), a comprehensive approach to drug treatment should include medical, social and vocational services for women and childcare, preferably including medical and early intervention services for their children. Family-oriented programs have been found to attract more women into treatment and result in pregnancy outcomes comparable to those seen in non-drug-using pregnant women.
Specialized treatment vs. mixed-sex treatment

A study by Copeland and Hall (1992) compared the characteristics of women seeking drug and alcohol treatment at a specialist women’s program with those of women attending traditional mixed-sex programs. They argue that the little consideration paid to any psychological and physiological differences between men and women, or to the sociopolitical context of women’s lives has failed to identify and address the potentially crucial treatment concerns for women. This being the reason they believe traditional services fail to attract women into treatment.

Copeland and Hall (1992) found that women in both programs for substance abuse treatment had delayed treatment due to the perceived social stigma. Both men and women were found to have similar social problems such as unemployment, broken relationships and unstable residences. The women at the specialized women’s service were found to have additional problems of dependent children, serious parenting deficits, and psychological and personal safety issues concerning their experience with physical and sexual abuse. The findings suggest that a specialized women’s center attracts women with a history of abuse, parental concerns and/or awareness of sexual politics. Copeland and Hall (1992) conclude that specialist women’s services may fill an important gap in the existing traditional mixed-sex treatment services.
Family Center Model

Kaltenbach and Finnegan (1992) discuss the Family Center Treatment Model that was developed in Philadelphia at Family Center that reflects a multivariable systems approach.

Services include a prenatal clinic with staff specially trained in the field of addiction and high-risk pregnancy. There is also a newborn nursery for infants that exhibit withdrawal symptoms, which is staffed by specialists in newborn medicine. The Family Center also offers a wide range of psychosocial services that comprise two components: education and treatment. The education component focuses on prenatal and parenting courses as well as prevention of sexually transmitted diseases. The treatment component aims at the development of personal resources, improving family and interpersonal relationships, reducing and eliminating socially destructive behavior and facilitating the parent/child bond (Kaltenbach and Finnegan, 1992). The Family Center Model was designed to cover all social and medical variables that complicated addiction and the recovery process. This is emphasized through outreach services, which helps facilitate appropriate medical care for chemical dependent pregnant women.

Treatment With Reinforcement

There are some treatment programs that use a reward system. Marlatt (2001) addresses contingency management programs in enhancing abstinence among addicts and increasing relapse prevention among those being treated. In
this comment on a study by Silverman where abstinence reinforcement was incorporated into a work-training program in which participants are required to provide drug-free urine samples, monetary vouchers were given to participants to reinforce abstinence and workplace attendance. Participants were pregnant women, which Marlatt says may add more motivation to abstain from drug use than other populations.

Marlatt (2001) mentions that job training as a reinforcer for maintaining abstinence provides a broader base of incentives than do programs that offer only reward vouchers for clean urine samples. Reinforcement was given to participants for other relevant target behaviors such as workplace attendance, productivity, professional demeanor and achievement of daily learning goals offering considerable promise in terms of increasing compliance among participants over and above the effect of rewarding only drug-free urine samples.

It has been argued that once reinforcement is terminated, relapse will occur. Marlatt (2001) argues that the longer a person abstains, the higher probability of long-term treatment success. Other “extrinsic” reinforcers for abstinence might include social reinforcement from family and friends, improved health, decreased legal problems and patients sense of self-efficacy or confidence in their mastery of a difficult addiction problem.

Marlatt (2001) adds that providing patients with traditional experiences and skill-training opportunities can enhance this type of treatment during the abstinent period. He concludes that contingency management for short-term
behavior change coupled with relapse prevention skills designed to enhance long-term maintenance would seem to be an ideal combination for a comprehensive behavioral treatment program.

A study by Jones, Svikis and Tran (2002) included motivation training in increasing an individual’s motivation to quit substance abuse and rewards for attending those sessions and providing drug-free urine samples. The purpose of this study was to compare women who complied with therapy to those who did not comply. Participants were pregnant women who were offered a $25 voucher or merchandise (baby supplies) valued at that amount for attendance of each session contingent upon providing a clean urine sample. A bonus of $100 would be given to participants who went to all four sessions and provided four clean urine samples. Being a compliant participant meant attendance of all four sessions. Noncompliance was measured by attending three or less sessions.

Jones, Svikis and Tran (2002) found that 71% of the participants attended at least one intervention and that 68% of the participants provided at least one drug-free urine sample. This suggests that this brief intervention may facilitate reduction in drug use during pregnancy. Participant compliance did not guarantee drug abstinence, though compliant women were found to have higher birth weight babies and they were most likely to be delivered drug-free than noncompliant women. They concluded that brief motivational and behavioral intervention for pregnant drug-using women has but further study the potential for both clinical as well as economic efficacy.
Drug Replacement

Replacement of drugs is a harm reduction technique that involves replacing a drug with another considered to be less harmful. One clear example of drug replacement that creates a decline in complications of pregnancy, childbirth and infant development when coupled with prenatal care is shown with the use of methadone, a pharmacological substitute for heroin (Kinney, 2003). Methadone requires less frequency of administration compared to heroin and also does not provide the rush that heroin supplies. There is no risk of contaminants or unintentional overdose with methadone since it is a drug that is FDA approved and administered in clinics by professionals. Like heroin though, withdrawal symptoms occur in the mother and the child.

Detoxification of a heroin or opiate dependent pregnant women can cause distress to the fetus. Though Finnegan (1982) contends that detoxification should be done under carefully monitored procedures, data of a detoxifying pregnant woman on methadone revealed a significant fetal response of the adrenal gland with an increase in epinephrine and of the sympathetic nervous system with an increase of the norepinephrine, both of which were dulled after methadone was increased. Kinney (2003) suggests that the use if methadone for treatment helps promote an environment in which rehabilitation efforts can take hold. He says that doses should be administered at a level that is comfortable for the individual and should not be decreased due to the chances of withdrawal by the mother and fetus (Kinney, 2003).
Dawn, Gerada and Strang (1992) developed a pregnancy liaison and outreach service to provide women with information on harm reduction, safer drug use and offered treatment for drug-dependence. The treatment goal of this study was slow reduction or low dose maintenance of methadone to retain women in treatment and to minimize non-prescribed drug use. The participants who had maintained their treatment with low doses of methadone had a significant reduction by delivery. Unfortunately, neonatal withdrawal symptoms were present in seventeen of the thirty-four babies born, two needing treatment.

Mothers who had lower doses of methadone at delivery were found to have babies born with less chance of neonatal withdrawal. They conclude that they were successful in attracting drug-using pregnant women to services and with many remaining in treatment throughout treatment. Treatment services appeared successful in reducing maternal methadone use and that improved access to health care for all drug users, in particular pregnant women, needs to be an aim of drug services (Dawn, Gerada and Strang, 1992).

Women who receive maintenance therapy during the majority of their pregnancy are more stable both physiologically and emotionally and also receive more prenatal care than those not receiving no such treatment, resulting in better maternal and neonatal outcomes (Fischer et al., 2000). Methadone is a safe alternative to heroin, but withdrawal symptoms can still occur. Fischer et al. (2000) studied an alternative to methadone, which is maintenance treatment with buprenorphine. This study was done to follow exiting evidence showing that
children born to mothers maintained on buprenorphine may be at lower risk for
neonatal withdrawal symptoms than those maintained on methadone.

Fischer et al. (2000) found that buprenorphine was well tolerated by both
mother and fetus, and that the level of neonatal withdrawal symptoms
experienced by the newborns was minimal. Twenty-six percent of the participants
delivered babies with no neonatal withdrawal symptoms. This study found that
only twenty-percent of the children born to mothers maintained on buprenorphine
to have moderate neonatal withdrawal symptoms compared to 100% of
participant’s babies born to mothers maintained on methadone. Results of the
study may be due to the fact that buprenorphine is a partial agonist with high
receptor affinity and low intrinsic activity compared to other full opioid agonists
(Fischer et al., 2000).

It was also found that the less cigarettes a mother reported to smoke the
more likely they had infants with no or mild neonatal withdrawal symptoms. The
benefits of reduced neonatal withdrawal include lessened distress and shorter
hospital stays with lessened costs (Fischer et al., 2000).

-Legal Issues-

To help with the chemical dependency problem amongst pregnant
women, states have taken a variety of approaches to fund treatment, protect
children from abuse or neglect and divert people convicted of drug related crimes
to treatment. Some of these actions have been made through state district
attorneys using several types of statutes to prosecute pregnant addicted women
(Steinberg and Gehshan, 2000). The debate that surrounds this issue is whether punishment or treatment is best for pregnant women with chemical dependency.

For Treatment

The American Psychological Association (APA) (1988) believes that alcohol and drug abuse by pregnant women is not a matter for the criminal justice system. They affirm that no punitive actions should be taken against women on the basis of behaviors that may harm a developing fetus and oppose mandatory/nonconsensual drug testing of women in the course of prenatal services. They urge for the development of treatment and outreach programs to treat alcohol and drug abuse among pregnant women. The APA (1988) recommends more education and training for chemical dependency professionals and more funds to go to research on reducing substance abuse during pregnancy and innovative methods to treat chemical dependency during pregnancy.

The Drug Policy Alliance (2000) asserts that drug-treatment is the most effective method of reducing substance abuse and related harms. According to Krupski (2004), receiving chemical dependency treatment is associated with higher infant birth weights and is also associated with a lesser amount of infant medical costs. With this proven fact, it has also been established that criminal prosecution of chemically dependent women deters them from seeking out necessary medical treatment as well as chemical dependency treatment. Women that do receive medical treatment may withhold vital information about their drug
use to their doctors due to new cooperatives between healthcare and the law. This increases the harm to both the mother and fetus (Drug Policy Alliance, 2000).

The American Society of Addiction Medicine (ASAM) (2001) which is committed to the “prevention of alcohol and other drug-related harm to the health and well being of children” believe that education, intervention and treatment are the most humane and effective ways to achieve this. The ASAM (2001) recommend:

1. Prevention programs to educate all members of the public about the dangers of alcohol and other drug use during pregnancy and lactation.

2. Early intervention, consultation, and case finding programs specifically designed to reach chemical dependent women.

3. Treatment services able to meet the needs of chemically dependent women.

4. Research on the effects of alcohol and other drugs used during pregnancy.

5. Law enforcement avoiding any measures defining alcohol or other drug use during pregnancy as “prenatal child abuse”.

Weber (1992) discusses Federal laws and regulations of confidentiality of drug and alcohol patient records. These laws and regulations guarantee strict confidentiality of information for individuals that have sought or received treatment or diagnosis for alcohol and other drug-related problems. These laws
and regulations were enacted by congress because they recognize that alcoholism and drug dependence are stigmatizing illnesses. They believe that without these strict confidentiality laws and regulations, chemical dependents would not enter or fully benefit from treatment.

According to Inciardi, Surratt and Saum (1997), public policy toward prenatal substance abuse needs to move in the direction of rehabilitative and social services. The U.S. Supreme Court has ruled that addiction is an illness and not willful, criminal behavior. The American Medical Association has recommended a medical rather than a punitive approach to maternal drug use (Inciardi, Surratt and Saum, 1997). The general assumption for those in favor of a punitive approach is that pregnant women willfully and criminally choose to hurt their fetus through the ingestion of damaging substances. Inciardi, Surratt and Saum (1997) mention a study that found that pregnant women seeking chemical dependency treatment to be motivated because they don’t want to harm their child/children. Education to pregnant women and the general public is also recommended to clear up misperceptions about the effects of different substances on the fetus. One study found that 90% of women knew that alcohol was harmful to the fetus in the first trimester, and less than 50% knew that it was harmful in the second and third trimesters. Inciardi, Surratt and Saum (1997) consider this information vital to high-risk populations as well as to the public.
Here are some examples of state legislation that support pregnant women in seeking chemical dependency treatment. (Steinberg and Gehshan, 2000):

**Arkansas**

Ark. Code Ann 20.85.101 Creates a cooperative program with the University of Arkansas for medical Sciences called the Family Treatment and Rehabilitation Program for Addicted Women and their Children. Charges the program with “develop[ing] a statewide program of treatment, rehabilitation, prevention, intervention and relevant research” on maternal drug use as well as “resources for local treatment and rehabilitation.”

**Colorado**

Colo. Rev. Stat. 25-1-212 Creates special treatment programs for women who abuse drugs while pregnant.

**Connecticut**

Conn. Gen. Stat 17a-710, 711 Requires the Dept. of health to provide care to pregnant women who are addicted to drugs or alcohol.

**Delaware**

Del. Code Ann. tit. 16,190, tit. 24, 1770 Requires any professional who treats or counsels pregnant women to warn them of the dangers of abusing alcohol, cocaine, marijuana or other narcotics while pregnant.

**Florida**

Fla. Stat. Ann. 381.0045 Creates the Targeted Outreach for Pregnant Women Program, a two-year pilot program that involves outreach, education and peer and cultural counseling and encourages HIV testing.

**Georgia**

Louisiana

La. Rev. Stat. Ann 46-2505 Adopts explicitly a state policy of addressing prenatal substance abuse through prevention and treatment rather than punitive measures. Instructs the Department of Health and Hospitals to structure appropriate programs and combat the public perception that substance abuse during pregnancy is a problem only among minority populations.

Maryland

Md. Code Ann., Health-Gen. 8-403.1 Requires state-operated drug abuse treatment centers to accept pregnant or postpartum women on priority basis.

Minnesota

Minn. Stat. 254B.01 Requires treatment initiatives for pregnant women to include halfway houses, aftercare psychiatric services and case management.

Missouri

Mo. Rev. Stat. 191.725 et seq. Requires doctors to be educated about the dangers of prenatal substance abuse and to counsel patients about prenatal substance abuse. Grants pregnant women priority at drug treatment centers. Establishes a hotline on prenatal substance use. Mandates that other services addressing the issue shall be offered.

Oklahoma

Okla. Stat. Tit. 43A 3-417 Requires alcohol and other drug abuse treatment centers to have adequate services for pregnant women, including residential treatment centers.

Pennsylvania

71 Pa. Cons. Stat. 553 Requires the office of Drug and Alcohol Programs, in conjunction with the Department of Health, to create a residential program for pregnant women and mothers with dependent children.
Washington

Wash. Rev. Code. 70.83C.020 Outlines prenatal substance abuse prevention strategies. Requires the secretary of the department of Social Health Services to develop a strategy for three pilot programs, to locate pregnant women using drugs, educate them about the health risks to them and their fetuses, and refer them to treatment.

Wash. Rev. Code. 74.09.790 Specifies that the Maternity Care Access Program must provide services for women addicted or at risk for addiction to alcohol or other drugs.

For punishment

Steinberg and Gehshan (2000) state that a statute criminalizing drug addiction during pregnancy would criminalize the woman’s status and identity rather than a specific criminal act. Some state district attorneys who have tried to hold pregnant women because of their drug use encounter problems due to the language of the statutes or laws in defining a fetus as a minor. Steinberg and Gehshan (2000) consider this to be the reason such prosecutions are avoided.

According to Inciardi, Surratt, and Saum (1997) the most common way of prosecuting women who use drugs during pregnancy is through abuse and neglect statutes. They discuss the first prosecution of a woman using this approach in 1977(Reyes v. California). Ms. Reyes had given birth to twins, whom were both born addicted to heroin. They attempted to prosecute her under child endangerment laws, but the conviction was overturned due to the statute not being applied to fetuses.

The central issues with the Reyes case and a majority of abuse and neglect prosecutions are (a) whether the fetus can be considered a “child” in the
Chemical Dependent Pregnant Women

tradition of state child abuse-neglect laws and (b) whether prenatal conduct can be considered an appropriate criterion for the determination of abuse and neglect sanctions. Most convictions of pregnant women who used drugs during pregnancies are successfully appealed. High courts suggest states to pass legislation that specifically establishes the fetus as a person (Inciardi, Surratt, and Saum, 1997).

States have also attempted prosecution of women by charging them with manslaughter and homicide based on drug use during pregnancies. A 1989 case, Alaska v. Grubbs, actually convicted a woman for the death of her cocaine-exposed child. She spent six months in jail and received probation. Another type of prosecution for pregnant women is using laws of trafficking and delivery of drugs to minors.

In 1989, Florida v. Johnson was the first case to successfully prosecute a woman under a drug delivery statute. Ms. Johnson had given birth to children who were found to be positive for cocaine. Prosecutors argued that the child is considered a minor immediately following birth and that the 60 seconds after birth, before the cord was cut, Ms. Johnson had delivered cocaine to the “minor”. Ms. Johnson received 15 years probation. The conviction was then overturned in 1992 due to the fact that the statute did not indicate delivery through the umbilical cord (Inciardi, Surratt, and Saum, 1997).
Chemical Dependent Pregnant Women - 21 -

Drug Testing and Constitutional Rights

Bornstein (2003) discusses a case involving the fourth amendment. He contends that policies that require drug testing and possible prosecution of pregnant women raise serious issues regarding women’s constitutional rights. These types of policies add a new “wrinkle” by potentially infringing on pregnant women’s rights. In Ferguson v. City of Charleston (March 2001), the Supreme Court struck down a South Carolina’s policy of testing pregnant women for cocaine use and turning positive results over to law enforcement for prosecution. This policy:

“(a) Established procedures for identifying and testing pregnant patients suspected of drug use;(b) required that a chain of custody be followed when obtaining and testing urine samples;(c) provided for education and treatment referral for patients who tested positive (d) contained guidelines for arrested patients who tested positive; and (e) prescribed prosecutions for drug offenses or child neglect depending on the stage of pregnancy.”

Due to the policy, thirty arrests were made. Of the thirty patients arrested, ten were plaintiffs/petitioners in the suit. They sued on the grounds that testing for drugs and turning the results over to police for possible prosecution violated their Fourth Amendment right against unreasonable search and seizure, that medical personnel committed tort of abuse in the process in administration of the policy, and that the policy discriminated against minority women. All of the drug tests were administered without patients consent.
In order for a testing policy to be successful, Bornstein (2003) suggests a policy that requires patients explicit consent to giving the police access to their test results (Although would result in some patients not seeking prenatal care). A less discretionary policy, such as testing for all pregnant patients, is also suggested to reduce hospitals discrimination of poor and African American patients. Regardless of suggestions for a successful policy, Bornstein (2003) argues that implementing such a policy would have a negative impact on pregnant substance abusers utilization of prenatal care.

Here are some examples of state legislation that support the prosecution of chemical dependent pregnant women (Steinberg and Gehshan, 2000):

**Arizona**

Ariz. Rev. Stat. Ann. 13-620(B) Requires health professionals who have reason to believe that a newborn has been affected by drugs and alcohol to report their findings to child protective services.

**California**

Cal. Penal Code 11165.13 Mandates that a positive toxicology screen at the time of a child’s delivery triggers a needs assessment.

**Florida**

Fla. Stat. Ann. 39.01(30)(g) Includes prenatal substance use under the definition of “harm” to child.

**Illinois**

Ill. Comp. Stat. Ann. ch. 325 para. 3-5 Defines neglect of a child to include prenatal substance abuse, as evidenced by a positive toxicology at birth in the bloodstream or meconium.
Indiana

Ind. Code 31-34-1-10 Defines “child in need of services” to include children born to a mother using drugs or alcohol.

Iowa

Iowa Code 232.68 (2)(f) Includes incidents where “an illegal drug is present in a child’s body as a direct and foreseeable consequence of the acts or omissions of the person responsible for the care of the child” under the definition of “child abuse.”

Iowa Code 232.77 (2) Instructs attending physicians to conduct a “medically relevant test” on children they suspect have been exposed to drugs or alcohol and report their findings to the state.

Maryland

Md. Code Ann. Cts. & Jud. Proc 3-801 Creates the legal presumption that any child born addicted to cocaine, heroin or derivatives is not receiving “ordinary proper care and attention.”

Massachusetts

Mass. Gen. L. ch. 119, 51A Requires that children found to be addicted at birth be reported as abuse children.

Nevada

Nev. Rev. Stat. 200.220 Defines prenatal substance abuse as manslaughter only if the mother intended to abort the fetus through drug use and the fetus was viable at the time of drug use.

South Carolina

S.C. Code Ann. 20-1-736 Establishes that children are presumed to be neglected and unable to be protected from further harm without being removed from the custody of the mother if either mother or child is found to have any amount of alcohol or controlled substance in their bodies at the time of the child’s birth.
Texas

Tex. Fam. Code Ann. 261.001(7) Defines “born addicted to alcohol or a controlled substance” as substance abuse. The statute describing “child abuse or neglect,” however, does not explicitly include children born addicted.

Virginia

Va. Code Ann. 16. 1-241.3 Establishes that a positive screen for controlled substances forms the basis for a suspicion that a child is abused or neglected.

Wisconsin

Wis. Stat. 48.01 et seq. The state of Wisconsin has rewritten its entire Children’s Code such that all its provisions concerning custody, child abuse, termination of parental rights and all other provisions explicitly include unborn children and/or pregnant women where applicable. Both the code and revisions are extensive.

Conclusion

The issue of chemical dependent pregnant women is important because not much attention has been devoted to it (Steinberg and Gehshan, 2000). Punishment of chemical dependent pregnant women has been shown to deter them from needed prenatal and medical treatment, as well as treatment for their addictions. Chemical Dependent pregnant women receiving treatment is vital due to studies that show infants are born healthier with higher birth weights and in effect require less medical attention (Krupski, 2004). The best option for this population is treatment that is comprehensive in nature. Providing family-centered services, such as day care, promoting self-esteem, coping skills and general mental health in the mothers and addressing other needs such as
transportation and nutrition are all predictive of successful treatment outcomes (Bornstein, 2003).

