ABSTRACT

Chronos and Kairos
Intoxication and the quest for transcendence

In the midst of the ordinary time (chronos), extraordinary time (kairos) happens
Mark Freier 2006

The concept of time is fundamental to our being, time structures not only everyday reality, but in many ways who we are and how we perceive ourselves and our world. Intoxication alters this experience fundamentally, it creates a ‘time-out’ where conventional codes are somehow less relevant or do not apply at all. The ancient Greeks had two words for time, chronos and kairos, where the former refers to chronological or sequential time, the latter signifies "a time in between", an undetermined period of time in which "something" special happens. With the rise of industrialization and the invention of the clock, chronos, or quantitative time, has become the dominant mode while kairos, which is more qualitative in nature, is hardly acknowledged at all. Paradoxically, while technology enables us to move faster than ever before, reflected in an ever-increasing flow of information, goods and human bodies, time itself has become a scarce commodity.

Within this landscape, drugs and intoxication quickly become a way to escape the oppressive iron hold of chronos, beginning with teenage consciousness which is especially susceptible to the slow and relentless progression of hours and minutes in schools by day and at home by night. Here the act of ingesting even a mildly mind altering substance like tobacco repetitively has a profound effect on the manner in which time is experienced by the user. Cigarette smoking becomes a way to break this oppressive temporal wave, by filling a long and brutally dull day into “an endless succession of happy occasions” (Lenson 1995:41). Smoking, like many other consuming habits, inserts a time-out, or comma within the “run-on sentence that consciousness has become without cigarettes”, and in this manner, each cigarette becomes a kairos, an occasion, or privileged moment that interrupts the tyranny of chronos, the “glacier of chronometry” (ibid.). This in turn is closely connected to the mechanization of time and contemporary work ethics, since intoxication is essentially a fabricated “time-out” or “antichronology”, it closely resembles the childhood world of play. Lenson calls this the “toyland syndrome” where intoxication becomes a regression that is really an attempt to return to the point where development began to go wrong in the first place.

Paradoxically however, for many playful souls embarking on their journeys beyond the “glacier of chronometry” the very means enabling temporary transcendence becomes the source of a new, although slightly different, type of drudgery. Here, intoxication as time-out becomes that future reward, in a somewhat bizarre yet highly destructive downward spiral where time-out becomes transformed into time-in as the addicts every waking moment is geared towards securing the next fix. Whether that next fix is a cigarette, a drink or a shot of heroin, the dynamics are quite similar, although the consequences of choosing heroin, in addition to cigarettes for example, will be harsher seeing as a heroin habit is obviously more problematical to incorporate into conventional life. This paper seeks to explore the frequently overlooked yet powerful core dynamic between kairos and chronos as it relates to intoxication.
within a contemporary matrix of consumer metaphysics, illustrated with empirical examples from my own fieldwork among hidden drug populations in Trondheim, Norway.

Identity Politics and the Quest for Peace and Development: Past Experience and Future Prospects

An Abstract

By

Muddathir Abdel-Rahim

(ISTAC, IIUM, Malaysia)

The recently negotiated peace agreement of The Sudan has renewed hopes that – despite the prolonged and tragic conflicts which have until recently ravished the country and its people – The Sudan and the Sudanese are about to commence a new phase in their history: one in which peace will prevail and development, long considered a dream or a mirage, will emerge as a practical proposition capable of being seriously pursued for the benefit of all.

There can be no doubt – especially at this juncture – that questions of culture and identity are among the most important core issues involved that call for close examination and in-depth analysis.

Having attempted to consider various aspects of this theme on a number of occasions in the course of the past four decades (including the inaugural address which was delivered by Prime Minister Sirr al-Khatim al-Khalifa at the beginning of the Round Table Conference on the Problem of the Southern Sudan in March 1965 and, a few years later, in my paper titled “Arabism, Africanism and Self-identification in The Sudan”), I now propose to look more closely-first-at the evolution of Sudanese identity from its earliest, primordial, origins and forms through subsequent stages until the present time when the concept of the “New Sudan” has gained wide popularity. In portraying the evolutionary process under consideration however I intend not merely to describe the unfolding of the said process as a narrative but – and this is my second point – to disentangle and analyse the various socio-political factors and forces which have either helped or hindered the unfolding of the process in question at the various stages of its evolution. Having done that, I will then proceed – thirdly – to evaluate future prospects in the light of existing trends and possible alternatives taking into consideration, as far as possible, regional and international factors involved.

Title
Islamic Movements and Micropolitics of Development
(Hamas Non Governmental Organizations as a Case Study)

Topic
Medical Clinics run by Al Salah Islamic Association

Abstract

In my research, I will examine the theories of micropolitics of development to the Islamic movements. I will examine global and local, ethnicity, gender, development professionals, bureaucracy, religion and culture. I am taking Hamas Islamic Movement’s charitable organizations as a case study. Hamas tries to spread Islamic values without violence through the provision of services, through productive work with the community, and by caring for humanity, especially when there a bad need for such services in the Palestinian society. I will also test the contribution of the role of the charitable organizations in the victory in the latest Palestinian elections 2006.

Introduction:
The dramatic political change in Palestine after the victory of Hamas in the latest elections took place in the Palestinian territories, January 2006, begs a cretin question about the reasons led Hamas to this victory. One of these factors is that Hamas runs charitable organizations in the occupied territories. Through charitable organizations, Hamas tries to spread Islamic values without violence through the
provision of services, through productive work with the community, and by caring for humanity, especially when there a bad need for such services in the Palestinian society.

**Why Al Salah Islamic Association?**

Al Salah Islamic Association is a charitable organization run by Hamas which is considered as the largest political faction in the Palestinian Islamic movement, and they won 56 % of the seats in the parliament. Al Salah Islamic association is one of Hamas charitable organizations and the largest association established in 1987 with 270 employees. I have chosen the medical clinics because it is one of Al Salah programs, and it has a history as it founded since 1994.

In my research, I will examine the theories of micropolitics to the medical clinics program. I will examine global and local, ethnicity, gender, development professionals, bureaucracy, religion and culture. It seems to me that religion could be the most important element affects the program.

**Methodology:**

After searching in the Middle East resources for the last ten years, no information mentioned the medical clinics run by Al Salah Islamic Association. There fore, I made three interviews through International phones calls to Gaza Strip. I interviewed the general manager and supervisor of the medical clinics ( Ali Nassar 43 years old), who is also, a board member of Al Salah Islamic Association since 1994. I interviewed two of the beneficiaries as well, a woman and a man. the woman ( Aom Hassan 35 years old) who refused to give me her first name and family name for security reasons. The man ( Mahmoud 35 years old) refused to give his family name for security reasons.
I am going to analyze the interview to the best of my knowledge. I also made a presentation about this research project at the class on Tuesday April 18th 2006, in addition to a brochure distributed to the students in the class.

**Challenges:**

Collecting information from Al Salah Islamic Association is a challenge, because this organization is run by Hamas movement, and they suspect outsiders. Even I am Palestinian from Gaza, but being at the United States is a suspicion for Al Salah members. I know a friend of mine from Gaza who introduced me to the manager of the medical clinics program association and asked to agree for interviewing him.

The manager of the medical clinics program did not answer two questions:

1- What kind of Islamic organizations support your program financially?
2- After the victory of Hamas, do you think that stopping financial resources to the new government run by Hamas will affect your work?

Because of the sensitivity of the program that it belongs to Hamas, the two beneficiaries whom I interviewed refused to mention their full detail information

**Background:**

“Hamas: "Islamic Resistance Movement" is a Palestinian Islamic Sunni organization established in 1987 during the first Intifada, and started as an offshoot of the Muslim Brotherhood movement in Egypt…. Hamas has created a network of social welfare programs throughout the West Bank and Gaza, explaining part of its popularity, but it is best known throughout the world for its military wing”.

The Gaza Strip is unique among its population, where most of them are refugees. Over half of the refugees live in eight camps. Most of the people who fled to the Gaza Strip as a result of the 1948 Arab-Israeli war were from Jaffa, towns and villages south of Jaffa, and from the Beersheva area in the Negev. According to the latest update of the United Nations for Relief and Work Agency (UNRWA), 200,000 refugees came to Gaza, whose original inhabitants numbered only 80,000. Such an influx severely burdened this narrow strip of land; an area of only 360 square kilometers. Over three-quarters of the current estimated population of some 1.4 million are registered refugees; representing 22.42 percent of all UNRWA registered Palestine refugees. Regarding the labor force in Gaza Strip, the International labor organization mentioned that in April 2005, the unemployment in the Gaza Strip estimated by 35.4% against 29.4% in 1995. However, the British parliamentary International Development Select Committee estimated unemployment to be around 60% - 70%.

Al Salah Islamic Association is a branch of Hamas social programs in the Gaza Strip. Al Salah Islamic Association was established in 1987, and then authorized by the Palestinian National Authority in 1995. The Association runs different educational, health, social and relief programs. It has a main headquarters in Gaza and five other branches with 270 employees”. http://www.alsalah.org/

**Main programs of the Associations:**

Al Salah Association offers services through five main programs;

1- Adopt orphans; 1500 orphans adopted, who receive a comprehensive care; educational, economical and social care.

2- Two schools teaching 720 orphan students from sixth to twelfth grade.

3- Support 3200 needy families financially, they receive 250,000 US $ a month.

4- Four medical clinics in Gaza Strip.

5- Eight kindergartens.
Medical Clinics:

Al Salah Islamic Association has four main medical clinics in the Gaza Strip, and the first one was established in 1994. The medical clinics offer General Medicine, Neurology, Dentistry, Laboratory, Service Obstetrics and have a pharmacy with inexpensive medicine. The medical program offers services to Palestinians in camps who suffer from cut off the cities, closures, invasions, home demolitions and unemployment.

The medical clinics were established on different times; Al Salah Medical Clinic 1994, Haifa 2001, Java 2002 and Beisan, 2003. “All are Palestinian cities under Israeli occupation”. The first medical clinic was established in Al Maghazy refugee camp. Because the medical service offered at the camps last only (8.00 am – 2.00 pm), by UNRWA medical clinic and the medical clinic run by the Ministry of Health. This service was not enough to cover 22,000 populations. And the service offered does not cover all the needs of the patients, the service is very weak. A service of general medicine, there is no specialty. The patient had to move to other cities to receive a medical treatment, which costs him 7 US $ to let the doctor see him plus the transportation and medicine payments, which is very expensive. The idea of establishing a medical clinic was to facilitate Palestinian’s life, and make it easy. There are 97 employees working at the four medicals clinics, third of them are females.

Objectives:

1- Help patients with a high quality service with a low cost.
2- Provide job opportunities for unemployed doctors, nurses and pharmacists.
3- Save patients’ efforts, time and money by providing a medical service close to their homes.
4- Provide continuous assessment and improvement to the community.

Stakeholders:
- 1.3 Million inhabitant in the Gaza Strip.
- Islamic NGOs.
- Palestinian National Authority.
- International NGOs.

**Beneficiaries:**

1000 patients receive a medical service daily by the four medical clinics.

**Service:**

There are several departments at the clinics include: Family medicine, dentists, heart, surgery, nerve, bones, optician, nose and ear, skin, pregnancy, physical therapy, ultra sound, laboratory, pharmacy. In addition, there are society awareness programs, lately we conducted a workshop about the bird flu.

“The service offered by the medical clinics run by Al Salah Islamic Association is better than the medical clinics run by other local NGOs. The service offered by Al Salah Islamic association is different even from the medical service offered by the Palestinian Ministry of Health. “It differs in term of the quality of services, providing the difference diagnostics specialist clinics with simple fees and offering many medical devices” (Aom Hassan). The notion is that the service provided is improved compared with the first year, moreover to new medical specialists opened significantly, which encourage more people to go to Al Salah medical clinics. “Through the last 10 years, the service offered in the medical clinics increased 600% compared with the first year” (Ali Nassar).

I do agree, as Palestinian from Gaza who is familiar with the nature if the NGOs work in the Gaza Strip, I think that Al Salah Association present a good service compared with other NGOs working in the same field. Many of Palestinians prefer to go to Islamic medical clinics rather than other medical clinics, because of professionalism, good service and transparency.
Global and Local:

Changes in natural environment have contributed to the birth of new global institutional arrangements to monitor and condition the human impact. Many of the changes are particularly severe in developing countries. International development co-operation is to a great extent carried out through local projects and local dynamics of development. Medical clinics program is an example which effected by the global institution. Medical clinics receive about US$ 500,000 annually, and these money go to buy new equipments, salaries, building new rooms for patients’ serving. These amounts of money received from different sources; the biggest part is from regional and International Arab and Islamic foundations, and International NGOs like European Union and The United States Agency for International Development (USAID). USAID through which the U.S. funds development projects in scores of countries around the world enacted the "Certificate Regarding Terrorist Financing" on December 31, 2002, requiring all recipients to sign the certificate in order to receive financial aid. It states that the organization certifies that "it has not and will not provide material support or resources to any individual or entity that it knows, or has reason to know, is an individual or entity that advocates, plans, sponsors, engages in, or has engaged in terrorist activity" or anyone acting as an agent for such individuals or groups. Recipients of U.S. financial aid must sign certificates pledging not to give material support or resources to any individual or group that is involved in terrorist activity, while Palestinian Nongovernmental Organizations (NGOs) object to signing such a certificate. It was a notion that Al Salah Islamic Association has singed that certificate, which is a condition to receive a USAID funds. “Al Salah Islamic Association signed the certificate, because we believe that we are a non terrorist organization, we are a humanitarian organization, offer humanitarian services to needy people” (Ali Nassar).

It seems to me that Al Salah Association signed the certificate for different reasons. Al Salah signed the certificate in the time were The Palestinian NGO Network (PNGO), an umbrella organisation
comprising 92 Palestinian NGOs, has urged groups not to sign the agreement, because the NGOs contend that the US requirement is extremely political and anti-Palestinian in nature and is particularly problematic within the Palestinian context, where the definition of "terrorism" is contentious. Therefor, Hamas Charitable organizations want to be the initiative to the international community and to the donors that they don’t practice “terrorism”, and the proof is that that they signed the certificate. Another reason stand behind that is that after September 11th, the Palestinian Monetary Fund demanded the accounts of 39 charities and NGOs working in the occupied Gaza Strip should be frozen, including al-Salah Islamic Society. The move affected the four medical clinics as well as other projects of Al Salah Association, and they have been looking for any resource of fund, where the USAID could be a good financial resource, which will enable them to continue implementing their programs.

**Ethnicity:**

Ethnicity is a concept of self identification and consciousness; it deals with a feeling or a need to belong to a group. Ethnic groups can be defined according to skin color, religion, language, territory, myths and historical landmarks. According to the Palestinian refugee homepage, more than 80% of the populations in Gaza Strip are refugees. Yet, the medical service is offered to patients is the same. No different between a refugee and a citizen. In spite of the small number Christians represent at the Palestinians community (1.1-2.4%). “The Islamic medical clinics make no difference in offering the service. They do not discriminate based on political affiliation, background, or religion” (Aom Hassan). It is significant that the majority of Palestinian people in Gaza Strip are organized; they belong to one political party or even supporters. “Hamas members and supporters do not enjoy with a better treatment compared with non-Hamas members or supporters (Mahmoud). “If a Christian asked for a medical service, we will offer him a service with all respect and appreciation, because there is no any
consideration for an ethnicity, religious or color backgrounds. The bottom line is that s/he is a patient” (Ali Nassar). Orphans and poor people do not pay any money for the medical service.

From my opinion, ethnic equality in providing the service could be a reason for transparent issue to the Al Salah Association, but it is not a big deal stand behind the popularity and the power if the program.

**Gender:**

Gender plays a significant part of the medical clinics work, because female is a part of the medical work. Employees are both males and females. Females are doctors, nurses and pharmacists, and third of the employees are females. Female doctors work in all field of medicine within the clinics, treating both men and women, and vise versa. Apparently, “there is no gender differentiation in providing the service. Service provided to all males and females. However, females are two third males who visit the medical clinics” (Aom Hsasan). Female patients and their husbands assume that they will find female gynecologists. Many Palestinians expect all female working in Islamic clinics to be dressed modestly and veiled either. Certainly, one can find Islamic clinics fulfill his desire to send his sister, daughter or wife to work at Islamic clinics or to be healed at Islamic clinics. This happens because the society in the Gaza Strip classified as a conservative society, and they have more belonging to religion. Therefore, Islamic clinics are a good choice to the people. On the other hand, Islamic clinics have a good moral reputation compared with other NGOs clinics. In my opinion, gender issues is important because people in Gaza deal with this issue on religious backgrounds. Meanwhile, I believe that gender is not the element of the medical clinics power.

**Development professionals:**

One of the significant points that distinguished Al Salah Association to be considered a transparent organization is that no place for mediation in hiring a job for any employee within the medical clinics.
“Hiring a job at any of the medical clinics depends basically on the scientific backgrounds, qualifications, professional experience and a good reputation as well” (Ali Nassar). Al Salah people “Development professionals” have a social role as well. They conduct a sight visit to the patients at their homes, basically those who are seriously sick, in a way of condolence and solidarity. In addition, development professionals conduct field work to examine the social and economical situation of the families visit the medical clinics for the first time. They decide who is poor and who is not, and accordingly, poor people served for free.

As a Palestinian from Gaza, I don’t think that development professionals hired a job for professional basics only. I believe there is a bias. I assume that if there are two candidates one is pro-Hamas and the other is not pro-Hamas with the same qualifications and experience, the administration will choose the person who is pro-Hamas for different reasons. First of all, most of the welfare associations run by Hamas have the same ideology and contribute to convey a special message. The second point is that the employees at the medical clinics for example work under Hamas umbrella, and it will be better if they have the same ideology. Finally, Hamas as a movement is interested to find job vacancies for its members, where rarely Hamas members could find a job within the governmental sector. Loosely speaking, development professionals is not a big factor for the medical clinics power.

**Bureaucracy:**

The medical clinics follow an administrative policy. “Each medical center has a manager who runs the daily works and has all delegations and authority within the center, and the administrative board does not interfere at his work at all. The clinic manager coordinates directly with the general manager and the Ministry of Health. The general manager supervises the four medical clinics, and contacts the donors. Throughout the daily works, management bureaucracy that affects the service negatively is strongly forbidden” (Ali Nassar). The medical clinics offer a service according to an organized system. “I think
there is an organized mechanism and rules in conducting these services in which all of clients must record their names at the reception office, then they refer to the specialized clinic according to their needs. After completing the different diagnostic procedures, the clients go to pharmacy to have the determined medical drugs without delay” (Mahmoud).

Talking about bureaucracy in term of social power, medical clinics contributed in the street popularity of Hamas movement. “The medical clinics and other social projects assist Hamas in achieving the victory in the last election” (Aom Hassan).

I believe that the welfare associations play an important role in the areas of relief and charity work; preschool, primary and elementary education; library development; the education and rehabilitation of physically and mentally disabled children and adults; primary and tertiary health care (one of the best hospitals in the occupied territories is Islamic, women's income-generating activities; literacy training; the care of orphans (which includes all aspects of their life from infancy to age 16); the care of the elderly; the care and placement of "illegitimate" children, who come to them as abandoned infants; and youth and sports activities. Islamic services directly reach tens of thousands of people and impact hundreds of thousands more. It would be more helpful to highlight some general trends characterizing the medical clinics as an example of the Hamas welfare NGOs; first of all, management and staff are well educated, highly trained and professionals; many individuals hold advanced degrees from Western universities. The second point is that the services provided are generally of high quality and are perceived as such by the population. In addition, most of the service offered to poor people, and most of the medical clinics are located at camps areas. The direct target group could be widows, orphans, women and children. Who could be the only kind of NGOs work with this type of people. Finally, the medical clinics are official and legally registered with the Palestinian Ministry of interior and a committee member with the Ministry of Health for deciding the medical need assessments of the people.
in Gaza Strip. All these facts positively contributed in the bureaucracy of Hamas in the street. Which led the ex-president of Al Salah Islamic Association to be elected as the mayor of the second biggest city in Gaza Strip, “Deir Al Balah” in the municipal elections took place in May 2005 in the Palestinian territories. Moreover, led to the significant victory of Hamas in the latest parliament elections took place in January 2006 where Hamas got 56% of the seats.

**Religion and Culture:**

The majority of Palestinians in Gaza are Muslims, and they are classified as conservative people. This is why I am going to discuss the role of Islam as a religion on the medical clinics, which I believe is the most important factor. I think that this understanding is derived from the holly Quran and the sayings of profit Mohammed “Peace Be Upon Him” (PBUH). God has made the purpose of the journey of humankind through life clear in His glorious Quran in his saying: "He brought you forth from the earth and hath made you husband it." (Hud: 61). Muslims believe that the required construction of the earth could be only achieved through continuous development and persistent efforts by mankind. Islam fights negative attitudes including laziness, dependency on others, and lack of labor. In other words, the attitudes that contributes in the developmental process. Development in Islam is achieved through the development of basic human needs, the development of natural resources and the realization of public welfare. Development in Islam means bringing balance and harmony, justice and peace, beauty and prosperity. It is the development of the total human being: soul, mind and body. Prophet Muhammad (PBUH) says "God loves for one of you, if you do a job, do it perfectly". Islam also calls for hard work and perseverance. The Prophet says "The upper hand is better than the lower hand" (i.e. he who gives in charity is better than him who takes it). For patience, profit Mohammed (PBUH) visited a Jew when he was sick. Accordingly, the service offered at Al Salah Association is based on religious reasons, or at
least religion play a great role in there. “The medical service is based on human relations, where good is inside human being. Yet, Islam as a religion plays a role of internal monitor for the humans. Religion encourages the employees to participate in community development” (Ali Nassar).

I argue that religion is the most effective part that influences the medical clinics to enjoy with it power, because religion is part of the Palestinians’ culture. Hamas used the benefit of being people in Gaza as conservatives, who are easily mobilized for religious purposes. The medical clinics program is an example for that. Medical clinics use verses from the holy Quran and sayings of Prophet Muhammad at different places in the clinics. In addition, Hamas used the slogan of “Islam is the Solution” which means that all their activities are based on the religious reasons. “I think this implementing project help in making the slogan near to truth, because it translate practical experience about most of the success projects is projected from the Islam is the solution” (Mahmoud). I think that the difference between Islamic clinics and other clinics may lie in the spirit of teamwork where service is provided. Patients expect to find a higher degree of personal care, attention, charity and honesty in the Islamic clinics which depend on religious reasons. “Yes, Islam is the solution. There is a strong relationship between our work and the Islamic message. Religion means good deeds. Islam encourages us for community development and prosperity. This is what we are doing” (Ali Nassar).

**Conclusion:**

The success of the medical clinics lies in the failure of other medical clinics working in the same field. Medical clinics “as well as other Hamas charitable programs” contributed in the street popularity of Hamas. I think this happened because Hamas charitable programs use religion as a main source of power to help, serve or mobilize people. In addition, financial transparency is an important factor; Hamas charitable organization has a good reputation in the administrative and financial issues. This happens in a time where the Palestinian National Authority institutions suffer from corruption. Hamas
used the weak of the Palestinian Authority for more mobilizing of people. Moreover, most of people in Gaza classified as poor people, and most of them depend on charitable organizations. So, Hamas used the need of people to their service for more mobilization. All of these elements contributed in the success of the medical clinics program. Meanwhile, I believe that religion plays the big role.

In addition, this research project give me trained me to work as development professional. My ideology is different from Hamas ideology, in spite of that I worked my research project on one of the Hamas charitable organization trying to void bias.
Abstract Submission for:

6th Annual Hawaii International Conference on Social Sciences
May 30, 2007 through June 2, 2007
Waikiki Beach Marriott
Honolulu, Hawaii

Author:

Henry Acosta, MA, MSW, LSW
Executive Director, National Resource Center for Hispanic Mental Health, and
Deputy Director, New Jersey Mental Health Institute, Inc.