The policies focusing on treatment are helpful in that they get to the heart of the problem. Punishment of pregnant women due to their drug and alcohol use doesn’t address the true problem of addiction. Having laws that require health care systems to report suspected drug use as child abuse breaks patient–doctor confidentiality. This makes it so that even women who seek prenatal care may not disclose their use of drugs to their doctors.

Drug policies need to be implemented by the law, as hospitals should only provide medical services. The teaming up of the healthcare system and the legal system doesn’t constitute a good arrangement for patients and their rights. The move for legislature has been to define a fetus as a minor in the books so prosecution of the mother can occur. Many states consider punishment to be the best way to fix the problem of drug and alcohol use during pregnancy.

In conclusion, the focus should not be on punishing the chemical dependent pregnant woman but on getting them to stop their drug and alcohol use. Studies on interventions that have helped reduce maternal drug use have shown that a fetus has a better birth outcome (Fischer et al., 2000). Legislature should be used for passing laws that will help motivate and educate chemical dependent pregnant women on seeking treatment.

Hawaii International Conference on Social Science

June 13 – 16, 2005
The Mythic Construction of Terror and the Acceptability of War as Response: A Rhetorical Examination of the Conflict in Iraq

(Abstract)

Bormann’s (1972; 1985) theory of Symbolic Convergence addresses how people organize not only their communication but world views in times of stress or discontent. The role of the mythic is used to help explain how persons’ communication uncovers their views and desires to find order and meaning in perceived chaotic or crisis situations. This paper applies Bormann’s theory to explain how War becomes an attractive mythic structure that is an acceptable, and even favorable, reaction to human’s construction of fears and uncertainty. Specifically the mythic construction of the “War on Terror” as a basis for societal consent to go to war in Iraq is analyzed, and the construction of the myths utilized and embraced by the public are rhetorically examined. The role of the rhetorical scapegoat, as developed by Burke (1968), emerges as a central figure in the mythic constructions.

Diversity in Debate: Reasons for Limited Asian-American Participation in Intercollegiate Debate

(Abstract)

Culture has been ascertained as an important factor relating to the comfort that one has in argumentative situations (Kim, 2002; Yeh & Chen, 2004). That comfort with argument and the likelihood to approach argumentative situations has impacts on the participation of a variety of students in intercollegiate forensics competition. This study is a follow up to the pilot survey on Asian-American college students’ inclination to argue (Woods & Wang, In press). The present research advances the pilot by increasing the sample size, and introduces a control group of non-Asian American college students for purposes of isolating the variable of cultural influence and measuring the strength of cultural impacts upon individuals’ tendency to participate in argumentative situations. By employing a survey instrument relating to competitive debate along with Infante and Rancer’s (1982) instrument on argument approachability (1982), this study further verifies the effects of culture upon individuals’ argumentative propensity and the differences between Asian and Western college students in approaching arguments and in their participation in debate.
Diversity in Debate: Reasons for Limited Asian-American Participation in Intercollegiate Debate

A good part of Western education in fact consists of teaching children how to generate arguments and counter-arguments concerning a given position. In contrast, there is very little emphasis on construction counter-arguments in the Asian tradition.

--Kaiping Peng & Richard Nisbett (1999, p. 748)

As American society rapidly moves from a “melting pot” to a multi-cultural society, cultural diversity is quickly becoming a reality in citizens’ daily life. This social cultural change has, to some extent, been reflected in American institutions of higher education as students of diverse cultural backgrounds participate in all fields, areas, and disciplines of intellectual inquiry. In the area of argumentation and debate, however, there is a severe lack of participation from students with Asian cultural backgrounds (Woods & Wang, 2003; In Press) as the great majority of forensic programs in the United States remain attractive mostly to Caucasian students with Western cultural upbringing. To increase active participation from Asian-American students, for instance, has been a significant challenge to forensic educators in the United States for some time. Assuming diverse student participation is an element of strength in American intercollegiate forensic programs, the real test facing forensic educators may lie in the obtainment of an understanding of the cultural barriers that have prevented Asian-American students from
participating in intercollegiate debate. Being informed of the reasons accounting for the lack of Asian-American student participation is indeed a necessary and important step before diversity in intercollegiate forensic program can be encouraged and effectively increased.

The purpose of this paper is to extend the pilot study run by Woods and Wang (2003) to ascertain further the impact of cultural upbringing upon Asian-American students’ attitudes toward, perceptions of, and personal involvement in argumentation and debate. Our primary interest lies in the discovery of the strength and magnitude of the influences of students’ cultural backgrounds on their propensity to argue and debate. We are also interested in uncover the reasons, if there are such reasons, that have discouraged Asian-American students from being personally involved in intercollegiate forensic programs. By utilizing a survey of Asian as well as Caucasian college students who were participants of intercollegiate forensic programs and students who were not involved in debate, we hope to reveal subjects’ argumentative traits and characteristics. Further comparison of the data collected enables us to gain knowledge and information leading to better understanding of the cultural obstacles standing between Asian-American students and their active participation in intercollegiate debate programs.

In Western cultures such as the United States and Canada, the tradition of argumentation and debate dates back to the ancient Greeks (Tannen, 2002). In fact, Peng & Nisbett (1999) argued that one of the essential elements of a Western education is the teaching of competencies relevant to the development of arguments and counterarguments. By the time a Western individual completes post secondary
education, constructing arguments and counterarguments will have become a natural
talent or, in Nisbett’s (2006) words, a “second nature to Westerners” as he explains:

The tradition of debate goes hand in hand with certain style of rhetoric in
the law and in science. The rhetoric of scientific papers consists of an overview
of the ideas to considered, a description of the relevant basic theories, a specific
hypothesis, a statement of the methods and justification of them, a presentation of
the evidence produced by the methods, and argument as to why the evidence
supports the hypothesis, a refutation of possible counterarguments, a reference
back to the basic theory, and a comment on the larger territory of which the article
is a part. For Americans, this rhetoric is constructed bit by bit from nursery
school through college. By the time they are graduate students, it is second nature
(p. 110-111).

On the other hand, the lack of argumentation and debate in Eastern countries
such as Japan and China has generally been attributed to Asian histories, languages,
philosophies, and religions (Becker, 1991). Even in modern Asia, the practice of
argumentation and debate involving face-to-face confrontation and refutation is still far
from being popular as Asian cultures emphasize group harmony and collective interests
(Kim, 2002). Nisbett (2006) argues that “the whole rhetoric of argumentation that is
second nature to Westerners is largely absent in Asia” (p. 110). In his discussion on the
inseparability of meaning and context, Edward T. Hall (1994) also argues that in high
context cultures such as China, Japan, and Korea, a large proportion of communicative
meanings rely on the context rather than the spoken word. Thus, implicit
communication, (*Han Xu*, a mode of communication that is reserved and indirect), Gao
(1998) asserts, is the preferred mode of communication for Chinese people. Han Xu, argued Yu and Gu (1990), is such an appropriate and widely acceptable form of communication that it is considered by the Chinese a fundamental character of their society and culture. The consequence of such an implicit mode of communication is often considered primary reason to account for the Chinese indirect expression. Gao (1998), on the other hand, proposes that “direct expressions in Chinese culture tend not to carry the same weight or be as meaningful as those that are indirect” (p. 171). To people in Asia, verbal interactions are intend for creating harmony in the group, maintaining interpersonal and inter-group relationships, and promoting collective interests. Gao (1998) thus claims that “the primary functions of communication in Chinese culture are to maintain exiting relationships among individuals, to reinforce role and status differences, and to preserve harmony within the group” (p.168).

Although the generally negative feelings of people in Asian cultures toward debate and argumentation are apparent and not difficulty to understand, there is no certainty that such cultural attitudes, perceptions, beliefs and values will be maintained and passed over to the next generation when cultural contexts are altered. Specifically, in the interest of this study, when Asians migrated to a culture such as the United States where argumentation and debate is strongly encouraged, will their attitudes toward, perceptions of, and involvement in argumentation and debate be changed as well? Assuming most Asian-American students were born and raised in a competitive environment that characterizes North American countries such as the United States, will their traditional cultures still impact upon their thoughts and behaviors in respect to participation in intercollegiate debate. Hence, it is of importance to ask:
(1) How argumentative are Asian-American students (non-debaters) as compared to their Caucasian counterparts?

(2) How argumentative are Asian American student debaters as compared with their Caucasian counterparts?

(3) What are Asian American students’ attitudes toward intercollegiate debate?

(4) What is Asian American students’ general perception of intercollegiate debate programs?

Methods

Procedure

Focusing on a control group of non-debating college students, and increasing the pool of debaters overall were the groups of interest to this study to help round out the data from the pilot study. A 20 item survey instrument was utilized and given to all participants. They were told their participation was voluntary and results would be anonymous. Students taking a communication class from a northwest campus were given the instrument, and random participants at the 2005 National Parliamentary Debate Tournament were surveyed. There was no attempt to target specific variables related to ethnicity, nationality, gender or other factor.
Participants

64 new survey responses were collected from debaters and non-debaters. These new survey responses were pooled with data collected previously to make a total n of 98. Of the total respondents 58 were female and 40 were male. The data was initially sorted into 3 groups: Asians (n=12), Debaters (n=45), and a control group of non-Asians and non-debaters (n=41). 3 surveys were thrown out from the control group because of incomplete data. If someone in the control group survey set indicated debate experience they were placed in the debater group.

The Survey Instrument

A survey questionnaire was utilized identical to the pilot study to collect information on students’ ethnic and cultural backgrounds along with questions that would determine respondents’ argumentativeness (c.f., Appendix ). Ethnic and cultural information was collected by having the respondents self identify rather than having them select from pre-set categories. The instrument incorporated in the survey to measure participants’ argumentativeness was developed by Infante and Rancer (1982) which asks questions that relate to tendency to approach arguments (ARGap) or avoid them (ARGav). The argumentativeness trait is determined by subtracting avoidance from approach (ARGgt = ARGap - ARGav). Subsequent applications and analyses of Infante and Rancer’s argumentative scale have consistently indicated high level of reliability and validity (Canary, Cunningham, and Cody 1988; Graham, 1994; Hample and Dallinger 1987; Infante and Gordon 1985; Infante and Rancer 1982; Rancer, Baukus and Infante 1985). For instance, Rancer, Baukus and Infante (1985) reported a coefficient alpha of .86 for
ARGap and .84 for ARGav dimension of the scale. For this study the original twenty
questions of the scale measuring argumentativeness were incorporated in its entirety.
Survey results were tabulated and ARGgt was calculated for each respondent group.

* includes new survey respondents and those from the pilot study pooled
n/c not calculated given size of sample

As was expected in the pilot study, the distinction between the argumentativeness
of Asians is disparate when compared to the control group, not just the debate group.
Debaters are more argumentative than the control group, and the difference between the
control group and debaters is about the same as control group to Asians. The score range
possible being from -40 (highest argument avoidance) and +40 (highest argument
approach) suggests that entering into an argument is more likely for the non-Asian
groups. The argumentativeness score indicates that Asians are more likely to be neutral
in preferring to approach or avoid an argument, where Caucasian/European American
students might be slightly more likely to approach an argument, with debaters more than
likely to approach and argument rather than avoid it.
Such results tend to support the analysis that culturally Asians are not likely to consider argument a preferable form of interaction. Even non-debater Caucasian students (the control group) were more likely to consider argument an acceptable behavior.

While not part of the original question, the data did provide the ability to compare ARGgt over two other variables that reflect a differentiation along a cultural basis. Most clear is the difference between males and females. Overall males had higher ARGgt scores in the groups identified, except debaters. The distinction in the control group is a factor of 7, which is nearly as great as the difference between Asians and non-Asians. The male ARGgt of the control group is actually closer to that of the debate group than it is to non-debate females.

While not within the scope of this study’s literature base, there is a basis in constructing the concept of gender as a cultural issue. Given that cultural realization, there is also a basis in viewing Western culture as favoring male assertiveness over females exhibiting the same behavior.

Interestingly, women debaters were slightly more, or nearly identical, in argumentativeness to male debaters. Given that debate is an activity in which one can self-select being a participant in, it is likely that rather than “making” women more argumentative, debate attracts already argumentative participants both male and female. Though, given that greater number of males who have higher argumentativeness scores in the group, there are more likely more males who would find the activity of debate more accessible or in line with their interests.
A second variable that could be tested for is that of age. While the numbers are not as strong and the distinctions in age not nearly as dichotomous as gender, there is still a difference worth noting.

Table 2: ARGgt by Age

<table>
<thead>
<tr>
<th></th>
<th>N</th>
<th>ARGgt</th>
</tr>
</thead>
<tbody>
<tr>
<td>All 18-21*+</td>
<td>67</td>
<td>8.12</td>
</tr>
<tr>
<td>All 22 &amp; Over*</td>
<td>30</td>
<td>13.1</td>
</tr>
</tbody>
</table>

* includes new survey respondents and those from the pilot study pooled
+ one respondent did not include age making n=97

Overall, the older a respondent was the more argumentative they were likely to be. It could be as persons get older they have become desensitized to argument, that they have built up more experience in argument, or that they have higher status in society and more social power so a positive outcome may be more likely when engaging in argument. But in all those explanations, cultural understanding is consistent with such a finding.

Conclusion

A strong result appears for the first research question in that Asians do not seem as argumentative as either non-Asian college students or debaters. However, there are distinct limits to answering the remaining questions. Given the lack of Asian and Asian-American participants in debate it is not possible to determine adequately their argumentativeness for comparison. While a random sample of debaters was taken (in
2005) and a convenience sample in the pilot (2003), it appears that direct targeting of Asian participants in debate is required to get enough respondents in that category to assess more accurately the status of their ARGgt.

There seems to be a rationale for the lack of participation given the attitudes revealed by the survey, but further data may be informative. As in the case of females, while in the control group they score a lower ARGgt score, female debaters are equal to or slightly higher in ARGgt score than males. It may true with Asians as well that those who are naturally more argumentative may find debate participation more attractive. Another explanation could be that participation in debate makes students more argumentative. In order to test this hypothesis more detailed data about length of participation would need to be collected to see if Asians or females enter debate less argumentative and increase, or if they enter with an already high ARGgt level.

The survey also was not able to effectively address issues of Asian attitude toward debate (questions 3 & 4). While the new survey did include questions regarding reasons for participation, no students who took the new survey identified themselves as Asian, so no attitudes could be ascertained.

Ultimately, such information can be used to help build diversity in participation in debate programs. If it can be determined why or why not participation in debate is attractive, new ways to encourage participation can be pursued.

As American debate professionals continue to expand Western style debate outside U. S. borders, more and more interaction with other cultures will add to the knowledge base. There have been programs for debate established in Asia for quite a while in Japan, and there is a growing interest in debate in Korea and China.
This research needs further exploration, and the logical expansion points toward including Asians in other countries, not just Asian students studying in America, or Asian-American students.

As debate comes to be taught to other cultures, an understanding and sensitivity to other cultures is necessary. While the method may not be altered, the means by which it is explained and carried out may need to be modified to have the best translation into new contexts. It may also be important to increase awareness of the trainers to the cultural aspects of argument that they may be taking for granted that need a better context and rationale. It may also be critical to explain argument in debate as a process, and not necessarily as a model for social or inter-personal interaction. Just as the scientific method has specific application, the method of debate may be useful for some issues and conflicts, but not for all.

Questionnaire

Instructions: This questionnaire contains statements about arguing controversial issues. Indicate how often each statement is true for you personally by choosing the appropriate number. Remember, consider each item in terms of arguing controversial issues.

1. While in an argument, I worry that the person I am arguing with will form a negative impression of me.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

2. Arguing over controversial issues improves my intelligence.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

3. I enjoy avoiding arguments.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

4. I am energetic and enthusiastic when I argue.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

5. Once I finish an argument I promise myself that I will not get into another.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

6. Arguing with a person creates more problems for me than it solves.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

7. I have a pleasant, good feeling when I win a point in an argument.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

8. When I finish arguing with someone I feel nervous and upset.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

9. I enjoy a good argument over a controversial issue.
   - never true
   - rarely true
   - occasionally true
   - often true
   - almost always true

10. I get an unpleasant feeling when I realize I am about to get into an argument.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

11. I enjoy defending my point of view on an issue.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

12. I am happy when I keep an argument from happening.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

13. I do not like to miss the opportunity to argue a controversial issue.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

14. I prefer being with people who rarely disagree with me.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

15. I consider an argument an exciting intellectual challenge.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

16. I find myself unable to think of effective points during an argument.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

17. I feel refreshed and satisfied after an argument on a controversial issue.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

18. I have the ability to do well in an argument.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

19. I try to avoid getting into arguments.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true

20. I feel excitement when I expect that a conversation I am in is leading to an argument.
    - never true
    - rarely true
    - occasionally true
    - often true
    - almost always true
Title of the submission: Private business associations in Shanghai: evidence of corporatism or civil society?

Name of the author: XIA Xiang, Grace

Affiliation of the author: Government and Public Administration, Chinese University of Hong Kong

Address of the author: Room A802, Jockey Club Postgraduate Hall 1, Chinese University of Hong Kong, Shatin NT, Hong Kong

E-mail address: s031204@mailserv.cuhk.edu.hk
Abstract

After Chinese leaders adopted “open door” policy in 1978, post-Mao society has seen a revitalization of the role of “associations” (xiehui). Extensive, if incomplete, decentralization of the economy and concomitant strengthening of economic actors during the last two decades and a half have allowed this limited, Chinese-style associational life to emerge. But do post-Mao associations truly and autonomously promote the interests of their members and reflect, as some have suggested, the emergence of “civil society” in China? Or do associations simultaneously exhibit elements of both state-domination and autonomy?

This research intends to examine the private business associations in Shanghai. Three associations are selected: they are Federation of Industry and Commerce, Self-Employed Laborers Association and Private Enterprise Association. This research aims at gathering enough data and finding out whether a civil society is being generated in contemporary China or the associations reflect the characteristics of corporatist nature.

In order to fully understand the relationship between the three private business associations and the state, the following questions need to be answered:
1. What are the functions and role of the three associations? Is there any functional change compared to earliest establishment?
2. What is the operation process of the three associations (eg. staff appointment, member recruitment, funding and spending, and etc)?
3. What is the relationship between the three associations and their supervision unit?
4. Can the three associations represent their members’ interest and how do the members think it?
5. Is there any relationship between the three associations? If yes, what kind of relationship, competition or cooperation or others?

Theory of civil society and corporatism will be used as the theoretical framework, as they are frequently being used to explain the changing state-society relationship in China by most scholars. I intend to look at whether these two theories can be applied to explain the relationship between private business associations and the state.

Because of the limited time and manpower, the study just focuses on one selected city—Shanghai and its different districts. A qualitative interview will be adopted to collect data. Shanghai has eighteen districts and each district has its own federation of industry and commerce, self-employed laborers association and private enterprise association. Five out of eighteen districts will be selected as the target of interview, plus the three business associations at city level.
Title: Between Perceived Personal Control and Mental Health: An Investigation into Cultural Differences

Name of Author: Yanmei Xu

Affiliation/Address: Sociology Department

E-mail: yxu@kent.edu
ABSTRACT

The classic stress process theory suggests a negative relationship between self-concepts and stress outcomes. First, life events and chronic strains result in a diminishment of self—i.e. mastery and self-esteem—which will directly lead to a higher level of psychological distress. Second, the sense of personal control buffers the negative impact of stressors upon mental health. Although studies carried out in Western countries have confirmed the validity of these two claims, little attention has been paid to cultural variations. Yet it is essential to apply mainstream presumption to a growing body of immigrants of various ethnicities in the U.S. This paper explores conceptually how cultural factors moderate the relationship between life events, perceived personal control, and psychological distress. Cultural values other than social locations determine whether an individual tends to possess internal or external control. Moreover, the effectiveness of personal control varies by cultural ideology and social control. The mitigating effect of perceived control found in one culture may be counteracted by a set of values in another culture. Furthermore, the occurrence of a diminishment of self out of negative life events depends on how people evaluate noxious circumstances. The inclusion of cultural factors into the stress process model has implications on clinic counseling for ethnic minorities.

5. E-mail address(es) of the author(s):
massy@kwansei.ac.jp

6. Abstract and/or full paper:

(Abstract) The present study investigates how parental native languages are used in interlingual families, where two or more languages are involved. In analyzing data collected from two different groups of interlingual families in Japan, namely Japanese-Filipino (J-Fi) and Japanese-English (JE) families, some intriguing group differences are found in regard to their language use: (1) the J-Fi families use the societal language much more than the JE families do in their communication among themselves; (2) the J-Fi families employ, either exclusively or complementarily, one or more languages not native to either of the parents (La), while none of the JE families use languages other than the parental native languages.

The analysis also found a significant group difference in assessing the general Japanese perception of bilingualism in their own native languages and in their bilingual child-rearing.

Conjoining with the author's previous findings (Yamamoto, 2001, 2003, in press), the present findings strongly suggest that how languages are used in interlingual families is language-sensitive, interrelating with the perceived prestige and possible merits of proficiency in a given language.
BRIEF COUNSELING
ANALYSIS OF A CROSS-CULTURAL COUNSELING SESSION

Abstract

In the past several years, the ethnic variable in counseling and psychotherapy has received increased attention. An awareness of the differences and similarities between Eastern and Western psychological paradigms is an important first step toward more therapeutically effective outcomes in counseling Eastern clients. Counselors should be willing to attain more specific information on appropriate therapeutic techniques, depending on the acculturation levels of individual client, in order to enhance the effectiveness of counseling session when meeting Eastern clients.

The international student population in the United States has experienced phenomenal growth over the last four decades. In addition to the educational and vocational decisions that all students must make, international students must acquire linguistic and daily living skills, integrate new values, and adapt socially. Hence the international students constitute a population with its own special requirements for counseling services. The need for professional counseling assistance in American universities is often greater among foreign students than American students. This is particularly true for students from oriental cultures. The Asian values of reserve, restraint of strong feelings, and subtleness in approaching problems may come into conflict with Western therapists and counselors who expect their clients to exhibit openness, psychological mindedness, and assertiveness. For culturally effective counseling, counselors should possess an understanding of their own basic tendencies, the way in which they comprehend other cultures and the limits that places on their
comprehension. According to Root (1985), brief therapy is a positive model for Asian-Americans in terms of their expectations of counseling.

The basic purpose of interventions in brief counseling is to help clients “do something differently.” As a strategic system process, brief counseling is a concise, action-oriented method that incorporates a solution-focused approach within a limited time frame. Brief counseling models have required that counselors employ an appropriate theoretical orientation and specialized techniques to help the client deal with his/her psychological problems within a time limit ranging from one to twenty sessions.

According to de Shazer (1985, 1988) there are several underlying themes in brief therapy. He believes that a counselor must understand the world view and values of the client, then help the client delineate the problem and set a specific goal. He suggested that “how” questions are better than “why” questions when working with what the client presents. Instead of emphasizing the problem, the counselor and client simply focus on breaking the problem cycle and discover acceptable solutions. One special technique is to employ the client’s own strengths and resources. In addition, the emphasis on genuineness, positive regard, and empathy in the relationship is stressed.

Essentially brief therapy is distinguishable from other dynamically-oriented therapeutic modalities in its use of five dimensions: (1) setting a time limit; (2) rapid assessment; (3) developing a central focus; (4) monitoring the transference; (5) flexibility in interventions (Hersh & Taub-bynum, 1985). One major difference between brief therapy and other models lies in the brief therapist’s idea that no matter how awful and how complex the situation, a small change in one person’s involvement (de Shazer, Berg, Lipchik Nunnally, Molnar, Gingerich, & Weiner-Davis, 1986).

This study is an analysis of a brief counseling session with a Taiwanese student. The intent of this study is to look at use of a four-step brief counseling model that are: (1) helping the client define a problem in concrete terms; (2) investigating the client’s attempted solutions; (3) helping the client set a specific, realistic goal and (4) giving compliments and assigning an intervention task or homework assignment to assist the client in reaching the goal (Fisch, Weakland, & Segal, 1982; de Shazer, 1985, 1988); and the utilization of specific strategies, as well as cross-cultural awareness, in assisting the client to resolve her problem.
A Study of Troubleshooting Strategies on PLC Circuits

Ching-Zon Yen, Ping-Huang Wu, Ah-Fur Lai, Ching-Fang Lin

National Taipei Teachers College
Tung Nan Institute of Technology
Municipal Taipei Teachers College
De-Lin Institute of Technology
E-mail: yenk@tea.ntptc.edu.tw

1. Abstract
The objective of this research basis includes: 1. Discussing the trouble-shooting behavior of a group of successful students, 2. Drawing up PLC breakdown tree analysis strategy, 3. Comparing the troubleshooting result between the Experimental Group and the Control Group (dividing the research design into two measures, i.e. quality and quantity). For quality measures, the research adopted Thinking Aloud with clinical investigation observation law, 6 second year students from the Institute Of Technology Electrical Engineering Department were arranged to carry out the PLC troubleshooting experiment; Next, drawing up the PLC breakdown tree analysis – this portion is proposed by the researcher based on their PLC teaching experiences and the breakdown tree analytical method, and inviting experienced teachers who have PLC teaching experiences to participate in this discussion for the draw up. For quantity measures, the researcher will select another group of 48 students who were then be assigned to carry out the research. According to their “PLC practice” semester results, the students were divided into Experimental Group and Control Group, each group consists of 24 students. Before carrying out the actual experiment, the Experimental Group is required to undergo 6 hours of troubleshooting training, after which the researcher will assign the water level control circuit and the automatic valve control circuit, 2 breakdown spots were set up respectively in each control circuit, which two groups of students were to carry out the troubleshooting experiment separately.

The conclusion of this experiment is: searching and questioning helps in minimizing the problem space. Searching plays an important role in PLC troubleshooting; Questioning is the key attribute to problem solving, it helps to confirm the attribute of the problem, thus assisting in the classification of the problem. Measurement is another indispensable method in the trouble-shooting process. Incorporating the implementation of visual evaluation, it leads to the completion of troubleshooting cycle. The open-ended method is most commonly used in PLC troubleshooting strategy, followed by the comparison test, short-circuits law, and trial and error.

Regardless whether it is water level control circuit or automatic valve control circuit, more students from Experimental Group completed the research as compared to the Control Group. In terms of the overall time taken, Experimental group takes shorter time than the control group. The result of
this experiment shows that it is more efficient to use the breakdown tree analysis to perform the troubleshooting of the PLC control circuit.

Keywords: PLC, breakdown tree analysis, and troubleshooting.

2. Plan Reason & Goal

Currently, information processing has become the mainstream in problem-solving research. With the influence of this theory, science education research has gradually got rid of supposition test and statistical pattern. Though common education research and its correlation research are becoming a rare scene, researchers believed that problem solving and its correlation research technique are working towards the quality of a research. “Thinking Aloud” in targeted research, as its language spoken, is receiving the attention of problem solving researcher (Schoenfeld, 1985). Piaget believed that the development of cognitive psychology research has clearly demonstrated that clinical investigation can be used as the foundation for scientific research.

Raising the ability in problem solving has become an important topic in today’s education. Teaching the technique of troubleshooting has become part of the problem solving training for every technical student. As troubleshooting in its correlation research stood the minority in local and foreign engineering education domain, this research will target towards PLC control circuit. By recording the troubleshooting behavior of the students in a targeted research, followed by troubleshooting analysis argument, it constructs the PLC strategy, untying the knot faced in the difficulty in troubleshooting, thus improving the method in technical teaching, as well as the efficiency in learning.

The process of troubleshooting is actually a course of minimizing a problem space: from a big space to a small space, from a big system to the diagnosis of a small component. From the strategy of minimizing a problem space, it can clearly demonstrate the important factor in the success or failure of a troubleshooting process. This research combines the troubleshooting tree analysis in minimizing a problem space. In addition, the researcher suggested the troubleshooting strategy to go through a number of experimental researches, and coordinate with the nature of “Thinking Aloud” research. In view of the PLC circuit system, researcher hopes to untie the knot faced in the difficulty of PLC troubleshooting by making use of troubleshooting experimental analysis, and exploring PLC circuit diagnosis behavior and strategy, thus guiding the diagnosis to reflect on the principles.

Based on the above summary, this research draws up the following goals:

i) Discussion on the trouble-shooting behavior of a group of successful students

ii) Drawing up the analysis on the breakdown of PLC strategy,

iii) Comparing the result of the troubleshooting experiment between the Experimental Group and the Control Group

3. Rationale

Troubleshooting is a continual problem solving process. The discussion of a problem solving should be annotated by problem space and the attribute of the problem. In addition, it should blend into the theory or principle of troubleshooting to continue the overall elaboration. Problem is composed by problem space, but problem space includes the initial state, goal state and
intermediate state. *Problem space is made up of the initial state, goal state, operating procedures and constrains* (Yang Kun Yuan, 1999; Glass & Holyoak, 1986; Hayes, 1989; Mayer, 1992); these characteristics define a problem. Problem can comprise of goal, useful resources and process and principles of deriving a solution. Problem solving is the use of past learning experiences and skills to derive a solution. Problem solving is a situation whereby the problem solver is faced with a given state and desired goal. Therefore, it is considered a process that starts from the initial state of a problem to the goal state. Troubleshooting is a one form of problem solving process. Troubleshooting also consists of the initial state and goal state. The initial state of troubleshooting takes the shape of the problem; and goal state refers to the normal operating situation after a problem is solved. The troubleshooter should be equipped with the necessary knowledge and skill, and have the ability to utilize the initiative cognition and verbalize his thought in order to troubleshoot a problem.

Representation is a general description of an object or behavior. A good representation helps in problem solving (Shi Chun Xie, 1999). Rasmussen & Jensen (1974) believed that representation of a problem is the key influence to troubleshooting process. Troubleshooting is actually a continual problem solving process, and the first step to problem solving is the representation of a problem. It comprised of the initial evaluation of a system, as well as any hypothesis that can solve a problem. Representation is helpful in providing a concise understanding of a system. In cognition analysis, most scholars agreed that problem solving can be divided into 2 phases, i.e. representing the problem and search for means to solve a problem. Therefore, difficulty in problem solving mainly occurs in the problem representation phase (Mayer, 1985). The formation of problem representation is the first step in problem solving. According to the theory of information processing, representation means one object replacing another. Representation of a system should consists of 5 essential factors (Luo Su Zhen, 1994; Rumelhart & Norman, 1988); 1. Represented the world, 2. Representing the world, 3. What levels has the represented world to represent? 4. Does the represented world have the levels to represent? 5. What is the corresponding relationship between these two represented worlds?

When the troubleshooter performs the troubleshooting process, he can correctly identify the cause of the problem (the initial state of problem), which allows the problem space to become more apparent. The troubleshooter gradually reduces the scope of the problem space by series of operation, thus achieving the objective of troubleshooting. However, the troubleshooter will not be able to achieve the objective of the troubleshooting process if he started with a wrong representation of a problem, or failed to integrate the correct troubleshooting procedures, and overestimated the problem space.

A problem solver will usually form an initial representation when he encountered a problem. The formation of a representation derives of an individual’s experience or memory. It can also be derived from external representation. After forming the initial representation, he can follow up with the searching of the problem space, and finally the evaluate the method to solve the problem.

There are many ways for a problem to achieve the goal state from the initial state. All these possible ways are known as problem space, thus problem solving means a problem solver attempt
to find the correct solution in the problem space between the initial state and the goal state. Therefore, problem solving is a type of searching process (Zheng Li Yu, 1993). The important capability of a problem solver is to build the problem space in a complicated task environment. If he can correctly find the important information in the problem space, and explore the foundation that can help in solving the problem, problem can easily be solved (Newell & Simon, 1972).

According to a survey, it is pointed out that most troubleshooters can identity the problem that exists in the system. They often adopt hypothesis from their experiences into new circumstances that helps in diagnosing the problem. Although, these hypotheses are usually very effective, they can cause confusion during synchronization. The conformity of knowledge and design minimizes a problem space, leading to troubleshooting of possible problem, for e.g. disrepair after many years, environmental factors and etc. (Flesher, 1993).

Basic mental pattern or problem space representation are very important. Barlett (1958) mentioned that problem solvers often build their own set of reference rules. The quality of mental pattern affects the result of information obtains. Schlager, Means & Roth (1988) pointed out that when both experts and newcomers troubleshoot a complicated system, experts are able to make use of the entire system to minimize a problem space. On the other hand, the newcomers are not able to identity the correct problem space for a similar problem, and were lost in the complicated system.

Can troubleshooters accurately confirm the possibilities of a problem? Well, they often depend on the type of information they received to make the decision. In order to achieve their goals in troubleshooting, troubleshooters often have to eliminate the problem areas in order to minimize the problem space as they perform their diagnosis.

The drawing up of a problem space normally requires the coordination of information collected and the strategy in problem solving. Now, hypothesis is divided into four levels; (1) system, (2) subsystem, (3) equipment, (4) components. Taking “Unable to start a car” for example, first he has to get better understanding of the problem, he needs the information on; the sufficiency of the fuel, ignition switch, starter, oil gauge indication, sound of the engine when the car was started.

The core of the system whereby “Unable to start a car” is branched out into several subsystems, the hypothesis from the subsystems minimizes the possible problem space. If the initial diagnosis of the vehicle is “the motor is possibly not working”, the mechanics will derive hypothesis from the equipment that can minimize the problem space and perform further investigation on the breakdown of the components (Johnson et al., 1993). Problem solvers should be able to extract important information from the problem, and reorganize them in order to effectively and correctly proceed with the problem solving process (Bodner, 1987; Eysenck & Keane, 1990).

In summary, problem space refers to the individual’s understanding between the goal and the present situation. Old knowledge and experience builds the foundation of the construction process of a problem space. Problem representation is helpful in the classification of a problem. When problem representation is formed, problem solvers are able to utilize the rule of problem solving, at the same time promoting the result of the solution. Moreover, troubleshooting process is a continual course of minimizing the problem space, from big space to small space, from big system to diagnosis of small components. The demonstration of strategy in minimizing a problem space
will affect the success or failure of a troubleshooting process. Problem representation is the first step in troubleshooting process. If the troubleshooters can grasp the correct problem representation and have a better understanding of the system, they are able to make use of the strategy in minimizing the problem space and expedite the process of achieving the goal.

4. Result and Discussion
This research first carries on the literature analysis by the researcher and reflect Polya (1945) proposal on the four stages problem solving strategy table, Schoenfeld (1985) proposal of problem solving stages and its correlated problem, as well as proposal on problem solving behavior and method, and analytical table by many local scholars like Lin Bi Zhen (1990), Yu Jing Tang (1999), Zhong Rui Guo (1997), Liu Xi Lin (1989). The spirit of problem solving construction, and its related troubleshooting theory and information (Johnson, 1993), takes the reference of this research.

This research is divided into 2 measures, quality and quantity. The quality experiment adopted Thinking Aloud with clinical investigation observation law. The result shows that the second year students from the Institute Of Technology Electrical Engineering Department were more superior. 15 students carried out the experiment. Only 6 students completed the troubleshooting process. Thus, these 6 students were taken as sample for the analysis of the original case. In quantity research, another group of 48 students was selected by the researcher. They were divided into Experimental Group and Control Group based on their semester “PLC practice” results. Every group consist of 24 students, the Experimental Group has to undergo 6 hours of troubleshooting training before the actual experiment. After that, the researcher will designate the water level control circuit and automatic valve control circuit, 2 breakdown spots were set up in each control circuit respectively, which two groups of students will carry out the troubleshooting experiment separately. This draws up the PLC breakdown tree analysis and troubleshooting strategy. The result of experiment on quality and quantity are as follows:

(1) Drawing up the analysis on the breakdown of PLC diagnosis strategy
This portion is proposed by the researcher based on their PLC teaching experiences and the breakdown tree analytical method, and inviting experienced teacher who have PLC teaching experience to participate in this discussion for the draw up. The method is: when the PLC troubleshooting process was carried out, the first thing to do is to list out the possibilities of the breakdown, characteristic of this analysis strategy does not require all the breakdown spots, but first judging the lamp signal of Y output, then draws up the partial breakdown tree analysis chart. If Y has no output, then check the current input of X. In addition, the calculation principle is derived from the judgment of the X-Y lamp signal shown in the chart. This calculation principle, under the correct operation, can highly achieve an accurate result for a specific goal. The utilization of this algorithm helps to expedite the process of troubleshooting. The input portion of the OR Gate in the chart helps to train the students to think of all possible breakdown reasons, thus raising the ability to solve a problem. In Chart 1, when a motor is unable to start, the troubleshooter could visually judge the PLC Y lamp signal, if the lamp signal is bright, then possibilities of the breakdown are wiring, connection, motor etc. If it is a wiring problem, then the possible reason may be the motor
and breakdown of the COM terminal or short-circuit, motor and power supply breakdown or short circuit, Y terminal and power supply breakdown or short-circuit. If Y lamp does not light up, look at X lamp. If X lamp does not light up, the possibilities may be the sensor, object, wiring, connections etc. This research institute proposed the following troubleshooting strategies: (1) The troubleshooter must understand the operating sequence, (2) The troubleshooter must understand the PLC wiring circuit diagram, (3) Troubleshooting tree analysis carried out using the Y-X judgment law helps to minimize the problem space.

Chart 1: PLC Control Circuit Troubleshooting Tree Analysis Diagram
(2) *Quality Research Experiment Result*

Table 1 shows the comparison between water level control circuit and automatic valve electric circuit troubleshooting analysis. This statistical table was obtained from the troubleshooting diagnosis performed by the 6 students using Thinking Aloud experiment, and inviting 2 teachers who have PLC teaching experience to complete the analysis of the original case. Table 1 indicates the number of times the diagnosis behavior appear: searching (16.0%), the question or asking a question (14.0%), survey (13.1%), visual evaluation (10.5%), repair execution (7.6%); As for utilizing strategy aspect, open-ended method (6.1%), comparison test (5.2%), short-circuit law (4.4%), trial and error (3.2%), replacement method (2.3%) etc.

Data from the table shows that searching and questioning is helpful in minimizing the problem space. Searching plays an important role in PLC troubleshooting process. Questioning can confirm problem representation, assisting in the classification of problem. Questioning is an important behavior in problem solving. Survey is also an indispensable method in completing troubleshooting work when coordinating and implementing it with visual evaluation.

Open ended method stands the majority in PLC troubleshooting strategy, whether this is the same as other electric circuits, there is still room for further exploration. The frequency of comparison test and short-circuit laws in the common electric circuit troubleshooting strategy is quite high. Trial and error is also one of the commonly used solution strategy. Replacement method is seldom used, as it is time-consuming.

(3) *Quantity Research Experiment Result*

This research is in line with the proposal by the institute to conduct the experimental study using the troubleshooting tree analytical method. The result of the experiment conducted by the experimental group and the control group are as follow:

★ P<.05

When $\alpha=.05$, the mean time calculation in Table 2 indicated: 19 students from the Experimental Group that uses FTA diagnosis strategy completed the troubleshooting but only 13 students from the Control Group completed the test. On the other hand, the mean time taken to complete the troubleshooting test: Experimental Group took $M=32.40$ while Control Group took $M=38.62$. Both groups took $t=4.08$, exceeding the standard value of 2.042, therefore reaching the predefined standard. This table clearly demonstrated the difference in the mean time taken by the Experimental Group and the Control Group in performing the troubleshooting test for Water Level Control Circuit.

</tbody>
</table>

★ P<.05

When $\alpha=.05$, the mean time calculation in Table 3 indicated: 13 students from the Experimental Group that uses FTA diagnosis strategy completed the troubleshooting but only 9 students from the Control Group completed the test. On the other hand, the mean time taken to complete the troubleshooting test: Experimental Group took $M=35.41$ while Control Group took $M=39.05$. Both groups took $t=3.43$, exceeding the standard value of 2.086, therefore reaching the given standard. This table clearly demonstrated the difference in the mean time taken by the Experimental Group and the Control Group in performing the troubleshooting test for Automatic Valve Control Circuit. Regardless whether it is a troubleshooting test for Water Level Control Circuit or Automatic Valve Control Circuit, Table 2 and Table 3 has clearly showed that the number of students from the Experimental Group is greater than the Control Group (Table 2: 19>13, Table 3: 13>9). Speaking of the mean time taken for the troubleshooting test, Experimental Group takes shorter time as compared to Control Group. (Table 2: 34.20<38.62, Table 3: 35.41<39.05), revealing a significant difference. The experiment result shows that it is more efficient to use the troubleshooting tree analysis method to carry out PLC control circuit and troubleshooting analysis.
Through discussion and experiment, it is discovered that the troubleshooting tree analysis method has greatly reduces the time spent in troubleshooting. PLC X-Y lamp signal judgment law blends in with the troubleshooting tree analysis, this method trains the students in the ability in troubleshooting and problem solving and to think within the problem space, and shaping the possibilities that causes the breakdown, therefore making troubleshooting process more efficient.

5. Result of Experiment
The result and achievement for this experiment are as follow:

1. Discussion of PLC circuit troubleshooting behavior and strategy, promulgating the difficulty in the PLC troubleshooting process and leading to the development of troubleshooting principles.
2. Discussion on the troubleshooting behavior of successful group of student, using it as reference to implement troubleshooting teaching in the school.
3. Save troubleshooting time by providing PLC troubleshooting tree analysis strategy, improving the efficiency in troubleshooting, using it as a reference for troubleshooting of local automatic equipments.
4. Comparing the result of troubleshooting between the Experimental Group and the Control Group in the teaching experiment, and confirms the PLC troubleshooting tree analysis strategy.
5. Using Thinking Aloud with analysis of the original case and clinical investigation in the teaching experiment to produce the technical and research literature.
6. Providing scholars references of valuable ideas from these experiments, which can be used as guidelines for future project education.

6. **Abstract:**

   Southeast Asia has seen a proliferation of anti-Sinicism over the last century, especially during political and economic crisis. Such anti-Sinicism is often accompanied by mob violence, whose victims ironically are not only the Chinese minority. Repeatedly in Southeast Asian history, we have seen tragedies caused by anti-Sinicism, the institutional cause of which, however, has been insufficiently addressed. I argue that the limited within-system political access leads the Chinese minority to seek extra-system avenues to become successful economically, which leads to resentment by the majority. Such frustration can generate a backlash against the Chinese minority, especially in times of crisis. Due to fears of such a backlash, the Chinese minority is motivated to secure its interests, oftentimes using extra-system avenues because of the limited within-system political access. This is a vicious cycle that feeds on itself. I will use comparative analysis through employing the most similar systems case study methodology. My paper will focus on the political access of ethnic Chinese in Indonesia, Malaysia, and Thailand, finding out why we see different degrees of anti-Sinicism during the Asian financial crisis. I chose the three cases because these countries vary in terms of political access enjoyed by the Chinese minority. The findings of this study reveal a negative correlation between political access and anti-Sinicism. This study will hopefully encourage policymakers to promote more political access for the Chinese minority in Southeast Asia in order to minimize violence caused by anti-Sinicism.
How Journalists and Public Relations practitioners in China view each other

Yu Shuting

Background

With the rapid growth of the economy in China has come the increasing demand for public relations in various industries. The function of public relations varies from initially focusing on “guest relations, translation, and guiding of tours” (Chen N. & Culberson H.M., 1992) to helping clients to expand market share, managing brand and building relationships with governments (Hung & Chen, 2004).