Title of the submission: Improving Mental Health Service Delivery to Hispanics-Latinos

Name of the Author: Henry Acosta, MA, MSW, LSW

Affiliation of the Author: National Resource Center for Hispanic Mental Health

Address of the Author: 3575 Quakerbridge Road, Suite 102
Mercerville, New Jersey 08619

E-mail of the author: hacosta@njmhi.org or hacosta@nrchmh.org

Abstract:

This workshop will focus on the contents and the activities leading to development of a nationally disseminated report titled Model Mental Health Program for Hispanics that was developed by the author and is based on original research activities conducted through the New Jersey Mental Health Institute’s award-winning and nationally and internationally recognized Changing Minds, Advancing Mental Health for Hispanics program. The report is specifically aimed at assisting mental health agency and social service administrators and direct service providers with learning how to best attract, retain and serve Hispanics in mental health programs and/or other social service settings. The session will provided an overview of activities leading to the development of the report and its recommendations, which to date have been implemented in at least 10 known states throughout the nation in various communities. Specifically the session will review the following:

- Brief overview of several nationally released reports highlighting disparities in access to and the provision of culturally competent mental health services to Hispanics.
- Brief overview of the initial goals and objectives of the Institute’s Changing Minds, Advancing Mental Health for Hispanics and subsequent activities, including the recently created National Resource Center for Hispanic Mental Health.
- Overview of the NJMHI’s Comprehensive Literature Review and Analysis of Hispanic Mental Health issues. This report, which is now published in the Journal of Immigrant and Refugee Services and in a textbook on Hispanic Mental Health Care, contains an overview of findings from studies on barriers that Hispanics face with accessing and receiving quality and culturally and linguistically competent mental health care, patterns of mental health services, clinical best...
practices with the population, and an overview of major studies on mental health conducted in the United States with Hispanics.

- Overview of the Institute’s *Model Mental Health Program for Hispanics* report. The report includes recommended areas for mental health agencies and clinicians to address in order to better attract, retain and serve Hispanics in mental health services and reflects practices that meet the needs and cultural preferences of Hispanics. The recommendations can, and have easily been adapted to fit other social service settings. The report was developed based on research and other information gathering activities conducted by the NJMHI under the direction, leadership and supervision of this author.

The learning objectives for the presentation are:

1. To educate participants about a project with a national focus aimed at increasing access to and the provision of quality mental health services for Hispanics; a population that has been found to be medically underserved and that is often over represented in many of our nation’s most vulnerable groups.

2. To stress the importance of developing culturally competent and sensitive practices for Hispanics to address the array of barriers facing Hispanics in accessing and receiving quality mental health services, and to share means on how to accomplish these tasks through outreach, education, advocacy, and community partnerships.

3. To assist participants in thinking about creative ways to engage and retain Hispanics in mental health programs and to share project findings and the project’s model for mental health professionals and clinicians to utilize in order to attract, retain and serve Hispanics in mental health services that reflects Hispanics’ needs and cultural preferences.
Title: Institutional Capacity Building: Public-Private Partnerships for Land Use Change

Authors: Soji Adelaja (Director), Melissa Gibson (Research Coordinator), and Mary Beth Lake (Associate Director of Operations)

Affiliation: Land Policy Institute, Michigan State University

Mailing Address: 1405 South Harrison Road, Suite 305, East Lansing, MI 48823

Paper Session Abstract

The mission of the Land Policy Institute (LPI) at Michigan State University (MSU) is to bring science-based solutions to policy makers and citizens in order to address land use concerns, such as urban revitalization, open space preservation, and regional planning. The Institute’s main strategies are to: 1) invest in and engage faculty at Michigan universities to implement multi-disciplinary work on land use issues, 2) conduct rigorous internal research to address real-time problems, 3) build relationships with private and non-profit land use stakeholders to ensure that research is germane, and 4) provide accurate information to decision makers at the local, regional, and state levels.

The Institute has developed a dynamic approach to implement the above-stated strategies. LPI has held three rounds of an internal grant program that provides seed funding to faculty and Extension teams at MSU and partner institutions; this research is intended to be multi-disciplinary and timely, with potential to attract larger funding from foundations and federal agencies in the future. An additional grant program, funded through the W.K. Kellogg Foundation, provided financial support to faculty, community, and faculty/community teams. Internally, the John A. Hannah Professor in Land Policy has built multi-disciplinary teams to address pressing policy issues (e.g. farmland preservation, residential density, and land use linkages to prosperity). These research projects have been guided by advisory committees, consisting of representatives from several stakeholder organizations (e.g. the Michigan Farm Bureau, the Michigan Economic and Environmental Roundtable, and the Michigan Environmental Council). Research results have been translated into easily-understandable and concise documents that can be shared with citizens and policy makers. Through training programs (provided by partner programs, including Citizen Planner and the Planning and Zoning Center) and legislative forums, appropriate information is provided to enhance land use decision making at all levels. Finally, an Annual Land Use Summit is held to facilitate dialogues, share information, and build effective relationships.

The expected outcome of these activities is increased awareness among policy makers, citizens, and academics about the impact of land use and the need for better-informed decisions. By enhancing the ability of faculty and Extension to attract funding and to work together to find comprehensive solutions to land use challenges, the Institute seeks to achieve sustainable funding. Building multidisciplinary research capacity in higher education is often a daunting
task, especially when it is intended to cut across the missions of teaching, research, and outreach. Such capacity, however, is particularly important in areas such as land use where many states and regions are struggling to find solutions and university research can be valuable in defining new tools and policies. An integrated research, outreach, and educational program must meet the interests of faculty while meeting the needs of stakeholders. The objective of this paper is to present one model of institutional capacity building.
Title: Assessing the Economic Impact of Land Conservation

Authors: Soji Adelaja (Director), Mary Beth Lake (Associate Director of Operations), and Yohannes Hailu (Assistant Professor)

Paper Session Abstract

Environmental organizations often lack the research infrastructure to evaluate the effects of their conservation activities or to communicate the impacts of their programs. One area where there is an information gap is the valuation of environmental and natural resource amenities (such as open space, lakes, waterways, and parks). Multiple research strategies, involving teams of faculty and stakeholders, are required in order to provide this essential information. This paper presents the findings of one such undertaking.

The Land Policy Institute (LPI) at Michigan State University (MSU), in partnership with the Heart of the Lakes Center for Land Conservation Policy (HOL), has embarked on a research effort to assess the economic value of Michigan natural resources and their public amenities. The objectives of this study include: 1) determining the local economic impact of Michigan State Parks, 2) evaluating the economic value of natural resources to landowners, and 3) developing a comparison of Michigan natural resource protection programs to those of other states.

In assessing the importance of Michigan State Parks, the study team utilizes existing data on industries and park user fees to estimate the local economic impact with the IMPLAN program. Evaluating the economic value of natural resources to landowners is achieved through a hedonic analysis of the impact of proximity to natural features on property values. The analysis of state natural resource programs across the nation involves a hedonic analysis regressing funding against natural resource characteristics (e.g. acres of forestland) and socioeconomic characteristics (e.g. GDP, unemployment rate). Michigan is then compared to other states along that continuum.

This study is expected to result in a better understanding of the importance of natural resources, particularly public land, to individuals, as well as local, regional, and state policy makers. The expected outcomes of this study include changes in land conservation and public service provision (e.g. access to state parks) that will enhance local economies and quality of life for natural resource beneficiaries: Michigan citizens and visitors.
6. ABSTRACT:

Evolving UN conceptualizations of the relationship between hunger and poverty have significantly impacted strategies for achieving the first Millennium Development Goal's (MDG) objective of halving global hunger by 2015. When the MDGs were drafted in 2000, hunger was merely considered a component of poverty. Such an approach, reflected in the Secretary-General's 2001 MDG Report, assumed that hunger would decline as a country experienced economic growth, and thus encouraged states to use GDP as a leading indicator of hunger reduction. However, because measures of aggregate economic growth often neglect a country's poorest, this frequently led to inadequately targeted strategies. Recently, key actors such as the Food and Agriculture Organization (FAO) have addressed hunger as an independent issue, noting that while it clearly relates to poverty, it correlates with other issues as well. This conceptualization aligns with the twin track approach: a strategy that focuses on agricultural development to reduce hunger and poverty in rural areas simultaneously. Additionally, it highlights the relationship between hunger and such global issues as HIV/AIDS and education. With global hunger currently increasing at a rate of four million annually, analyzing the efficacy of FAO-type approaches is critical in helping least developed countries meet MDG #1 by 2015.
PERSISTENCE OF TRADITIONAL LIFESTYLES AMONG BEDOUIN FAMILIES IN THE ALRASS REGION OF SAUDI ARABIA

Topic area of the submission (sociology)

Presentation format (Poster)

Names of the author:

Dr. Mohammad A. Alshaya
Assistant Professor of family

ABSTRACT

The purpose of this study is to understand the reasons for Bedouin families retaining their traditional lifestyle despite the Saudi government’s incentives for them to participate in its modernization project. The questionnaire was distributed to 100 male heads of household. Seventy-five of the potential respondents agreed to be interviewed. Their attitudes were elicited on the following possible reasons for their resistance: (1) tribalism, (2) cultural dignity, (3) economic considerations and (4) the perceived utility of modern technology and mass media. Tribalism and economic considerations were found to be the most important reasons for their resistance. Their responses were analyzed in relation to the following demographic variables: age, educational level, occupation, monthly income and length of residence. Younger, educated, and employed respondents were found to have more positive attitudes toward modernization in certain sections of the questionnaire. Finally, based on the results, the researcher gives some policy implications and recommendations for future research.
Abstract

Students (n = 18) in fall quarter (2006) Family Life Education class were assigned an academic service learning project as part of the requirements for the course. One student worked alone, eight worked in dyads (four dyads), and nine worked in groups of three (three groups). The purpose of the assignment was to apply Family Life Education Methodologies to a real population in order to solve a need in the community and to allow students to present to a community audience. Students worked directly with their population creating a Needs Assessment. They then produced a poster board, kept a weekly journal, and wrote a lesson plan, outline of a three-day program, and a reflection paper. Eight different projects were completed: 1) Preschool Children Learning Proper Nutrition, 2) Preschool Children Becoming Aware of Stranger Danger, 3) ROTC Cadets and Active Military Member and Maintenance of Long-Distance Relationships, 4) Disability Awareness Among Middle-School Children, 5) Babysitter Trainer Program, 6) Child Safety in and out of the Home: A Program for Parents, 7) Preventing Stranger and Non-Stranger Rape, and 8) Media Influences on Adolescents. Overall reflections from the students indicated that Family Life Education Methodology skills were increased and personal growth and awareness were enhanced through participation in an academic service learning project. Community participants demonstrated happiness and personal growth also.
Background Information

“Academic service learning is a teaching and learning methodology that bridges in-class learning to the community classroom through meaningful service opportunities” (Christiansen, Amby, & Bowers, 2001, p.1). It is a bidirectional process in which students first apply course knowledge and skills to meet community needs. Then through a reflective process (journaling or small group discussion), students connect their service experience back to course concepts, skills, and other ideas (Hatcher & Bringle, 1997). The goal of academic service learning is to increase the learning of course content and skills, enhance personal growth, and enlarge personal civic responsibility (Stacey, Rice, & Langer, 1997). A key component is that learning should extend beyond the classroom and foster the development of others (Corporation for National and Community Service, 1990). The connection of classroom content with service leads to a learning outcome that is far greater than can be produced in the isolation of in-class learning or of service not connected to content (Fenstermacker, 1990).

Purpose

As a means of increasing student knowledge and awareness of issues in Family Life Education, this professor decided to incorporate academic service learning into a four-credit upper level class on Family Life Education. The framework for the project was based on the human ecology and ecosystems approach and the content area of Family Life Education Methodology as identified by the National Council on Family Relations.

The human ecology and ecosystems approach combines the human ecological and systems perspectives into an analytical framework to view diverse living styles and complex environments. Human ecology stresses the interdependence of organisms and their environments, which simply stated means humans interacting with their environment. The
systems perspective places emphasis on the relationships among interacting units. Elements of this ecosystem are members, environments, and organization (Goldsmith, 2000; Rice & Tucker, 1986). The members for this project consist of the professor, college students, community workers, children, adolescents, and young adults. The environments are the classroom and community organizations. The organizational unit is academic service learning.

In 1984 the National Council on Family Relations established standards and criteria for the certification of family life educators, college university curriculum guidelines, and content guidelines for family life education. Ten substance or content areas were included in these standards and criteria (Powell & Cassidy, 2007). This paper addresses the area of family life education methodology and how college students can apply these methodologies to community settings.

Methods

Students (n = 18) in fall quarter (2006) Family Life Education class were assigned an academic service learning project as part of the requirements for the course. Students had the choice of working alone or in a dyad or in groups of three. Students were asked to choose a topic of interest in the field of family life education and to find a community group or individual to participate in their research and lesson plan. During the quarter, students were given class release time to spend a minimum of ten hours working with a community organization to create a three-day program and implement a fifty-minute lesson plan. A list of community organizations was provided and students self-selected a group or person to work with during the quarter. Family Life Education theories and methodologies were presented in class. The purpose of the assignment was to apply these theories and methodologies to a real population in order to solve a need in the community. Students were required to spend a minimum of ten hours working
directly with a community organization, to complete a Needs Assessment, to produce a poster board on their lesson plan, and to write a project paper which included a reflection paper, weekly journals, outline of a three-day program, and a complete lesson plan for a fifty-minute presentation.

Results

One student chose to work alone, eight students chose to work in dyads and nine students chose to work in groups of three to complete their academic service learning projects. A total of eight separate projects were generated and completed: 1) Preschool Children Learning Proper Nutrition, 2) Preschool Children Becoming Aware of Stranger Danger, 3) ROTC Cadets and Active Military Member and Maintenance of Long-Distance Relationships, 4) Disability Awareness Among Middle-School Children, 5) Babysitter Trainer Program, 6) Child Safety in and out of the Home: A Program for Parents, 7) Preventing Stranger and Non-Stranger Rape, and 8) Media Influences on Adolescents.

Answers to Reflective Questions

Answers to the reflective questions were similar for all students. Of the eight different groups of students, four reported problems they felt were difficult to overcome. The difficulties involved finding a suitable place in which to do the academic service learning. Other difficulties centered on individual differences within the dynamics of the group. Such issues as group members not showing up for meetings or showing up late were common. The instructor worked with the students and found them appropriate organizations to work with and helped students solve their group issues. In the end, their projects ended up being one of the best received and had the most positive interactions from their audience. All of the students felt varying degrees of
apprehension, anxiety, and fear going into the project. At the end, they all reported feeling transformed by the experience.

*Feelings Going Into the Project?*

Most of the students were initially excited and enthusiastic about the whole idea and messages of their projects, they liked the members of their groups, and they were eager to get started. However, many also were anxious and apprehensive about working with unknown community organizations. Many stated they felt the projects were too time-consuming. However, when they were reminded that class time would be devoted to much of the work, they thought their projects were manageable. Some students reported being nervous going into the project because they did not know what to expect and had never done a project with the community. Other students felt overwhelmed by the idea, felt the task was too big, and were scared about presenting in front of a group of people.

Some students reported more positive feelings going into the project. For example, one student was excited about creating her own presentation and thought that this type of presentation would look good on a graduate school application. Another student thought the project would be fun and was looking forward to presenting her lesson plan to children.

*Benefits of the Field Experience to the Community Audiences*

Overall, the students felt that their projects were worthwhile and benefited their community audiences. Two groups were proud that they were able to help young children learn about stranger danger and the benefits of eating nutritious foods.

One group selected a seventh-grade honors class to present information about disabilities. Two of the presenters had disabilities and it was very helpful for the young students to interact with graduating college students who were physically challenged; one with Cerebral Palsy and
one with Attention Deficit Disorder. It helped the youth to see that people can succeed in the midst of challenges. The youth were particularly interested in how a person with Cerebral Palsy went about everyday activities.

Three groups selected adolescents as their audience. One group worked with high school students and helped them realize that not everything the media portrays is true and actual, such as appearances, body image, sex, and violence. They felt that their program helped the teens to think for themselves when presented with something from the media.

Another group worked with teens to increase their awareness of the dangers of sexual assault and rape. The adolescents left the presentation better prepared to stay safe when they go to parties and when they begin relationships.

Another group addressed young teens on how to be a better babysitter. The teens became aware of many safety features and how to put together a babysitting box filled with ideas and toys to stimulate children of varying ages.

Two groups worked with young adults. One addressed the issue of communication in long-distance relationships to young adults in the military. The young adults were amazed at the many different ways that one can stay close by using computer technology.

The other group gave new parents great tips on how to make their house or apartment child-safe. The parents benefited by receiving great information and a bag full of useful things that they can use to make their living space child-friendly, such as plastic inserts for electrical outlets.

*Personal Growth and Learning*

All 18 students who participated in the projects felt that they gained new knowledge and experienced personal growth. Most mentioned that they learned a lot about themselves and their
group members. They learned how to work under pressure, how to organize and distribute work, and how to resolve personal issues within the groups. Some learned that they are natural leaders and others learned that leadership is not for them.

Many students expressed that they learned patience and how to compromise. They learned the importance of deadlines and how to communicate wants and needs to group members.

Many had never done a Needs Assessment and learned not only how to conduct one, but also the value of doing one. They learned that by knowing the needs of the audience, they can find interesting ways to motivate the audience to participate. Many had never created flyers or brochures before and were proud of their products and found how useful they were in getting people to attend their programs.

The student who worked alone on her project realized that it would have been helpful to have at least another person to work with to share ideas and work load. The new skill she learned was time management.

Many students mentioned that they initially were frightened by having to give a fifty-minute presentation. However, by the end of their project, many gained confidence in their abilities and were excited and eager to try them out with other community groups.

Many students expressed that they had never given a presentation to a group other than college students in class and they felt they learned a lot about how to teach to different age levels and different learning styles. They learned which teaching strategies worked best for their audiences.

Group members working with the student with Cerebral Palsy reported that they gained valuable insights and information from working with her. They learned how she has
mainstreamed and persevered while having Cerebral Palsy. Her determination and willingness to be so exposed about her disability touched her group members. They increased their awareness and tolerance levels.

Overall personal growth was described in detail by one student. Her comments will remain anonymous to respect her confidentiality; however, they are stated so well and summarize the thoughts of others that her comments are included in her words.

Although most of the work was done on our own outside of class, I felt like that is what I needed the most in a class. This is a class that provided the guidance if and when it was needed and let the students independently do things on their own. It followed the true definition of one earning one’s own grade. I really enjoyed every moment of it. In the ‘real world’ at work you aren’t guided every step of the way by your boss. Your boss is there for support and guidance when needed, but not all of the time so this class provided me with that personal growth of furthering my independence not only for myself, but in the work force. New skills that I learned were people skills, better presentation skills, teaching skills, and having more confidence in myself. I learned that teaching involves knowing how a student or a group of people enjoy learning so that they will engage in your teaching (Anonymous, Personal Communication, December 5, 2006).

Overall, the projects were a great success for the students and community members. The projects offered personal growth for the students and served as a bridge from the university to the community.

Does Accountability Reduce Corruption in a Corrupt Political Environment?

(Abstract)

Managing ethics is a crucial aspect of public management. Coordinating accountability and anticorruption measures plays a key role in developing coherent policy in this field. Preventing corruption is as complex as the phenomenon of corruption itself and a combination of accountability mechanisms and effective law enforcement mechanisms are needed for success. Public organizations need to be effective and accountable to the public. This means that there must be proper mechanisms of control as a way of assuring accountability and preventing corruption. Recently the World Bank published a report indicating that control of corruption is a key element for good government performance. The report explores the impact of corruption on government and concludes that serious problems with corruption lead to a poor situation in global public affairs. Thus, governments should seriously combat corruption. But how we can control corruption in the public sector? Scholars have studied the problem of corruption from different perspectives especially economics. This paper analyses corruption from the perspective of public administration. Based on the theories on corruption and government and the results of the OLS regression analysis using cross-national data, this article concludes that controlling corruption in public administration is highly dependent on accountability and the quality of bureaucracy. Thus, in countries with highly accountable public organizations we can expect low levels of corruption. In this vein, for effective prevention of corruption, greater attention must be devoted to developing: clear policies and procedures, quality and ethical standards, systems of transparency, and effective, law enforcement mechanisms. The implementation of these systems
will require a lot of effort and it definitely is a tough challenge. However, by improving accountability systems we can expect higher levels of integrity in the public sector.
Does Accountability Reduce Corruption in a Corrupt Political Environment?

I. Theory Analysis

1- The research question

The phenomenon of corruption has been studied from different perspectives. This paper focuses on understanding corruption from the perspective of public administration. The foundations of public administration basically rely on accountability issues. Thus, in a country with highly accountable public organizations we can expect a low level of corruption in that country. But how we can ensure accountability and control corruption in the public sector? The answer is not easy and it definitely turns in a challenge for public administrators. This research question is important in the real world since almost all countries in the world are being affected by corruption occurring in the public sector (King, Keohane, and Verba 1994).

2- Theories on Corruption and Public Administration

2.1 Corruption

The concept of corruption varies depending on the perspective from which it is studied. It is impossible to cover every aspect of every form of corruption in each country (Caiden 2001). For that reason, and in an effort to simplify the case, the World Bank defines corruption as the exercise of public power for private gain (World Bank 2000). Certainly this definition involves all activities in which public officials use their power not for the public benefit but for their own gain. The bribed official typically agrees to undertake or to forego a designated action in return for a bribe.
2.2 Causes of Corruption

As the concepts of corruption vary depending on the perspective from which one looks at them, the causes of corruption also vary widely. According to Klitgaard (1998), corruption is the result of monopoly plus discretion minus accountability.

Monopoly

In brief, monopoly refers to the concentration of power in the government. It presents a situation where the government has control of all public service. The basic element here that leads to corruption is the lack of competence (Klitgaard 1998). The obvious way to tackle the problem of monopoly is competition in the market of public service delivery.

Discretion

According to Merton (1956), the chief merit of bureaucracy is its technical efficiency, with a premium placed on precision, speed, expert control, continuity, discretion, and optimal returns on input. For Merton it is good to bring discretion to bureaucrats since they usually have the expertise to do their jobs well. Moreover, Cook (2000) points out that bureaucrats deserve discretion since they conduct themselves with integrity. Nevertheless, this discretion might be used for public benefit rather for private benefit; this of course, leads to administrative corruption.

A decision on whether or not to reduce bureaucrats’ discretion depends on the kind of public service delivered. There is a higher probability of reducing discretion in the work of street level bureaucrats than in bureaucrats in charge of formulating public policy.

Accountability

In its simple form, accountability may be defined as any situation in which individuals who exercise power are expected to be constrained (and in fact are reasonably constrained) by
external means, i.e., reversal of decisions, dismissal, and judicial review and to a degree by internal norms, i.e., codes of ethics and professional training (Mckinney, and Howard 1998). Administrators must know, through established criteria, to whom and for what they are accountable.

In the Government environment we have that the three political powers: judicial, legislative and executive are accountable to each other depending on the issue (Campos Ed. & Lateef, Sarwar 2006). Thus, for instance, the executive needs the authorization of the legislative to initiate governmental plans such as public sector reform. In this sense, in order to succeed in an anti-corruption plan in the public sector we need to get a commitment of the three political powers to be accountable to the national plan. This kind of accountability is known as political accountability.

According to Romzek and Dubnick (1987) there are four types of accountability: bureaucratic accountability, where effective control emanates from within the executive branch; legal accountability, where control from the outside is effective; professional accountability, where internal structures and processes produce low levels of control; and political accountability, where control is external and limited. From these forms of accountability it seems that our study refers to bureaucratic accountability issues.

Bureaucratic accountability involves answering to a higher authority in the bureaucratic or interorganizational chain of command (Kearns 1996.) In this regard, the role of public administrator is crucial. If they are accountable their subordinates will also be accountable. Certainly to assure accountable behavior, public administrators need to implement control mechanisms which constrain bureaucrats’ behavior i.e. to prevent corruption.
In order to implement bureaucracy control mechanisms Gruber (1987) points out that two basic aspects of bureaucratic behavior subject to constraint should be taken into account: the procedures used to make decisions and the substance of the decisions actually made. For instance, procedurally, an administrator may be required to hold hearings, to consult certain groups before taking action. Substantively, the administrator may be limited, for example, to making decisions that serve to increase production in the country. Sometimes “procedure” and “substance” may be the same. For instance, the holding of public hearings may at one and the same time be the process by which decisions are made and the substantive result of an earlier decision about how to proceed. Thus, there is not an absolute distinction between “procedure” and “substance.” Nonetheless, Gruber (1987) points out that either or both may be constrained through specific control mechanisms. This is absolutely valid since the more constrained behavior is, the smaller will be the range of permissible alternatives to corruption open to the bureaucrat.