Among the various relations that public relations practitioners are to handle, media relations dominates a central position in public relations because the media serves as gatekeepers, controlling the information flow to other publics (Grunig&Hunt,1984).
Since media bridges corporations with the public, relations with the mass media is so
critical that many public relations practitioners believe that public relations is nothing
more than media relations (Grunig&Hunt1984).

Public relations practitioner’s daily work, indeed, is preoccupied with media relations.
“Employers and clients come and go,” Cutlip and Center claim, “but the press and its
gatekeepers are here forever.” (Cutlip, S.M. & Center, A.H., 1982)  Journalists’
perception of and confidence in a corporation is a valuable asset, helpful to build a
favorable corporate image. To capture the essence of how journalists perceive the
images of corporations can be a key to excellence in media relations building.

Information dissemination significantly influences the public opinion. Journalists,
because of the long tradition as leaders in mass media, are considered as key role in
information flow. Consequently, the relationship between journalists and public relations
practitioners would have effect on information dissemination. Disagreeable relation
influences the mass communication process or the writing of the news. On the contrary,
for practitioners, cooperative relations contribute to building favorable image of clients.

Attitude toward public relations will be investigated in this study. Also, perception and
cross-perception of news values are researched in an attempt to test the difference
between journalists and practitioners.

**Purpose of the research**

Public relations plays a key role in building corporate images, promoting products,
addressing internal conflicts and managing crises. Excellent public relations can promote
and protect the reputation of the corporation. Excellent relations can motivate customers and help the organization to generate more market share. Excellent public relations can also reduce the cost of conflict management and advance harmony between organizations and publics.

Central to practicing public relations and the process of creating the media’s news agenda is a productive working relationship between journalists and public relations professionals. Journalists and public relations professionals play distinct roles. At times, their interests come into conflict and their relationship becomes stressed. Past research results, however, suggest that journalists tend to hold a negative, often antagonistic, attitude toward the practice of public relations and public relations practitioners (Spicer, C.H., 1993).

Whether journalists’ attitude toward public relations and assessment of news value provided by practitioners have changed or can change remains to be an interesting and important question. If journalists and public relations practitioners do misperceive each other, information flow would be affected greatly. A journalist who will not use information from a public relations person because he or she does not trust any practitioner may miss out on some good stories or include incomplete, unclear or inaccurate information in articles. A practitioner who finds he or she are not trusted simply because of the position he or she holds will find it harder to do job and may feel forced to use unethical means to get a message to the public. Neither situation benefits
the news media, public relations or society. As a result, it is significantly important to investigate the perception and cross perception between journalists and practitioners.

Taking up China as a case for inquiry, this study will, first, identify if journalists in print media and practitioners may have different perception toward public relations practice in general; and second, whether journalists and practitioners viewed news values differently. Answers to these questions will shed new light on how public relations can build and maintain good relations with media. Journalists use more public relations-supplied information today than ever before. To effectively disseminate news about a client or an organization, one must always provide accurate, timely, and comprehensive information. Only in this way can any medium adequately inform its readers, listeners, or viewer about matters affecting them. (Wlicox D.L. & Nolte L.W., 1990). If the type of information that certain newspaper departments want and are offered by public relations sources is different, public relations professionals should devise tailored contact strategies. By doing so, customers receive complete, accurate, and balanced information via mass media. (Wlicox D.L. & Nolte L.W., 1990)

This project will entail academic implications to interpret the research findings. Other public relations and communication theories, including the coorientation model, agenda-setting and agenda-building theories, symmetrical versus asymmetrical public relations and, will also be involved.

**Outline of the thesis**
This study has journalists and public relations practitioners to evaluate their attitude
toward public relations professionalism. Subsequently, journalists and public relations
practitioners were also required to assess the news values on their own and of each other.

**Literature review**

Growth in mass communication has been phenomenal in the last three decades.
Newspaper journalists have been cited as emerging professionals of communication
industry (McLeod, 1964; Linehan, 1970; Lattimore, 1974; Johnstone, 1973; Janowitz,
1975). But public relations, which has advanced considerably in size and status since the
days of Ivy Lee, has been often overlooked.

Most of the past literature center on the routines and values of the reporter.
Communication scholars ignored the attribution of professionalism of public relations to
the various communication-related occupations (Cutlip & Center 1971). Public relations
sets the agenda for media because the source in source-reporter interaction is often either
a public relations practitioner or a practitioner’s client.

Since it is impossible for journalists to cover all events and issues, public relations
practitioners serve as a useful role for news media. Consequently, probability that an
event or issue will be covered increases, thereby achieving communication goal for
organization.

**Journalists/public relations practitioners relationship**
Mutual assessment

Given the importance of public relations to the formation of news content and news agenda, the impact and role of public relations have been extensively studied since 1960s. These studies spanned both qualitative and quantitative methods and look at topics ranging from effective “story pitching” to hegemonic role of public relations sources in the information economy, from the ethics of public relations to power dynamics in source-reporter relationship (Cameron, G. T., Sallot L. M. & Curtin P. A., 1997).

Aronoff (1975) through a systematical investigation of the perceived status of practitioners and journalists, asserted that “journalist have negative attitudes toward public relations practitioners and perceive heterphilous (opposite) news value orientations and occupational status as compared to public relations”. When the subjects are asked to rank 16 occupations, including practitioner, journalist, architect, artist, banker, farmer, politician, and professor etc, journalists rank themselves first and practitioners last contrary to practitioners who ranked journalists third and themselves fourth, indicating perceptions of almost equal status.

Jeffers (1977) investigated what he called the “apparent bi-level nature of status and perceptions of cooperation in the journalist/practitioner relationship.” He found that journalists have higher expectations for their own occupation than public relations practitioners when practitioners are undifferentiated. Also, Jeffers found that journalists had more respect for and rated higher those practitioners with whom they had worked than for other practitioners.
Swartz (1983) noted that though journalists and practitioners have much in common, the main difference based less upon the skills that each group uses than how each occupation is perceived by others. Brody (1984) found that antipathy between journalists and practitioners was exaggerated. Although his finding indicates that practitioners’ perception are more positive than that of gatekeepers, ratings of their counterparts on items like ethical behavior, writing skills were high for both groups.

In a survey of newspaper journalists, Kopenhaver (1985) found that the journalists disagreed that public relations was a profession equal to journalists. Ryan, M., & Martinson, D.L. (1988) claimed that the antagonism journalists feel toward public relations is firmly rooted in journalistic culture and influence the mass communication process.

Stegall and Sanders (1986) used a Q-sort technique of 50 statements to replicate Kopenhaver’s (1984) coorientation study. This study identified two distinct public relations practitioner profiles. First are those long-time practitioners who are idealistic, altruistic, and see themselves as journalists or communicators; second are those who see themselves as businessmen first, with first loyalty to the institution, and a marketing orientation.

Two replications of Aronoff’s work have drawn similar conclusions. Sallot (1990b) argued that low valuation by journalists of practitioners’ news values contributes to the
low credibility journalists assign to practitioners. Carroll (1994) found the reporters held negative opinions toward practitioners, ranking themselves higher status and did not perceive the same news value orientations for practitioners as for themselves.

Another study in 90’s has attempted to verify if the journalists’ views have grown more positive or more negative. Pinus, J.D., Rimmer T., Rayfield R. & Cropp F. (1993), for example, studied newspaper editor’s perceptions of public relations and compared the difference between business, news, and sports editors. Their study shows that journalists and public relations practitioners are doubtful of each other’s roles in influencing the news agenda. Journalists complain that public relations people do not understand news and block the media’ access to organizational sources. Public relations practitioners argue that media people are biased against them.

These mutual assessment studies share an interesting pattern. Distrust and low esteem for practitioners are more profound in the abstract than in the specific experience of journalists. Perhaps “it is hard to hate up close” or may be a stereotype exists. Further evidence also suggests that college courses in journalism are anti-public relations. Another replication of Aronoff’s work by Habermann, Kopenhaver, and Martinson (1988) found that news-editorial faculty held only slightly less negative attitude toward public relations than their professional counterparts.

Cline (1982) reviewed mass communication textbooks’ treatment of public relations and concluded that journalists’ negative attitude about public relations practitioners is
perpetuated by their education received. In sum, education apparently has an impact on subsequent professional values. Textbooks and course content may be sources of generalized negative assessments of public relations.

Turk (1985, 1986a, 1986b) offers an explanation of journalists’ negative assessments of public relations that journalists biased practitioners engaged in puffery and manipulation of information, and indeed practitioners themselves are indoctrinated to expect that attitude of distrust from journalists (Turk, 1986a).

This summary of journalistic folklore is supported by evidence from a study investigating why such attitudes are held. Ryan and Martinson (1988) sought to analyze some of the reasons for the state of this relationship. Blind prejudice and unprofessional practices contribute to negative reporter attitude.

Ryan and Martinson’s subjects were all practitioners. Sallot (1990b) replicated their work but surveyed journalists as well as practitioners. The two groups are consistent that journalists believe their work is more important to society than is public relations, which may account for some of the journalists’ antagonism. The journalists also believed that practitioners bear part of the responsibility for journalists’ negative attitudes because they are responsible for “policing the peripheral bad apples”. But the practitioners attributed journalists’ negative attitudes toward public relations to the journalists’ inflated views of their own status and their negative experiences with few “bad apples”.

The practitioners also believed that journalists’ dim view of public relations is not fair. The journalists blamed practitioners for being unprofessional and insufficiently concerned about journalists’ needs for clear, concise, accurate information and believed their negative attitudes were justified.

Using a role theory perspective, Belz, Talbott, and Starck (1989) applied Q-methodology to four categories of roles—personal characteristics, rights, duties, and skills—to study cross-perceptions of journalists and practitioners. Attitudes between the two groups differed sharply about the role of public relations as well as specific issues such as freedom of the press, balance, objectivity, aggressiveness, protection of the public interest, withholding of information, diplomacy, previous experience, and ability to construct interesting messages. The journalists viewed public relations practitioners negatively for their role as advocates and for having hidden agendas, withholding information, and compromising ethics.

Based on these prior studies, we propose the research question of this study:

Research question: how journalists and practitioner in china view each other?

In China, as mass media is increasingly becoming attractive to audience, audiences rely on mass media to access information. Therefore, organizations play further emphasis on mass media to disseminate information. Many organizations blindly believe coverage of news would promote the sale of products. On the other hand, those organizations try all
means to increase reports taking into consideration that news releases save more money than advertising (www.bbstday.com).

Grounded on the belief that widening coverage of news will enhance products sale, practitioners on behalf of their clients have to push journalists to fill in the news. Thus, journalists are often bothered by practitioners with their purpose of persuading journalists to publicize news.

Compared with public relations practitioners, journalists think highly of their own profession and consider practitioners to be low-credibility resource. Is public relations misinterpreted? According to media voice, it is widely accepted that the terminologies concerned with Public relations are described as abbreviations of pleas and cheat. Media reports scarcely relate the organizational positive events with public relations. Although public relations agencies on behalf of their clients have done certain good job worthy of public support, the articles and book praising the contribution of public relations are not popular.

Having reviewed the western studies on attitude toward public relations and practice in china, hypothesis 1 is given.

Hypotheses 1: journalists in china have antagonistic attitude toward public relations profession and public relations practitioners.
Contrary to practitioners, journalists in China are more important in information dissemination because the development of news media in China entail the journalists’ powerful status.

Economic reform in 80’s has rendered China’s media system more liberalized than ever before (Chu, 1994; Hong, 1998; Zhao, 1998) within the effect that the system becomes more commercialized, depoliticized, and internationalized (Hong, 1998; Swartz, 2002b). Although the fundamental structure and content of the media is still under control, the media is permitted by the government to maximize their commercial gains and increase newspaper circulation and advertising revenues. (Swartz, 2002b; Zhao, 1998). As a result, the main goal for Chinese journalists and media professionals is to successfully solicit mass subscriptions and advertising revenue from organizations.

With the growth of purchasing power, audience is becoming large and diverse. Increasing audience are not satisfied with the similar style and content of mass media. In order to attract audience, media is growing to be varied and appealing. In the past couple of years both the number of media and style of media have changed so as to adapt the new trend. In turn, more and more audience is attracted by mass media and show loyalty toward certain medias. Accompanying with growing readers, news media is empowered to communicate with publics directly and efficiently. Therefore, mass media gradually gained importance in Mainland China.
Given the importance of news media in China, the newspaper institutions, which have broad circulation, are more likely to occupy important status in this industry and are considered as the first targets of persuasion. Journalists from newspapers having large publication show less respect to public relations profession than those from newspapers having small publication in that they highly praise themselves more. Location of the newspaper is another factor inducing different attitude because public relations in metropolitans and smaller cities developed differently and thus the extent of journalists’ understanding PR varied.

Before serving as journalists, some of them carry out the role of practitioners, the prior experience attributes to another attitude toward PR. It is possible that these journalists feel more sympathy to public relations professions than others. Moreover, past studies suggest that journalists hate to be pushed by practitioners for obtaining report exposure. Frequency of contact with practitioners is likely to be a cause of the contempt.

Hypothesis 2 aims to look into whether the attitude of journalists towards public relations will be influenced by the variables like education of journalists and circulation size of the newspapers etc.

Hypothesis 2: circulation size and location of the newspapers, prior public relations experience and frequency of contact with public relations practitioners influence journalists’ attitude toward public relations.
When more international business operational models are introduced into China market, public relations agencies become to be known as building image for those successful foreign corporations. One of the successful experiences of foreign corporations is that the public relations of these organizations is operated by professional PR agency. Being aware of this experience, local companies increase needs for more public relations agencies. Besides, with the consciousness that public relations play a significant role in building organizational image, boosting company and changing crisis to opportunities, local companies are also eager for increasing public relations agencies.

Local PR agencies mainly provide the service such as writing news releases, holding news conferences, marketing promotional activities, and building relationships with local governments (Hung & Chen, 2004). With regard to foreign PR agencies, their service are mainly to expand the markets for their multinational clients, helping their clients build businesses in China, and opening new accounts with local organizations. (Hung & Chen, 2004)

Contrary to local public relations agencies concentrating on integrated marketing communication, multinational public relations agencies stress brand management practices (Hung & Chen, 2004). In a survey of public relations agencies conducted by CIPRA (China International Public Relations Association, which was founded in April 1991 in Beijing, is the most influential public relations association), IT (information technology), health communication, and consumer products are the main service areas in China. While local public relations agencies emphasize execution ability, service quality
and creativity, multinational public relations agencies give more attention to agency quality, expertise in furthering corporate reputation, and public relations know-how in their services. (Hung & Chen, 2004)

According to Chen (2002), corporations of different size have different communication characteristics. Small corporations tend to help firms with image building through publicity and the practitioners are more like technicians. In the medium-sized organizations, public relations involves facilitating communication between managers and employees and also bridging channel between client and external publics. Larger corporations tend to place emphasis on strategic planning and corporate-culture cultivation.

Viewing the public relations function of various agencies, international agency perform advanced function compared with local company. The practitioners in international agencies gain more training and satisfaction instead of those working in local agencies. Likewise, practitioners in larger agencies fulfill superior function and achieve better opportunities than those in small agencies. All in all, the size and type of the agency could be facets constituting the different views of practitioners.

Hypothesis 3 is designed to address this problem.

Hypothesis 3: size of the agency and type of the agency make difference of practitioners’ attitude towards their own profession.
**News value**

Public relations practitioners and journalists share some common values while at the same time differ on others. To some extent, public relations practitioner and journalists are dependent on each other. Journalists use public relations as a main channel to get news material. By the same token, practitioners depend on journalists to publish information. However, such dependence is not widely recognized in previous literature.

Gaining editors’ respect and admiration is vital to public relations success. Practitioners rely on news media to convey and publish the information relevant to their clients. As a result, it is especially important for practitioners to provide newsworthy material to the mass media.

Practitioners’ understanding of journalists’ views of the news is a key to a successful journalist-public relations relationship. A prolific research examines how editors, as gatekeepers, determine which news to print (Breed, 1955; Shaw & McCombs, 1977; White, 1950) and how public relations practitioners persuade editors. (Cutlip, Center & Bromm, 1985; Grunig & Hunt, 1984; Aconoff, 1976; Boorstin, 1961; Schabacker, 1963).

Agenda-setting is a process that mass media influence the public’s perception by determining which issues to be discussed and thus positioning these issues. The information which is most likely to be considered as news shares certain characteristics like conflict, progress, disaster, consequence, eminence, novelty, human interest, timeliness, and proximity (Graber, 1984; Harris & Johnson, 1965). The efficiency of these
criteria was reinforced by Turk (1988), in which she found that editors’ decision to use public information was based on relevance, timeliness, oddity, and subject prominence.

A corollary to agenda-setting is agenda building, which places the media in the role of audience or receiver in the agenda-setting process (Rogers, Dearing, & Chang, 1991). Agenda building focuses on who sets the media’s agenda. Public relations practitioners play a role in the agenda-building process by supplying editors with newsworthy materials or ideas.

Aronoff (1975) found that practitioners’ perceptions of journalists’ news values were accurate and correlated highly with journalists’ reported values, whereas journalists’ perceptions of PR practitioners’ reported values were highly inaccurate.

By examining press releases in 1984 and 1985, Turk (1988) found that about half of the information provided by public information officers was used in subsequently published stories and that most topics identified by public information officers as salient to their agencies were the same topics salient to media coverage. Press release supplied by public relations can influence which stories would be in the news, but they did not necessarily influence the content of those stories.

Many journalists use the information provided by practitioners to contact sources and to fill space, but are often bothered by practitioners intending to persuade them. Brody (1984) found that, although editors and practitioners differed significantly on four of
eight ethical factors, they differed on only one of four factors related to news quality. Two groups agreed substantially on what constitutes good news stories while they failed to agree what constitutes fairness and public interest.

Despite the antagonism, some research has applied the Chaffee-Mcleod (1968) coorientation model and has indicated surprising similarities of news values between journalists and public relations practitioners. Kopenhaver (1985) found that practitioners rated news values similarly with journalists but journalists’ perceptions are not consistent with that of practitioners. Journalists intended to believe that practitioners were more likely to mislead the public than was actually reported to be the case.

In term of coorientation model, this model is particularly vital in the present study because the research will base on this model to compare the evaluation of journalists and public relations practitioners toward public relations professionalism and to assess the perception and cross-perception of each other on news values.

Coorientational analysis permits comparison of attitudes toward an object among two or more groups of people, analysis of communication effects, and measurement of relationships. Such coorientation measures have been found to be effective in explaining dimensions of pluralistic ignorance or false consensus, i.e., overestimations or underestimations of others’ views. The projections of estimations of the other’s perceptions are useful determinants to measure whether two groups are conflicting or not.
This study employs coorientation to examine the perceived conflict of public relations practitioners and journalists in terms of agreement, congruency, and accuracy.

Congruency is to the extent that person thinks the other’s opinion resemble his own is Agreement is to the extent that person’s evaluation resemble other’s. Accuracy is to the extent that one person’s perception of the other’s evaluation resembles the other’s true evaluation. Accuracy, agreement and congruency are not functionally independent of one another, since each is based in two measures that from part of the basis for the other two concepts. Thus, if agreement is low and congruency is high, accuracy is necessarily low; if agreement and congruency are both high or both low, accuracy is high.

In this study, the agreement stemming from comparing the attitude of journalists and practitioners towards public relations and the congruency and accuracy occurred in evaluating perception and cross-perception of news values between these two groups will be calculated.

Hypotheses 4 and 5 are attempting to explore the perception and cross-perception of journalists and practitioners on news values.

Hypotheses 4: public relations practitioners in china will perceive the journalists’ evaluation of news values as more congruent to their own than the converse.

Hypotheses 5: public relations practitioners will predict the journalists’ actual value of news values more accurately than the converse.
How to improve media relationship

Good media relations contribute to effectiveness by building quality, long-term relationships with mass media. Grunig introduced four models of public relations. These four models describe the practice of public relations and are accepted widely in the world.

These four models are called press agentry/publicity, public information, two-way symmetrical, and two-way asymmetrical. Press agentry/publicity and public information are both one-way models. Practitioners of press agentry try any possible means to gain attention for their organization, whereas public information practitioners are journalists-in-residence who disseminate correct, but usually only favorable, information about their organizations. Practitioners with the two-way asymmetrical model, conduct research to determine how to convince publics to behave like what the organization wished. With the two-way symmetrical model, practitioners using research and dialogue produce mutual changes in the ideas, attitudes, and behaviors of both the organization and its publics. This model is viewed as the best effective one to contribute to organizational effectiveness.

For media relation to be excellent, organizations should build up two-way and symmetrical relationships with journalists. Using press agentry or public information model will be more likely to inefficiently communicate with journalist because practitioners often present only the good side of the story. Intentions of persuading journalists are often characterized as obstructions in the journalists parth to the truth. By
using the two-way symmetrical model practitioners position themselves from the point of journalists. The more valuable news practitioners provide, the more respect they gain from journalists.

Summary

As the media’s gatekeepers, journalists decide which information to use in building their newspaper’s agenda. Public relations practitioners attempt to position themselves in journalists’ eyes for the sake of obtaining favorable publicity for their clients. Previous research has consistently identified the mistrust and conflict in the journalist-public relations relationship, particularly from the journalist’s perspective. Generally, journalists have unfavorable attitude toward public relations practitioners. Previous studies also suggest that journalists do not have great respect for practitioners and they consider themselves superior in many ways to practitioners.

Since perception is so important in mass communication, we thought it would be useful to replicate the part of the earlier work, using different population. The research will imply Aronoff’s study to investigate how journalists and practitioners in china view each other. If the results of the China study duplicated those of earlier research, the probability would be high that public relations practitioners face serious negative attitudes of journalists. The antagonism between journalists and practitioners may prevent new comer entering this field. Besides, it is more likely that journalists miss important information because of their mistrust of public relations practitioners.
Two content analyses demonstrate a convergence of academic and journalistic stereotypes of public relations. In an analysis of the terms “public relations and PR” in 84 published press references, Spicer (1993) found that more than 80% of the time the terms were embedded in negative contexts. Bishop (1988) concluded that journalists view public relations as equivalent to publicity while publicity is only one of many functions performed by public relations practitioners.

**Research questions and hypotheses:**

This study will be guided by the following general research questions and research hypotheses:

Research question: *how journalists and practitioner in china view each other?*

Hypothesis 1: *journalists in china have antagonistic attitude toward public relations profession and public relations practitioners.*

Hypothesis 2: *circulation size of the newspapers, location of the newspaper, prior public relations experience and frequency of contact with public relations practitioners influence journalists’ attitude toward public relations.*

Hypothesis 3: *size of the agency and type of the agency make difference of practitioners’ attitude towards their own profession.*

Hypothesis 4: *public relations practitioners in china will perceive the journalists’ evaluation of news values as more congruent to their own than the converse.*
Hypothesis 5: public relations practitioners will predict the journalists’ actual value of news values more accurately than the converse.

Research methods

Design

With regard to the research question and research hypotheses, independent variable and dependent variable are developed to conduct the research.

Independent variable

Two groups: journalists and public relations practitioners.

Prior studies indicate journalists and practitioners have different attitude toward public relations and different perception of news values. The conflict derives from the difference between these two professions. Besides, other independent variables, which are in an estimation to be the reasons causing conflict, will be tested in the current study. These potential variables which may affect journalists’ attitude include circulation size and location of the newspapers, prior public relations experience and frequency of contact with public relations practitioners. Conversely, the latent variables probably influencing practitioners’ attitude are size and type of agency.

Dependent variable

Attitude toward public relations and perception and cross-perception of news values

Subjects

Questionnaires will be mailed to both journalists and practitioners. 200 print news media, including daily newspaper, weekly newspaper and monthly magazine, are selected from
the list of All-China Journalists Association web (http://www.acja.org.cn) and china post web (http://www.chinapostnews.com.cn). Also, these news media are chosen from six cities, Beijing, Shanghai, Guangzhou, Shenzhen, Hangzhou and Chengdu. They varied in circulation-size and industry. The questionnaire will be mailed to two journalists of each news media.

Public relations practitioners are selected from 70 public relations agencies covering these six cities. A purposive sample was selected from lists of China Public Relations Association (www.chinapr.com.cn). Moreover, other samples of PR agencies will be accessed by using Internet. 70 public relations agencies are identified as research sample and the questionnaires will be mailed to two practitioners of each agency.

**Measurement**

Two questionnaires are designed to explain the research questions and hypotheses. The questionnaires are divided into three sections and sent to journalists and practitioners separately. These two questionnaires share the same first two sections except the last section. The first section explores the attitudes of journalist and practitioners toward public relations. To measure attitudes toward public relations, we incorporated 22 statements cited from Florida study and Aronoff’s study. Respondents indicate their agreement/disagreement by checking the appropriate blank on a five-point scale.

1/ journalists and PR practitioners are partners.

2/PR competes with advertising.
3/PR information helps the quality of reporting.
4/PR has an equal professional status with journalism.
5/PR practitioners are obstructionists.
6/PR promotes undeserving products.
7/PR is promotion disguised as news.
8/PR practitioners provide useful information.
9/PR practitioners push trivial events.
10/PR practitioners are extensions of news staff.
11/PR practitioners are errand boys.
12/PR practitioners are good people.
13/It is a shame that press depends on PR information.
14/PR practitioners understand deadlines.
15/Journalists’ do not trust PR practitioners.
16/Journalists and PR practitioners battle
17/PR practitioners are frank and honest
18/PR practitioners help editors get good information.
19/PR uses shield of words as cover
20/PR is needed to produce newspapers
21/PR releases have high news value
22/PR main goal is to get free advertising.

Concerning the second section, eight news values scales (Sallot L.M., Steinfatt T.M. & Salwen M.B. 1998) will be measured. The items were designed to enable coorientational
analysis of perception and cross-perception of practitioners’ and journalists. Respondents will be asked to rank news values twice, first based on their personal views, and second based on how they perceived the values would be preferred by their public relations/journalist counterparts. (That is, public relations practitioners are asked how they think journalists would rank them, and journalists are asked how they think practitioners will rank them).

1/factual values
2/interest to readers
3/usefulness to readers
4/completeness
5/prompt, timely publication
6/depicts subject in favorable light
7/mechanical/grammatical accuracy
8/fairness to different views

The final section is to address demographic questions and descriptive information. Regarding to questionnaire designed for journalists, questions involve gender, education, circulation size of the newspapers, prior public relations experience and frequency of contact with public relations practitioners. As far as questionnaires for practitioners are concerned, the questions are relevant with gender, education, position in the organization, size of agency as well as type of agency etc.
Three phases helps to address the research question and research hypothesis.

Phase 1
Before disseminating these questionnaires, the questionnaires involving the above statements will be translated into Chinese. Two journalists and practitioners will be employed to proofread the questions in order to eliminate any ambiguous statements.

Phase 2:
A practitioner working in Mainland China who has been trained to appropriately conduct survey step by step will be responsible for collecting the surveys. From 1 April on, the survey will be sent by email to the journalists and practitioners. The responses will be collected within one week. After one week, respondents who do not respond are sent the survey again. Also, the responses in this turn will be collected within one week. Finally, the survey will be emailed to those others who do not respond at third time.

Data analysis techniques:
Data analyses will be done using SPSS. Research question and hypothesis 1 are discussed using descriptive statistics and cross-tabulations. To resolve hypotheses 2 and 3, an attitude toward public relations index is developed, using factor analysis techniques. The PR index will be tested for reliability with Cronbach’s alpha, and it is used as a dependent Variable in two and three-way cross-tabulations and in developing a multiple regression model incorporating the predictors identified in the research question. Hypotheses 4 and 5 will be analyzed using a Spearman rho test.
Phase 3

Besides survey, in-depth interviews will be conducted to elicit candid opinions. Employing different research methods in examining the same subject assists to strengthen the reliability and validity of the findings. Qualitative method is significant in understanding human actions and their social context. This study will conduct in-depth interviews with 20 journalists and 10 practitioners in Beijing to identify possible variables that interpret the findings. Information from the depth interviews served both as insight and elaboration of survey data. The interviewees will be selected by convenience sampling using one public relations practitioner’s network. Snowball sampling also will be used as some participants will recommend others for interview.

**Anticipated findings**

The negative attitude of journalists towards public relations professions is foreseen. In addition to anticipating circulation size and location of newspaper as cause of antagonism, prior PR experience and frequency of contact with practitioners have impact on the attitude. Regarding to the attitude of practitioners toward their own profession, the chance is that both size and type of agency affect practitioners’ perception.

It was predicted that the two groups would show similar news values but perceive different news values in the other group. If these hypotheses are correct, then the two groups are misperceiving each other and have more common similarity actually. It was predicted that both groups would believe that public relations exert a powerful influence in shaping news agenda.

Foreign Borrowing and Economic Fluctuations-Banks’ Role in Transmitting Shocks

Abstract

There is considerable research being developed to explain why the Asian crisis occurred. However, less attention has been paid to the transmission mechanism that acts as the intermediary between the external financial shock and the local economy of the countries in crisis.

In this paper, I examined the effects of the external financial shock (in the form of an unanticipated reduction of foreign loans due to contagion) on the real economic activities, focusing on the role of domestic commercial banks in the transmission mechanism.

In the model, the representative domestic bank finances its funds through both domestic deposits and foreign borrowing. The representative household needs use demand deposit to carry out transactions and the representative firm has to borrow from the bank to pay its wage bill prior to the production. Banking is costly in this economy; the cost of providing banking services depends on the size of bank credits, demand deposits as well as the bank’s foreign loans. In this economy, the effects of an external shock of capital outflow on the economy are two-fold: firstly, it decreases the available banking credits directly; secondly, it increases the banking cost, thus causing a decline of consumption and deposits through the increase in deposit spread, therefore leading an additional reduction of the available bank credits to the firm. This reduction of bank credits to the firm drives down the output, wage rate and employment. Therefore the commercial bank spreads the external financial shock to both the demand and the supply side through its central role in the economy.

In the empirical part of the paper, I presented estimates of a VAR model including the bank lending spread, lending rate, real claim to private sectors, employment, industrial output and
foreign loans. Using generalized impulse response functions, I showed that a shock of increased foreign loan led to a decrease in lending rate and domestic spreads and a rise in the credits, employment and output, which are consistent with the analytical results derived before.

From Networks to Influence:
China’s Think Tanks in Policy Process

Abstract:

This paper engages in analyzing the factors that determine the influence of China’s Think Tanks in policy process. According to a survey about 301 China's think tanks, this article argues that social capital is the most important factor, and the structure of networks performs as a significant role. In the model of this paper, two kinds of think tanks networks are deduced to analyze the functions of structure of networks. The regression result shows that strong ties have more significance to the realization of think tanks’ influence than weak ties, according to communicative action theory. And another result tell us that it's most beneficial for think tanks' heads to know the officials at the bureau director levels to increase think tanks’ influence.

Keywords:
China’s Think Tanks, Influence, Social Capital Networks, Policy Process

Introduction: The policy process and think tanks networks

In China, think tanks are stable and independently running organizations that research and consult policy issues to influence the policy process. It is a pity that only a few scholars paid attention to China’s think tanks in the areas of politics and sociology. (Chen 2000; Tanner 2002; Shambaugh 2002, Glaser and Saunders 2002; Gill and Mulvenon 2002; Naughton 2002). The researches found that in China, as one of the countries of Confucianism, the traditional patron-client relationship of guanxi (social connection) is an important determinant of the relationship between intellectuals and researchers, and state officials (Chen 2000). In this paper, I will not only strongly validate this argument by quantitative analysis, but also discuss the impact from the nature of guanxi and the structure of networks on the performance of China’s think tanks.

As policy actors, think tanks not only need to make research on the policy problems but also have to keep close ties in society to influence the policy making. The social ties of think tanks consist of their peers, the press, government and bureaucracy institutes, foundations, universities and so on. (Stone, 1996. p127) In establish and maintain these relationships, think tanks experts have to invest a lot of time and energy to attend social activities and to advocate their policy beliefs and
persuade the policy decision makers to accept their ideas. Because of these consistent efforts, think tanks experts can develop stable social networks.

Domhoff implemented the concept of close ties in the social networks theory to finding out the means these elite influences the policymaking (Domhoff 1983). After he made a wide research on the elite’ social background, he found that those elite has similar family and education background, same races and genders and they join the same clubs and go to vacation in the same place, all of which disclose the close ties between them. These elite has found a better way to influence through the network communications rather than the formal presentations. On the one hand, think tanks scholars try to keep a close tie with the influential to receive funding, and on the other hand, their ideas could better influence the policy making though those ties. (Abelson 2002)

The idea of the policy subsystems cannot be ignored in the study about how think tanks participate in the policy process. The policy subsystem is an aggregation of certain policy programs, the actors and organizations. Many scholars point out that the precise analysis unit should be policy subsystem instead of the government or the policy programs. For example, there usually exist about ten different policy programs in the sectors such as air pollution controls or telecommunication policies and these programs are related with different levels of government bodies. A policy subsystem consists of actors from either public or private institutions who are concerned with policy problems, including officials in the traditional ‘iron triangle” (e.g. the administrative institute, the legislative committee and the interest groups), the government professional networks, journalists, research groups and policy analyzers. There always involved overlapped groups of actors since these programs deal with related topics in a certain area. (Ostrom 1983; Jordan 1990) Think tanks participate in the policy subsystems and do make great influence on the policy creation, diffusion and revolution. Empirically, these subsystems either could be led by a single interest group or could be in the struggle of several interest groups or they can be broken after some time. And they may have their own independence which is different from other subsystems.  

In policy subsystems, there is a “closed loops” among policy community and policy research institutes. This loop develops step by step: firstly, a think tank establishes communication and influence channel through administration relation and some other occasional opportunities; secondly, some suggestions are debriefed and accepted; thirdly, government starts to trust in this think tank and their valuable research outcome; fourthly, some research projects from government are allocated to those think tanks government trusts in, which means funding community has primarily formed; fifthly, think tanks submits internal report as research outcome, which means policy community has become to work; sixthly, influence networks are consolidated, therefore, this step-by-step loop is closed and repeated. We can see the figure as follow.
The influence of China’s think tanks

The study of think tank’s influence on the policy is as difficult as any other study related with the issues of the policy process. However, fortunately, the practices of Chinese government make it easier for us to obtain more obvious indicator for think tanks’ influence, especially their direct influence. Based on the analysis framework of social structure, we find a three-dimension method to measure think tanks’ influence: the decision making nuclear, the center and the periphery °. (Galtung 1965) At the same time, we divided think tanks’ influence into ‘from words’ or ‘from activities’ according to their origins.

As mentioned before, it’s hard to find indicators applicable to all the countries to measure think tanks’ influence on policy making since different countries take different approaches in handling their policy making issues and adopting the experts’ suggestions. The government practices are a decisive factor on how think tanks influence the government and are of importance for us to set up think tanks’ influence indicators. So first of all, we’d like to talk about the approaches Chinese government accept the experts’ thoughts before we set up think tanks’ influence indicators.

In China, most of think tanks’ research papers that are turned to government bodies are called ‘internal reports’. However, the number of papers cannot reflect the
exact chances to influence the policy. It’s Chinese characteristic that the ‘leader’s remark’ plays a uniquely important role in the decision-making. When the government leaders read some selected papers from certain research institutes in his busy work and find their policy advice worthwhile, he would write his remarks in the reports. In China, those comments would expedite the policy action such as ‘acceptance’, or ‘execution’. So obtaining the leaders’ remarks for think tanks’ internal research papers is the most direct and most effective way to influence the policy making. This Chinese characteristic has solved the biggest challenge in our study on how to measure think tanks’ influence. That is, we can tell explicitly that a certain policy is implemented because a research paper by a certain institute won the leader’s remarks.

Now The Chinese government has become more and more willing to listen to the experts’ advice. The central government often invite experts at seminars or hire them as consultants and the ministries and the local governments follow these common practices. That’s why the number of the ‘remarks’ from the Chinese government leaders can be regarded as one of the indicators of China’s think tanks’ influence on the policy making process.

Chinese government is constantly innovating and enriching their approaches to obtain think tanks’ thoughts. Since the 16th National Congress of Communist Party of China at the end of 2002, the Political Bureau of the Central Committee, which is the nuclear core of the Communist Party, has hold more than ten group studies. In addition, they attended the seminars every month to listen to the experts’ advice in certain areas. Because of their exemplary behavior, the local governments also began to invite think tanks experts to organize seminars and group study for the officials. However, this has not become common practices nationwide so we didn’t count the number of “seminars for officials” as an indicator of think tanks’ influence. But we can add this indicator in our later research if this government practices are widely spread out.

To sum it up, we will introduce two indicators as think tanks’ influence on the policymaking, “leaders’ remarks” and “invitations to the government seminars” which will represent the influence from their origins of “words” and “activities”.

Think tank elites’ influence come from its academic credit whose most important symbol is the number of published papers. But firstly, we must guarantee that the readers of the published papers are social elite that’s why the papers from the popular mass media cannot be counted. Secondly, more emphasis should be put on the influence of the papers than the absolute numbers. Since so far we cannot get the indicator of think tanks’ influence in China from publishing the papers (the paper citation frequency is used internationally as the influence), we will introduce the number of papers published on “the Chinese Core Journal” as indicator of their social elites’ influence. This criterion is widely used and authoritative in China because in order to be selected into the Chinese Core Journal a paper has to meet a comprehensive indexed standard based on seven indicators. They are the overall indexes counts, overall digests counts, overall citations, overall indirect citations, the digested frequency, the influence factor and winning the national award or being
selected by the large searching engines in China or abroad. So we choose the indicator of “Chinese core journal papers” to reflect their influence in China.

As for the indicators for think tanks’ other influences, we chose “invitations to academic conferences” as indicator for the elite influence in the “activities” criteria and selected “press reports” and “press interviews” as indicators for think tank’s influence on the public. (Zhu and Su 2004)

So far, all the indicators for the Chinese think tanks’ influence have been set up and are shown in the table 1 below.

Table 1. The indicator matrices for China’s think tanks’ influence

<table>
<thead>
<tr>
<th>Policy influence</th>
<th>Elite influence</th>
<th>Public influence</th>

<td>Core journal papers</td>
<td>Press reports</td>
</tr>
<tr>
<td>Activities</td>
<td>Invitations to the government conferences</td>
<td>Invitations to national academic conferences</td>
</tr>
</tbody>
</table>

From table 2 we can see the statistical regression analysis about the above-mentioned indicators and the matrices in table 3. From table 3, we can find some features of Chinese think tanks. The press influence is related with all kinds of think tank’s actions while the government’s influence is independent from the academic influence. The influence from the origins of words and activities decreases as they move far from the policy core. It demonstrates that the more peripheral the information is, the more public it will be.

We combine these six influence indicators through the Method of Factor Analysis step by step. Firstly we get the influence factors about all social stratum and then the influence factors for each institute. Then we chose Varimax Orthogonal Transformation as the rotation method and the Principal Components Method to extract the factors, based on the correlation matrix of the independent variables.

Since in the measure unit of independent variables varies).

A. Policy making (nuclear) influence factor distribution
B. Elite (center) influence factor distribution
C. Public (periphery) influence factor distribution
D. Think tanks influence factor distribution

Chart 2. The influence factor distribution for Chinese think tanks

From calculating think tanks’ influence factor, we get separate influence factors which indicate both think tanks’ influence on different social stratum and the overall influence factor. The mean value of the overall influence factor of all think tanks is 0 with a stand deviation of 1, a minimum of -0.97 and a maximum of 4.792. We can categorize think tanks into five groups according to their influence factor: very weak influence with a factor below -0.5, semi-weak influence between –0.5 and 0,
semi-strong influence between 0 and 1, strong influence between 1 and 2 and very strong influence above 2. We can see from Chart 1 that the statistical distribution inclined to the low value area, showing that about 65 percent of think tanks have semi-weak influence.

**Social capital of China’s think tanks**

The analysis of the networks of think tanks is important when we make research about think tanks’ influence. We will apply the concept in the Social Capital Theory to find out the relationship between the social networks and think tanks’ influence since the theory regard the social networks as the observance objective.

We can simply note that social capital is the scarce resources captured through social relations. The scarce resources include power, status, fortune, funds, knowledge, chance, information, etc. When these resources become scarce under a certain social environment, people can get from two kinds of social ties. One is a stable relationship between a person and his affiliated social group or institute and an individual can obtain the scarce resources from these groups or institutes. The second is the social network which doesn’t require any membership qualification or any physical groups or institutes and starts and develops by people’s contact, communication, exchange and other interactions.

In order to estimate social capital, we take the procedure below.

Firstly, we take the personal social network of think tanks’ heads representing the institute’s social capital. The former study cases show that since China’s think tanks are still at a preliminary stage, their head’s charisma characterizes the social activities of most think tanks. The heads represent their institutes to attend all kinds of activities and also bear the responsibility to spread out their ideas and promote the institute image. That’s why we regard that social capital of the head can represent that of think tanks. It’s true that there is not only one renowned expert in some institutes. But only head is counted can simply and standardize our statistical calibers, which is quite practical in this study.

Secondly, two kinds of the social networks of the heads are counted to measure their social capital.

The head try to maintain their reputation among the social elite through all kinds
of social activities. The social activities could be attending various academic or social groups or accepting some part-time academic positions. These can both stable their social network in some circle. So we can find out the number of organizations that the head attends representing his stable social network. We designed two indicators, one is “how many social or academic part-time positions that you hold besides your present job?” and the other is “how many social groups you join besides the present institute?” The difference between the two indicators is that there is strong tie in the social part-time job with more commitment of participation while there is weak tie in the social groups with less participation.

We can observe the size of his social network, that is, the approximate number of people he knows, as his personal unstable social ties. This method is rather objective with an explicit question so the interviewees won’t make conjectures and make the data biased. We categorized the social ties of the head into several groups including officials at or above the governor and minister levels, officials at the bureau director levels, ordinary officials from other government bodies and the heads of private and state-owned companies, and People from the press and media areas, the numbers of which would be counted if think tanks head at least have met them twice. Their social network is categorized into five groups from less than 10 people, 10 to 50 people, 50 to 100 people, 100 and 200 people and above 200 which are defined as 1 to 5.