### 2.3 Forms of committing corruption

The most typical form of corruption in public administration is bribery (Transparency International 2000). Bribes may act as incentive bonuses to public employees not satisfied with their salaries (Ware & Noone 2005). For instance, it is more attractive to clients to pay a bribe instead of larger amounts of taxes and customs duties imposed on them by the government.

In some societies a bribe is just a gift, while in others it is the price of a favor (Rose Ackerman 1999). In some countries the word “bribe” is used as a means of “transaction” or “social exchange”. There, most actions that are considered corrupt by rule enforcers within, or critics outside a political system are basically varieties of exchange transactions. Depending on
the technique employed, the transactions create varying degrees of specificity of obligation on the part of the officeholder (Heidenheimer 1989).

However, it does not seem adequate to apply the name “social exchange” to corrupt activities inside bureaucracy. It would be dangerous to tolerate some corrupt activities in a public organization such as tax collection or the provision of public utilities since it might encourage its spread to other areas in the public sector. Corrupt activities should be punished despite the amount of the bribe received by the public servant.

2.4 Corruption in Public Organizations

Applying the general literature on corruption detailed above, discretion and lack of accountability are the key elements that lead to administrative corruption (corruption in public organizations). In this sense, the impact of accountability in reducing or preventing corruption is analyzed in the following paragraphs.

The Core Principal-Agent Theory

One of the approaches to evaluating accountability in public administration is the principal-agent theory. According to this theory, a principal is an actor who enters into a contractual relationship with another actor, an agent. The agent is entrusted to take actions that lead to outcomes specified by the principal. According to Gormley and Balla (2004) when delegating, the principal may face problems with adverse selection and moral hazard as they can not completely be sure about the ability and integrity of the agent. Moe (1984) considers that there is no guarantee that the agent will do what is in the best interest of his/her principal.
The principal delegates the implementation of a task to an agent but will need to monitor the agent efficiently to confirm exactly what has been accomplished (World Bank 2006). This problem could be tackled by appointing official executives whom the principal can trust. This measure should be taken along with some control mechanisms to assure accountability in public administrator’s activities. As mentioned above, control mechanisms are important in order to control bureaucratic behavior inside public organizations (Gruber 1987).

The ideas and insights described above show that accountability is definitely the key point to reduce corruption in public administration. Another element, which was not mentioned by the global literature on corruption, is the quality of bureaucracy. This concept includes level of professionalization and efficiency of bureaucracy in the deliverance of public service. This variable needs to be included in the model since it may positively affect control of corruption. Thus, high levels of accountability and quality of bureaucracy may significantly reduce corruption in public organizations.

In other words in order to get high levels of control of corruption we need to work more effectively in accountability and quality of bureaucracy. We may then present our formula for controlling corruption in public administration:

\[
\text{Control of Corruption} = \text{Accountability} + \text{Quality of bureaucracy}
\]
II. Data Analysis

Dependent and Independent Variable

<table>
<thead>
<tr>
<th>X (independent)</th>
<th>Y (dependent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voice and Accountability (voicea~t2004)</td>
<td>Control of Corruption in public organizations</td>
</tr>
<tr>
<td>Quality of bureaucracy (qbureauc~t2004)</td>
<td></td>
</tr>
<tr>
<td>Control of corruption (2002) (contro~t2002)</td>
<td></td>
</tr>
</tbody>
</table>

The data for the variables are taken from the World Bank Institute (WBI) 2004 which itself is a composite data index.

Description of the variables

According to Governance Matters IV, World Bank 2005, “Control of Corruption” measures perceptions of corruption, conventionally defined as the exercise of public power for private gain. It contains data related to frequency of “additional payments to get things done (bribes) and frequency of payments to gain public contracting out (kickbacks). “Control of corruption 2002” contains the same kind of information but it belongs to 2002.

“Voice and accountability” measures accountability rates of public officials. This variable also includes the presence or absence of public channels to denounce unaccountable behavior of public administrators. In a country where there is no voice and accountability it may be hard to constrain public administrators being accountable to the public and as result hard to control corruption.
“Quality of bureaucracy” measures the quality of public service provision, and the quality of the bureaucracy, and the independence of the civil service from political pressures. It also measures the level of professionalism of bureaucrats and discretion. In a country where the level of quality of bureaucracy is high there may be fewer opportunities for corruption in the public sector.

**Description and relevance of the data applicable to this research**

The data from the World Bank consist of surveys of firms and individuals, as well as the assessments of commercial risk rating agencies, non-governmental organizations, and a number of multilateral aid agencies. They cover 203 countries for 1996, 1998, 2000, 2002, and 2004. Thus, the data are based on several hundred individual variables measuring perceptions of corruption, drawn from 37 separate data sources constructed by 31 different organizations (see more description in Governance Matters IV, World Bank 2005).

All sources generally apply a definition of corruption such as the misuse of public power for private gain, for instance, the bribing of public officials, kickbacks in public procurement, or embezzlement of public funds. Each of the sources also assesses the “extent” of corruption among public officials and politicians in the countries in question. A sample of the questions included in the surveys made by the different agencies that provided data to the World Bank are listed in table 1.

After obtaining the surveys’ results made by the more than 31 different organizations mentioned above, the World Bank develops a composite score for corruption by combining all survey data, estimating the media, and ending up with scores between -2.5 and 2.5 for each country. Thus, virtually all scores lie between -2.5 and 2.5, with higher scores corresponding to
better outcomes. For instance, in appendix C of the document Governance Matters IV (World Bank 2005) countries such as Sweden, Denmark, Iceland, Finland, obtains scores of 2.20, 2.38, 2.43, 2.5, indicating that they are doing well in controlling corruption. In contrast, countries such as Afghanistan, Turkmenistan, Central African Republic, Equatorial Guinea obtains scores of -1.33, -1.34, -1.36, -1.65, indicating that they are doing poorly in controlling corruption.

Since the scores mentioned above are elaborated from the results of the surveys made each year, the situation of control of corruption in each country may vary from one year to another depending on successful implementation of anti-corruption plans.

The World Bank applies the same methodology described above to create composite index of perceptions on accountability and quality of bureaucracy.

**Regression Analysis**

Because the theory presented in this paper says that in order to control corruption we need to basically reach high levels of accountability, we need to control for quality of bureaucracy. The level of professionalization in bureaucracy will determine the level of the quality of service which means more efficiency less delays and as consequence less opportunity for corruption. As accountability and quality of bureaucracy increase we may expect also an increase in the level of control of corruption. To assess this theory regression is run by using ordinary least square method.

As expected, the regression results confirm the theory (see table 2). By obtaining a “p” value .007 for “voicea~t2004” we may say there is a significant positive relationship between accountability and control of corruption. The $R^2$ for this model is 0.9179 indicating that how we
control accountability and quality of bureaucracy explains 92% of the variance in control of corruption.

We can be more than 95% confident that for every one point increase on accountability we can expect an increase between .0231133 and .1416544 controlling for quality of bureaucracy. For every one point increase in quality of bureaucracy we can expect an increase between .8352704 and .952997 in control of corruption controlling for accountability. These results definitely show that the best way of controlling corruption in public organizations is by improving accountability and quality of bureaucracy.

In order to prevent an endogeneity problem, meaning for instance, that accountability may lead to better control of corruption, or control of corruption may lead to reach high levels of accountability, another variable is included in the model: control of corruption for a previous year (2002). After running regression, the model has not experienced substantial changes. In fact it is almost the same results as previously (see table 3). The coefficients for “accountability” and “quality of bureaucracy” have not substantially changed. Moreover, the coefficient for “control of corruption 2002” obtaining a “p-value” .739 is not statistically significant. Furthermore the R-squared is maintained at 92%. Therefore, control of corruption in public organizations is highly dependent on the level of accountability and the quality of bureaucracy.
III. Final Evaluation and Conclusion

Final Evaluation

From the results of the theory and data analysis detailed above the problem of corruption in public organizations can be combated by addressing quality of bureaucracy and accountability systems which are the key variables in controlling administrative corruption (corruption in public organizations). Although administrative corruption cannot completely be eliminated, reforms in the public sector may help to reduce it (United Nations 1997). In this regard, reform attempts need to include three basic mechanisms: a political agreement that supports a government decision for obtaining accountability in the public sector; the implementation of whistleblowing systems; and the quick administrative punishment of corrupt high-level public officials (see more details in table 4). The latter must be genuine and its implementation depends on each country’s legal reforms incorporating administrative sanctions such as immediate suspension and firing of corrupt high level public officials.

Additional recommended anticorruption measures for reforming bureaucracy are based on successful anticorruption experience in Philippines (2000), and Hong Kong (1990) detailed in Klitgaard 1998:

- Professionalization of employees by recruiting high honors graduates from high quality universities of the target country
- Rotating officials in order to avoid potentially corrupt personal relationships with taxpayers
- Participation of outside auditors to supervise tax revenues
Promotion of honest and good performance through the implementation of a system of rewards and penalties.

Conclusions

- For the purpose of this study corruption has been defined as the misuse of public power for private gain (World Bank 2005) for instance, bribing of public officials, kickbacks in public procurement, and embezzlement of public funds.

- The data used in this paper include perceptions of corruption elaborated by the World Bank 2004. They appear to accomplish the basic requirements of reliability, validity and replicability.

- The theory and data analysis show that controlling corruption in public administration is highly dependent on quality of bureaucracy and accountability systems.

- The main three mechanisms to implement a reform for combating corruption in the public sector include a political agreement that supports government decision for obtaining accountability in the public sector; the implementation of whistleblowing systems; and the quick administrative punishment of corrupt high-level public officials. The latter must be genuine and its implementation depends on a country’s legal reforms incorporating administrative sanctions such as immediate suspension and firing of corrupt high level public officials.

The “Caudillo” Government Style in Venezuela: From Bolivar to Chavez Administration

Abstract

This paper analyses the political culture in Venezuela, including the economic and social aspects which originated the emergence of the “caudillo” presidential leadership style. This analysis is based on the theories developed by international and classics scholars from political science and comparative politics and on an insightful review of the Venezuelan political history throughout its democratic life since the “caudillo” Bolivar Administration. The paper then turns its attention to current “caudillo” president Chavez’s governing style and evaluates his influence in other Latin American presidential administrations.
The “Caudillo” Government Style in Venezuela: From Bolivar to Chavez Administration.

Introduction

The name Venezuela means “little Venice”; it was given to the area by Spanish settlers in the early sixteenth century because the first Indians whom the Spanish saw lived in villages built on stilts in the middle of Lake Maracaibo. In 1777 Venezuela expanded closer to its present boundaries with the creation of the Captaincy-General of Venezuela with Caracas as its capital. Supported by brave Venezuelans Simon Bolivar defeated Spanish Conquers and declared its independence on July 5, 1810. Then after 1821, when the last Spanish forces were driven from Venezuela, Simon Bolivar attempted to weld together what are today the countries of Colombia, Ecuador, and Venezuela into one nation: Gran Colombia. Bolivar’s dream did not come true during his time since those countries were interested in building their democracies alone. Bolivar established an authoritarian presidential leadership style called “caudillo” which military leaders replicated after his death. Nowadays, Bolivar’s dream is resurging in the person of current Venezuelan President Hugo Chavez, known in Venezuela as “national caudillo”. Throughout its history, Venezuela has experienced the rise of many “caudillos” who justified the coups as an attempt to build a fair government. Although they had all economic resources derived from the petroleum industry they failed to be responsive to Venezuelan citizens. Instead they implanted authoritarian governments which caused severe political, social, and economic consequences. Theories developed by international and classic scholars from political science and comparative politics, explain many of the political, social and economic events occurred in Venezuela.
The “Caudillo” Government Style in Venezuela: From Bolivar to Chavez Administration.

I. Political Culture

Since 1936 Venezuela has experienced three military coups, among other unsuccessful coup d'états attempts, and five constitutions have succeeded one other. How could we explain this occurrence in a wealthy country such as Venezuela. Huntington (1968) points out that “military explanations do not explain military interventions. The reason for this is simple military interventions are only one specific manifestation of a broader phenomenon in underdeveloped societies: the general politicization of social forces and institutions. In such societies, politics lacks autonomy, complexity, coherence, and adaptability.” Throughout Venezuelan history, military force intervened in politics because of lack of responsiveness from the government. Neither dictators nor elected presidents were responsive to the public. Most of them just looked for their own benefit, which led them to commit corrupt acts. This situation led Venezuelans to always expect for a new leader, a caudillo who could liberate them from irresponsible governments.

The political disorder such as corruption and aimless governments made Venezuelans learn to hedge their bets on democracy. Much of their value system comprises traditional, nondemocratic values which have been adapted successfully to the demands of urbanization and industrialization. The nondemocratic values accepted for example military interventions. This particular characteristic of Venezuela led David Blank (1973) to describe Venezuelans political culture as Personalism. “Venezuelans tend to give loyalty and obedience to the person in command rather than to his institutional position. Contemporary Venezuelan leaders
appear to be locked into the mold established by the traditional *caudillo*.” In fact, many
*caudillos* emerged after Simon Bolivar’s declaration of liberation in 1819.

The first *caudillo* that emerged in the 1900s was General Juan Vicente Gomez. In 1908
he seized the presidency in order to re-establish the political order but he ruled an
authoritarian unfair government. Nevertheless, Venezuelans looked for another *caudillo* who
could look for fair implementation of citizen rights. Another dictator who emerged arguing to
reestablish political order in Venezuela was Gral. Marcos Perez Jimenez. During the period
1948-1958 dictator Perez Jimenez set a government policy totally different from predecessors
supported by AD (Democratic Action). In place of the highly politicized development
program of the AD regime with its emphasis on human resource development – that is,
education and agrarian reform – Perez Jimenez focused his regime on the “conquest of the
physical environment” which was aided by the boom in petroleum production. Government
revenue doubled between 1951 and 1956. The government began a number of major
economic development projects, such as the iron and steel mill in the Orinoco River Valley, a
petro-chemical plant in Caraboba state and a major dam and irrigation system in Guarico state.
More frivolous government projects included luxury hotels and military officers’ clubs.

In 1952, Perez Jimenez wanted to legitimize his own rule through an election. He
allowed both the URD (Democratic Republic Union) and the COPEI (Organized Political
Committee for Independent Elections) to contest this election. However, after it became
apparent that the URD had won the election, it was annulled and many URD leaders were
exiled. The increasingly personalist and corrupt nature of the dictatorship alienated a growing
percentage of the urban middle class and the armed forces. The December 1957, plebiscite
farce which reelected Jimenez destroyed the armed forces’ respect for him. A civilian general
strike on January 23, 1958, followed by a military uprising, forced Perez Jimenez into exile.

The aimless and corrupt dictatorship of Perez Jimenez had offended the Venezuelan social and economic establishment.

Huntington (1968) poses a theory that explains Venezuelan dictators’ corruption. He points out that in Venezuela among the other “mulatto” countries (Panama, Cuba, Brazil, Dominican Republic, and Haiti) of Latin America, there appears to be greater social equality and much less rigidity in the social structure than in the “mestizo” (Chile, Colombia, El Salvador, Honduras, Nicaragua, Paraguay) countries. Correspondingly, however, the relative “absence of a governing class ethic, with its sense of “noblesse oblige” and hence “there seems little doubt that it is countries in this socio-racial category in which political graft reaches its most flagrant heights.” Perez Jimenez in Venezuela, Batista in Cuba, and Trujillo in the Dominican Republic all came from non-upper-class backgrounds and all became multimillionaires in office. This theory fairly explained political corruption committed by dictators Gral. Gomez (1908-1935) and Gral. Marcos Perez Jimenez (1952-1958). However, it does not apply to President Carlos Andres Perez (1974-1979), (1989-1993) whose corrupt acts caused devastating consequences to Venezuela. After the 1960’s, Venezuelan society started changing into a more hierarchical social class. It was due to petroleum profits which enriched people involved in its exploitation. President Carlos Andres Perez was of high social status but despite that he also committed corrupt acts for which his government faced in 1992 a coup d’état led by Hugo Chavez.

Although Venezuela frequently experienced coups and attempts at coups, it did not experience a strong revolution such as the Cuban revolution. Venezuelan history shows us, as Huntington (1968) said, that those military interventions occurred because of lack of
autonomy and coherence in the government. Furthermore I believe that those military interventions occurred since Venezuela did not count on solid political parties. In an attempt to build a democratic system, political parties started rising in Venezuela during the 1940’s.

Democracy is strengthened by the existence of political parties. The appearance of political parties strengthened democracy in Venezuela and they played a very important role in Venezuelan society. After the death of dictator General Juan Vicente Gomez in 1935, a new period opened the way for free political activity and free expression in Venezuela. Since then, Venezuela’s modern political parties were formed. Notably in 1941 the DA (Democratic Action), Venezuelan first political party appeared. This political party led a series of mass mobilization towards democracy. Peasants and workers joined in political movements such as: The Venezuelan Peasant’s Federation (FCV, Federacion Campesina de Venezuela). In 1945, this group led by AD caused a revolution in rural Venezuela since the power was concentrated in the hands of big land owners. Urban workers also joined in a National Labor Confederation (CTV)

The period 1945-1948 also known as the Mass-Mobilization Democracy Period, saw the creation of those other political parties which have remained important actors in contemporary Venezuela: COPEI and the URD. The Social Christian Party-COPEI started as the Organized Political Committee for Independent Elections in 1946. The URD (Democratic Republic Union) was the spokesman for the urban middle-class interests seeking a government of unity and calmness rather than the tension-producing, partisan orientation of AD. During this period the Venezuelan Communist Party (PCV) was also able to function publicly in its own name.
Realizing their important role in consolidating democracy in Venezuela, political parties compromised themselves to reconstruct democracy after a long period of authoritarianism. In 1958, AD, URD, and COPEI, signed the *Punto Fijo Agreement*, a pact by which all three parties agreed to form a government of national unity, regardless of the results of elections. The rebuilt AD organization came through with an impressive rural vote to elect party leader Romulo Betancourt president for 1959 – 1964. Faced with a major economic depression and violent challenges from both rightist military factions and leftist revolutionaries, the government of national unity began to come apart in late 1960.

The 1958 *Punto Fijo Agreement* is a genuine one in Latin America and it shows the efforts of political parties to reconstruct national unity. Levine (1973), Karl (1987), Rey (1991) and Kornblith (1999) centered their attention on this agreement and believe that it was very important to maintain stability of democracy in Venezuela.

Blank (1973) pointed out that all political parties that emerged in Venezuela during the 1940s were groups with one interest rather than with one ideology. “Venezuelans generally view the particular interests of their members and followers rather than as communities organized around a given program or ideology.” Also, regarding workers mobilization, Coppedge pointed out that Venezuelan workers had greater “cognitive mobilization” and psychological involvement in politics, that is, their participation was motivated more by their own interests than by external inducements. Katrina Burgess (1999) stated that most party-union alliances in Venezuela in the twentieth century developed around the principle of state intervention in the economy. This principle generated similar norms regarding the rights and obligations of each partner. In the socioeconomic arena the party was expected to use the power of the state, when available, to deliver wage and non-wage benefits to labor, as well as
to adopt procedures that gave labor leaders a role in formulating and implementing relevant policies. In return affiliated unions were expected to moderate their strike activity and to refrain from maximizing their wage demands when the party was in government, particularly in times of economic crisis. Finally, Kenneth Roberts pointed out that in Venezuela there were political parties that have relied on Patron-clientelism, which entails an exchange of material benefits, for political support.  

In summary, the theories mentioned above have argued that Venezuelan political parties emerged without a real ideology but with just particular interests. Venezuelan history has only confirmed these ideas. Venezuelans joined in political parties and social movements looking to achieve individualistic interests rather than to build democratic ways to help governance. History shows us, that Venezuelans looked at political and social groups as patronage machines. Partisanship was sought in order to achieve individual’s goals. Nowadays in current Venezuelan society, on the level of interpersonal relationships, Venezuelans like to know the party affiliation of the people they deal with. It appears that few intimate friendships cross party lines and that partisan difference often reinforce family and neighborhood feuds. I believe this characteristic is part of the Latin American political culture. Latinos use to organize in political groups, joined for the same interest, and participate in congressional elections in order to make true their interests. That’s the reason of the existence of a multi-party system in Venezuela.

But even though first political parties in Venezuela did not have a political ideology they did play a very important role in the society. Political parties are the makers of democratic government Javier Corrales (2001). Competitive political parties enhance the political capacity of civil society to undermine authoritarianism and the propensity of elites to
deem political liberalization rational. As we have seen in Venezuela political parties helped to build democracy but the population itself did not believe that democracy would be built through the democratic way (elections). Venezuelans used violence and military force to build democracy. Between 1958 and 1964 the most significant political participation occurred in the arena of *revolutionary violence*. In fact, I believe effective political participation in contemporary Venezuela has taken two different forms: elections and violence.

The theoretical basis of representative democracy is the aggregation and demonstration of mass support through elections. Contemporary Venezuela has one of the broadest-based electorates in Latin America. Since 1958, the electorate has averaged close to 40 percent of the total population. All Venezuelans eighteen years of age and over have the right to vote without regard to literacy, sex, or property. Venezuelan politicians decided, after Perez Jimenez dictatorship in 1958, to make voting compulsory in order to prevent large voter abstention from being utilized by antidemocratic elements to demonstrate the unpopularity of representative democracy. However, there was also a tendency in Venezuelans to participate in politics through force.

Venezuela apparently has been an exception to the generally accepted rule that, in developing nations, increased political participation is inversely related to increased system stability. We learn from history that Venezuela experienced periods of instability in its democracy. Thus, democratic presidents attempted to gain the majority support from citizens taking special care in getting the peasantry’s support. The establishment of universal suffrage at the commencement of the democratic experience, along with the contained mobilization of peasants, made Venezuela’s “green uprising” (political mobilization of the peasants) a stabilizing factor in the nation’s politics. Samuel Huntington (1968) pointed out that rural
mobilization or “green uprising” is far more important politically for the later modernizing countries than it was for most early modernizers. The vote of the more volatile urban groups, the barrio dwellers and the petty bourgeoisie, was overwhelmed by the more easily satisfied rural vote. Moreover, I believe that Venezuela’s compulsory voting most likely aided the moderating effect of the electoral “green uprising”.

However, the long period of military interventions led Venezuelans get accustomed to have them as their political arbiters. In 1959, Venezuelans incumbent president, Rafael Caldera said that “Venezuelans are so accustomed to making the army the arbiter of their political contests, that at each moment the most varied groups for the most dissimilar ends attempt to involve the army in new adventures to change our political reality.” This assertion has its roots in sociological theory based on hierarchical societies. According to Hillman (1994), in Venezuela as in the rest of Latin America, the influence of traditional Spanish Catholicism, political absolutism, and military ascendancy resulted in a society structured hierarchically by rank, but also structured vertically by major corporate groups (armed forces, church, oligarchy, bureaucracy). Accordingly, those within the system have interrelated obligations that produce a patron-client system of collective benefit. This form of patrimonialism directed by elite hegemony has produced a strong tendency toward centralist, authoritarian politics. Paradoxically, a concurrent cultural pattern of political rebelliousness and resistance to authority was also transmitted by the Spanish. Thus, a dominant culture of political centralization and authoritarianism competed with a sub-culture of decentralization and resistance to authority.

By electing Hugo Chavez, former coup leader, as president, Venezuelans demonstrated that they wanted some kind of authoritarianism against public administration problems such as
corruption. In fact, as history reveals us, Venezuelans were always looking for a *caudillo* who could reestablish political order and be responsive to citizens. It was also proven scientifically. Myers and O’Connor (1998) conducted statistical analysis of national surveys of public opinion, scientifically designed and implemented, existing for 1973 and 1993, two periods economically different. One period had more economic prosperity than the other. They hypothesized that the view of military coups as an integral component of democratic politics is embedded as a “mediating orientation” in Venezuelan political culture. After doing a statistical survey, they found that many Venezuelans supported the idea of military coups. By doing some regression statistics equations on the results of the surveys they found overwhelming support in the abstract and varying support for individual *golpes* related to specific political circumstances. This result contradicted Huntington’s argument that revolutions occur where the processes of political modernization and political development have lagged behind the process of social and economic change. During the 1970s, when Venezuela had levels of modernization: growing urbanization, industrialization, rising middle sectors Venezuelans were willing to support a coup. The gap between economic and institutional development did not lead to radical regimes. I believe that Huntington’s theory did not apply here for Venezuela because of the 1958 *Punto Fijo agreement*. This pact did not fail in Venezuela because of a rational answer from politicians. The rational-choice had a *historic-institutionalist* answer: the existence of competitive political parties.