We get social capital factor in the similar way that we obtain think tanks’ influence factor. We get the respective contribution rate of two kinds of social tie factor though the Factor Analysis Method. Then we chose Varimax Orthogonal Transformation as the rotation method and the Principal Components Method to extract the factor, based on the correlation matrix of the independent variables. (Since the difference in the measurement unit of independent variables). The mean value of overall social capital factor of all think tanks is 0 with a stand deviation of 1, a minimum of -1.894 and a maximum of 5.440. We categorize social capital of think tanks into four groups: coefficient less than -1 is regarded as very low level of social capital; from -1 to 0, low level; from 0 to 1, high level and very high level if above 1. We can see that there is a normal distribution in social capital from the chart below with 55 percent of think tanks in the area of low level of social capital. We can see the statistical distribution for social capital of think tanks from the chart below.
About other independent variables

The economy cost of think tanks: cost of policy research of think tanks (unit: 10,000 Yuan)

Labor capital of think tanks: We define labor capital by the number of the researchers in the institute. The researchers are divided into full-time and part-time ones. We regard the part-time researchers as half unit of a labor. Then we can get:

\[ \text{The number of researchers} = \text{the number of full-time researchers} + (0.5)\times \text{the number of part-time researchers} \]

Social Capital and the Structure of Networks

Contribution of Social Capital

Capital investment always expects some returns. Economists have kept developing the definition of capital since Carl Marx began his research on capital. The production activities such as the industry production can be explained by a function with economic capital and labor capital. Social capital also becomes useful when the sociologists begin to pay attention to the value of social network which is a ladder for both the individual and the institute upward. As a special institute to produce the public products of “thoughts”, think tanks’ value lies in their influence. And we would set up a model with the independent variables of economic capital, labor capital and social capital, which are indicators of think tanks’ influence.

The China’s government since assumed that the strength of the research institutes
is determined by labor capital and the research cost which are then described as indicators of the overall research strength. (China’s Soft Science Survey and Statistics Team 1996) However, based on the theory exploration on the policy process, think tanks’ networks and social capital, we can estimate that the most influential factor is social capital, not their economy or labor input. That’s why we make the hypothesis on social capital.

**Hypothesis 1:** The contribution of economic capital and labor capital is much lower to think tanks’ influence than that of social capital.

**Functions of Structure of Networks**

*Communicative action and strong ties proposition*

There are instrumental action and expressive action in the theories on action. (Lin 2001, p.58) For instrumental action, the sociologists once believe that “weak ties” are more useful than “strong ties” towards success. In the famous Weak Ties Theory of Granovetter, weak ties would provide more useful information than strong ties (people who are more familiar with us) since strong ties are usually homogenous while weak ties are often heterogeneous. (Granovetter 1973; 1982) The proposition of social capital believes that the success probability of instrumental action has a positive correlation with social capital and the usage of weak ties has a positive correlation with social resources. (Lin 1982; 1990) However, Researchers used to find counter examples in weak tie hypothesis in China or other Chinese communities. (Bian 1997a; 1997b) So we would like to know that what kind of influence weak and strong ties could have on think tanks’ influence?

We believe that think tanks’ behaviors for their influence have fundamental differences from the above theories. The action they take belongs to neither instrumental action nor expressive action but communicative action. Communicative action is an interaction between the participants via the media of languages. They use language or non-language codes as tools to understand each other’s situation and purpose. That’s why each other’s understanding becomes the core of communications so the language plays a very important role in communication. (Habermas 1984; 1987) The difference between communicative action and instrumental action lies in the failure of instrumental action can be concluded as “having contradiction” between certain “disappointing” reality and our expectation while the failure of communicative action derives from the contradiction between different forms of “objective spirits” in our life. The actors then began to object a kind of distinct objectivity - the objection from the actors of the same organization due to their different values, moral beliefs and traditions in their life. The difference between communicative action and expressive action lies in that communicative action is a two-direction interaction which doesn’t need special efforts from the action makers and need the responses from the action receivers while the expressive action is a one-direction positive action. Since the research products of think tanks have to be accepted, agreed and adopted by
others to make influence, that is, to be agreed by the policy makers on the value, beliefs and ideas of think tanks’ products. This agreement stands for the success of think tanks in campaigning their policy ideas. So we can see that the efforts that think tanks have been making to have their influence and to make others’ "objective spirits" accord with them. And these efforts are "communicative action".

There are different mechanisms of social ties’ impact on communicative action and on instrumental action. (Chris 1995; Kihlsrtom 2002) Social ties make contributions to instrumental action in making it easier for actors to obtain more useful information and more help while they contribute to communicative action in the way that actors find it easier to accept each other's values through social ties. Therefore, there exists a positive correlation between whether to accept each other's values and their social background, the similarity of their experiences and the intimacy of their contacts. That is to say, strong ties are more helpful to the success of communicative action than weak ties. During think tanks' efforts to realize their influence, think tanks’ experts try to increase the reputation of their own institutes and social networks by attending all kinds of organizations so the communicative action can be realized. Moreover, the more they participate in these organizations, the closer ties they will have with the other members, and then it is easier to realize their influence.

Therefore, we have "strong ties proposition" below on think tanks' influence:

Hypothesis 2: Strong ties have a positive correlation with the success of communicative action.

Hypothesis 2 a: In think tanks' networks, strong ties set up during the participation in external organizations have more significance to the realization of think tanks’ efforts.

Among the indicators of social capital, the two indicators of think tanks' "part-time jobs in other societies or academic institutes" and "memberships in other social organizations" can be interpreted as strong ties and weak ties respectively. This is because that the part-time positions in the society clarify more explicitly between the rights and the responsibilities, while the relationships between the members of the social organizations are looser and the benchmark of the membership is quite low. In this way, we can reinterpret the proposition 8 as below:

Hypothesis 2 b: The more part-time positions the heads of think tanks hold in other societies or academic organizations, the more influence they will have; while the number of their other memberships won't help to increase their influence much.

In addition, communicative action is an interaction between actors so there is the spiral effects for think tanks experts to participate frequently in the external organizations--the more part-time positions they have, the more reputable they will are and more organizations are willing to invite them for the social activities. But reactive effects of the influence on think tanks’ networks is not the topic we are discussing in this paper.
The ladder of networks

This topic comes from the theories of policy process and social resources. The main features of China’s policymaking process can be summarized as "the democratic centered system". That is, each official in the government can express their opinions when discussing the policies while the high-level officials have the final decision rights. So the ladder of China’s policy decision making under democratic centered system means that the higher administrative positions the leaders have, the bigger controls they have over the policy making while the lower level officials can only make advices. Moreover, the theory of social resources believes that the social resources distribute in the shape of the pyramid. (Lin 1982) That is, the higher position the person has in the networks, the more social resources he would obtain. (Lin 2001)

From the above conclusion, we may deduce that the higher administrative position the government officials in think tanks networks hold, the greater contribution they will make to think tanks' influence, while officials with lower positions will make less contribution to think tanks' influence.

Is that right? We should re-observe policy process in China. We used to think that the officials of higher administrative rankings in the government has more power over the decision making so it’s more helpful for think tanks to get to know the higher level officials to make their research ideas influential than to know the lower level officials. But we statistical analysis shows the conclusion is that only the officials at the bureau director levels play the most influential roles in think tanks’ influence. This phenomenon makes it necessary for us to reconsider the administrative operation and policymaking process of Chinese government.

In Chinese government, especially in the central ministries, the officials at the bureau director levels play the role of “bridge” in connecting the upper and lower level, and internal and external relationships during China’s policy decision making process, and therefore, they have the direct controls over the policy making. The officials at the minister levels are the namely superintendents over the policy drafting but they usually don’t attend the policy making seminars but are handed in the reports by the officials at the bureau director levels or attend the work report meetings. When the meetings are over, the officials at the minister level will make a summary about the previous work performance and most of the time they will make compliments and will not make comments on the specific policy rules. But the officials at the bureau director levels directly participated in the policy making process and are in charge of many government policy seminars where many policy ideas are initiated and then approved by the department head of the ministry. Then the officials at the bureau director levels will hand in policy drafts to the minister-level officials at the ministry meeting for approval. While other officials in government in lower levels are the executors of the specific project from drafting the plans, organizing the seminars to inviting think tanks’ experts and officials from other government bodies. Think tanks’ good relationships with the officials at the bureau director levels would open a channel to communicate with the most key persons who directly make the policy rules.
Our statistics analysis strongly supports this Chinese characteristic.

So we may draw the proposition of China's networks ladder. This ladder is not based on administrative ranks but on the resources over policy making (including the decision making information, the collection of draft plans, the preliminary selection and the bridge connecting both the upper with the lower officials and internal and external.)

We may conclude the propositions that the contribution of the members in China's think tanks' networks will goes down with the decrease of the decision making resources the members control, and that in China, it's most beneficial for think tanks' heads to know the officials at the bureau director levels to increase think tanks’ influence.

Hypothesis 3a: The contribution of the members in China's think tanks' networks will goes down with the decrease of the decision making resources the members control.

Hypothesis 3b: In China, it's most beneficial for think tanks' heads to know the officials at the bureau director levels to increase think tanks’ influence.

We categorize the indicators of the networks’ size into three different government administrative rankings: the number of officials at or above the governor and minister levels, those officials at the bureau director levels, and ordinary officials from other government bodies and the heads of private and state-owned companies. The three indicators can be regarded as three levels in think tanks' networks ladder.

### Data and findings

From table 4, there is a very strong correlation between economic capital and labor capital while social capital is not interchangeable with either economic capital or labor capital. Social capital is a constant item for think tanks and has nothing to do with the institute's economic and labor input.

a: The dependent variable is think tanks’ influence factor

*: P<0.05; **: P<0.01; ***: P<0.001 (one-tailed test)

From the multiple linear regressions above we can see that economic capital and labor capital (Model I & II) both contribute to think tanks’ influence when we make a regression on them respectively. (P <0.05 and P<0.01 respectively, and the standardized coefficients are 0.142 and 0.183 respectively.) This reflects that the increase of the research cost and the labor cost can really improve the institute influence. But the single contribution of social capital is more significant to think tanks’ influence than that of economic and labor capital (Model III: P <0.001 and the standardized coefficient is 0.496). While we make regression on the three independent variables, we can see that economic and labor capital input become insignificant.

Chinese government thinks that they should make those weak think tanks “bigger and stronger” through implementation of policies since economy capital and labor capital physically reflect the sheer size of think tanks. Our model and test shows this thought is not totally right. Furthermore, it will not become very effective to merge think tanks to improve their influence either.

Since the determination factor of think tanks’ influence comes from social capital so we put the economic and the labor capital aside and try to find the relationship between social capital and think tanks’ influence. We already know that social capital of think tanks can be explained by the characteristics of its existing networks, so we
would like to discuss the mechanism of the structure of networks.

*a: The dependent variable is think tanks’ influence factor

*: P<0.05; **: P<0.01; ***: P<0.001 (one-tailed test)

The model I in the table 6 strongly supports the strong ties topic. The part-time social or academic positions of the heads of think tanks as strong ties have a strong positive correlation with think tanks' influence (p<0.001, with a standardized coefficient of 0.484). After comparing Model I with Model II, we can see that a more stable social network (model I) has more contribution than an unstable one. (F = 35.56 and 18.585 respectively.)

When we include the two kinds of social networks of think tanks' head into model III, although the standardized coefficients of each indicator goes down, but overall speaking, the model III supports the same conclusion in model I and model II. But the interpretations becomes more powerful in model III since the R square value increases from 0.205% and 21.3% respectively in model I and model II to the 31.5% in model III.

However, the emphasis we have to discuss about here is that model II and model III both showed a result which is different from our hypothesis of networks ladder.
That is, the benefits for think tanks' heads from knowing government officials don't decrease as their administrative rank drops. On the contrary, it doesn't benefit their institutes a lot if they know the officials at the governor- and ministry levels, while it's most helpful to get to know those officials at the bureau director levels. This phenomenon really drew out attention and needs our interpretation.

**Conclusions**

Think tanks’ influence is difficult to make sure. There are several reasons have been concerned by researchers. (Stone, Maxell and Keating 2001) But this paper heuristically develops an index to measure think tanks’ influence according to framework of social structure. In this framework, think tanks’ influence on policy does no longer act only on the policy decision maker. The individuals who take part in policy process and concern policy problems throughout the social structure are all those think tanks want to influence, therefore, a three-dimension-index is the more convenient method to compare different behavior effort by different think tanks.

To establish a channel or connection to policy process actors is the first step for a think tank to make research into policy. Chinese culture and bureaucracy are dominated by Confucianism, therefore, *guanxi* becomes the absolutely most important factor for decision maker in bureaucracy to accept policy advice from research institutes. Furthermore, this paper point out that not all connections is equally efficient for think tanks to get influence channel. We have the conclusion that the structure of think tanks networks has quite complicated function for think tanks to realize their influence.

**Appendix A. The survey about the heads of China’s think tanks**

**Data Collection**

With the help of the Ministry of Science and Technology of P. R. China (MOST), we handed out the questionnaires to the heads of China’s think tanks to get the data. Based on the registered information at the MOST in 2003, we mailed the questionnaires to 1,124 qualified institutes and received 301 valid responses from 25
provinces (cities or municipalities).

**Test of Sample Representativeness and Other Selection Bias**

According to the list of China’s soft science research institutes (policy and decision research institutes including think tanks and official policy research branch, in Chinese term) from the statistical result of 2001-2002 by the MOST, there are 1634 soft science research institutes in China, which means the think tanks we have surveyed cover with 18.4% official statistics.

We test the data distribution from each province for two indexes, such as the number of think tanks and the average researcher size of think tanks to analyze the sample representativeness.

Firstly, we observe whether the number of samples can represent the actual distribution from each province. According to table A-1, the callback rate of Beijing is higher than others’, probably because of sufficient institutes information and also because author lives in Beijing so that it is convenient to contact with these surveyed institutes of Beijing. There are several frontier provinces that no institutes responded, such as Gansu, Hainan, Inner-mongolia, and Ningxia. But we don’t know the reason why there are no institutes in Jilin, which is not frontier province.

Secondly, considering that different attention may be paid by heads of think tanks because of the different researcher size of institutes, we observe the institutional size characteristics from each province. From table A-1, the two average sizes of total tank tanks all over the country from official data and survey data are so close, respectively 29.74 and 29.89, which means that the average size of the responded institutes can represent that of all the institutes of China. Besides, we compare the average size from each province. The data of each province are quit equal, so we can conclude that there is no bias from the feedback province in terms of the average researcher size of the responded institutes.

</table>

After that, we randomly sampled 62 institution heads who didn’t respond to the questionnaire and inquired about the reasons. Among those respondents who didn’t filled in the questionnaires, respectively, there are 10 people whose addresses were not registered properly, 10 who changed telephone numbers and 17 who didn’t answer the phones, 8 who changed the jobs or retired, 13 didn’t receive the mails, 2 who didn’t get the mails personally, 1 whose letter was taken care of by others and 1 whose response didn’t arrive us. This sample group shows that nobody intentionally declines to answer the questionnaire and the reasons causing not to respond are mostly because of force majeure or unconscious behaviors.

In conclusion, the data from this wide-range survey are strongly representative and are believable and effective.

The definition and measurement of weak tie in job seeking

Granovetter’s (1973) hypothesis of the strength of weak tie has stimulated a great deal of research in the study of the effect of social ties in the job seeking process. Though these important empirical results let us have more understanding about the different effect of weak tie and strong tie in the labor market, few of them pay enough attention to a key question—how to measure tie strength.

In “The Strength of weak tie”, Granovetter (1973) give us the definition of “the strength of weak tie”, which is “a (probably linear) combination of the amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services which characterize the tie”.

Granovetter (1983) argue that “individuals with few weak ties will be deprived of information from distant parts of the social system and will be confined to the provincial news and views of their close friends. This deprivation will not insulate them from the latest ideas and fashions but may put them in a disadvantaged position in the labor market, where advancement can depend”.

Though the argument of “the strength of weak ties” is creative, the definition is so rough that Granovetter can not give us an accurate measurement of tie strength.

Granovetter (1973) use two principles to describe how one tie is stronger than another one. The first principle is “the overlap of social network”, which means “the stronger the tie between A and B, the larger the proportion of individuals in S to whom they will both be tied, that is, connected by a weak or strong tie. This overlap in their friendship circles is predicted to be least when they tie is absent, most when it
is strong, and intermediate when it is weak”.

The second principle is “the level of similarity”, which means the stronger the tie connecting two individuals, the more similar they are, in various ways. Thus, if strong ties connect A to B and A to C, both C and B, being similar to A, are probably similar to one another, increasing the likelihood of a friendship once they have met”

These two principal are more helpful than four elements in the definition for us to understand the character of tie strength, nevertheless these principal are also hard to operationalize.

As Granovetter (1973) mentioned, “discussion of operational measures of and weights attaching to each of the four elements is postponed to future empirical studies. It is sufficient for the present purpose if most of us can agree, on a rough intuitive basis, whether a given tie is strong, weak, or absent”.

So, in his own research, Granovetter (1974) use a very simply variable “the amount of time spent together by the two people” to measure tie strength. He asked respondents how often they saw their personal contact around the time that he pass on job information to them, and use the following categories for frequency of contact: “often”—at least twice a week; “occasionally”—more than once a year but less than twice a week; “rarely”—once a year or less.

Of 54 people who found their job through contacts, 16.7% reported that they were seeing their contact “often”, 55.6% “occasionally”, while 27.8% saw him “rarely”. Additionally, those who found their job through weak ties reported much more often that their contacts “put in a good word” from them, as well as telling them about the
Following Granovetter’s study, more and more studies use different research data in different area to verify Granovetter’s “strength of weak tie” hypothesis. Unfortunately, most of these studies develop their own measurement of tie strength based on their research need, and none of these measurements are totally accepted by other researches. In this chapter, I will review most typical measurements of tie strength, and then give my own comment on these measurements.

Friedkin (1980) used mailed questionnaire to study the network among faculty members in seven biological science departments of a single university. In this research, he asked respondents their relation between other faculty members. To describe the relation, the respondent was asked six questions:

1. I know something of person’s work;
2. I have read or heard person present his/her work;
3. I have talked with person about his/her work;
4. I know something of person’s current work;
5. I have read or heard person present his/her current work;
6. I have talked with person about his/her current work.

According Friedkin (1980)’s design, he use two method to convert the answers of these six questions to tie strength.

The first method is use scale, “the measure, is constructed by adding together the number of different relationships each member of a dyad reports having with other member.” By this method, the tie strength is treated as a interval variable.
The second method is more convenient, which measure tie strength as a dummy variable. “Strong tie are defined as those in which both faculty member’s current research activity has been discussed, and weak ties as those in which only one of the faculty member’s current research has been discussed.” Friedkin (1980) explained this measure is consistent with Granovetter (1973) that treats asymmetrical contact as a weak tie and reciprocal contact as a strong tie.

In the study of how 299 scientists in one Canada and one U.S university get the information about their current and earlier positions, Murray, Rankin and Magill (1981) used two different methods to measure the tie strength.

The question of the first method is similar to what Friedkin (1980) used. Respondents are asked 1) did that person know your work well? 2) Did that person know you well personally? Ties are coded “strong” if the job informer knows both the job candidate’s professional work and the job candidate himself well. If the job informer knows only the candidate or his work well, the tie is code “intermediate”. “Weak tie” constituted those responses in which the job informer knew neither the job candidate nor his work well. Murray, Rankin and Magill (1981) named this method “strength of tie”.

At the same time, the respondents are also asked “How often were you and the job informer in contact at that time”. This method is similar to what Granovetter (1973) used, and Murray, Rankin and Magill (1981) named it “frequency of contact”.

Comparing the result from two different method, Murray, Rankin and Magill (1981) find “strength of tie” is positively related to “frequency of contact” (gamma =0.71).
But Murray, Rankin and Magill (1981) also pointed that the frequency of contact with their job informers was greater at times other than when they were applying for jobs. So Murray, Rankin and Magill (1981) argue that strength of tie is probably a better measure of the job informer-job applicant relationship, since it is less affected by temporary variance in the frequency of interaction. But I think that this bias is only cause by the question focusing on “that time (the information was transmitted)”, so if we improve the question about “frequency of contact”, focusing on the interaction in a long term, this bias may be avoided.

Another important question I should point is the inconsistent classification between the two methods. If we use Granovetter (1973)’s classification, which treat “often”—at least twice a week as stronger tie, “occasionally”—more than once a year but less than twice a week as intermediated tie; “rarely”—once a year or less as weak tie, then some of intermediate ties (9.1%) according to Murray, Rankin and Magill (1981)’s first method will become strong tie, at the same time, some of strong tie (18.1%) and intermediate tie (5.6%) according to Murray, Rankin and Magill (1981) ’s first method will become weak tie.? As Murray, Rankin and Magill (1981) do not show us the result using “the frequency of contact” measurement, we don’t know whether the different results from these two classifications will cause huge difference in the result of tie strength effect on job seeking. However, the inconsistence of tie strength caused by the different classification should arouse our enough notice.

<table>
<thead>
<tr>
<th>Table 1 Frequency of contact by Strength of tie</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency of Contact</td>
</tr>
</tbody>
</table>

Based on Friedkin (1980)’s measurement, Murray and Poolman (1982) added “frequency of interaction” variable used by Granovetter (1973) and develop their own new method to measure tie strength.

In their study, Murray and Poolman (1982) ask person in biological and social science to report how they had first learned of the existence of each work they cited in a recent publication. If someone had told them this information, respondents were asked:

1. Is this someone with whom you have discussed your research?
2. Is this someone with whom you have discussed his/her research?
3. Is this someone with whom you converse weekly (or more often)?

If exactly one of the first two questions was answered “yes”, the relation was treated as “weak tie”. If the third of these questions was answered “yes”, the relation was treated as “strong tie”.