Although Venezuela experienced revolutionary military interventions they have never been as severe as the Cuban revolution. In late 1960, the extreme political left attempted to duplicate the Cuban experience led by Fidel Castro. Fidel Castro took power in Cuba on January 1, 1959. The Cuban revolution occurred between Romulo Betancourt’s election to the
presidency of Venezuela in December, 1958 and his inauguration in March, 1959. Although much of their rhetoric was similar, the Cuban and Venezuelan situations were quite dissimilar. In fact, Betancourt was principally concerned with reconciling his party, AD, with the two other major political parties, COPEI and the URD, and with nonpartisan power contenders like the Church, the armed forces, and the business community. The grand transformation of Venezuela via a program of revolutionary reforms was not contemplated by the AD leadership. Betancourt’s decision to make its reforms within a framework acceptable to international agencies like the International Monetary Fund, finally eliminated any idea of emulating the Cuban experience.

No revolutionary movement has succeeded in overthrowing a democratically elected government in Latin America.20 Indeed, Samuel Huntington (1968) has argued that “perhaps the most important and obvious but also most neglected fact about successful great revolutions is that they do not occur in democratically elected systems.”21 This historical invulnerability to revolutionary overthrows is quite probably not due to any inherent “immunity” to such challenges on the part of democratic systems. Rather, it reflects the enormous obstacles facing a revolutionary movement attempting to construct a “winning” coalition against a regime, democratic or not, which enjoys the support of at least some key sectors of society and the acquiescence of the rest. This theory worked in Venezuela during the period post Punto Fijo Agreement (1958-1992)

After Betancourt both democratic presidents Leoni (AD) 1964-1968 and Raul Caldera (COPEI) 1969-1973 implemented some reforms in the public sector. However, there was growing demand for new classroom space and hospital beds caused by the population explosion. From 1964 to 1980s violence played a more limited and contained political
representational role. Nevertheless, in 1992 violence seemed to return to Venezuela. There were two attempted military coups led by Col. Hugo Chavez. The government has not succeeded in redistributing petroleum’s profits. Another issue was the achievement of constitutional integrity: the recognition and respect of the rules of the game by all power contenders under conditions of full political participation. Since the coups did not succeed, Chavez formed his own political party called “Polo Patriotico” (coalition party) and decided to participate in the presidential elections of 1998 which he won.

So is there a weak Democracy in Venezuela?

All the military coups and attempts at coups that occurred in Venezuela lead me to pose the idea that there is a weak democracy in Venezuela. Almost all scholars who have focused on Venezuelan democracy agree with the idea that there is a weak democracy in Venezuela. On this point, Coppedge (1993) argues that institutions and the roles they impose explain the strength and weakness of Venezuelan Democracy. Thus, the way the president and the people in the government organize public institutions and their roles influence in the stability or instability of democracy. 22Political culture and rational choice approaches may provide additional insights about that issue. Most democratic governments, as we have seen in the description of Venezuela history, has faced military coups during the period (1900-1958.) However, during the 90s we have seen that democracy has strengthened in Venezuela. Nevertheless, since President Chavez comes from a military background some scholars have posed the theory that politics has been militarized. Daniel Levine (1973) believes that in Venezuela there is a militarization of politics.23
I believe that this new political order is a revolutionary model that hinges on a basic relation between a national leader *caudillo* and a popular mass, absolutely majoritarian, that designates him personally as its representative, in order to carry out a broad, but above all a deep, process of change. This new order causes change in the social economic structure of Venezuela. Everything is becoming centralized in the executive power because of the influence of the *caudillo* government style. This management style tends to centralize the power in the executive.

From the beginning, President Chavez centered his political agenda around the Constituent Assembly call for a new constitution. The New 1999 Constitution brought many changes such as basic restructuring of institutions and the creation of a uni-cameral National Assembly replacing the old two-chamber Congress and the Office of Vice President. The new political order brought by the New Constitution is trying to be more accountable to the public. This theory has to be proved. They could be tested by using statistical analysis comparing social economic indices before and after the Constitution of 1999.

Several new issues are challenging the Venezuelan political system such as economic dependence on petroleum and an inequitable distribution of wealth. I’ll analyze this issue in the last part of this document titled “the future of the system.”

**II.- Economic Aspects**

When the foreign oil industry was established on Venezuelan soil, Venezuela rapidly changed from a stagnant agricultural society, torn by civil strife and indebted to foreign powers, into the world’s major oil exporter (Coronil, 1997.)\(^{24}\) This new economic situation set Venezuela in a dependency relationship with foreign investment (Tugwell, 1974.)\(^{25}\)
Before 1920 Venezuela’s economy was almost entirely based on agriculture. Most of the nation’s limited foreign exchange depended upon its coffee and cocoa exports. Between 1921 and the present, petroleum has propelled Venezuela’s economy. Eighty per cent of Venezuela’s petroleum is produced by the world’s giant petroleum companies: BP, Chevron Texaco, CNPC, Conoco Phillips, Exxon Mobil, Repsol-YPF, Shell, Statoil, Total, Petro-Canada. Other small American companies and the Venezuelan government’s Petroleum Corporation (CVP) are responsible for the remainder. The presence of transnational American Oil Companies represents also a political presence in Venezuela. This situation made Venezuela highly dependent on foreign investment and international market price. According to non official statistics, outside of the petroleum sector, around 50% of all large Venezuelan firms have some financial connection with United States firms. United States investment accounts for 70% of the total foreign investment in Venezuela.

The fact that the virtual life and death of national prosperity has been at the mercy of a foreign-owned industry has given Venezuelan politics a crucial development focus. In 1960 Venezuelan Minister of Hydrocarbons Juan Pablo Perez sponsored the creation of the Organization of Petroleum Exporting Countries (OPEC): Kuwait, Saudi Arabia, Iraq, Iran, and Venezuela. Since then, Algeria, Indonesia, Libya, Nigeria, Qatar, The United Arab Emirates have joined. The principal purpose of OPEC is to maintain the price of petroleum at times when surplus production threatens possible reductions.

New international trade politics is needed in Venezuela. Jorge Salazar (2004) assessed for Venezuela economic politics alternative. He focused on finding support for other economic activities outside of other than petroleum. In fact, Venezuela is a country with a pattern of trade based on raw material exports specifically derived from petroleum industry.
Thus, even though Venezuela has started to develop other industry, the petroleum industry will continue to lead exportations.

Venezuela does count on other alternative exporting products. Since 1960, Venezuela has been implementing a policy of export diversification. The basis for the Venezuelan government’s effort to develop new export industries was the discovery of a major iron ore deposit in the eastern region state of Bolivar and the development of a petro-chemical technology which made possible the conversion of its plentiful petroleum reserves into plastics, fertilizers and artificial rubber. Venezuela has staked its hopes for post-petroleum prosperity on the development of its regions rich in iron, ore, and mineral deposits.

III.- Social Aspects

Latino countries which were Spanish colonies in the sixteenth and seventeenth centuries remained highly stratified after liberation. Traditional social class status which was extremely important at the time of colonization remained in the conscience of the people of former Spanish colonies. Although modernization has destroyed many of the traditional bases of the old social order, such as privileges of birth, and caste, there remain some social aspects such as color of skin that differentiate social status. Although no census of racial identity has been undertaken in this century,27 a general accepted estimate is that the Venezuelan population is about 70 percent mestizo28 and mulatto,29 20 percent white, and 10 percent negro. We can observe that the majority of the population is composed by mestizo and mulatto. It might explain that Venezuelans feel warmer toward a presidential leader who looks more like them. It might explain current president Chavez’s large base of support from Venezuelans. The majority of the Venezuelan population feels represented by him. He looks
like many mulattos in Venezuela. This population’s attitude does not only occur in Venezuela, but it also has occurred in Bolivia, Ecuador, and Peru (all of them former Spanish colonies.)

The existence of many races in Venezuela has created subcultures which also take a particular political attitude. David Blank (1973), identified four subcultures: Urban Cosmopolitan, Established Urban, Marginal Urban, and Peasant. Although the peasantry is by far the poorest sector in Venezuelan society, it has been the electoral base for reformist governments since 1958. The allegiance attitude and behavior of the peasants and their general satisfaction with the political system have provided a crucial stabilizing element to politics.

The notion that a large rural proletariat of landless labor is a potential source of insurrection and revolution may be somewhat closer to the truth (Moore, 1993.) A discontent peasantry, if large, may conduct a revolution. In Venezuela, the peasantry attempted to revolt but at the end compromised with politics in an agrarian reform. In contrast with other nations, Venezuelan peasants did not revolt despite their unfavorable situation. Large landowners flocked to the capital to take advantage of the opportunities opening up in government and petroleum administration. Peasants who stayed in their lands experienced an agrarian reform.

Democratic governments are able to enact land reforms where there is vigorous and popular executive leadership and strong party organization with a corporate interest in winning the peasant vote (Huntington, 1968.) In 1960 the agrarian reform law passed by the Venezuelan congress was the result of a broad-based coalition. The formulation of the legislation was itself largely the product of a commission which included representatives of labor, business, and large agricultural landlord groups in addition to members of the four major political parties from COPEI on the right to the PCV on the left. The passage of this legislation was the acid test of attempts by the elected political elite in the Betancourt...
government and the private entrepreneurial elite to develop the nation through a policy of reconciliation and moderate reform.

Assessing the results of the Agrarian Law Reform, it had in fact very little effect since it did not go beyond redistribution of land from large-scale holdings (*Latifundia*) to small, family-size farms. I believe that the failure was due to the lack of an overall agrarian reform program. As Blank (1973) states “Agrarian reform, regardless of its focus, is more than the settlement of a peasant family on a plot of land. In order truly to end the marginal social and economic status of the peasant, tremendous financial commitments must be made to provide the recipient of land with adequate credit, education, technical assistance, and reasonable access to markets.”

In reality, what peasants really seek, are those crops and cultivation techniques which will give the highest and most stable payment for labor (Scott, 1976.) An agrarian reform is not only a redistribution of lands or giving a piece of land to peasants but it also is a full reform program which should cover techniques for improving crops. In 1960, the potential beneficiaries of agrarian reform were estimated to include between 260,000 and 380,000 landless and land-poor peasant families. They were supposed to work their lands and prosper on them. However, in 1970 it was revealed that about 30 per cent of those families had abandoned their allocated land.

The agrarian reform was not really a reform. It was only limited to a redistribution of lands. A real reform goes beyond that. Instead of improving the peasantry’s social and economic situation, it has deeply increased the social difference among peasants. Those peasants who came to the agrarian reform settlements with rudimentary knowledge of marketing systems and modern farm technology and with a previous orientation towards farm
technology and with a previous orientation toward material improvement have done well and are on the way to becoming a class of successful small farmers. Those peasants who misspent their initial government credit and who have not been successful farm operators are now ineligible for further credit and may be frozen out of further opportunities to advance. Many of these unsuccessful peasants have either left the agrarian reform settlement or have hired themselves out as farm hands to the more successful farmers. As a result, many peasants have immigrated to the cities looking for jobs. The exodus of unskilled peasants to the cities has led to the growth of vast squatter slum areas, or barrios around all of Venezuela’s cities.

The former peasants now in the urban cities formed the barrios. In this new social order those living in the barrio have discarded the former peasant loyalty to the established political parties and have become the most dissatisfied element. This is a constant variable.

On the other hand, Blank (1973) missed indigenous subculture in his classification of Venezuela’s subcultures. The amount of indigenous people is negligible in Venezuela and as Montoya (1996) analyzed they are not involved in political activities. This is an aspect where the government’s plan has not involved yet. If the number in total of these indigenous were higher than they actually are. They might represent a latent revolutionary movement in Venezuela.

IV- The Future of the System

The future of the Democracy

Venezuelan democracy faces four challenges in the future: maintaining organizational strength while opening the political space; reforming institutions to better reflect a more pluralistic civil society; stemming the decline in living standards and reversing the trend of
growing inequality; and dealing effectively with the ups and downs of the international economy on which Venezuela depends so heavily. Analyzing current situation in Venezuela we find that the first challenge: Organizational rebuilding and diversification are under way. Political parties such as COPEI and especially AD have reattached their party structures to their followers. Efforts have been made to decentralize nomination procedures and other internal party decision making procedures.

Regarding the second challenge, Venezuela has implemented some reforms plans during the late 1980s and the 1990s. However those reforms were focused only on the economic aspects. The reforms did not address social problems such as large inefficient bureaucracy, and lack of a fair redistribution of national revenues. Considering that the former peasants now in the urban cities formed the barrios have discarded the former peasant loyalty to the established political parties and have become the most dissatisfied element, the government should promote social welfare. Future reforms should address those issues in order to get a better government. The third and four challenges are related to an effective international trade policy. If the government succeeds in fairly redistributing petroleum profits, it may result in a better economic situation of the Marginal Urban, and Peasant subcultures.

The future of the Petro State

The President Chavez’s administration has encouraged private investment rather than the establishment of state-industries. No alternative products other than petroleum are accepted in the economic presidential plan. This situation might lead Venezuela to a more dependency. Dependency on foreign capital is a constant problem in the Petro State.
However, dependency may be managed by the executive in order to issue development policies aimed at creating new jobs which could be part of the petroleum industry. Venezuela counts on rich natural resources other than petroleum. Exploring alternative products other than petroleum, Venezuela may face its incredible unemployment rate and alleviate the economic situation of thousands of Venezuelans.

Ronald Sylvia and Constantine Danopoulos (2003) pointed out that there are two aspects of the Chavez foreign economic policy. First is Venezuela’s participation/leadership of OPEC (Organizations of Petroleum Exporting Countries) since Chavez took office. Second is Venezuela’s hemispheric and foreign policy initiatives and its attempts to spread Chavez-styled Bolivarism throughout Latin America. It seems that Chavez’s policy is not focusing in the promotion of alternative products industry. Focusing on alternative exports may alleviate economic situation of unemployed Venezuelans.

Scholars from the Terry Karl school, have considered that the petroleum industry might cause instability in Venezuelan democracy. The peculiar characteristics of the petro state (bloated bureaucracies, excessively autonomous leaders, endemic massive corruption, elitist institutions and truncated participation) make this particular democracy neither viable nor democratic. In order to be responsive to citizens’ necessities a fair redistribution of petroleum profits should be conducted. This redistribution may be done by taking into account the following elements. First, taking the perspective of the poor; Second, cooperation of the nation’s elite; and finally, finding a way of dealing with the technocrats who control the economic system. Current political situation shows us that by taking the perspective of the poor, Chavez is investing petroleum revenues in providing public’s needs such as health, education and jobs. So, from a concrete functional analysis we could point out that Chavez is
being accountable to the public. This situation has been the catalyst for the advent of a populist movement in favor of President Chavez. Indeed, Chavez is trying a government that represents the majority of Venezuelans. The future will tell us about the result of populism in Venezuela.

V. Conclusion

From the analysis above I may say that:

1- The political culture of Venezuela is a synthesis of traditional Latin America values with modern values, and with the adaptability of much of the nation’s social structure to the requirements of modernization.

2- In Venezuela, violence remains a political weapon for the unprestigious and politically underrepresented groups such as unskilled workers, barrio dwellers, and university students.

3- Effective political participation in contemporary Venezuela has taken two different forms: elections and violence.

4- The Punto Fljo Agreement of 1958, aimed to maintain democracy, is an important variable inside Venezuelan politics.

5- Venezuelan political parties enhanced the political capacity of civil society to undermine authoritarianism and the propensity of elites to deem political liberalization rational. They perform the crucial function of converting the multitudinous demands emanating from various groups and sectors of society into a manageable number of policy alternatives.

6- Agrarian Reforms caused deep social differences among Venezuelan peasantry. The former peasants now in the urban cities formed the barrios. In this new social order those living in the
*barrio* have discarded the former peasant loyalty to the established political parties and have become the most dissatisfied element. This is a constant variable.

7-Taking the perspective of the poor, President Chavez is investing petroleum money in providing public needs such as health, education and jobs. Thus, from a concrete functional analysis it could be said that Chavez is being accountable to the public.

37 According to Tugwell, dependency involves a misperception of the forces at work and do little to clarify the range of alternatives open to policymakers.

Orlanda Amarilis: the short-story and female authorship

This paper focuses on the story-story, the genre’s main characteristics and its reception by literary criticism. In a brief introduction I explore the arguments of Poe, H. G. Wells and Julie Brown, the editor of American Women Short Story Writers: a collection of critical essays (New York: Garland Publications, 200), which converge on the idea that what defines a short-story is its length and not its themes.

Orlanda Amarilis published three collections of short-stories so she is one of the most representative writers of this genre in the context of Cape Verdean literature. Thirteen out of the sixteen published stories focus on women characters (MacNab, 1987), so the question is therefore necessary: can her writing be considered feminine or feminist? The difference between these two forms of writing constitutes the main textual corpus of the paper. Feminist writing proclaims women’s social rights in modern society. It derives from the feminist movement re-emerged with Betty Friedan’s The Feminine Mystique (1963). On the contrary, feminine writing is interior, comes from the inside experience and possesses a peculiar trait which makes it particularly emotional. It is a female, hence more delicate and
intimate, perspective of the surrounding reality without any political or activist intention. When appropriate, some of Amarilis’ stories which can be found in *Cais do Sodré té Salamansa* (1974) are brought to discussion as well as the author’s own views on these matters.

Finally, it is raised the question of whether a man has the ability to write from a feminine perspective. As a result, his writing would be considered feminine. António Aurélio Gonçalves is highlighted as the contemporary Cape Verdean writer who better understood the meaning of feminine writing and achieved it in one single story out of his numerous *noveletas*: ‘Pródiga’ (Noite de Vento, (SI: Instituto Caboverdeano do Livro, 1985).

**Orlanda Amarilis:** the short-story and female authorship

The short story is a genre that somehow has been disregarded by literary critics. When I say disregarded I do not mean ignored. Obviously, there have been some explanatory studies which aimed for the understanding of the short story, its goals and its role in literature. However, if we compare these studies to the ones made about novels, we immediately understand how marginalized the short story critic has been. When studying this genre, critics tend to refer names as Virginia Woolf, James Joyce and D. H. Lawrence, all of them magnificent story tellers. However, these approaches tend to focus on male story telling and rarely on female writers. In *American Women Short Story Writers: a collection of critical essays* this tendency is reversed as all matters regarding female short story’s writers are exploited and questioned.¹

In the introduction, the critic and editor Julie Brown draws the origins of the short story. According to her, this genre can be traced back to Boccaccio’s work *Decameron* or

Chaucer’s ‘The Canterbury Tales’.\textsuperscript{2} She points out that the earliest short stories are always attributed to men and quotes Somerset Maugham’s opinion on the matter:

\begin{quote}
It is natural for men to tell tales, and I suppose the short story was created in the night of time when the hunter […] narrated by the cavern fire some fantastic incident he had heard of.\textsuperscript{3}
\end{quote}

I believe women have always played an important role in story telling. I am thinking specifically in the secular feminine tradition of telling old stories to young daughters, stories which these women had heard from their mothers; stories which normally tended to be about a charming prince that fell in love with a simple and honest girl, the common Cinderela tale that has been passing throughout several generations. Maybe it is not that important to assert who actually began this process, but there is no doubt that it is, in fact, an ancient one.

Edgar Allan Poe, amongst other writings, published some studies on this matter. In his “Review of Twice-Told Tales”, Poe alludes to ‘the unity of effect or impression [that] is a point of the greatest importance. It is clear, moreover, that this unity cannot be thoroughly preserved in productions whose perusal cannot be completed at one sitting.’\textsuperscript{4} Poe’s main argument had to do with the narrative’s length. If the story is too long to be read in a couple of hours, inevitably ‘worldly interests intervening during the pauses of perusal, modify, annul, or counteract, in a greater or less degree, the impressions of a book’ and therefore it would ‘be sufficient to destroy the true unity’ of it.\textsuperscript{5} This opinion is also shared by H. G. Wells who, as quoted by Valerie Shaw, stated that “in order to produce its ‘one single vivid effect’ [Poe’s words], the short story must seize the attention at the outset, and never relaxing, gather it together more and more until the

\textsuperscript{2} \textit{idem}: Introduction by Julie Brown, p. XVIII.
\textsuperscript{3} \textit{idem}: ibidem. Maugham’s words have already been cited in Valerie Shaw’s work \textit{The Short Story: a critical introduction} (London: Longman, 1983), from whom Brown quotes directly.
\textsuperscript{5} \textit{idem}: p. 61.
climax is reached. [It must] explode and finish before interruption occurs or fatigue sets in.”

Poe and Wells’ reflections on the short story seem to convey the following: the most relevant characteristic of the genre is a result of its length and not of its hypothetical standard themes or narrative techniques. Both in Poe’s article or in H. G. Wells’ quoted words there are no references to the short stories’ main themes. Indeed these can vary according to the author, his historical and cultural context and the message he wishes to transmit.

In the words of David Brookshaw, she ‘exploits both story telling techniques […] as well as the favourite themes of oral tales – the supernatural, the proximity of the world of the living and the world of the dead.’

It is undeniable that most of Amarilis’ short stories focus on women or, as Brookshaw puts it, ‘portray with sensitive insight the plight of women.’

Gregory MacNab believes it is significant that thirteen out of the sixteen short-stories Amarilis has published focus on the female experience.

The question is, therefore, necessary: is her writing feminine or feminist? In order to understand the difference between these two terms, I shall begin by quoting Regina Barreca’s words:

[Women’s short stories] often depict the lives of women who would be considered perfectly ordinary because they have gone through much of their lives not calling attention to themselves; however they are actually extraordinary women whose dreams, ambitions, desires and rages have been suppressed.

---

8 *idem*: ibidem.
9 Gregory MacNab, Sexual Difference: The subjecton of women in two stories by Orlanda Amarilis, Luso-Brazilian-Review, Madison WI (LBR), 1987.
Let us bear in mind that Barreca is referring to feminine writing as it depicts a woman’s microcosm, especially her inner feelings, desires, frustrations and sorrows. The fact that the author herself is a woman may not be arbitrary and the question of how good could a male writer write about women can be raised. I will deal with this question further on. At the moment, I shall focus on the issue of a woman writing about women and how feminine or feminist may her work be considered. Clare Hanson has a word to say about female authorship:

The short story is the preferred form for those women writers who have what in conventional terms would be viewed as a 'squint vision'. Such writers see things differently from men—hence the potential charge of distortion. They also express what would otherwise remain hidden: a sense of alienation from dominant culture and ideology which may be frightening in its intensity.11

Hanson’s opinion reinforces the idea that a woman, as a sensitive being whose main trait is a ‘squint vision’ of the world has a privileged position to narrate the stories of what we could call a minority. By minority I refer to women alienated from the ‘dominant culture’, that is men’s. Minority here does not stand for factual numbers but for general influence on today’s world. Modern societies are male dominated and Cape Verde is no exception, on the contrary, it is a vivid example of it. Men rule and women play a secondary role when it comes to the making of important decisions. Feeling somehow cast aside from their own society, some women may develop a literary sympathy to portray their reality through a more sensitive and necessarily female way. When the female author chooses to focus on women the result is feminine writing. We may wonder why Orlanda Amarílis decided to highlight mainly women’s lives and not men’s. Is it because she is a woman or is there another reason? I am convinced that, as a Cape Verlean female author, and bearing in mind the post-independence context, she found to be her mission to write about the women of her islands. As she puts it in an interview to Michel Laban:

11 Re-reading the Short Story, edited by Clare Hanson (Basingstoke: Macmillian, 1989), p. 5.
Throughout her stories she reveals two different realities both concerning Cape Verdean women: the emigrant woman, her hard work, her nostalgia or pride when thinking of the island she has left; and the woman who remains in Cape Verde, land of emigrants, most of them men, leaving a great number of women behind who had to deal with each other and also with the notorious lack of men. Being a woman was definitely an important condition for her to approach the female part of society. As important is women’s situation on the islands after men’s departure: the competition for male affection, for example, is quite a recurrent theme. We see this in ‘Esmola de Merca’ as two young women compete for the attention of their white boss. In the end, one gets upset with the other, revealing that ultimately friendship is not as relevant as finding a man. At a greater extend, the life of Mindelo’s people in this story is symptomatic of a much wider competition as their struggle for some new clothes and food becomes violent and extremely competitive. It is not a happy picture Orlanda Amarilis is depicting. On the contrary, it is a truthful sketch of how desperate those men and women were in the past, and how selfish and inconsiderate human mankind can be when in great need.

The female protagonist of ‘Desencanto’ is the prototype of some Cape Verdean women who, living in the metropolis, have lost all hopes of a happy life. She is immersed in a heavy daily routine which denies her the dream life she has wished for. As a woman, Amarilis understands the female children imaginary so she is able to focus on the exact opposite and, most important, she manages to truthfully convey the intimate frustration of an angel’s fall. Using the stream of consciousness with such

---

13 Both ‘Esmola de Merca’ and ‘Desencanto’ are part of Cais do Sodré tê Salamansa (Linda-a-Velha: ALAC, 1991).
verisimilitude is one of Amarilis great strength. She combines this narrative technique with her own personal feminine perception which enables her to tell the story from the inside of her female characters and not from an exterior and considerably more superficial perspective.

Feminine shouldn’t be mistaken by feminist. The feminist movement consists in proclaiming women’s rights in society, such as universal suffrage and equal working opportunities. The movement’s aims are to make women achieve identical social roles as men and stop sexual discrimination. These political ideas have nothing to do with Orlanda Amarilis’ short stories. In an extremely honest comment, the writer clarifies this difference:

Olhe, meu amigo, as feministas lutam por igualdade de oportunidades, por acesso a cargos e outras actividades onde os homens estão em maioria e ainda por remunerações ideais em trabalhos onde há discriminação salarial. Neste momento eu queria apenas isto: Ser homem em Portugal para poder, ao voltar do trabalho, não ter de me preocupar com tachos e panelas.14

It is clear that she is not trying to achieve more social rights to the women characters she depicts. Her goal is to highlight their simple and ordinary lives, their power to multiply in mother, wife, woman and worker in such a way that would make the reader reflect on how great in courage and strength they are. Thus, her literary purpose may be identified with Portuguese Neo-Realism, which main objective was to create a thinker reader, a reader who would reflect on the social matters portrayed in a narrative.

Finally, the ultimate question I would like to approach: can a man write in a feminine way? Could he be able to exhibit the characteristics of what a female perception of the world is like? We may immediately think this is not possible, especially due to human nature innate differences which are the main responsible for each one’s awareness of the surrounding reality. When reading carefully Cape Verdean literature we acknowledge that, although it is not an easy task, it can be done. Going through the collection of short stories Noite de Vento (1985),

the reader may be deceived about its author. It is indeed a man, António Aurélio Gonçalves. His greater strength is the detail he conveys in the characterization of female characters. He narrates both the stream of consciousness and the actual conversations of women of all ages (from the child in ‘Biluca’ to the elderly in ‘Miragem’) with great accuracy. By focussing on oral and popular registers, Gonçalves describes with a high level of truthfulness Mindelo’s colloquial tone that can be heard in the spontaneity of the streets. ‘Virgens Loucas’, ‘Biluca’, ‘Burguezinha’ and ‘Miragem’ are some examples of the writer’s ability to describe some women’s daily routine which is shaken by some casual episode. To describe, however, is quite different from to express or to transmit. In my opinion, Gonçalves masters feminine writing only once and this happens in ‘Pródiga’. The stream of consciousness of both Xandinha and her mother, nha Ludovina, is remarkable for the emotions it conveys. None of the previous writers from the islands had gone so far towards feminine writing. Gonçalves manages to express absolute and exclusive female feelings of rejection but what makes this story even more extraordinary is the situation in which the narrator places himself in: he is in between the sorrows resulting from a vivid discussion between a mother and a daughter. The result is an emotional expression of female characteristics: Xandinha’s pride standing in front of nha Ludovina’s door, combined with a childish wish of embracing her mother; the latter’s feeling of embarrassment when confronted with her daughter’s deviant behaviours and, in the end, the apparent cold-shoulder they give to each other when in fact what they want is to fall in the other’s arms. It is certainly a challenge for a male writer to depict so candidly such a delicate and much female universe. Gonçalves has done it and, although ‘Pródiga’ is the only one which fits adequately in feminine writing premises, the others constitute some minor examples of successful women’s characterization ever attempted by a Cape Verdean male writer. This is perhaps the best comparison I may establish in order to make my point about feminine and feminist writing. The author may be a man, but the
perspective he adopts in writing is a female one. Therefore his narrative is predominantly feminine.

With her first collection of short stories, Cais do Sodré té Salamansa, Orlanda Amarilis inscribes her name in the Cape Verdean literature’s pantheon. Although there are, and were, other female writers from the islands, Amarilis is the first one to receive a huge applause from the critics, not only in Cape Verde but throughout the literary world.

Abstract
The social arrangements surfing communities construct to govern the commons of the surf break have been largely ignored by scholars. However, these arrangements offer a unique and interesting subject for scrutiny using Ostrom’s (1994, 2005) Institutional Analysis and Design framework and analytical frameworks in the emerging literature on the robustness of social institutions (e.g., Anderies et al. 2004). Such analysis suggests that the institutions of traditional surfing communities are fragile and vulnerable to destabilization and disintegration. Insights from gang theory help explain why and how crowding, commercialization, and cultural change are undermining the traditional institutions of surfing communities.

Peace Corps and the Demise of Communism: from Containment to a Commitment to Development.

From the end of 1989 through 1991, the world witnessed a series of events that had strong impact on the geopolitics of the world. The destruction of the Berlin wall, the independence of the Baltic Republics (Lithuania, Estonia and Latvia) followed later by the collapse of the Soviet Union are among others, events that would hurry the end of the Cold War. Different interpretations have been made of this event. Some talk about the end of history, but one of the most important interpretation is that of the victory of the capitalistic west over communism. This theory is usually referred to according Allen Hunter as the ‘Vindicationist’ scholarship¹. Hunter believes that:

“The vindicationist’s interpretation of cold war history is the official national history. As President George bush put it in his January 1990 state of the Union address, ‘for more than 40 years, American and its allies held communism in check and ensured that democracy would continue to exist.” In December 1992 bush even more expansively proclaimed, ‘the Soviet Union did not simply lose the Cold War. The Western democracies won it. I say this not to gloat nut to make a key point. The qualities that enabled us to triumph in that struggle—faith, strength, unity, and above all, American leadership are those we must call upon now to win in peace.’²

On the same line of thought, Paul D. Coverdall, the former Director of the Peace Corps observed, “the Cold war has ended and that totalitarianism was clearly the loser. As a general observation about the world, he adds that:

“ We are entering a new era in world history- an era that is both exciting and perilous. Democracy and free enterprise may eventually prove to be the dominant political and economic forces on the globe.”³

¹ Allen Hunter, “The Limits of Vindicationist Scholarship,” in Rethinking the Cold War, Temple University Press (Philadelphia, 1998): “In the vindicationist interpretation the end of the Cold War demonstrates the superiority of the American political and economic system, not only because we won but because our former enemies now embrace our economic and political values. The world is better off because the United States met the challenge.” P.2
² ibid, p.3
Whatever the thesis, it is clear that things are no more the same in Eastern Europe nor are they in the former Soviet Union where the economy is down and the population is striving for a better life.

It is sometime very useful for scholars to read the history of a country through its representational institutions; they could be sources of enough information. A good illustration of this assertion is that of the U.S Peace Corps, whose recent history tells a lot about the contemporary evolution of the US foreign policy. Through its evolution, the Peace Corps reveals the rise of the United State as a global power and its victory over communism at the end of the Cold War.

Created on March 1st, 1961 by the Executive Order 10924 on a temporary basis, the Peace Corps was perceived by many observers as an instrument of the Cold War. More than a decade after the collapse of the Soviet Union and the supposedly acknowledged end of the Cold War, the organization still exist, operating in many countries even in the former soviet union and what was perceived as a its zone of influence that is the Eastern European countries.

Such a striking survival is in a way due to a flexible policy that had permitted the organization to overcome internal, as well as national and international difficulties regarding its missions and its activities.

It is undeniable that in a large part the Peace Corps was integrated in the guiding principle of the US postwar foreign policy, which was the policy of containment of communism. As a matter of fact the organization can be rightly perceived as a strategy of the Cold war. But the problems attached to the creation of the organization, the fight for its independence added to the treaty signed with the
CIA have soon made the organization a very special instrument of the US foreign relations more oriented to people-to-people cooperation whose main purpose was to promote understanding among nations on a bilateral basis.

It should be remarked that former Soviet Union ideological expansion, which followed the Second World War and its domination over the Eastern Europe, led the US government to adopt a foreign policy known since the publication of the famous Mister X’s article in 1947, as containment. The antagonism between the two superpowers and the will to have zones of influence created what was commonly denominated the Cold War. It was a situation of no overt bloody conflict between the communist Soviet Union and the United States, whose ideology was based on the tradition of western capitalistic democracy. The corollary of those rivalry and ideological antagonism at the strategic level was the arm race between the West and the East chiefly between the Soviet Union and the United States. It ensued a general fear of nuclear war and the perception of nuclear powers as monsters.

That was the general socio-political context that prevailed on the eve of the presidential elections of the 1960’s in the United States where the administration was accused of having but a monolithic view in foreign policy and lack of purpose. To play a leadership role, America needed to redefine relations with the emerging nations.

That argument played strongly in the idea of the creation of the Peace Corps. Alarmed by his visit to South Asia in 1951, Kennedy then senator perceived that the prestige of the USA was fading away in the third world and that in his cooperation with third world countries, the Soviet Union was depicting the United States as a
As an alternative he would suggest that the youth help the US to play its leadership role that is his in the changing world by devoting part of their life to service for the nation through volunteerism. The reaction of the youth to this idea made of it an issue of election during the presidential of the 1960’s. The Peace Corps would be created after Kennedy became president. Its objective as stated in section 2 of the Executive Order 10924 is as follows:

“The peace corps shall be responsible for the training and service abroad of men and women of the United States in new programs of assistance to nations and areas of the world, and in conjunction with or in support of existing economic assistance programs of the United States and the United Nations and other international organizations.”

It is interesting to notice the neutral tone used in the above-cited text. The phrase “new programs of assistance to nations and areas of the world” suggests certain ideological and political neutrality and a lack of segregation in the choice of host countries, even though most of the countries in which the Peace Corps operates were third world countries. The text shows that the organization, from its inception, is opened to any nation of the world that would be in need. Nevertheless in reading the text between the line, it appeared that Peace Corps follows the new orientation the president wanted to give the American diplomacy, that is, instead of a strict conformism to the traditional East and West geopolitics of the world born out of world war II, the Us should include the rising nation of the third world and add a North-South dimension to that diplomacy; hence the use of the phrase ‘economic

---

4 Executive Order 10924, Establishment and Administration of the Peace Corps in the Department of State, March 1, 1961, <http://www.nara.gov/fedreg/061961k.html>
assistance’. In general, assistance is given to people or nations in need. This explain
why the first group of volunteers was sent to third world countries, newly
independent nations who were in need of skilled, well trained human resources to fill
the emptiness created by the departure of the colonial administration.

The text is also on the same line as most of President Kennedy’s public
declarations. From his inauguration, Kennedy was aware of the changes in the world.

He declared:

“The world is very different now. For man holds in his mortal hands the
power to abolish all forms of human poverty and all forms of life. And yet the
same revolutionary beliefs for which our forebears fought are still at issue
around the globe—the belief that the rights of man come not from the
generosity of the state but from the hand of God.” [5]

This reference to God betrays the influence of religious volunteerism on the creation
of the Peace Corps. It will become more vivid when soon he announced the
humanitarian character of the organization’s mission:

“To those people in the huts and villages of half the globe struggling to break
the bonds of mass misery, we pledge our best efforts to help them help
themselves, for whatever period is required—not because the communists
may be doing it not because we seek their votes, but because it is right. If a
free society cannot help the many who are poor, it cannot save the few who
are rich.”[Inaugural] [6]

Even thought the humanitarian mission prevails, the reference to ‘communists’ place
the organization back to the Cold War context. Nevertheless, the Peace Corps was
conceived to favor people-to-people contacts over governmental relations.

Kennedy did express it clearly in the statement upon signing the order that:

“Our peace corps is not designed as an instrument of diplomacy or
propaganda or ideological conflict. It is designed to permit our people to

5 “President Kennedy’s Inaugural Address” in President Kennedy’s Program, Congressional Quarterly
Service, May 1961:1
6 ibid
exercise more fully their responsibilities in the great common cause of world development.”

The purpose was to give the American people, chiefly the youth a sense of their mission of leadership in the world by devoting part of their life to the fight against poverty, hence the famous declaration:

“And so, my fellow Americans: ask not what your country can do for you—ask what you can do for your country. My fellow citizens of the world; ask not what America will do for you, but what together we can do for the freedom of man.”

In light of the historical context and the above cited text, it can be inferred that the strength of the Peace Corps and its adaptability to the evolution of time came from the fact that it is an organization whose mission was apolitical and whose birth is part of the American cultural tradition of humanism that is why it has succeeded since its first years to maintain a national consensus. Its preference of people to people cooperation made it acceptable to the host countries.

But beside this political reading of the Peace Corps creation, the organization bears in its creation the whole story and identity of an era, the sixties. Elizabeth Hoffman gives a better understanding of this link with the sociology of the sixties.

Elizabeth Hoffman argument is that the Peace Corps is the best illustration of what happened in America in the sixties both at cultural and political levels. As she wrote ‘At its inception the Peace corps told Americans what was best about their country and about the 1960’s: the promise of youth, the New Frontier envisioned by John F. Kennedy, the humanitarian impulses of the United States, the pioneer spirit

---

8 Kennedy’s Inaugural, op. cit.
reborn, and the persistence of America’s democratizing “mission.” 9 She further mentions that “it symbolized what America wanted to be, and what much of the world wanted America to be: superhero, protector of the disenfranchised, defender of the democratic faith. 10

After the postwar economic affluence gained by the US, the country underwent by the late fifties and the beginning sixties, a cycle of contestation and rejections of mass culture. Hoffman relates these movements to influence of existentialism. According to Hoffman the impact of the existentialist philosophy could be seen through he social contestation and the widely acceptable movement of volunteerism either in the USA or in other Western countries.

The existentialism emphasizes individuals as the ends and not as the means. Hoffman explains: “ existentialism demanded that people should be treated as ends, not means, and that the individuals responsibility and creativity be defended.” 11 Therefore she thinks that “ the voluntary heroic act, undertaken with love and honesty, was the only salvation for modern man and woman.” 12 Applied to the United States, it increased the sense of responsibility among young Americans. As she explains: “Existentialism increased a commitment to individual responsibility among young Americans. To deny a person responsibility (as in denying students their responsibility for the Peace Corps) could be equated with denying their full personhood. For Americans, and perhaps especially males of the period, existentialism resonated as well with the notion of proving oneself. Since the frontier

---

10 ibid.
11 ibid.,p.30
12 ibid, p.30
was gone and since weapons of mass destruction seemed to make war unthinkable, other opportunities for acting manfully had to be manufactured.\textsuperscript{13} This cultural explanation is completed by a political justification which makes of the Peace Corps an organization contemporary of the Cold War and the decolonization.

In fact those two major themes influenced the International politics during the sixties. Hoffman placed the Peace Corps in the overall US Cold War policy. Quoting George Kennan, she wrote that the Soviet Union in those years was perceived as “committed fanatically to the belief… that it is desirable and necessary that the internal harmony of our society be disrupted, our traditional way of life be destroyed, the international authority of our state be broken.”\textsuperscript{14}

The Kennan article has had a strong impact on U.S foreign policy in the postwar years. Soviet threat was taken seriously

Thus it is with pertinence that Hoffman concludes that the United States would spend the remaining part of the twentieth century and much of its wealth to meet the Soviet threat.

Another important international issue that influenced the creation of the organization was Decolonization. By the end of World War II, many nations of the southern hemisphere began to express their need for self-determination. From the fifties through sixties the, many African, Asian countries have successful for or negotiated their independence. The proclamation of the independence of India in 1947 launched the process of decolonization, which compelled the US to rewrite the maps of the world. Yet “the US government recognized decolonization as an

\textsuperscript{13} ibid, p.31
\textsuperscript{14} Ibid, p.89
important event in its own right: But most of the officials, politicians and military men responsible for US security were nevertheless drawn to read almost all phenomena by the light of the Soviet threat."\textsuperscript{15}

Despite the claim that the Peace Corps was not and should not be an instrument of foreign policy, its strategic importance could not be denied. Hoffman argues that the Peace Corps is part of the Cold War policy coupled with Kennedy’s belief that the US need a more effective competition with the Soviet Union for ‘the allegiance of the newly independent countries.’ As a matter of fact, in compliance with Walter Hixson’s opinion that between 1945 and 1961 the U.S. governments had come to recognize that cultural diplomacy could “transcend governments and reach the masses of people”, she argues that ‘the Peace corps used culture-to-culture diplomacy to make friends in nations that had little inherent power but that could without warning become theaters of the cold war.”\textsuperscript{16} She contends that by creating the Peace Corps, “Kennedy looked East, South, and West. She thinks that it was “a counter move against the soviets and a gesture of friendship toward the Third World.”\textsuperscript{17} Undoubtedly it would not be exaggerated to ray that the Peace Corps played in the rise of the US to globalism. Rice supports this argument when he argues that the creation of the Peace Corps by President Kennedy was an important act that promotes mutual understanding between the United States and the rest of the world especially the third world.

Rice believed that it gave the Americans chiefly the youth of that era a new hope. In his word “Vietnam scarred the American psyche, leaving memories of pain

\textsuperscript{15} ibid, p.90
\textsuperscript{16} ibid, 91
\textsuperscript{17} ibid
and defeat. But Kennedy’s other initiative inspired, and continued to inspire, hope and understanding among Americans and the rest of the world. In that sense, the Peace Corps was his most affirmative and enduring legacy.”

For him the creation of the Peace Corps was mostly suggested by the missionaries’ example and by in the government actions’ history by the Civilian Conservation Corps (CCC) created by President Franklin Roosevelt during the depression. But he noticed that the CCC was more national while its ideals resemble that of the Peace Corps.

The denomination of the organization as the Peace Corps was justified by the general postwar context of nuclear threat, which engendered fear all over the world. To change the perception of America as a bellicist country, the government need to initiate a policy which was different from the traditional diplomatic cooperation which the candidate Kennedy criticized for not being effective in giving a good image of America abroad thereby leaving way to the Soviet to reinforce the negative perception of the US by the third world countries.

But if generally speaking the organization is seen as a piece of art of President Kennedy, according to Rice it is a product of the combination of the ideas of three talents: Hubert Humphrey, Henry Reuss in the 50’s and President Kennedy in the sixties.

Explaining the conditions in which it has been created, Rice contends that three streams of interest have contributed to the acceptance of the idea of its creation.

These include:

---

18 Gerard T Rice *The Bold Experiment: JFK’s Peace Corps* (Notre Dame, Ind.: University of Notre Dame Press, c.1985), ix
Kennedy’s visit in 1951 in Asia, which “persuaded him that nationalism was the most vital political emotion in the Third World.” According to Rice, Kennedy believed that the most important test of US foreign policy in those days was its ability to meet the challenges of imperialism. He noticed that Kennedy criticized the Eisenhower administration for focusing too much on the Western Europe countries.

From the launching of the idea of such organization to the actual creation, Rice noticed that the idea has gained support from a large part of the population, an illustration of the humanitarian value in American culture.

A second stream of interest in which this idea fell was Kennedy’s determination to reinvigorate US foreign aid by differentiating the aid as provided to Western Europe and the type of aid that should be provided for developing countries. Rice noticed that in the perception of Kennedy the Western Europe countries have already the structure for and expanding economic development whereas the southern, Third World countries technical and educational assistance was more important.

The third stream of interest was the belief of President Kennedy that America has a global mission. That is the United States has the duty to share its democratic virtues with other peoples especially the poverty-stricken masses of the third world.

Once created, the organization was set with three goals: the first goal was to make the difference by providing trained manpower to the nations in need. The second goal, which is in the streamline of the people-to-people cooperation, is to make the Americans understood by foreign citizens. That is to change the traditional image foreigners have of the American through movies and television or the image of

\[19 \text{ ibid, 23}\]
the tourist. The third goals completes the above cited is to educate the Americans about their way of seen foreigners and foreign countries. 20

Like any new idea and any human actions, the Peace Corps did not operate in the most ideal and peaceful context as its name might suggest it. Assessing the first decade of the organization, Rice notices three categories of problems can be noticed in the operation of the first period: the fight for the independence of the organization on financial level, the reaction of host countries which in general were afeard of the infiltration of the CIA and the behavior of the volunteer.

After a long period of divergence on the issue whether the Peace Corps should be subsumed by the AID, on May 1, 1961 it was decided that the Peace Corps should be organized as a semi-autonomous unit of the States Department.

One of the problems encountered in the first decade of the Peace Corps was the comportment of the volunteer in the host countries. Rice allude to this cultural shock in a rather peculiar way when he cite the incident of the post card which nearly prejudiced the existence of the organization and almost threatened its international credibility as an apolitical organization. 21 In fact what happened was one of the volunteer in function in Nigeria sent a postcard to her boyfriend describing how the population where living in the street, the lost card would be found by student at the University of Ibadan who, after having read the postcard accused the volunteer to be spies.

21 Rice, op cit, 241-244.
Those were in fact the major issues of concern of the Peace Corps in the first
decade. Overall Rice thinks that the first decade was very important in the existence
of the organization. He says: “the Peace Corps was never to recapture the vigor and
enthusiasm that characterized it in the Kennedy years.” 22. David maintains that the
first generation of the volunteers was the brightest and the best ever since the
evolution of the organization. A much laudatory assessment that David P. Searles did
not share. Searles believes on the contrary that the adoption of the New Directions
policy under the Nixon’s administration gave a new vigor to the policy of the Peace
Corps.

As a former director of the regional Peace Corps in Philippines, Searles argues
that most of the literatures produced on the Peace Corps are more focused on the
Washington headquarters of the organization. He thinks that to have an understanding
of the organization and of how it works, there is the need to consider the works of the
local bureau.

He explains that: “the literature of the peace corps is either volunteer-centered,
concentrating on the experience of an individual or at most a few volunteers, or
Washington-centered and concerned with the larger issues of history, politics, and
public perception.” He asserts than there is a need to explore a third aspect of the
Peace Corps experience: the operational policies and procedures meant to transform a
basic resource (volunteers) into a force capable of achieving the organization’s three
goals. 23

22 ibid, 300.
University Press of Kentucky, c1997), 71.
After a general survey of the first decade of the organization, that is the sixties, Searles notices that a special credit should be given to the impact of the Nixon policy on the organization and the positive result the changes brought in the organization by the policy of New Directions. Searles listed the five most important points that the ‘New Directions’ was made up:

- The volunteer’s job must be more beneficial to the country,
- The volunteer must possess the required skill to do the job,
- The partnership of with the host countries,
- Multinational effort in volunteerism,
- And the greater use of volunteers when they return back home, to address the nation’s internal needs.

Drawing from his experience as a regional director, he observes that because of its realities, the Philippines is a typical example of how the policy has been applied in other Third World countries.

He thinks that the major implication of the new directions’s policy for the Philippines was the realignment of the Peace Corps programming priorities so that they could correspond to those of the Philippines government.

Searles argues that in general “New Directions shifted Peace emphasis to involvement in areas of agriculture and social development in line with contemporary economic development theory.” Consequently for developing countries like the Philippines a policy of self-sufficiency in food production would be advocated. Searles notices that if a poor nation must use most of its hard currency to purchase

---

24 ibid, 75.
food, it cannot make the essential investment in infrastructure development that must precede any measurable improvement in economic activity.  

In the case of the Philippines the volunteer were more useful in the “delivery of service designed to increase agricultural production and to address basic diet and health concerns at local level.

For example the agricultural sector of the Peace corps program eventually came to include project in livestock and poultry husbandry, the production of rice and other foodstuff, the delivery of credit to small farmers and the development of small scale fish farming industry.  

Searles explains that the concentration on the regional bureau of the organization must not shift the attention from the core role of the Washington Bureau. He asserts that the Washington bureau is important in four major areas: recruiting the volunteers, funding the organization and sanction the volunteers when needed.