Ericksen and Yancey (1980) studied 1780 adults aged sixty-five and under living in the Philadephia area in 1975. If respondents received help from another person in finding their current job, they will classify as having used ties. If the person providing

Source: Murray, Rankin and Magill (1981) Table 1

Based on Friedkin (1980)’s measurement, Murray and Poolman (1982) added “frequency of interaction” variable used by Granovetter (1973) and develop their own new method to measure tie strength.
help was a relative or friend of the respondent, the tie was considered strong. If the person was classified as an acquaintance, the tie was considered weak.\(^1\)

In Nan Lin, Ensel and Vaughn (1981), they use the similar measurement, weak tie is acquaintances and indirect ties; and strong tie is relatives, friends and neighbors. Compared to Ericksen and Yancey (1980), Nan lin, Ensel and Vaughn (1981) add a new catalog “neighbors”, and call them strong ties. In the note of this paper, they mentioned that neighbors are classified as weak ties in Wellman (1979), but because less than 3% of all individuals in the sample used neighbors to attain jobs, so Nan lin, Ensel and Vaughn (1981) think this classificatory difference does not appear very significant. But in my opinion, the importance of the classification of “neighbors” is not only the statistical significant, but also the understanding of the concept of tie strength. Without detailed explain or data support, classifying “neighbors” as neither “weak tie” nor “strong tie” is rough and opinionated.

Five years later, in another paper whose first author is also Nan Lin, Nan Lin and Mary Dumin (1986) back to the measurement used by Ericksen and Yancey (1980), in which only relatives and friends are strong tie, the catalog “neighbors” used in Nan lin, Ensel and Vaughn (1981) disappears. When authors use this study to verify “the strength of weak tie” hypothesis, they get some disappointed result. Only when they treat friends as weak tie and relatives as strong tie, “the strength of weak tie” hypothesis can be confirmed. But if acquaintances are added, the result is inconsistent. The effect of friends is stronger than acquaintances, and the effect of acquaintances is

\(^1\) Because Ericksen and Yancey (1980) is an unpublished manuscript, the detail of the measurement of tie strength is cited from Granovetter (1983)
stronger than relatives. That means some strong ties are better than weak ties, and the other strong ties are worse than weak tie. Nan Lin and Mary Dumin (1986) think this inconsistent result may be caused by the underestimation of the significance of acquaintances, which is due to recall and definition problems. Despite the possible underestimations of the strength of weak ties, Nan Lin and Mary Dumin (1986) also agree that when one uses relatives, friends and acquaintances as classifications, it is wise not to automatically lump relatives and friends into a single category.

Weimann (1983) study the flow of information and influence in the network of conversational ties in a kibbutz community. When measuring ties strength, he uses three scales: the importance he/she attaches to the tie, the frequency of contact and the duration of the tie. Different from former studies only asking one respondent about his/her relation with another person, every tie in Weimann (1983) was rated by two respondents, and then summed the scores given by each member of the dyad to the same tie, thus adding the element of mutuality. In the end, the variable used to describe ties strength is a continuous variable, which is ranged from 1 (weak) to 18 (strong).

In the same paper, Weimann (1983) also mention the problem of multiplexity, finds that weak tie have an average of 1.62 forms of interaction while the average for strong tie is 3.64 forms of interaction, so he believe weak ties and strong ties have difference in multiplexity, and multiplex relations are strong relation.

In the study of weak ties and the integration of peer friendships, Hansel (1984) use a very simple method to measure tie strength. Students were asked to indicate their
liking for each student by checking one of three faces. The first face had a big smile and the label “a lot”, the second face had a moderate smile and the label “some”, and the third face had no smile and the label “not much”. Liking a lot was considering a strong friendship tie, and liking some was treated as a weak friendship tie. Liking not much was assumed to indicate the absence of a friendship tie. In the note of Hansel (1984), he mentioned that this measure may have some disadvantages. Ratings of the degree of liking may not be equivalent to nominations of friends or best friends.

In the same year, Bridges and Villemez (1986) also publish a paper about contacts used in labor market. The method they used to distinguish weak tie and strong tie was based on Nan Lin, Ensel and Vaughn (1981), which uses “acquaintance, relatives, friends and neighbors” four catalog, but Bridges and Villemez (1986) consider more special situation, and use a complex classification tree to do the measurement.

From Table 2, when contact is relative, whether they live in same household will be considered, and if they do not live in same household, the frequency they meet each other should be considered. This consideration can help to avoid the problem that some relative contacts have little intercourse with the respondent, but they are classified as strong tie. When contacts are neighbor, whether they grew up or attended school will be considered. This consideration can solve the problem Ensel and Vaughn (1981) faced and is better than Ensel and Vaughn (1981) treat neighbor as strong tie roughly and arbitrarily. However, there is also a new problem Bridges and Villemez (1986) never explain in their paper: why use daily or 3+ times/week to distinguish strong tie and weak tie in friends or acquaintance contacts. This frequency
is different from Granovetter (1974) -- at least twice a week, and also different from Murray and Poolman (1982) -- converse weekly. Why 3+ times/week can be a scale of classification? If there is not enough research to support this classification, it is also rough and arbitrary.

Source: Bridges and Villemez (1986)

Besides weak and strong tie, Bridges and Villemez (1986) also use another way to classify social contact—work related and communal ties. According their definition, work-related ties were defined as job informants who were known to the respondent because they were either past or present employers, supervisors, or co-workers. Communal ties were defined as relatives, neighbors, or friends and acquaintances made in school, childhood, voluntary associations (except unions and business associations), church, or recreation groups. If an individual qualified for both the work-related tie and communal categories, preference was given to the work-related
In their research, they find that the distinction between work-related and communal ties retains more of its power than does the contrast between weak and strong tie, so they argue strong-weak dimension of ties is not the only, or even the most important, attribute of personal relationships in the labor market.

The concept of work-related tie is interesting, but I won’t think work-related is a new dimension of social contact, instead I prefer to treat work-related tie as a new measurement of strong tie and weak tie. In the latter part of this chapter, I will pay more attention to this problem.

Wegener (1991) is a very important literature in the development of tie strength measurement. In this study, Wegener (1991) use very complex method to measure tie strength and divide tie strength into three different focuses.

Six indicators are used in this study: (1) a classification of contact persons into “types”: father, mother, sibling, spouse, other relative, friend, superior or teacher, colleague of father or mother, neighbor, colleague at an earlier work place, someone from vocational training, someone from responder’s club, close acquaintance, distant acquaintance, accidental acquaintance. (2) A ten-point social distance scale ranging from “distant” to “very close”; respondents were asked how close they felt to the contact person at the time they were looking for the job. (3) Length of time the respondent had known the contact person at the time of contact (in weeks). (4) Frequency of contact with the contact person, ranging from “daily” to “less then once a year” (six categories). (5) A list of seven items describing activities the respondent
did or could imaging doing with the contact person (adapted form Fischer 1982a). (6) Interest on the part of the contact person in the respondent getting the job; a ten-point rating scale from “not at all interested” to “very interested”.

After collecting so much information, Wegener (1991) didn’t combine them into a single variable, whatever a dummy variable (strong/weak) or an interval variable (degree of the strength). He thinks the common practice of inferring strength of ties from kinship bonds leads to imprecise result, so he use factor analysis to convert six variable into three dimensions: intimate focus of social tie, formal focus of social tie and leisure focus of social tie. He argues that “It is misleading, therefore, to classify strength of social tie according to the types of persons with whom ties are maintained. It is also difficult to determine for which dimension a particular tie should be considered weak or strong; tie are weak or strong depending on which of the three dimensions is considered.” In his data analyze part, Wegener (1991) found there is a nonlinear influence of social ties on job mobility, but this influence is restricted to the intimacy (negative effect) and formality foci (positive effect) and depends on the prestige of prior jobs. So in the conclusion part, Wegener (1991) repeats his argument about tie strength measurement, that “tie strength, the central independent variable underlying Heider’s (1958) and Granovetter (1973) “strength of weak ties” theory, was replaced by variables describing the multidimensional structure of social ties. Social relations with others are not just “weak” or “strong”, they differ on a broad range of qualities (Feld 1981). More research is needed to confirm that the foci of intimacy, formality and leisure are valid dimensions of social ties. It is unlikely that
these dimensions are an exhaustive description of social ties.”

After summarizing some typical measurement used by former studies, I will express some principals I used to judge these measurements. I believe using these principals will help us to know more about the advantage and the disadvantage of these measurements, and develop better measurements of ties strength.

1. Subjective or objective. When we measure the tie strength between two persons, we will ask he/she some questions. Some of these questions are objective, such as “Is he/she your relative?” even the respondent does not answer the question, we can also find the answer from other source, for example, asking his/her relative or friends whether these two person are relative. So we need not afraid of the answers’ accuracy. But, other questions are subjective, such as “how close between you and him/her?” Only the respondents can give us answers, but their answers are not equal to the true fact, there may be bias. As Wellman (1983) mentioned, ties often are asymmetrically reciprocal, differing in content and intensity. In Shulman (1972, 1976)’s study, “only 36 percent of those named as close friends and kin feel symmetrically close in return to the persons who had named them. Their own close ties are with others; they have weak asymmetric ties to those who name them”. This is a big problem Ericksen and Yancey (1980), Nan Lin, Ensel and Vaughn (1981) and other studies that use such as “close friends” and “acquaintance” catalog to classify weak tie and strong tie have to face, that when A tell us he/she and B are close friends, they may be only acquaintances in fact and vice versa. The actual factor that affects
the inflow of information between two people is the actual tie strength between them, not the feeling of any of them. The method asking both sides of the tie to describe the tie strength in Weimann (1983) is a good way to reduce the bias caused by the problem of asymmetrical tie, but I don't think this method can totally avoid the bias, as both sides of the tie may have different direction and degree of bias when they describe the tie strength, but the actual tie strength not necessarily equals to the average of two respondents’ description.

Another problem of the subjective measurement is the importance of involuntary ties, which is also mentioned in Wellman (1983). The involuntary ties are “with network members whom one does not like and with whom one would not voluntarily form a twosome…..they maybe be ties to persons who must be dealt with at work or in the neighborhood.” Wellman (1983) argued that despite their involuntary nature, such ties are often important in terms of the time spent on them, the resources that flow through them, the ways in which they constrain other network members’ activities, and the indirect access they give to the resources of third parties. Though involuntary ties can be very important, because of their involuntary nature, the respondent may underestimate the tie strength of involuntary ties. This problem is also hard to avoid when subjective measurements are used.

So the better way is using objective question to measure the tie strength. Though objective questions may ignore many details of the tie, especially the dimension of emotion, I think this ignoring will affect our understanding of the
influence between two sides of the tie more than the inflow of information. As
“the strength of weak tie” is a hypothesis about the inflow of information, so
this ignoring may be not a big problem.

2. Information-centered or tie-centered. Granovetter (1974) believe the advantage
of weak tie is that they can bring us more information we don’t know, and this
new information can help us in many area such as the process of job seeking or
the spread of ideas. So the core logic of “the strength of weak tie” hypothesis is
‘weak tie’ \(\rightarrow\) more information \(\rightarrow\) benefit.

Comparing different measurement of tie strength, we can find some
measurements (Friedkin 1980, 1982, Murray and Poolman 1982) are
information based. They directly ask the respondents how many they know
each other, and treat the dyad which is reciprocal or know each other and
detailedly as strong tie, while treat the dyad which is not reciprocal or know
each other superficially as weak tie. Because these measurement are
information based, which directly focus on the step two of the logic “more
information \(\rightarrow\) benefit”, those information-based weak tie should be bring the
respondent much more information.

On the contrary, most measurements are tie based. They directly ask the
respondents about the tie strength, such as whether they are close friends or
acquaintance or the frequency of they meet each other. They believe those ties
which are weak according to their measure standard should lead to receiving
more information. But none of those study use data to confirm whether these
tie-based weak tie actually bring the respondent more information. Because the lack of this confirmation, even when we find tie-based weak tie $\rightarrow$ benefit, we can not said we have confirm “the strength of weak tie” hypothesis, as the benefit may be caused by other fact except for more information.

So in the future, a good study about the tie strength and the inflow of information should pay more attention to each step of the logic “weak tie $\rightarrow$ more information $\rightarrow$ benefit”. If someone does not use information-base tie strength measurement, they should remember to prove that the weak tie they believe actually can bring more information.

3. Indicators or predictors. Marsden and Campbell (1984) pointed that there is two type of variables used in the measurement of tie strength: indicators and predictors. According their definition, indicators are actual components of tie strength, and predictors are aspects of relationships that are related to, but not components of, tie strength. For example, the duration of the relation is an indicator of tie strength, which focuses on the time spent in a tie, the first element Granovetter (1974) used to define “the strength of weak tie”; on the contrary, “whether the contact is your relative” is a predictor of tie strength, though it does not measure any of four elements used by Granovetter(1974) -- amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services which characterize the tie, studies using “whether the contact is your relative” as a variable believe that the relative contact is stronger. But without enough data support, we don’t know whether a strong tie which is
your relative must be stronger than other ties in all of four elements, or they only must be stronger than other ties in most of four elements. Besides this uncertainty, we even do not know whether all of relative ties are stronger than other ties, or relative ties only have the higher probability than other ties to be strong ties. Using indicator instead of predictor is a good way to avoid such uncertainty, but indicators also have their own problem. From different indicators, we can know more details of a social tie, but each indicator can only show us about one element of a social tie. How to covert several indicators to one variable, which can show us the whole of a tie, is an easy task. Even we agree that the tie strength is only compose of amount of time, the emotional intensity, the intimacy (mutual confiding), and the reciprocal services, but nobody know whether the tie strength is a linear combination—Granovetter (1974) only said “probably”. Even it is a linear combination, how much is the proportion of each element. So we can find most studies using indicators to measure tie strength used only one indicator to measure only one element of a social tie, and treat it as the whole, which also will cause measure bias. Marsden and Campbell (1984) found, the use of frequency as a measure of strength will tend systematically to overestimate the strength of ties between persons who are neighbors or co-workers; while the use of duration as a measure of strength will overestimate the strength of ties between relatives. Indicators and predictors have their own advantage and disadvantage, so using which one to measure tie strength should be considered carefully.
4. Ordinal or continuous. In most of studies focusing on the strength of weak tie, the tie strength is a dummy variable, which means a social tie should be a strong tie or a weak tie. When using predictors such as “relative” to measure tie strength, this is not a problem--relative tie can be treat as strong tie naturally. But when using some indicators, such as the frequency of meeting each other or the duration of the social tie, it is not proper to divide a continuous variable into a dummy variable. For example, Bridges and Vellmeze (1986) use “See daily or 3+ times/week” as an important dividing line of weak tie and strong tie. But why the dividing line is 3+ times/week, not 2+ times/week or 4+ times/week? Comparing different studies which use the frequency of meeting each other as a measurement of tie strength, we can find Granovetter (1974) used “twice a week”, and “once a year” as dividing line; Murray and Poolman (1982) used “weekly” as dividing line, all of these dividing lines are totally different, and none of these studies explain why choose these frequencies as dividing lines. So when using indicators as measurement of tie strength, keeping their continuous characteristic, like Weimann (1983), may be a better way than divided them into a dummy variable arbitrarily.

Another advantage of continuous variable is that we can test whether tie strength has nonlinear effect. According to Granovetter’s “the strength of weak tie” hypothesis, weak tie is better than strong tie for they providing more new information. But this hypothesis is plausible, whether the tie strength is the weaker the better, or only the middle strength tie is better than stronger ties. In
Nan Lin and Mary Dumin (1986), when relative ties treated as strong tie, close friends as weaker tie, and acquaintances as weakest ties, the close friends is better than stronger relative tie and weaker acquaintance. Whether this result means the effect of tie strength is nonlinear is an important problem need future studies, and treating tie strength as a continuous variable will have some advantage in regression analyze.

The Table 3 is a summary of tie strength measurement in all studies mentioned above. We can find when they measure the same thing—tie strength, the measurement is so different. Without the common agreement of how to measure tie strength, it is hard to compare results from different studies, as the bias caused by the measurement is hard to avoid.

Before expressing my measurement of tie strength, I should pay additional attention to another important principal: “role-centered tie or person-centered tie”. This principal emphasizes the importance of the context and the content of social ties, which means that same content social ties will have different benefits when used in

---

<sup>3</sup> “The importance he/she attaches to the tie” is a subjective measurement. “The frequency of contact” and “the duration of the tie” are objective measurements.

<sup>4</sup> “See daily or 3+ times/week” is an indicator measurement about the frequency. And questions such as “Grew up or attended school together”, “Live in same household” and “relative” are predictors.

<sup>5</sup> The ten-point social distance scale and “Interest on the part of the contact person in the respondent getting the job” are subjective measurements. “A list of seven items describing activities the respondent did or could imaging doing with the contact person” can be treated as either subjective measurement or objective measurement, depending on whether respondent answers “did” or “could imaging doing”.

<sup>6</sup> “a classification of contact persons” is a predicator, and other questions are indicators.
different context, and different content of social tie also will have different benefit in same context.

To study the strength of weak ties in the flow of information, Weimann (1983) divides information into three categories: “gossip”, “general news” and “consumer information”. According to Weimann (1983)’s definition, “gossip” is the information such as a rumor about the impending divorce of two member, “general news” is the information such as the arrival of a new physician at the community, and “consumer information” is the information such as a new product being offered to the members. To measure the efficiency of the flow, three variables are used: accuracy (how many accurate details the respondent knows), speed (when he/she first heard about it) and credibility (how strongly he/she believes the “news”).

In the result of the data, weak ties and strong ties behave different effect on the flow of different information. From Table 4, focusing on the speed of the flow of information, weak ties have advantage in all of six contexts. But focusing on “accuracy” or “credibility”, weak ties only have advantage in both two of six contexts. This is a good support of the hypothesis that social ties will have different benefits when used in different context.

Source: converted from Weimann (1983) Table 4

Podolny and Baron (1997) examine how the content of individual’s networks in the workplace affects introorganizational mobility. Podolny and Baron (1997) argue that some type of information exchanges through a specific network tie. “Formal position is especially likely to circumscribe and structure network ties that transmit task-related information and resources. After all, the task-related information that ego can provide and that ego needs is largely determined by formal position, and the alters best situated to provide ego with task advice also depend on ego’s formal role. In contrast, informal ties of friendship and social support are likely to be discretionairy, reflecting interpersonal attraction and trust, and therefore are less rigidly circumscribed by formal position”. Based on this belief, Podolny and Baron (1997) emphasize that “the distinction between ties that are “position-centered” or induced by organizational structure versus those that are “person-centered” or induced by interpersonal attraction and trust should not be overstated, as it is more a matter of degree than of kind” About this problem, Podolny and Baron (1997) give us some example. “Some type of strategic information conveyed in the workplace depend, almost by definition, on ego’s and alter’s formal positions, whereas other type of
When studying the social support networks in urban Shanghai, Gina Lai (2001) also get the similar finding. In his study, the social support was divided into six areas: (1) emotional problem; (2) financial problem; (3) marital problem, (4) interpersonal
problem at the workplace, (5) domestic services; (6) major life decisions. Sources of support are categorized by role relationship. A total of 17 sources are listed in the questionnaire, including spouse/partner, father, mother, son, daughter, sister, brother, father-in-law, mother-in-law, other kin, neighbor, classmate, person from the same hometown, friends, colleague, supervisor, and other source. Then these 17 sources are re-grouped into eight types: (1) spouse/partner; (2) parent/parent-in-law; (3) child; (4) sibling; (5) other kin; (6) coworker(colleague and supervisor); (7) friend; and (8) others(neighbor, classmate, person from the same hometown and other sources.

Gina Lai (2001) finds that the type of support may vary according to the nature of problems. Family ties, which include spouse/partner, immediate kin, and extended kin, are important sources of help in all areas except interpersonal problems at work. On the contrary, help from coworker is most frequently used, particularly for interpersonal problem at work. So Gina Lai (2001) argues that work-related ties tend to be specialized in help for relational problems at the workplace.

If we all agree with the hypothesis that information used in different context flows through different and special content of social ties, it seems that we should also bring “the content and context of social ties” into our measurement of tie strength, and develop a new role-centered tie strength measurement.

One individual always plays different roles in their daily life. What role he/she will play depends on with who he/she is interacting, and in what context he/she is interacting. What information will flow from the interaction also depends what roles they are playing.
For example, A is the son of B, and they work in the same company. When they are at home, A plays the “son” role, and B plays the “father” role. They are relative relation, so they may be talk about their own personal life, their personal friends and their relatives. On the contrary, when they are at office, A plays “one employee” role, and B plays “another employee” role. In that time, they are colleague relation, so they may be talk more about their company, their colleague, and the competitor of their company.

Another example, C is also the son of D, and they work in the different companies in different industries. When they are at home, they are similar to A and B, C plays the “son” role, and D plays the “father” role. They are relative relation, so they may be also talk about their own personal life, their personal friends and their relatives. On the contrary, when they are at office, C plays “the employee of one company” role, and D plays “the employee of another company” role, they are not colleague relation, they are not in the same company, they won’t receive similar work task, they don’t have same colleague, so they may seldom chat about their own work, especially in office time.

Let’s imagine what will happened if both A and C plan to change their job and hope to get more job information from their father.

If we use person-centered method to measure the tie strength, no matter relative/close friends/acquaintance three catalogs, or frequency of they meeting each other, B will be treat as A’s strong tie, and D will be treat as C’s strong tie. According to Granovetter (1974) “the strength of weak tie” hypothesis, strong ties are similar in
ego self and their network, so strong ties (both B and D) can provide few new
information than other weak tie.

But is this the reality? When we use role-centered method to measure these two ties,
we can get totally different result.

First tie, A and B is composed of two role relation, relative relation and colleague
relation. Because A and B are in the same company, they will have more probability
to know similar colleague in the company and other outside contact from the
work-related interaction, their networks are highly overlapped and provide similar
information, so B can not provide much new information that A never heard. Based on
role-centered measurement, A and B are strong tie all the same.

Second tie, C and D is mainly composed of only one role relation, relative relation.
C and D are not in the same company, even not in same industry, so they won’t have
common colleague and have less probability to know similar outside contact from the
work-related interaction. Their networks are lowly overlapped, so D can provide
much new information to C. Based on role-centered measurement, C and D are
weaker tie, different from person-centered measurement.