Assessing the role of the Peace Corps he notices that it change the volunteer and improved the way ordinary citizens of the worldview Americans (different from what they knew about the movie actors and the image of the tourist.)

In economic and social development, Searles argues that for some reasons appropriate to third world countries, the impact of the Peace Corps cooperation cannot be assessed. But he notices at macro level that, first it “has increased the body of knowledge that informs the development process and second it has created a cadre of development professionals working in the Third world” (Searles p.217)  

---

25 ibid
26 ibid, 78.
27 ibid, 217
Moreover it provided “formative international development experience for a number of experts and professionals in the fields.”

If Searles think the new directions policy that came from the incorporation of the organization in Action was beneficial to the Peace corps, Rice in “the Peace corps in the eighties argues that it “whatever the relative merits and demerits of this new move, there is no question that within the ACTION bureaucracy, the Peace Corps lost much of its autonomy and visibility. [Rice peace in the 80’s, p.7] thus it is with a certain relief that he would rejoice the independence regained by the organization in December 1981 under the direction of Loret Ruppe who believed that by the mid 80’that the peace corps is more popular than ever.

At the end of the eighties and the beginning of the nineties, the world was undergoing a significant transformation. The arrival of Gorbatchev in power since 1985 in USSR with his adoption of the policy of glasnost and perestroika would create a different context for internal political claims in Soviet Union. Internationally, it will engender an atmosphere more favorable to the negotiation on a certain number of issues concluding that of the German reunification in a short run the Berlin wall will be destroyed followed by many other important act that undoubtedly announced the end of an era, the end of the bipolarization of Europe and the world that followed world war two. Like many transformations the transition from a socialist order to that of a free market could not be done without socio-economic and political problem. In most of the former Eastern European countries the economic situation was destroyed and it became more and more difficult for the average citizen to meet ends.

---

28 ibid, 219.
In short these countries felt in a slight level of comparison as in the same situation the western European countries were in the post war period when the Marshall plan was adopted and that of the third world countries after the decolonization.

In Western Europe the Marshall plan was adopted to give a hand and help those nation rebuild their whole economy and political institutions. In the sixties the US would create the peace with the Kennedy administration to give another direction to US foreign policy and foreign aid by emphasizing the cooperation with the third world nation.

Somehow the comparison here does show some nuances, if not visible differences, that make the situation of the Eastern European countries more peculiar. In fact unlike the situation of the third world countries that lacked many socio-political and administrative infrastructures, Eastern European countries are different in that these structures existed already and did not need a new personnel. The existing personnel simply need to acquire the appropriate skill to face the transition from a socialist economy to a market economy.

That is why the western nations including the US felt the moral obligation to help former Soviet Union and the eastern European countries including Poland, Hungary, Czechoslovakia and others to ease their transition. It is in this general climate that the Peace Corps will join the international community effort to ease the transition in those countries. This effort was recognized and encouraged in a report by the General Accounting Office in. after having recognized the historical opportunity the end of the cold war presented for the Peace Corps to intervene in Eastern Europe, the
report highlights as evidence of its involvement some of the first projects initiated in
the that part of the world.

“The end of the Cold War presented the Peace Corps with a historic opportunity: For the first time, the countries of the former Eastern bloc became open to Western economic and technical assistance. In July 1989 the president announced that the Peace Corps volunteers would teach English in Hungary. Shortly thereafter, new program were started in Poland and Czechoslovakia, then successively throughout Central and Eastern Europe. In December 1991, the Secretary of State announced that he would like to see at least 250 volunteers placed in the states of the former Soviet Union by the end of 1992. From 1989 through 1993 the peace Corps established 18 new programs throughout central and Eastern Europe and the Former Soviet Union.” P. 2

The question we are entitled to ask here is why does this official document talk about historic opportunity. An intervention of the Peace Corps in Eastern Europe is subject to many interpretations due to the historical context of its birth and the international implications its existence had in its first decade that is the sixties when the Cold War was at one of its most critical moments with Kennedy and Crutches. The ideological conflict that preceded and edulcorated its existence in the first decade, justifies in large part the above assertion which in fact is simply a reflection of what some scholars like Allen Hunter called the vindicationist school who interpret the event of the end of the eighties as a victory of the capitalistic west over the socialist eastern Europe and also as an embrace by the latter of the American economic and political value. Of course sending volunteers might not be perceived as an embrace by the former socialists (or communist) of the western values but its more meaningful as it

---

implicitly denotes the weakness of the former system which in a way could not make it through the twentieth century.

As to corroborate the thesis of the vindicationist, the legal document signed by the Peace Corps and the former communist countries above listed bears some phrases that are in agreement with the idea that US ‘formenemies now embrace’ its ‘economic and political values’.

In the Agreement signed by the Peace Corps with the Czechoslovakia Republic, it is sated in article 1 paragraph 2:

“The volunteers shall work under the immediate supervision of Czechoslovak government governmental or private organization designated by mutual agreement between the Peace Corps representative and competent Czechoslovak authorities.”

The interesting thing about this article, if there is a need to remind the reader, is that it shows the changes that occurred in the socio-economic structures of the countries. In fact it recognized the competence of ‘private organization’, an act that was not conceivable decades before then. It explains that the Czech are now open to a market economy with a liberalization of the economy and the rise of private sectors.

Paragraph three of the same article states that the volunteers shall perform assignment that will be determined by both the peace corps representative and the competent Czechoslovak authorities. This idea of mutual agreement is present in most of the agreement signed with the eastern European countries. This partially is explained by a

32 The same observation can be made about article 1 of the agreement signed with the Republic of Poland; “Peace Corps: Agreement between The United States of America and Poland,”(Warsaw, February 23, 1990), 2. Article1: “ The United States of America shall furnish peace Corps volunteers to perform mutually agreed tasks in the Republic of Poland. The Volunteers will work under the immediate supervision of governmental or private organizations designated by mutual agreement of both governments. The government of the united States shall provide training to enable the volunteers to perform effectively these agreed tasks.”
certain commitment to freedom which usually follows US intervention in the northern
countries. A historical example would be that of the Marshall Plan that enabled
western European countries to design their own plan of reconstruction financed by the
USA through its program of foreign assistance.

Unlike the above-cited agreement Peace Corps commitment in Uzbekistan
would be in specific fields as it is explained in Article II:

“The Peace Corps may provide consultative and technical assistance in the
following fields:

-Non-commercial assistance to small and medium sized business enterprises,
education, health, urban development, environmental protection, and other
field as mutually agreed.

The government of the United States will train the volunteers in order that
they may carry out their working the most effective manner possible.”\(^{33}\)

Not many innovations are listed here for these fields fall within general the traditional
scope of the organization. Somehow it is important to notice the use of the phrase “
small and medium sized business enterprises”, a recurring and less surprising phrase
in quite indicative of the changes brought by the beginning of the nineties; the process
of democratization and economic liberalization the country was undergoing.

While it is quite obvious how these legal document express the changes and impact of
the end of the Cold War on the peace Corps in the former soviet zone of influence,
let’s notice that while doing research for this paper, many attempts to find official and

\(^{33}\) “Peace Corps : Agreement between the United States of America and Uzbekistan, signed at
legal documents related to the operations of the Peace Corps in Russia were unsuccessful. A less surprising fact in the analysis of Worsnop who explain that:

“Some observers question whether the soviets will ever take such a step. To do so would be tantamount to acknowledging that the countries, in many ways, at a third world stage of economic development. This admission, by one superpower to another, might well be too humiliating to risk, notwithstanding the country’s manifold needs.”

Worsnop remarks weaken partially the vindicationist thesis for it shows the hesitancy of the officials the former US enemies to embrace their political and economic values. The population would override this hesitation as he notices in the same article that many ‘inquiries’ have come from citizen and from ethnic groups. The peace is now in Russia. And its tasks as it could be predicted are not as simple as one could think for Russia is not a third world country nor is it a country devastated by war whose infrastructure is not operational.

According to the US embassy in Moscow,

“The idea of sending Peace Corps Volunteers to Russia and the former soviet Union is one that has intrigued and excited Americans since the agency’s inception in the early 1960’s. At the same time, however, it seemed the most unlikely of ideas, given the antagonistic relationship between the United States and the USSR, as well as Peace Corps’ traditional emphasis on the “third world” nations of Asia, Africa and Latin America. With the dissolution of the Soviet union and its sphere of influence in eastern and central Europe, however, the Peace Corps is now moving quickly to meet a challenge unprecedented in its thirty-year history.” [Peace Corps in Russia…

As explicit as this analysis could be it is not unwelcome to wonder where the challenge would come from.

Generally speaking, any engagement of the Peace Corps requires enough funding and more trained volunteers to meet the expectations of the host countries. But it

seems that apart from the funding one difficulty that could come along the path of the organization is to move from its traditional locus of competence, that is the Third World, to a developed country where the realities are not the same. That is where the challenges of sending volunteers with the appropriate skills come in. The US embassy in Moscow is clear about this when it states that:

“In choosing to allow the Peace Corps to be among the first American agencies to serve in the new Russia, the government of the U.S. gave a new mission to a group of men and women whose institutional history had included service mainly among third world or developing nations. Service of the neediest of the needy has been a hallmark of the Peace Corps since its inception more than thirty years ago. In sending volunteers to Russia--a nation whose educational history and culture are second to none in the world--the Peace Corps faced the challenge not of providing assistance to those who wished to improve a deprived or marginalized education, but to work along side of those who faced the monumental task of transforming a massive and successful education system into one that promoted the openness and creativity required to cope successfully on the international information market.”  

No doubt this is a matter of controversy for some advocate that the Russia is not a third world country and therefore does not need the peace corps volunteers and others support that there should not be any artificial limit to the expansion of the organization.

In the words of Paul D. Cordell Peace Corps director in the 1990’s, Peace Corps should not limit itself in sending volunteers to developing nations. He says “there should be no artificial barrier on the pursuit of peace’ for him it is ‘ as important to promote small business development in Poland as it is to teach child nutrition in Paraguay.”

36 ibid.
37 Worsnop, op cit., 61
Edward Patrick Healey, a former Director of the Peace Corps in Zaire, took another stand on the question. He argues that the peace corps was ‘conceived as a way for the idealism and skills of the U.S citizens to help countries with severe development needs’ in his argument, as some of the best educated in the world, eastern European countries and particularly Russia do not need expatriate teachers.”

38 A pertinent argument that should be considered to have an effective program. It seems somehow that as assistance in Russia is more a help to facilitate the transition from a socialist economy to a market economy the type of teaching provided now might be very useful for the country.39

The evolution of the Peace Corps shows continuity and change in the organization and overall continuity and change in the history of the U.S foreign relations. The organization may have had some strategic and political motives at its creation but today it appears that above all it is an institution that has its roots in the American culture and tradition of humanism.

The Peace Corps has shown that where diplomatic negotiations failed, a humanitarian cultural policy based on people-to-people cooperation can be more effective. It is undeniable somehow that the organization has both political and cultural roots. The irony of the contemporary ideological and politico-economic history of the International relations has been to see an organization that was supposed to contain the expansion of a world power to be serving with the boundaries

38 ibid.  
39 U.S. embassy in Moscow, “Peace Corps in Russia”, op cit.: Volunteers offer to transfer business knowledge and skills by teaching in institutes, offering business seminars, providing Internet training and access, sources of information and contacts, and offering their Russian clients basic business know how such as how to write a business plan, do due diligence and market themselves their products.
of that same power (Russia) and in its zone of influence (Eastern Europe). There could not be any meaningful sign of a victory of one system over the other than that of the Peace Corps serving in Russia. As many vindicationists’ theoreticians would put it, the capitalist West led by the US had won the Cold war over the socialist eastern European countries led by the Soviet Union.  

The Peace Corps was a cultural but strategic respondent to the spread of the soviet ideological and political expansion in the world. In an international atmosphere in which the American image was fading away because of the conflict between the western allies and the war in Vietnam, the Peace Corps has been created to give another image of the United States it became important to prefer a cooperation based on a relation between people not conditioned by ideological principles. Today as its evolution shows, it is most likely on a more humanitarian level, an instrument of development, participating in an effort to save lives of millions of individuals as senator Christopher DODD explained it in his testimony:

“I also believe the Peace Corps, while not single-handedly transforming the world as some early supporters believed possible, has had enormous success in tackling small pieces of the development problems around the globe. Most without fanfare, Peace Corps volunteers have been improving health systems, water supplies, food sources, nutrition, housing, forestation and education.”

With a much confident tone he would add that ‘If people live longer and healthier lives in poorer countries today, if children have more nutritious meals and better

---

40 Allen hunter op cit, p.2
schooling, it is in no small measure a result of the contribution of fellow Americans who have given a few years of their lives to the cause of development and Peace.” 42

Nationalism and Nation-building in Africa: still a way to go.

Reflecting on colonialism, Meredith Martin argues that one of its consequences on Africa was the ethnic division between Hutu and Tutsi. Among others the Rwandan genocide shows one of the essential problems of post independence Africa.

At the center of the debate is the failure of independent Africa to build nations with the kind of loyalty that helped overcome the colonial power. African countries inherited their boundaries from of colonial era and managed with somewhat a successful skill and mechanism to maintain them boundaries for more than four decades after independence. Viewed from this perspective, the creation of African states can be classified as a political success since it brought some stability and peace on the continent. This is more noticeable in west Africa to the extent that Arie M. Kacowicz classified it as one of the ‘zones of peace’ in the world along with: South America, Western Europe and North America. However, the formation of a national identity, in many of these countries is still a project not fully accomplished.

Discussing African effort of nation building require to trace back the root of the nationalist feeling of Africans especially from the colonial experience. A look at the African map, show almost fifty states; some tiny like Gambia other giant like Sudan or former Zaire with well defined boarders. Unfortunately this empirical signs of statal entity does not reflect in reality a sense of national identity in most of these states. In many cases, these boarders are just covers for too many ethnic, regional, economic frustrations that make the existence of nation-state in Africa an elusive concept. This is

---

quite ironic for a continent that has been able to generate the patriotic feeling that led to its liberation. What prevents African states to build cohesive entities free from cleavage and why didn’t the unity of decolonization era prevail at the independence?

***

Africans had a tradition of governing themselves before the Europeans came. Traditional African society was a society of tribe, ethnic group and African had their way to express their belonging and loyalty to these primordial elements of their identity. This makes nationalism in Africa peculiar because it is “a subjective feeling of kinship or affinity shared by people of African descent. It is a feeling based on shared cultural norms, traditional institutions, racial heritage, and a common historical experience.”  

Contrarily to what other might think African nationalism was no generated by colonialism. For Vincent Khapoya, “It is worth stressing that African nationalism, like nationalism elsewhere in the world, is not new; it is as old as ancient times. In fact, in Africa, contrary to a common view in western scholarship of Africa, African nationalism predates colonialism. In the annals of African history, one finds coherent organized African communities with a very strong sense of identity, prepared to defend their territorial and cultural integrity against those who would want to destroy or undermine them.”

These traditional African forms of resistance, expression of loyalty and identity will be transformed by colonialism. The oppressive regime of colonialism generated new style of resistance giving a new turn with different stakes to African nationalism. Ali Mazrui divides its evolution into four stages:

---

4 Ibid.
“There was first the phase of the pre-Second World War elite agitation for greater autonomy. There was then the phase of popular involvement in the struggle against Nazism and Fascism. There was, thirdly, non-violent popular struggle for full independence after the second world war. Finally, there was armed engagement for the political kingdom—the guerilla wars against white minority governments especially from the 1960’s onward.”

Along with this succinct periodization Vincent Khapoya identifies a set of catalytic factors that help develop modern African nationalism. He mentions the colonial experience itself, the influence of church and modern education, the two world wars and the influence of pan-Africanism and the opportunities offered by the league of nations and the United Nations for Africans to express African issues and concerns.

In his words, Africans have bad memories of the colonial regime because it was mainly by every means “negative, exploitative, and oppressive experience.” Some of them may have benefited from it but in general they “were humiliated, their culture denigrated and distorted, and their land confiscated by European immigrants, who were encouraged to come to Africa as pioneer farmers and which resulted in severe consequences for African communities. Large plantations were established for growing cash crop.”

A human being subject to any oppressive situation can only bear so much. This oppression and humiliation of Africans gradually generate resentment against the system. As it is commonly said you can fool a man one time but you cannot fool all the people all the time. Soon resistance began and took different forms. The first were mostly violent

---

5 General history of Africa / UNESCO . VOLUME VIII: AFRICA SINCE 1935 Edited by A. A. Mazrui 1993, p 106
6 Khapoya 151
and took the form of ‘armed revolt’ [7]. But faced with a fierce and ruthless repression by the colonizers, different strategies would be adopted later on. These were in forms of grievances presented by associations related to issues such as low wages, inadequate prices for cash crops etc…

One may think that a man suffering needs not to be reminded that he is. Well sometime the very astute and subtle way the mechanism of oppression is implemented requires some leadership to make the victims aware of their situation. Modern education through the elite provided this leadership in colonial Africa. Missionary churches were one of the (if not the) first institutions to have started modern education in colonial Africa. In that respect they did play a catalytic role, as Khapoya explained, (indirectly probably or more specifically a miscalculated role) in developing African nationalism: “

In many African colonies, mission schools were the main educational institutions, and the expense of educating Africans was often borne entirely by the missions. In other colonies, the colonial government provided the funding, but the teaching staff and the curriculum were the responsibility of the missions” [8]. Apart from spreading the gospel, these missionary churches were not only also imparted the mission of asserting the superiority of the western values but also that of helping raise the level of productivity of the Africans. This clearly shows that the civilizing missions of colonization that was the motto of some colonial powers like France was just a cover for the real goal: serve the interest of the colonizers and the colonial power.

Africans found it useful and important to have a western education because it is a common belief that educated African will become the link between Africans and the

---

[7] ibid
[8] Khapoya ibid., 153
Europeans. Leaders like Jomo Kenyatta and Leopold Sedar Senghor’s respectively from Kenya and Senegal show that Africans were right Both through their mastery of European languages were able to present the beauty of African values and culture to the west while criticizing as well the horrors of colonialism on the African people. They both became president of their country. 9 African elite through modern education, acquired the skills that help them to articulate their demands and question the legitimacy of colonial authorities; it also turned out to be a powerful medium of acculturation of Western Christian (and political) values, values that the African very cleverly and ingenuously, to the utter surprise of his colonial master, incorporated into political debate over their struggles. As Ali Mazrui puts it: “The destruction of the ‘pagan’ African culture was naturally accompanied by attempts to replace it with some aspects of the English way of life. Next to making the boys and girls upright Christian, this was an important aim of the Christian educators.” He concludes that missionary education was perhaps far more successful at producing a new cultural African than a consistent Christian.10 In fact many of the first leaders of independent Africa were products of missionary education. One could name few among them like Apart from Senghor( Senegal), and Kenyatta( Kenya), list include Julius Nyerere ( Tanzania), Kenneth Kaunda ( Zambia), Nnamdi Azikiwe ( Nigeria), and Kamusu Banda ( Malawi). 11

By showing a clear dichotomy that existed between its teachings and its daily practices, the Church contributed to the growth of African nationalism. Its contemptuousness to African traditions and cultures contradict sharply with its doctrine

9 Khapoya p.,154-5
10 Khapoya p.,155
11 ibid
of spiritual kinship of every human being regardless of his ethnoroacial origins.\textsuperscript{12} The church’s silence on colonial oppression, its constant way of shutting down any attempt by Africans to discuss political affairs and issues related to Africa at school would soon lead to the birth of African churches lead by African enabling Africans to pinpoint the double standard of the colonial church. \textsuperscript{13}

Until then the myth of the white man superiority on which most of the colonial enterprise rested was still not seriously challenged. It would take the two world wars to persuade Africans (with the experience of ex-service men) that in peace as in wars human experiences –whether white or black- are the same and therefore there is no difference between Europeans and Africans.

The second world war played an important role in weakening the colonial powers. France for example was humiliated by Germany, a defeat that ‘helped to destroy the myth of its imperial invincibility.” England was impoverished by the war and war forced within a couple of years to let India go.\textsuperscript{14}

For Davidson there is not much difference between African nationalism and European nationalism. Just like the rights of man was the main pedestal of European nationalism, so were the principle of equality and freedom to the African nationalism. “In Africa, as in Europe,” he explained, “the driving inspiration was not that all men should be divided by becoming nationals, but that all men should be united by becoming free.” \textsuperscript{15}

Most of the effort of resistance /defiance developed under the colonial oppression would eventually lead to the independentist movement of the post second war period. By the period following the Second World War, African nationalism became more established probably because of the influence of the African intellectual with the Diaspora community particularly with the pan-African movement. “Pan-africanism started as a protest movement against the racism endured by black people in the new world. It then slowly evolved into an anti-colonial struggle instrument, “dedicated to bringing about African leaders and intellectuals who hoped that perhaps in the future, African states might be federated as the United States of Africa.” 16

If some of the Africans were more conciliatory with the colonial administration, a large part of them were also defiant to those governments. Many of them were the pioneer of the independence movement. By the sixties, many African countries became independent. But the consciousness and the solidarity gained during the decolonization period will soon prove ephemeral. Ethnic division and other internal political rivalries put on hold the project of nation-building in many newly independent African states. The lesson from the fight against the white man (colonial power) could not unfortunately be wisely used by the newly these countries. If many of them have kept the boundaries inherited from the colonial powers, their effort to build a united nation confined within those boundaries after independence soon became a daunting task that many are still facing today almost fifty years after the independence. Bringing together various ethnic groups speaking different languages under the same flag has not been easy. Meredith Martin summarizes these post colonial challenges as follows:

16 Khapoya, p.166
“The most difficult task facing Africa’s new leaders was to weld into nations a variety of different peoples, speaking different languages and at different stages of political and social development. The new states of Africa were not ‘nations.’ They possess no ethnic, class or ideological cement to hold them together, no strong historical and social identities upon which to build. For a relatively brief period, the anti-colonial cause had provided a unity of purpose. Nationalist leaders had successfully exploited a variety of grievances among the urban and rural populations to galvanize support for the cause. But once the momentum that they had achieved in their drive for independence began to subside, so other loyalties and ambitions came thrusting to the fore.” 17

The case of Benin (my country, ex French colony under the name of Dahomey) is quite illustrative of what followed the independence. The North is peopled by ethnic groups (Dendi, Somba, and Bariba) that do not culturally like to relate to the Southerners who practice mostly traditional religions and Catholicism. Soon after the independence in 1960 the cleavage North-South became of the main sources of political instability for the perception of Northerners’ identity was different. They did not like to be referred to as Dahomeans because Dahomey derives from the kingdom of Abomey (Dan Home, in the womb of snake) which is a predominantly Fon kingdom. Lack of trust in Fon from Abomey explains some frustration and resentment among the northerners. Every time a Fon is in power, there is fear of not being associated with the power. Since for a long time many northerners have been in the national army, the result was the political

instability the country went through from 1960 to 1972. The last putsch was by Mathieu Kerekou (a northerner) who rules under a Marxist government from 1972 to 1990. As a way to solve this crisis of identity, Kerekou would change the name of the country in 1975 from Dahomey to Benin.

Meredith Martin insight on the political condition is still pertinent in the case of Benin. But one should recognize that the political changes of the 1990’s created a stable environment where every citizen of the country is able to express under the law his frustration and disagreement with the central government without putting the national stability in jeopardy.

Through this example it is clear that the political management of many countries has not been completely able to avoid the very problem that engenders resentment and defiance under the colonial oppression: the non association of some groups to the ruling system. The result is a fragmented sense of identity and priority given by many Africans to their ethnic origins over their loyalty to their country. That is the point raised by J. Isawa ELAIGWU when he claims that “Africa’s supreme political struggle in the post-colonial era can be reduced to two paramount longings-a striving to give greater coherence to African nationhood, and a striving to lend greater stability to African statehood. The crisis of nationhood is a crisis of flawed collective identity. The crisis of statehood is a crisis of unstable authority.”

The flawed collective identity poses a serious question about the possibility of reaching national cohesion in many African countries and also makes us question what

---

the meaning of the concept of ‘nation’ especially in a context where different people of different languages share the same space and owe loyalty to the same authority.

Elaigwu suggests three definitions for the concept of nation:19 The first could be a “stable, historically developed community of people with territory, economic life, distinctive culture, and language in common’ or “the people of a territory united under a single government; country; state’ or finally it could refer to “a people or tribe.”

The first definition would be applicable to some extent to African countries because of their historical experience of foreign domination. But one that is missing but is on the other hand provided by the European domination is the common language. Since colonization gave many African countries a lingua franca, it is possible to argue that regardless of their ethnic difference African populations like the Ibo, Hausa and Yoruba in Nigeria can be united under the same nation.

The second definition is similar to what is practiced in international law as it has all the element of sovereignty that are: a government, a population and a territory. The only thing it did not list is the army. All these elements are present in the case of African countries.

The last definition is very narrow and yet quite relevant in the African context. Following that definition there could be many nations in a single African country. The problem is how to bring them together and form a larger nation. Would that involve abandoning one’s ethnic identity? For Elaigwu nation-building does not involve a transfer of loyalty from a ‘narrow or parochial levels’ of ethnic groups to a larger unit. Ethnic identity he contends is not transferable. Nation building for Elaigwu involves “widening the horizons of identity of parochial units to include larger units such as the

19 ibid, p.437
state.”

He distinguishes between the vertical dimension of nation-building and the horizontal dimension of the nation-building. The vertical dimension requires an acceptance of the legitimacy of the central authority (government) and the horizontal dimension which requires that each member of the civic society accept the other members as equal and sharing the same rights. He gave the example of Nigeria and concluded that the end of the war indicated the acceptance of the central authority by every Nigerian as the symbol of the country. What Elaigwu was silent about is the condition of the acceptance of the central government. Which form should that acceptance take? Should citizens of Africa accept a government that is not representative of their interest especially if it comes to power by a putsch?

Besides one may ask why isn’t the ‘widening’ of horizons happening so fast? It is clear that the rhetoric and the practice of power are still not completely inclusive in many African countries. Political discourse is not persuasive enough to incite cross regional, or cross ethnic adherence and support. In electoral periods for example, the ethnic origin of the candidate in many respects plays an important role in the decision-making of the voter especially during presidential elections. That is what Meredith argues when she explains that “in a continent where class formation had hardly begun to alter loyalties, ethnicity provided the strongest political base. Politicians and voters it was alike came to rely on ethnic solidarity. For politicians it was the route to power. They became, in effect, ethnic entrepreneurs. For voters it was their hope of getting a slice of government bounty.”

---

20 Elaigwu p.438
21 Elaigwu p.439
22 Meredith Martin, 156
Despite the pertinence of such analysis, it is important to put it in context. One should recognize some positive changes that occurred in the African politics in the nineties and noticed that the ethno regional division that was very sharp at the beginning of independence is gradually though slowly becoming dimmer and blurred in many countries. If Africa is still one of the continents lagging behind in terms of literacy, the literacy rate in many states is certainly much higher than what it used to be in the colonial days. Education has somewhat had an impact on the way Africans from each country perceive their identity. More and more political agenda gets priority over empirical elements of belonging (example the recent elections in Benin) forcing voters to sympathize with a candidate who offers more promises of better fulfillment of their expectations. May be moments of crises are catalyst of successful effort of nation-building.

***

African nationalism may have not been born under colonialism but the latter did transform its history. Responding to its oppressive mechanism, African nationalism was able to create Africans awareness about Europeans’ exploitation and mechanism of oppression this help African elite galvanize efforts from Africans from different walk of life to criticize the missionary church, create African churches and more importantly launch the decolonization movement that would result in the independence of the post second world war era.

Unfortunately the departure of the Europeans did not ring the bell of Africans problems. If anything it brought to light other issues like the unity of Africans as nations that were just put on hold by the colonial administration. Political instability, putsch and
other ethnic conflict soon revealed that African was still a continent of fragmented identity where nation-building is not yet accomplished. But it would be too pessimistic to conclude that African nation-building have failed. Rome was not built in day as the proverb says, with the smooth transition toward new leadership on the continent, new hopes seems to be on the way the question is for how long should we have to wait? And to what extent should the external factor (influence would be limited?)

ABSTRACT
In the past two decades, numerous commentators have advocated closer economic integration between Australia and New Zealand. Given the significant dependence on trade for both countries, one key issue involved is the responses to terms of trade shocks. There are two potential sources of difference between the two economies. The first is the significant difference in the exports of the two countries. The second is that the terms of trade and real effective exchange rate are not as strongly correlated for New Zealand as for Australia. This paper investigates empirically the responses of the two economies to terms of trade shocks for the period of floating exchange rates. A VAR in levels model, estimated for the period 1985:2 – 2006:3, leads to two principal conclusions: firstly, for both economies real GDP, the real exchange rate and the price level respond as theory predicts; secondly, the Australian economy adjusts more rapidly than New Zealand’s.
Introduction

For almost two decades, prominent New Zealand people and organisations have advocated even closer economic relations between New Zealand and Australia than exist currently. Some have promoted the formation of a currency union with either Australia (the so-called “Anzac dollar”) or with Australia and the United States. For example, in a speech to the United Nations in September 2000, the New Zealand Prime Minister, Helen Clark, stated that currency union with Australia might be one of those things that become inevitable as the two countries move closer to economic integration. Others, such as the Australia-New Zealand Business Council, have advocated a true single market formed by Australia and New Zealand (the “borderless market” concept). Yet others, such as Professor Bob Catley, a former Australian Labour Party MP, in his book *Waltzing with Matilda*, have argued that New Zealand is too small to go it alone in the modern world and should apply to join Australia. (Catley, 2001)

As recently as December 2006, Australia’s House of Representatives standing committee on legal and constitutional affairs considered the possibility of harmonising the legal systems of the two countries, suggesting that Australia and New Zealand should also consider introducing a common currency. This proposal was rejected emphatically by New Zealand’s Minister of Finance, Dr Michael Cullen. Dr Cullen told reporters that the idea of a closer union between Australia and New Zealand, specifically a common currency, had been “mooted before and rejected before”. Dr Cullen stated that the Australian Government has said that New Zealand is free to adopt Australian currency but “we are not going to do that.” Dr Cullen said that while that might lessen volatility in the Australian-New Zealand dollar cross rate, it “doesn't necessarily lessen volatility with the rest of the world and most of our trade is denominated in US dollars not Australian dollars”. In late January 2007, an official New Zealand government press release issued immediately after the annual bilateral talks between Dr Cullen and the Australian Federal Treasurer, Peter Costello, stated that the talks had provided “momentum” for “the development of an Australia-New Zealand Single Economic Market”.

The modern trans-Tasman trade relationship was started by The New Zealand Australia Free Trade Agreement (NAFTA), signed in 1965. NAFTA accepted in principle that both countries could gain from freer trade between them, but New Zealand’s continued adherence to import licensing protected the domestic economy against competition from Australia. Although a full free trade agreement – the Closer Economic Relationship (CER) – was not reached until 1983, by the mid-1980s New Zealand and Australia had developed considerable integration in their economies and labour markets. Full free trade under CER was achieved by 1990 (apart from some irritations such as blocks on New Zealand apple exports). The debate generated, which continues today, forms the background motivation for this study. 1

Although for more than half of the 20th century there had been a net population flow from Australia to New Zealand, a reverse flow began in the middle of the 1960s. This was a direct reflection of Australia’s superior economic performance from the 1960s onwards, when the two economies began diverging with faster growth in Australian real GDP per capita than in New Zealand’s real GDP per capita.

---

1 Relevant background material that can be accessed readily is provided by (Deane *et al.*, 1981), (Hargreaves and McDermott, 1999), (Brash, 2000), (Grimes *et al.*, 2000), (Grimes, 2000), (Bjorksten, 2001), (Holmes, 2002), (Nixon, 2003), (Haug *et al.*, 2003) and (Hunt, 2005).
Figure 1 shows that a persistent outflow of permanent and long-term migrants from New Zealand to Australia began when the two economies started diverging. There is considerable empirical evidence to support this claim, some of which is presented in (Auld, 2006).

The principal reasons for the growing gap in real GDP per capita include New Zealand’s lower export growth arising from the dominance of the land-based primary sector, New Zealand’s lower labour productivity (principally due to lower capital per worker for reasons that are unclear) and New Zealand’s smaller scale and greater degree of geographical isolation. Compared with New Zealand, Australia has roughly 28 times the land area, 5 times the population and 6.5 times the real GDP. As measured by proximity to World GDP, New Zealand is the most remote country in the world. Australia is New Zealand’s biggest trade partner, whereas New Zealand is a small partner for Australia.

The impact of terms of trade shocks

There has been controversy over the hypothesised superior ability of flexible exchange rates compared with fixed exchange rates to insulate the economy against real shocks (such as terms of trade shocks) ever since the hypothesis was advanced by (Friedman, 1953). According to the Mundell-Fleming-Dornbusch model, a rise in the terms of trade raises exporters’ incomes, resulting in greater output and employment in the export industries. With floating exchange rates, greater foreign exchange earnings cause the nominal exchange rate to appreciate. Rising output and employment puts upward pressure on interest rates and the price level. When nominal exchange rates adjust more quickly than prices, the real exchange rate appreciates and undermines international competitiveness, which puts a brake on the expansionary impulse from the terms of trade shock. (Obstfeld, 1985) and (Caves, 1993) review the roles of fixed and flexible exchange rates. Textbook treatments of the basic ideas can be found in (Obstfeld & Rogoff, 1998) and (Layton, 1994).

---

2 This is the average between 1988-2006 for real GDP measured at 1990 US dollars (converted at Geary-Khamis PPPs). Source: Groningen Growth and Development Centre and the Conference Board, Total Economy Database, January 2007, [http://www.ggdc.net](http://www.ggdc.net), ted071.xls
There have been numerous studies that consider the links between real and nominal shocks and the real exchange rate. For example, (Bagchi et al., 2004) examined the effects of the terms of trade and the expected real interest rate differential on the real exchange rate for small, open, developed economies using cointegration analysis to find long-term links. Of interest to this study is the finding that for both Australia and New Zealand, a rise in the terms of trade causes the US dollar-home currency real exchange rate to appreciate (see their Table 3). (Bjornland, 2004) used a structural vector autoregression (SVAR) model to investigate for Norway the extent to which the real exchange rate was a shock absorber or a source of shocks. Her investigation addressed the issue of whether Norway should remain outside the European Union and thus the European Monetary Union. The variables were GDP, the real wage, the real exchange rate and the unemployment rate. The results were somewhat ambiguous in that the relevant outcomes depended on whether the shocks were real or nominal.

(Edwards and Yeyati, 2005) address the issue of the impact of terms of trade shocks on economic performance under alternative exchange rate regimes. Of particular interest to them was whether flexible exchange rate regimes moderated the impact of growth when economies were hit by terms of trade shocks. They found evidence that countries with more rigid exchange rate regimes were harder hit by terms of trade shocks. Unlike most studies, which apply variants of the VAR methodology, Edwards and Yeyati used a two-equation dynamic model for growth in real GDP per capita for a large sample of countries. Their first equation provided estimates of long run growth rates for the countries. Their second equation was formed like an error correction model that incorporated deviations from the long run growth rate arising from terms of trade and other (including political) shocks. Using a de facto classification of exchange regimes, they found that flexible exchange rate regimes moderated the real impact of terms of trade shocks, both in developing and industrial economies. They also found asymmetries between the responses of output to positive and negative shocks, with there being greater asymmetries for countries with more rigid exchange rate systems.

**A comparison between Australia and New Zealand**

(Chen and Rogoff, 2002) argued that “from a macroeconomic perspective, Australia, Canada and New Zealand are near perfect examples of...well-developed, small open economies...where internal and external markets operate with little intervention and where floating exchange rate regimes have been implemented for a sufficiently long period of time.” Floating exchange rate regimes were adopted by Australia in December 1983 and by New Zealand in March 1985. This paper explores the relationship between terms of trade shocks and the real exchange rate for the Australian and New Zealand economies during the era of floating exchange rates.

There are two potential sources of difference between the Australian and New Zealand economies in the responses to terms of trade shocks. Firstly, whereas Australian exports are principally commodity based (coal, iron and gold), New Zealand continues to export mainly dairy, meat and forestry products. Secondly, New Zealand’s terms of trade and real effective exchange rate are not correlated as strongly as Australia’s. Figures 2 and 3 chart the real effective exchange rate and the terms of trade for both countries.

---

3 (Broda, 2004) and (Hoffman, 2005) study the relative performance of fixed and flexible exchange rates for developing countries.
Methodology and data

Table 1 provides a complete list of the variables and the sources of the data used in the analysis. The data are quarterly and cover 1987:2 to 2006:3. There are two reasons for choosing this period: the era of floating exchange rates is spanned for both countries and consistent data for New Zealand real GDP exists currently only from 1987:2.

$^a$ The levels of LRGDP and LCPI were estimated with intercept and trend, while NZD90, AUDS90, and LRER were estimated with intercept alone.

For end-of-quarter data for the period 1987:2 – 2006:3, the contemporaneous cross-correlation coefficient between the real effective exchange rate and the terms of trade for New Zealand was 0.24, whereas for Australia, it was 0.50. An implication of such lower correlation is that New Zealand’s real exchange rate is not as effective as Australia’s as a buffer against external shocks. Therefore, given the differences in the export mix and the correlations between the terms of trade and the real exchange rate, it is likely that there will be differences between the two economies in their responses to shocks to the terms of trade.

The augmented Dickey-Fuller (ADF) test for unit roots were applied to the levels and first differences of the time series using EViews 5.1. The resulting ADF test statistics, with their prob-vals in brackets, are presented in Table 2. Most of the variables can be classified as nonstationary I(1) variables. At first sight, the result for New Zealand’s CPI is rather surprising, but it is supported by the DF-GLS, Phillips-Perron and KPSS tests. The CPI’s apparent stationarity appears to be the consequence of a change in March 1999 in the calculation of the index, when interest costs were excluded. ADF tests for the data prior to, and after, 1999:1 indicate that LCPI is I(1).
(Broda, 2001) was followed in that a vector autoregression (VAR) model was used that incorporated the terms of trade, real GDP, short term interest rates, consumer prices and the real effective exchange rate. Under the small country assumption that the terms of trade are exogenous, the impulse response functions reveal the impact of shocks to the terms of trade.

When the variables are nonstationary, the principal specification problem is whether estimation should be in levels or first differences or as a vector error correction model. If cointegration exists and the cointegration vectors are known, the VAR should be estimated as a vector error correction model.

Estimation in levels is chosen here for a number of reasons. Firstly, the Johansen procedure provided mixed evidence for cointegration among the variables for each of the countries, with the number of possible cointegrating vectors being ambiguous. Secondly, this study is concerned with the relationships between the terms of trade and the other variables in the system rather than with the cointegration structure. Thirdly, (Sims et al., 1990), (Stock and Watson, 1988) and (Hamilton, 1994) provide theoretical support for estimation in levels. Estimation in levels implies that potential cointegration relationships between the non-stationary variables are determined implicitly within the model (Hamilton, 1994). Fourthly, when cointegration information is taken into account, parameter estimates are more precise and efficient, whereas estimation in levels results in inefficient but consistent estimates of the VAR parameters. Fifthly, if the wrong cointegration restrictions were imposed, the estimates might be inconsistent, resulting in convergence to the wrong long-run equilibria and biased short-run dynamics.

For both Australia and New Zealand, the VAR model estimated used the reduced form

\[ X_t = \sum_{k=1}^{p} A_k X_{t-k} + Z_t + u_t \]

where \( X_t \) is a vector of \([t, y_t, i_t, p_t, e_t]\), with \( t \) being the log of the terms of trade, \( y \) the log of seasonally-adjusted real GDP, \( i \) the short term interest rate, \( p \) is the log of the CPI and \( e \) the log of the real effective exchange rate. \( Z_t \) is a vector of deterministic variables (constant, trend, dummies).

EViews 5.1’s lag selection tests were used to choose the number of lags. As these tests tend to suggest different lags for the VAR, a judgement was made to use 3-lags, a constant, a linear trend and dummies for outliers and various events. In particular, for New Zealand, dummies were used to account for the change in the goods and services tax (GST) rate from 10% to 12.5% in June 1989. The change in the CPI index in March 1999 appears to have no impact on the estimations. For Australia, the introduction of GST in July 2000 appears to have no impact on the results. Although EViews was used for the estimation of the VARs and the impulse response functions, PcGive 11.0 was also used to identify the outliers from the residuals. PcGive’s comprehensive output indicated that there was still some autocorrelation arising from the short term interest rate in New Zealand’s case and some lack of normality in the residuals arising from real GDP in Australia’s case.

---

4 See Appendix One for some tests and vector error correction impulse functions for real GDP.
5 (Phillips, 1998) offers quite severe criticism of estimation of VARs in levels of non-stationary variables. (Ramaswamy and Sloek, 1997) present further discussion of the issues involved.
6 There were no significant differences between the unrestricted VARs estimated by EViews 5.1 and PcGive 11.0.
Results

Figure 4 displays the estimated impulse responses for 25 quarters when a one standard deviation rise in the terms of trade occurs. The IRFs have ±2 standard error confidence bounds (the dashed lines) based on Monte Carlo simulations with 2000 draws. As predicted by the theory, for both countries, a rise in the terms of trade causes rises in real GDP, short term interest rates, the price level and the real effective exchange rate.

What is of greater interest is that the impact of the terms of trade shock is greater on the New Zealand economy. Whereas the impact on Australian real GDP is weak and lasts for about 7 to 8 quarters, expansion of New Zealand’s real GDP is significantly stronger and lasts for about 12 quarters. The rise in the terms of trade has a greater impact on Australian interest rates and prices than New Zealand’s but a weaker impact on Australia’s real effective exchange rate. An oddity in the results for New Zealand is the initial drop in the short term interest rate following the terms of trade shock. Estimation of the model over 1990:1 – 2006:3, the period of inflation targeting, indicates that the short term rate rises from the start. This points to the oddity as arising from the data prior to 1990:1, possibly a consequence of the impact of the GST change.

Conclusion

There is an important issue that has been ignored in this study. The Optimal Currency Area literature argues that membership of a currency union results in loss of a country’s independent monetary policy and the ability of the exchange rate to act as a shock absorber. In his review of Optimal Currency Areas, Buitert argued that with the “high degree of international financial integration, market-determined exchange rates are primarily a source of shocks and instability”. In their paper entitled “The exchange rate - A shock-absorber or source of shocks? A study of four open economies”, (Artis and Ehrmann, 2004) address this issue for the UK, Canada, Sweden and Denmark, all of which are faced with option of a monetary union with a large neighbour. Their SVAR study indicates that the benefits of the exchange rate as a shock absorber depend on whether the shocks are symmetric or asymmetric relative to the large neighbour. If the shocks were asymmetric, the exchange rate can play a role as a shock absorber. If the shock were symmetric, the exchange rate’s role as a shock absorber is limited. (Farrant and Peersman, 2006) analysed the role of the real exchange rate with an SVAR model for the UK, the Euro area, Japan and Canada relative to the United States. They found that the exchange rate was more a source of shocks than an absorber of shocks.

An unstated assumption of the VARs estimated in this study is that the exchange rate acts solely as a shock absorber. No investigation is made as to whether the exchange rate acts as source of shocks. Given this proviso, the evidence from the VARs indicates that the exchange rate is a better shock absorber for Australia than New Zealand, but it is impossible to conclude anything from this evidence about the merits of a currency union. It is also impossible to say whether the adoption of the Australian dollar would strengthen the exchange rate as a shock absorber for New Zealand. More investigation into these issues is needed.
Figure 4: 1 standard deviation shock, ±2-SE Monte Carlo error bands (2000 draws)
APPENDIX

Possible cointegration between the variables LTOT, LRGDP, D90, LCPI and LRER was tested with the Johansen procedure. For EViews 5.1’s Case 3 (intercepts in the CE and VAR, linear deterministic trend in VAR), the results for New Zealand data were:

Under the assumption that there are, in fact, two cointegrating vectors, a vector error correction model was estimated under Case 3. The cointegration vectors are reported in Table 4. For the equivalent Australian data over the same period and Case 3, the trace test indicated one cointegrating vector whereas the maximum eigenvalue test pointed to two cointegrating vectors. This is not an unusual outcome. With small samples, there is evidence that the Johansen procedure over-rejects when the null is true. (Harris and Sollis, 2003) have a good textbook discussion of the problems raised when using the Johansen procedure, especially when dummy variables are present.

A vector error correction model was estimated under Case 3 and the assumption of two cointegrating vectors. (Estimation assuming one cointegrating vector produced essentially the same impulse response functions.) The negative signs on LRER mean that a rise in the terms of trade causes the real exchange rate to appreciate.

Figures 5 and 6 show the impulse responses arising from the two estimations. Assuming that the vector error correction models are valid, it is clear that the central conclusion from the
levels estimation holds: New Zealand’s real GDP is more responsive to terms of trade shocks.

Estimation of volatility in financial markets is of considerable practical importance. There has been evidence that daily bilateral exchange rates for some countries embody multiple volatility trends. This paper applies Component GARCH and state space stochastic volatility models to New Zealand’s daily bilateral exchange rates with its major trading partners for the post-float period (July 1986 to January 2007). The CGARCH models provide convincing evidence of the existence in New Zealand’s daily exchange rates of time-varying permanent and transitory components. Principal components analysis is made on the volatilities extracts by the CGARCH and state space models to investigate the possibility of common trends in the bilateral daily exchange rates. The permanent and transitory components in the bilateral exchange rates are weakly correlated with each other. This study reveals no convincing evidence for the existence of a common trend in the exchange rates.
The volatility of daily exchange rates  
A New Zealand case study

Introduction

A key property of many economic time series, especially for financial assets, is that their volatility varies over time. The tendency in financial time series for big shocks to be followed by big shocks in either direction and small shocks to follow small shocks is called volatility clustering. Volatility clustering is particularly marked in high frequency data such as daily or weekly returns in shares and exchange rates. Figure 1 presents the daily returns for the USD/NZD exchange rate and a 20-day moving average of the square of those returns for the period March 1998 – February 2007. Using the squared returns as the measure of volatility, it is obvious that periods of higher volatility punctuate periods of lower volatility.

This paper investigates the possible existence of long term and short term components in the most important bilateral exchange rates with the New Zealand dollar. Various researchers have suspected the existence of multiple components in higher frequency returns for financial assets. (Harvey et al, 1994) used unobserved components models to contend that were two volatility trends in daily US dollar exchange rates with the German mark, the British pound, the Swiss franc and the yen.

As part of a larger study of forecasting, (McMillan et al, 2004) considered the existence of multiple components in UK stock market indices. Recent papers studying financial asset markets that are closest to this paper are (Black & McMillan, 2004) and (Ané, 2006). Black and McMillan found evidence supporting the existence of short term and long term volatility components in a number of US dollar exchange rates. Ané found that decomposition of the volatility in Hong Kong stock market into short and long components improved the ability to forecast long term volatility.

The principal approach used is the application of the Component GARCH (or CGARCH) model introduced by (Engle & Lee, 1993) to the daily returns to foreign exchange rates with the New Zealand dollar. Structural time series models are also applied in the attempt to find supporting evidence for the existence of multiple trends in the daily returns.

Figure 1: The data are for the US/NZ dollar daily exchange rate (March 1998 – February 2007)
Methodology

One way to model volatility clustering is to allow the current variance of the time series to depend on its past values. (Engle, 1982) incorporated this idea in his concept of autoregressive conditional heteroscedasticity (ARCH). His key idea was that while the unconditional error variance, should it exist, might be constant, the conditional error variance can be time-varying. (Bollerslev, 1986) extended the ARCH methodology to incorporate a lagged dependent variable in the conditional variance (the Generalised ARCH or GARCH model).

In its general form, the GARCH(p, q) model can be formulated as:

\[ X_t = a_0 + \sum_{i=1}^{p} a_{-i} X_{t-i} + \varepsilon_t \]  \hspace{1cm} (1)

\[ h_t^2 = \alpha_0 + \sum_{i=1}^{q} \alpha_i \varepsilon_{t-i}^2 + \sum_{i=1}^{p} \beta_i h_{t-i}^2 \]  \hspace{1cm} (2)

The GARCH(1, 1) model is:

\[ h_t^2 = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \beta_1 h_{t-1}^2 \]  \hspace{1cm} (3)

The conditional mean equation (equation 1) is a function of exogenous variables with an error term. The conditional variance (\( h_t^2 \)) is given by the conditional variance equation (equation 2), where the error term \( \varepsilon_t \) is serially uncorrelated with zero mean. The first summation of the squared errors is the ARCH process, while the second summation is the GARCH process. This specification allows the conditional variance to change through time. For a well-defined process, all the parameters in the infinite-order autoregressive representation must be non-negative. For a GARCH(1, 1) process, this means ensuring that both \( \alpha_1 \) and \( \beta_1 \) are non-negative. If \( (\alpha_1 + \beta_1) < 1 \), \( \varepsilon_t \) is covariance stationary.