From this example, we can see clearly that role-centered tie strength measurement
focus on the context and content of social ties, so they can describe the real effect of
social ties in the special situation better and more truly. That's why in this paper I will
use work-related tie/communal catalog, a new and role-centered method to measure
the tie strength.

Another important thing should to explain is my classification about work-related
tie/ communal catalog. I treated work-related tie as strong tie, and communal catalog as weak tie. This classification will contradict most other measurement, in which most weak ties are work-related tie.\(^7\)

Why work-related tie should be treated as strong tie? Let's back to the two principal used by Granovetter (1973) to explain why one tie is stronger than another one. If ego and his contact are work-related tie, which means they were either past or present employers, supervisors, or co-workers, as I mentioned in the example above, they will have more probability to know similar colleague in the company and other outside contact from the work-related interaction, “the overlap of social network” is high.

In the same time, as they are work-related tie, they are work in the same industry, in the same area, and may be in the same occupation. The knowledge, skill, experience and other characteristic needed by their work may be more similar, which means “the level of similarity” is also very high.

Now that work-related tie seems stronger based on both “the overlap of social network” principal and “the level of similarity” principal, why not treat them as strong tie?

Besides expressing the reason why I treat work-related tie as strong tie theoretically, in the future chapter, I will also use empirical data to support this classification.

In the end of this chapter, I will say more about the advantage and disadvantage of work-related/communal measurement according the four principal I point in this chapter.

\(^7\) For example, Ericksen and Yancey (1980) noted that in their study, most acquaintances(treated as weak tie) were work-related tie, and about two thirds of the strong ties were relative.
Firstly, work-related/communal measurement is objective. Even the respondent does not answer the question, we can also find the answer from other source, and the result won’t be different from their own answer. This measurement does not have the asymmetrical problem like close friend/acquaintance catalog.

Secondly, work-related/communal measurement can be seen as both information-centered and tie-centered. Whether the contact is work-related is a direct measurement about the tie self, but in the same time, it also include some measurement of information. As I mention above, if two persons are work-related tie, especially they are in same company, they should know each other clearly about their work-related information, even their some work-related information are totally same (such as work industry, work company and so on).

Finally, work-related/communal measurement is a predictor and a dummy variable. This may be a big weakness, and can’t test whether tie strength has nonlinear effect. In the future study, I think there are two different directions to improve the work-related/communal measurement.

One direction is to combine work-related/communal catalog with other indicator of ties strength, such as frequency or duration. The other direction is to divide work-related catalog in different dimension. For example, we can use industry (manufacturing, retailing, banking and so on), company name, department (marketing department, human resource department, finance department and so on) and occupation these four dimension to measure the role-centered tie strength. The more homology in these four dimensions, the stronger the tie is.

Title: Planning and Design of Child-Friendly Walkable Neighborhood
Name: JungA Uhm, Ph.D. Candidate in Planning
Affiliation: University of Southern California
Address: 3333 West 2nd St. #53-211
Los Angeles, CA 90004
E-Mail: uhm@usc.edu

Abstract:
This research investigates walkable neighborhood environment and its role in strengthening the children-school-neighborhood nexus in the context of enhancing neighborhood sense of community and livability. Its significance drives from school construction standards and funding policies that encourage large new schools in sprawling locations, alternative educational facilities that focus on magnet schools, and programmatic imperatives such as busing. I argue that these changes are increasingly displacing the community of schools from the community of place, thus fragmenting the relationship between children, family, school, and neighborhood. By restoring the connection between communities of school and communities of place, my goal is to illuminate salient issues for urban design and planning in inner city revitalization.

The concept of ‘school as a center for community’ is now increasingly shared by educators, policy makers, and civic organizations, calling for a collaborative approach in building new schools. This renewed interest in the children-school-neighborhood nexus embodies a shared understanding that the quality of urban public education cannot be improved without enhancing the capability and livability of the inner city neighborhoods. However, the revitalization of inner city neighborhoods by focusing on the children-school-community nexus has received less attention within planning and design discourses. No conceptual or policy framework is available now to define the nature and scope of planning and urban design concerning the children-school-neighborhood nexus. This research proposes a child-friendly walkable neighborhood model by examining; (1) elements of walkable neighborhood, (2) factors that affect children’s travel to school, especially by walking or bicycling, and (3) relationship between walkable neighborhood and the children-school-neighborhood nexus.
MUSLIM-CHRISTIAN ATTITUDES AND IMPRESSIONS ON PEACE AND DEVELOPMENT INITIATIVES IN MALUSO

A Thesis
Presented to the Faculty of Graduate Studies
University of Perpetual Help System Laguna
Sto. Nino, Binan, Laguna

In Partial Fulfillment
Of the Requirements for the Degree of
Master of Arts in Education major in Administration and Supervision

By
Maria Sheila Balosbalos- Arado
April 2004
RECOMMENDATION FOR ORAL EXAMINATION

This thesis entitled "MUSLIM-CHRISTIAN ATTITUDES AND IMPRESSIONS ON PEACE AND DEVELOPMENT INITIATIVES IN MALUSO" prepared and submitted by MRS. MARIA SHEILA BALOS BALOS-ARADO in partial fulfillment of the requirements for the degree of MASTER OF ARTS IN EDUCATION MAJOR IN ADMINISTRATION AND SUPERVISION, has been examined and is recommended for Oral Examination.

Overview of the Study

This research was undertaken to determine the kind of attitudes the Muslims and Christians have for each other. One hundred respondents living in Maluso Basilan province were selected using the stratified random quota design.

The study had the following research problems:

1. How much exposure to each other are reported by Muslim and Christian respondents?

2. What attitudes do they have for one another?

3. Is there significant difference between the attitudes of Muslims and Christians for one another when data are grouped according to:
   a. gender
   b. age
   c. civil status
   d. occupation
   e. highest educational attainment and
   g. ethnicity

4. What are the impressions of Muslims and Christians toward the peace and development initiatives in Maluso?

Mean, T-test and ANOVA were the statistical treatment applied to know the difference in the responses of the sampled population and to identify the selected socio-economic variables, like ethnicity, age, gender, civil status, occupation and highest educational attainment that affected the attitudes of the respondents as measured through their responses in the data gathering instrument.
FINDINGS

The findings may be summarized as follows:

EXPERIENCE/EXPOSURE WITH MUSLIMS/CHRISTIANS

1. Majority of Muslim and Christian respondents admitted having high exposure for each other. Fifty two percent (52%) of Christians have average, polite and casual encounters of the other religion in contrast to Muslims thirty four percent (34%).

2. Only two percent (2%) of the Muslim respondents have indifferent, apathetic, detached encounters in contrast to the Christian’s eight percent (8%).

3. Majority of both religion have had Muslim neighbors (54%), Christian neighbors(72%); Muslim playmates (64%), Christian playmates (80%); Muslim classmates (74%), Christian classmates (92%); and Muslim friends (76%), Christian friends (84%). Three (3) out of ten (10) Christian respondents have boyfriend/girlfriend relations in contrast to six (6) out of ten (10) Muslims.

4. Almost one hundred percent (100%) of the respondents experienced visiting Muslim homes/ Christian homes (90% & 86 % respectively). Sleeping in Muslim homes were attempted by forty eight percent (48%) of Christians as compared to fifty four percent (54%) by the Muslims.

5. Majority of both religion currently have special Muslim/Christian friends ( Muslim 74% and Christian 68%). Five (5) out of ten (10) Christians admitted having conflict with Muslims. Some of such circumstances included conflicts over sports competitions, religious differences, and, at the most extreme, violent cases of kidnapping and killing of family members. Thirty four percent (34%) of Muslims figured in conflict with Christians. Religious differences were cited as the main cause.
THE MUSLIM/CHRISTIAN IMAGE

1. On the potency component of the scale, the Muslim respondents scored very high (x=5.4) where most of the Christian respondents (41.2%) said that Muslims are "aggressive", "ambitious", "powerful", and "confident".

2. Muslim respondents also rated highly on the activity component of the scale. Christians perceived them to be "strong", "quick", "dynamic" and "active". On the downside, they were also perceived to be "lazy" and moderately "stimulating".

3. Muslims scored poorest in the evaluative component of the scale. Less than ten percent (>10%) of the sample gave them highest marks for the traits of being "helpful", "good", "fair", "honorable" and "clean".

4. Shifting to positive configurations, Christian respondents said that Muslims possess cohesiveness and solidarity, strong family ties, and unity. They appear deeply religious although they do not practice and apply their religious faith to real, every day life situation.

5. The study also revealed that Muslims perceived Christians to be good, friendly, pleasant, helpful, and hospitable.

SOCIAL DISTANCE

1. An overwhelming majority of the Muslims appeared tolerant of Christians living within the town. Exactly the same percentage (98%) would allow Christians to live within the barangay, a little lesser proportion (78%) to live within the house, while only half agreed to share his/her room to Christians. These figures took a sharp turnaround with the Christians attitudes toward Muslims. While a little more than half (52%) would allow Muslims to live in the town, and half (50%) to live within the barangay, a drastic drop is noted on the subject of accommodating Muslims to their house (10%), and into their rooms (6%).
2. There is a great amount of reservation on Muslims ascendancy to power. Christians are equally split, five (5) out of ten (10), on the issue of allowing Muslim leadership at the barangay level, almost half of the respondents were inclined to allow Muslims to become mayor, and legislator, while a narrow one fifth (1/5) would allow a Muslim to assume the highest position of the land, the presidency. These figures jumped dramatically with the Muslims more tolerable attitude in granting authority and power to Christians. Interestingly, nine (9) out of ten (10) were willing to have Christians as Barangay Captain, in the same way as Mayor; eight (8) out of ten (10) would allow Christian legislator, and more than one third (1/3) agreed to have a Christian President.

3. The study also revealed that both respondents tolerate relationships characterized by lower degrees of intimacy like, for instance, having Muslim and Christian classmates and friends. Beyond that, only three (3) out of ten (10) Christians would allow their kin/close relatives to have relations with Muslim boyfriend/girlfriend, while just a little over one (1) out of ten (10) agreed to taking a Muslim spouse. The figures otherwise revealed that Muslims were more tolerant in terms of allowing their kin and close relatives to establish more intimate relationships, that of having Christian boyfriend/girlfriend (64%), and spouse (44%).

**DIFFERENCE IN ATTITUDE OF MUSLIMS AND CHRISTIANS IN TERMS OF GENDER, AGE, CIVIL STATUS, OCCUPATION, HIGHEST EDUCATIONAL ATTAINMENT AND ETHNICITY**

1. In terms of gender, there is no significant difference between the attitudes of male and female Christians toward Muslims when the subject involve closeness and intimacy (sig. 485). The difference appears significant on the issue of allowing Muslims to occupy power and authority (sig. 024).

2. A high frequency (F-7.22.) is noted on how Christian male and female look at Muslims at the potency level. Both genders differ significantly (sig.010). Potency component includes "aggressive", "powerful", "confident" and "ambitious". No significant difference exists on the evaluative and activity component.
3. There is a great difference (F-7.394) between the responses of male and female Muslims on the aspect of granting power to Christians. Muslim males dominate in terms of not allowing power and authority to be granted to Christians while no significant difference is noted between the responses of male and female Christians.

4. No significant difference exists between the attitude of both male and female Muslims towards Christians as to closeness and intimacy.

5. Looking at the Muslims’ image of Christians, no significant difference is noted between genders.

6. On the issue of closeness, a significant difference (alpha.040) between Christian age groups is evident. No significant difference is noted for Muslims between age group.

7. In terms of power (alpha.321) and intimacy (alpha.149), ages between groups showed no significant difference. A similar findings on the image scale is noted.

8. No significant difference is noted as to image and social distance between Muslims and Christians for both married and those who are not.

9. In both issues of social distance and image towards Muslims, no significant difference is noted between groups. Muslims registered a significant difference in the evaluative component. The Muslim professionals and students have quite significant margins as against the rest of the respondents when they said that Christians are unconcerned, bad, unfair, dishonorable and dirty. No significant difference is noted for Muslims toward Christians in terms of potency and activity component.

10. There is no significant difference between the attitudes of Muslims in view of their educational attainment.
11. By ethnicity, for both Muslims and Christians there is no significant difference on the issue of social distance and image. Muslims between groups registered a significant difference (alpha.053) in terms of closeness. Muslims tend to distance as compared to Christians.

**IMPRESSIONS ON PEACE AND DEVELOPMENT**

1. When asked about their notions of peace, majority of both religion agreed that peace means freedom from war, total harmony between Muslims and Christians, a feeling of joy and love, good livelihood, enough food to eat.

2. Whether peace is important to them, ninety percent 90%) of the Christians acknowledged its extreme importance and seventy six percent (76%) for the Muslims.

3. On the issue why they considered peace as extremely important, both religion shared the same view when they said peace would bring about progress and development in Maluso, to enjoy glorious life, that students can pursue and complete their studies, and to have peace of mind.

4. Majority of the Christians answered “Fiesta Celebration”, “Christmas Season”, and for Muslims, “Hariraya” and “Ramadan” are among the cultural tradition that they practice in observance of their group’s concept of peace.

5. When they were asked to describe the state of peace in Mindanao in the area of education, the Christian respondents said that teachers are committed to teach regardless of tribal affiliations and financial conditions of their students; that education should inculcate issues on peace and justice; that teachers should not carry guns; that it is easier to educate Christians than the Muslims; that Muslims are taught to hate Christians in their religion classes; that there can only be peace if there is no more kidnapping of teachers; that language barrier is a problem; and for teachers- respondents, they said they feel helpless because they run out of ways to educate the Muslims.
6. For the Muslim respondents, they described the state of peace in education as: that Christian teachers should treat Muslim students fairly; students; that Islam religion should be incorporated in the curricula; that the educational system should be Islamic; that the teacher should teach human rights. In the extreme, few respondents said that education is the source of conflict.

7. As to the state of peace in terms of Inter-ethnic relationships, both religion agreed that there is a conflict between Muslims and Christians and that there is a need for understanding and respect for each other’s belief. A few Muslim respondents said, “we have to co-exist.”

8. Both religion describe politics as dirty where massive vote buying is rampant during election; that politics is the root cause of the problem. Some Christian respondents said that Muslim leaders do not make good leaders; that politics in Maluso is not intended for Christians but purely for Muslims, and that an ex-rebel leader should not be given the chance to hold power.

9. In describing the state of peace in terms of History, Muslims said that before they live in peace but now it is gone; that they have a rich culture but very few people are aware of it; that the Spaniards conversion of the natives is hard to forget; that historical teachings must be rectified because they are anti-Muslims. The Christians, on the other hand, said that history is the basis why Muslims are seeking for autonomy; that since time immemorial Muslims are fighters; that history should instead teach us that we are brothers, therefore, we should not fight and kill each other but love, honor, and respect one another, and that tragic events in the past should be a challenge for improvement.

10. As to Religion, Christians said that there can only be peace if both Muslims and Christians follow the teachings of God or Allah because both religion worshipped only one God; that real Muslims will have unity with Christians; that religion is the root cause of Muslim–Christian conflict; that Muslim religious leaders should not teach Muslims to hate Christians. The Muslim respondents believed that Islam teaches peace and therefore religion should be Islamic; that Christians should respect their belief and should not discriminate them.
11. When asked whether peace is still attainable, eighty six percent (86%) of the Muslims said yes while only sixty six percent (66%) of the Christians agreed.

12. Among the reasons cited by Muslims why they believed that peace is still attainable are: we still have laws; presence of the military; that the conflicts are mostly family conflict; that students can still go to school and that it would entirely be dependent upon the leaders. Fourteen percent (14%) cited kidnapping, war, indifference between Muslims and Christians, graft and corruption by government leaders, the Abu Sayyaf and the rule of guns as reasons why peace remains elusive.

13. For the sixty six percent (66%) of the Christians, peace is attainable with the active involvement of the Church and the Non Government Organization, if there is a change of mind and heart, when there are no prejudices and suspicions, and when there is representation from the different sectors of the community. More than one third of the Christian respondents cited loose firearms, killings, kidnapping, extortion, tribal conflict, weak and corrupt officials, Christians bitter experience with Muslims as among the reasons why peace is not attainable.

14. When asked what possible contributions or compromise should the various communities undertake in order to resolve the conflict, correct the historical injustices and bring about solidarity among the various peoples of Mindanao, more than half of the Muslims proposed for dialogue between Muslims and Christians, other Muslim respondents mentioned equal sharing of bounty and the need to understand and respect each other’s beliefs. Christians echoed similarly a solution of dialogue and the need to respect each other’s beliefs. Of significance to the Christians is the role played by leaders of faith in influencing the minds of their followers. Others would like to include the participation of both civil and military authorities in the full development of the communities in Mindanao; national leadership should prioritize the agriculture and fishing industries in Mindanao to improve the living condition of the people; conflicts should be brought to proper authorities; literacy; training skills, and employment for the jobless. Some negative reactions include: Muslims are powerful, they always prevail; dialogue may be useless because they are traitors.
15. On the question whether they are aware of the peace and development initiatives by government and non-government organizations in Maluso, ninety percent (90%) of the Muslims agreed and for the Christians only sixty four per cent (64%). Of these figures, both respondents agreed that the initiatives come mostly from the Christian Children Fund (CCF), a Non Government Organization.

16. Both Muslims and Christians agreed that CCF provided housing, health services, education, medicines, educational supplies and children’s playground. Mentioned likewise by both Muslims and Christians is the role of the Department of Social Welfare and Development (DSWD) in providing livelihood assistance and support for the educational needs of their children.

17. When asked about the initiatives undertaken by the Government, particularly the Local Government Unit (LGU), both Muslims and Christians said that the unfinished road construction is the only project done by the LGU. They also said that the LGU is corrupt.

18. The top three (3) local prominent Christian leaders chosen by the Muslim respondents were: Liza del Puerto, Project Manager of the Christian Children Fund; John Francisco, former Municipal Councilor of Maluso; and Aurellano Laping alias Kumander Leleleng, present Vice Mayor and former Ilaga Kumander during the 70’s.

19. The top three (3) local prominent Muslim leaders chosen by the Christian respondents were Jojo Camlian, Abdua Abubakar and Hadji Yacub “Spider” Sahidulla.

CONCLUSIONS

The attitudes of Muslims and Christians reflect a lingering, systematic prejudice, and discrimination against each other. The Christians having the greater bias against the Muslims. However, both religion proposed for dialogue and recognized the need to understand and respect each other’s beliefs.

The impressions of both Muslims and Christians towards peace and development initiatives typified the lack of conscious effort on the part of the local government unit to address even the basic needs of the
population. At the core of administrative leadership, it is a disturbing commentary to find out how the most immediate and primary of all institutions in a supposedly functioning society could have crumbled and degenerated so abnormally low in the consciousness of the people. The statistics will bear the cold infamy: both respondents recognized that only a Non-Government Organization, specifically the Christian Children’s Fund helped them in terms of education, housing, health and sanitation. What makes for a resemblance of government is seen and felt from the external, outside of the political apparatus. The local government has remained a fatal failure, a dubious identity, that has long been increasingly short in its ability for governance. When the people of Maluso are most vulnerable to acquire their basic needs, the impulse is to resort to outside help in the hope of efficient delivery. Taken at a depreciated value by the people, the case of how a formal organ, equipped with so much legal investitures and compulsive authority plunged itself to such anomalous depths may helped to explain the recurrence of dearth in initiatives which severely indicts on the search for peace and development. In as much as government is relegated to the sidelines, the vacuum in authority and leadership is often provided by external forces with vested interests, each having their exclusive agenda imposed on the people.

It is noteworthy to acknowledge the important role played by the Catholic church in forging peace and better relations between Muslims and Christians in Maluso.

The church through the efforts of the Claretian Missionary Fathers remains active in the areas of education, and peace advocacy in Maluso. It also established a foundation to help the Samal, a sea faring Moro tribe in Mindanao. One of its projects already implemented was the free housing given to Samal beneficiaries. The Claret School of Maluso, until now, continues to provide education for both Muslims and Christians. The church also built and provided the town’s main water facility. All these were left unnoticed by respondents because many of the church frontline activities were initiated through the Claret Community Extension Services (CCES), now known as the Christian Children’s Fund.
RECOMMENDATIONS

To forge better understanding between Muslims and Christians and properly address their concerns, especially in the full enjoyment of their basic human rights, the following recommendations are posited:

1. Establishment of more Non Government Organization with excellent track records to assist the Local Government Unit in Maluso;

2. The DSWD as a welfare agency should strengthen its services to both Muslim and Christian communities by offering livelihood programs that answers the needs of both religion in Maluso;

3. Adequate medical and health facilities and medical personnel to fully operationalize the abandoned medical building in Port Holland, Maluso, Basilan;

4. Fair and accurate media reportage on issues involving both religion through the creation of media advocacy group for anti-discriminatory media practices with support from the academe and media;

5. Strict monitoring of government programs intended for Muslims and Christians;

6. Review of selection criteria for beneficiaries of government programs;

7. Subjects on peace, cultural diversity, and respect for human rights should be incorporated in elementary and secondary classroom discussion;

8. Researches on conflict resolution or peaceful settlement of disputes by indigenous communities, or indigenous notions of justice; strategies and tactics available to less empowered groups which are more likely to lead to a productive rather than destructive process of conflict resolution.
9. Rewriting or writing of history or textbook which reflects the true Muslim moral character and historic accomplishment to rectify the distorted image of the Muslims; and

10. Adequate provision must be made in the laws of the Republic to protect the Muslims in their cultural, economic and geographical patrimony.