Engle and Lee recognised the possibility that the conditional variance could incorporate short term and long term components. In their words, the “unobservability of the volatility process” led them to use the “ARCH methodology…to construct the \textit{ex ante} volatility of stock returns”. Their model decomposes the conditional variance into a time-varying permanent (or long run or trend) component and a transitory (or short run) component in a spirit similar to the Beveridge-Nelson decomposition for economic time series. They formulated the CGARCH(1, 1) model as:

\[ h_t^2 = q_t + \alpha (\varepsilon_{t-1}^2 - q_{t-1}) + \beta (h_{t-1}^2 - q_{t-1}) \]  \hspace{1cm} (4)

\[ q_t = \omega + \rho q_{t-1} + \phi (\varepsilon_{t-1}^2 - h_{t-1}^2) \]  \hspace{1cm} (5)

The permanent component of the conditional variance is \( q_t \). Depending on the value of the parameter \( \rho \), \( q_t \) can be either an integrated process (\( \rho = 1 \)) or a non-unit root process (\( \rho < 1 \)). Equation (5) indicates that the autoregressive parameter (\( \rho \)) measures the persistence of the permanent component: the closer \( \rho \) is to unity, the more persistent that component.

The transitory component is given by \( (h_t^2 - q_t) \). For this component, the ARCH process is determined by the parameter \( \alpha \), whereas the GARCH process is determined by the parameter \( \beta \).

---

1 In the absence of multiple components, the CGARCH model reduces to the GARCH(1, 1) model.
The persistence of the transitory component is determined by the parameter sum ($\alpha + \beta$). A measure of this persistence can be gauged from the half-life:

$$\lambda = \frac{\ln(0.5)}{\ln(\alpha + \beta)}$$

(6)

As long as $\rho > (\alpha + \beta)$, $q_t$ represents the component that has the longer memory. Equations (4) and (5) show that $q_t$ is driven by the forecasting error term ($\epsilon_{t-1}^2 - h_{t-1}^2$).

Equations (7) and (8) show that the strengths of shocks to the permanent and transitory components are determined by the parameters $\phi$ and $\alpha$ respectively.

$$\frac{\partial q_t}{\partial \epsilon_{t-1}^2} = \phi$$

(7)

$$\frac{\partial (h_{t-1}^2 - q_t)}{\partial \epsilon_{t-1}^2} = \alpha$$

(8)

When $\rho < 1$ and $(\alpha + \beta) < 1$, the GARCH process is covariance stationary, implying that for the conditional variance to be stationary, the permanent and transitory components must both be covariance stationary.

Supporting evidence for the CGARCH results is obtained from a structural time series model. Structural time series models decompose observed time series that need not be stationary into their unobserved components (trends, cycles, seasonal and irregular factors). Harvey and his various collaborators argue in many papers that the model-based approach is superior to other methods for separating trends and cycles. For example, (Harvey & Trimbur, 2003) point out that the filters defined by the model are consistent both with each other and the data and that they adapt automatically to the ends of the sample. This means that no observations are lost as with the Baxter-King filter (Baxter and King, 1999). Although irrelevant for this study, an advantage of structural time series models is that explanatory variables, outliers and trend breaks can be incorporated easily into them. Both univariate and multivariate models can be estimated (Koopman et al., 2006, Harvey, 1989). For the univariate model, the general specification is:

$$y_t = \mu_t + \phi_t + \gamma_t + \epsilon_t$$

(9)

where:

- $y_t$ is the observed series, often in natural logs
- $\mu_t$ is the trend component, which can be specified as a stochastic process in quite flexible ways
- $\phi_t$ is the cyclical component, which can be specified as a stochastic process
- $\gamma_t$ is the seasonal component that can be stochastic or non-stochastic
- $\epsilon_t$ is the irregular component.

The local linear trend model can be written as:

$$y_t = \mu_t + \epsilon_t, \epsilon_t \sim \text{NID}(0, \sigma_\epsilon^2)$$

(10)

with the trend component specified as:

$$\mu_t = \mu_{t-1} + \beta_{t-1} + \eta_t, \eta_t \sim \text{NID}(0, \sigma_\eta^2)$$

(11)

$$\beta_t = \beta_{t-1} + \xi_t, \xi_t \sim \text{NID}(0, \sigma_\xi^2)$$

(12)

where $\mu_t$ is the level and $\beta_t$ is the slope (the growth rate for log variables). The level and the slope can be stochastic or fixed according to judgements made about the path of the trend.
The local linear model assumes that level and slope are stochastic. The smooth trend model assumes that the level is fixed and the slope is stochastic and that they are combined with a cycle or autoregressive component. Structural time series models are estimated by putting them into state space form. Maximum likelihood is employed to determine the parameters, with the Kalman filter being used to update the unobserved components. More detail can be obtained from (Harvey, 1989) and (Koopman et al., 2006).

**Data and descriptive statistics**

The analysis presented here is based on almost 20 years of the mid-rate spot exchange rate data as at 11:10 am daily that are posted on the Reserve Bank of New Zealand’s website (www.rbnz.govt.nz, file: hb1.xls). The exchange rates are the foreign currency price of the NZ dollar. A set of four currencies is analysed. The data are available for the US dollar (USD), the Australian dollar (AUD), the British pound (GBP) and the Japanese yen (YEN) from 1 July 1986. The total number of observations is 5116. The New Zealand dollar was floated in March 1985 so the data cover this period. It is believed that since the float, the RBNZ has not intervened in the foreign exchange market. The level of the exchange rate is influenced via short term interest rates.

The exchange rates were transformed into daily returns (first differences of logs as in 100ln[X/X(-1)]). The descriptive statistics for the daily returns are in Table 1. They confirm that the daily returns are highly volatile (e.g. the coefficient of variation for RUSD is about 15,000%) and non-normal in distribution (as measured by the Jacque-Bera statistic). The kurtosis for the British pound is particularly striking. As figure 2 reveals, this is entirely due to two outliers in early February 1992, well before Black Wednesday (September 16, 1992), when Britain was forced to leave the European Exchange Rate Mechanism (ERM), which had been joined about two years earlier. When these outliers are eliminated, the kurtosis falls to 6.850, not too dissimilar to the other returns. Figure 2 shows that there was some extra volatility in the British pound about the time of withdrawal from the ERM.

The battery of unit root tests in EViews, including the group tests, were applied to the logged exchange rates. Unsurprisingly, they indicate that the levels were I(1) and that the returns were stationary. Tests using the Johansen procedure with varying numbers of lags offered no evidence of cointegration between the levels or the returns, either collectively or bilaterally. The Engle-Granger tests were also applied to bilateral exchange rates: these, too, offered no evidence of cointegration.

---

2 More general specifications for stochastic trends can be implemented. These are irrelevant for this study. See (Harvey & Trimbur, 2003) and (Koopman et al, 2006) for more detail.

3 These tests are not reported as they are peripheral to this study.

CGARCH Results

The results are presented in Table 2. The autoregressive term in the conditional mean equation was included for the Australian dollar and British pound on statistical grounds. The AIC and BIC information criteria favoured this specification for these two equations. Unreported experiments with the inclusion of GARCH effects in the mean equation showed that they were irrelevant for all sets of returns. There were hints that threshold effects might be significant in the evolution of the transitory component for the US dollar.

The equations for the transitory components are reasonably conventional. The ARCH terms have α-coefficients that are all positive and highly significant for the US dollar, the Australian dollar and the yen. The coefficient for the British pound is almost significant at the 5% level. Except for the US dollar, the GARCH terms are not significant even at the 10% level and negative for the British pound and the yen. For the US and Australian dollars, short term stability is established as the sum (α + β) is positive for both currencies. For these two currencies, the half-lives are defined and are equivalent to 16 and 1 trading days respectively. As the sum of the transitory component parameters is negative for the British pound and the yen, there is no half-life defined for these currencies.4

The equations for the permanent component are well-defined for all of the daily returns. The autoregressive parameter ρ is very large and highly significant for all currencies, implying that there is slow convergence of the permanent volatilities to their mean levels. In all cases, the autoregressive parameter is bigger than the sum of the transitory components, implying slower mean reversion in the long run. In all cases, ρ < 1, which implies that the process is stable. For all sets of returns, the parameter φ > 0 and highly significant. The Lung-Box test statistics point to no serial dependency in the residuals. Except for the British pound, the ARCH-LM test indicates no ARCH effects in the residuals. Except for β for the Australian dollar, the results imply that the CGARCH model provides a better description of exchange rate volatility than a GARCH(1, 1) and that the conditional variance can be decomposed into permanent and transitory components.

---

4 The Appendix provides a crude demonstration that the presence of the two outliers in February 1992 for the British pound has a significant impact on estimations.

NOTES: Estimations were carried out with EViews 5.1 using Bollerslev-Wooldridge robust standard errors and covariance. The models were chosen on the Log likelihood and the BIC and AIC information criteria. All results are rounded to 3 decimal places. a0 is the constant and a1 the coefficient for the return lagged once in the mean equation. Qk is Ljung-Box test statistic at k lags. Ak is the ARCH LM test statistic for k lags (Obs*R2 option). JB is the Jarque-Bera test statistic for residual normality. Prob-vals are in brackets.

Figures 3 and 4 show the permanent (or trend) components extracted from the conditional variance. There is no obvious common trend that would indicate some common factor being at work.
The contemporaneous correlation coefficients between the permanent components are reported in Table 3. The correlation coefficients reinforce the impressions gained from the graphs of the permanent components. There are no strong correlations between the daily returns and, in particular, the correlations between the British pound and the other currencies are quite low. As might be expected, and as Table 4 confirms, the correlations between the transitory components are very weak and lower than for the permanent components for all pairs of currencies.

Table 5 compares the standard deviation of the permanent component to the standard deviation of the temporary component for the four currencies to get a measure of which component contributes more to the volatility of the daily returns. On this measure, both components are equally important for the US dollar, whereas the permanent component is dominant for the other three currencies.

Structural Time Series Estimation

(Harvey et al., 1994) is followed in this paper. Their modelling was based on a stochastic volatility model which assumes that the stochastic variance of the returns \( y_t \) follows the AR(1) process:

\[
y_t = \sigma_t \varepsilon_t = \sigma \varepsilon_t, \exp(h_t/2) \quad \varepsilon_t \sim IID(0,1)
\]

where \( \sigma \) is a scale factor and:

\[
h_t = \gamma + \phi h_{t-1} + \eta_t \quad \eta_t \sim NID(0, \sigma^2_\eta)
\]

In order for quasi-maximum likelihood estimation to be used with the Kalman filter, the observations have to be transformed to give:

\[
\log(y^2_t) = \kappa + h_t + \xi_t
\]

To avoid practical problems that arise if some of the observations are zero, either the mean is subtracted or the following transformation is used:

\[
\log y^2_t \approx \log(y^2_t + cs^2_y) - \frac{cs^2_y}{y^2_t + cs^2_y}
\]

where \( s^2_y \) is the sample standard deviation of the variable \( y \) and \( c \) is a small number. In this application, this modified variable (using \( c = 0.02 \)) was created and STAMP 7.0 used to estimate a model with the components being fixed level, AR(1) and Irregular.\(^5\)

Some of the relevant estimation information is presented in Table 6. As might be expected, the AR(1) coefficients (\( \phi \)) are quite large but less than one, implying that the evolution of the stochastic volatility is stable for all four currencies. The presence of heteroscedasticity in the residuals is rejected decisively by the H-stat. The Box-Ljung test statistic (Q) rejects decisively the existence of autocorrelation in the residuals except for the AUD.

</tr>
</tbody>
</table>

NOTES: Prob-vals in brackets. H-stat test for heteroscedasticity. The Box-Ljung test statistic (Q) is based on the first 70 residual autocorrelations and 67 dof. - rounded to two decimal places.

Figures 5 and 6 chart the evolution of the stochastic volatilities. As for the CGARCH permanent components, there is no obvious trend in the data.

---

\(^5\) \( C = 0.02 \) is used because it was the default value in STAMP 6.0. Experiments with other small values produced almost identical results for the AR(1) process that represents the stochastic volatility, as did the estimation with demeaned data.
Comparison between the CGARCH and Stochastic Volatility models

In an attempt to test whether there might be common trends in daily returns, principal component analysis was conducted on the correlation matrix for the CGARCH permanent components and the stochastic volatilities. The results are presented in Tables 7 and 8.

The ordinary correlation matrix in Table 7 shows that the permanent components are relatively weakly correlated, especially between the British pound and the other three currencies, an outcome that is not very supportive of a common trend amongst the four currencies. The first two principal components account for 70.4% of the variance in the volatility. The first component is suggestive of a common trend for the US dollar, the Australian dollar and the yen. The second component is strongly correlated with the British pound.

The ordinary correlation matrix for the stochastic volatilities in Table 8 shows that there are weak correlations between the four currencies. The first two principal components account for 75.4% of the variance in the volatility. In this case, the first principal component hints at a common trend for all four currencies. The second component is strongly correlated with the Australian dollar.

Figure 5: stochastic volatilities

Figure 6: stochastic volatilities
Conclusion

Both the CGARCH and stochastic volatility models provide empirical evidence for volatility in the daily exchange rates for the US dollar, the Australian dollar, the British pound and the yen. The CGARCH decomposition provides convincing evidence for the existence of permanent and transitory components in the conditional variance of the four currencies covered. For the Australian dollar, British pound and the yen, the permanent component is dominant, whereas for the US dollar the two components are relatively equal in their contributions to the volatility.

The integration of financial markets raises the possibility of common trends in daily exchange rate returns. Somewhat surprisingly, principal component analysis revealed no convincing evidence for the existence of common long run trends for the New Zealand dollar, as estimations from the two models are contradictory.

It is trite to say that volatility of returns is a key issue for researchers in financial economics and analysts in financial markets. Because the prices of financial assets are functions of the expected volatility of returns, financial institutions make volatility assessments as a part of monitoring their risk exposure. Further work is required to assess the ability of the CGARCH model to provide good estimates of the volatility in New Zealand exchange rates.

APPENDIX: Alternative results for the British pound

The estimation of the CGARCH model for the daily returns for the British pound is influenced heavily by the existence of the outliers in February 1992. Some evidence for this is provided by the re-estimation of the model with the two extreme returns eliminated. The results (with prob-vals in brackets) are:

\[ \text{RGBP}_t = 0.0019 - 0.0282 \text{RGBP}(-1) \]
\[ (0.847) \quad (0.070) \]
\[ h_t^2 = q_t + 0.0637(q_{t-1}^2 - q_{t-1}) + 0.818(h_{t-1}^2 - q_{t-1}) \]
\[ (0.000) \quad (0.000) \]
\[ q_t = 0.001 + 0.998q_{t-1} + 0.012(e_{t-1}^2 - h_{t-1}^2) \]
\[ (0.000) \quad (0.007) \]

The positive and significant values for \( \alpha, \beta \) and \( \rho > (\alpha + \beta) > 0 \) implies that the evolution of the permanent and transitory components will be well-behaved.

Abstract

In this paper we present three studies exploring the nature of racial identification. In the first study, we examined the way in which people racially identified themselves, using a typical survey approach at a Southwestern university. Over 1000 participants were asked (1) to “choose your primary racial group” (from a list of six standard racial categories) and (2) if they saw themselves as multiracial, monoracial, or unsure. Of the students who claimed multiracial identity, when asked to choose a single identity, 12% originally marked White, 21% Asian, 26% Black, 35% Hispanic, 60% American Indian/Alaskan Native, and 50% Indian. The second study asked participants to indicate how they personally identify racially, and how strangers typically identify them in public. This study revealed that 30% of participants claimed that strangers typically misidentified them—with the largest discrepancy seen amongst Asian, Mixed Asian, and Pacific Islander participants. Finally, the third study investigated how student samples from Texas and Hawai‘i differ in their conceptions of race—i.e., whether they tend to focus on social versus biological indicants of race. It was hypothesized that multiracials would view race as more socially constructed than do their monoracial peers. Post-hoc tests revealed that multiracials and those who were unsure of their monoracial/multiracial status were significantly more likely to view race as a socially constructed concept than do their monoracial peers. In addition, when asked about their dating preferences, it was found that young people possessing a more social construct of race (one not based on physical appearance) would be more likely to date people not belonging to their own racial group than those with a more biological construct of race. This suggests that one’s beliefs about race could be one, amongst various factors affecting mate selection.

These results (1) question the validity of current surveys, which typically ask people (including those of mixed ancestry) to indicate a single race, and (2) do not make it clear as to the purpose for which categorization is being sought. Consequences of having a more biological or social view of race and the ability to manipulate this construct will be further discussed.
Women in 1950s America had it rough. From a young age, they were taught that their ultimate goal was to find a suitable husband, and that their greatest joy would be to stay at home and raise a family while her spouse served as the household’s bread-winner. She would be happy, content, and eager to be the primary child rearer while their father took a backseat role. Any ambitions she had outside the household were discouraged. She was expected to wear feminine clothing, to be demure and passive in the presence of other men, and to be satisfied with her limited life.

Society today looks back on the women of the 1950s in America with a sense of accomplishment, thinking that we’ve come so far, that we’re no longer forced to fill that role if we don’t want to, we can do anything a man can do, and maybe more. We are not seen only as baby factories, but instead as human beings with minds of our own, not driven by some insatiable desire to be married off and shoved into a household to create a family. We have the advantage of observing the era and its relics (like ads in magazines clearly depicting women as homemakers, and men as bread-winners) in retrospect.

Similarly, in 50 years, or a hundred years or more, what opinion of our time will men and women of the future have concerning the way our society treats women today? They will have proof of our treatment through items like the magazine ads we have from the 1950s. However, having technologically progressed beyond a time when the printed word was the most reliable, thorough, and telling source of our culture’s treatment of its
members, we must assume that the most useful artifacts would spawn from some electronic source, the most thorough of course being related in some way to the internet. Our chosen artifact must also be something that clearly represents our trend of thought based on numbers; the number of people who have access to, are exposed to, or use this artifact needs to be somewhat large in order to provide a fair and balanced account of people living today, and what we think of each other based on gender.

I propose the online game World of Warcraft represent this artifact. World of Warcraft (hereon referred to only as “Warcraft”) is what is known in the gaming world as an MMORPG, a Mass Multiplayer Online Role Playing Game. This means that it is a game played online by many people who can interact with each other within the game. Each person creates a character which serves as an avatar, with which the person can move throughout the virtual world, cooperating with (or hindering) others’ characters in order to accomplish tasks and make progress. To have a character that represents a real person within a game is what designates Warcraft as an RPG (Role Playing Game). Events, characters, and items found within the game can be discussed in real life as “in-game” items, characters, etc. Therefore, in-game money is not real money, and cannot be used to buy anything except in-game items, which can be worn, used, consumed, bought, sold, or thrown away. There exist also characters within the game called NPCs (Non-Player Characters). These characters do not represent real life people. Instead, they are representations of programs whose sole function is to interact with real player characters (characters represented by real life people) when prompted by real player characters in the virtual world. With these very basic guidelines in place, we can now discuss the details of this wildly popular game, and their implications pertaining to gender.
In order to create a character within the game, the player must choose from a number of options, including race (elf, orc, troll, human, dwarf, etc.), class (priest, mage, hunter, paladin, warrior, etc.), and gender. The most significant difference among all these choices is clearly race, but the disparities between genders are painfully apparent within each race. The males of each race are bulkier and significantly more muscular. Each would be considered a body-builder were he to have a real life counterpart, however if female humans for instance were to have a real life representative, she would be fit, perhaps toned, but certainly not muscular. The human female has large hips, small feet, C-cup breasts, a small waist, and her choice of which smiling face with which to equip her. Male humans on the other hand have nothing but straight, sometimes angry faces to choose from. Male night elves have nothing but sneering faces and angry, glowing eyes. Male trolls are constantly hunched over, even when they run, while female trolls stand erect, back arched, with perky breasts, flat stomachs, and long toned legs.

Bear in mind that everything in Warcraft, like any other completely fabricated game, work of art, etc., is intentionally made to be a certain way. Every single detail was specifically laid out, debated (or instinctively done), and executed with purpose. This means that this discrepancy was thought of, weighed, then painstakingly done, using different gender-related cues specific to each race to let the common gamer know immediately upon seeing a character its gender. What’s more is that these are stark differences between genders, and yet they are never questioned by the gamers who encounter them over and over. How do the creators of Warcraft know what distinguishing marks say “male” or “female” to their audience? Moreover, why doesn’t
the audience realize it is being manipulated with its own assumptions regarding gender and gender relations?

The answer lies in human nature. Throughout recorded history, the male of the species has physically been the more dominant of the sexes. This is assumed to be the case, this is what we are taught from a very young age, and this is exactly why cues like those used in Warcraft are placed unquestioningly upon an audience that accepts it without a word. Let us look at this portion of the game from the perspective of a future archaeologist. After playing the game, he would understand that a world full of adventurers hell-bent on killing everything they come across demands that everyone in the game have an unusual amount of muscle. This might explain the physique of all the males in the game. After seeing the female characters, our archaeologist might conclude that their sex appeal is one method to attract an audience (assuming it still is at the time of our future archaeological dig), so there is no reason to give gamers the option of choosing a human female with anything other than a perfect body.

Everything in this game is meant to appeal to the nature of the gaming community. With that in mind, our archaeologist needs to use every part of this game to learn everything she can about this very specialized community. She can attempt to disassemble various aspects of the game in order to reconstruct the portion of our society that consists of gamers, their concept of gender, and the disparity that distinguishes male from female in their eyes. She can begin with the physical appearance of each character. But physique is just one aspect of the game that serves to help the archaeologist analyze how gamers categorize male and female attributes. The way each gender wears their armor can be very telling.
Every gender of every race has the opportunity to wear the same armor, be it cloth, leather, mail or plate. There are various levels of armor, some enabling the wearer to be more thoroughly defended than others. Cloth armor tends to consist mostly of full-length robes, which often resemble a woman’s dress, however male characters are not made fun of for wearing them, since what matters is how effective a job they do. When human males wear these robes, they are loose-fitting, cover his entire body, and fall straight to the ground. However, when a human female dons the same set of robes, suddenly the skirt is skin tight, a slit runs up her leg, and the top shows off her stomach, arms, and back. The worst of these instances occur with very advanced plate armor, where a male character will appear to wear a solid black metal breastplate, and a female character wearing the same chest piece will appear ready for a day at the beach, complete with bikini top. We should consider how our archaeologist would react to such a stark difference in clothing type. She may ask why it is acceptable for males in this game to cover their bodies while females are allowed (rather, expected) to show more skin. Bearing in mind the fact that the gamer community consists almost entirely of males between the ages of 13 and 35, she may conclude that this game is simply catering to its audience. She may also conclude that while the men clearly wear armor, the women are merely dressing up, forcing them to fill the role of the dainty woman even while in combat. Tami Amanda Jacoby puts it well:

“Since women have traditionally been unarmed and absent from the upper echelons of the defence [sic] industrial complex, men have inadvertently
been conferred the right to “protect” women, while women have been defined as vulnerable and in need of protection.”¹

Diablo II is another computer game in which women are forced, even on the battlefield, into more passive, feminine roles. Unlike in Warcraft, Diablo II does not give each class its choice of gender. The warrior character, here called the “Barbarian,” is always a man. He is vicious, bare-chested and tattooed. The paladin, like the barbarian, is also male, and uses only hand-to-hand combat to defeat his foes, a very confrontational way to win a battle. The Necromancer, one who wakes the dead to fight for him, is never given a female equal in the game. Each of these fighters is very physical or dark in their fighting styles. The only two female real player characters in the game are the Amazon, who fills the role of the hunter and is encouraged to use distance attacks like arrows or throwing spears, and a Sorceress, who depends on her knowledge of the elements to attack her enemies with balls of flame and ice. Our archaeologist would surely be struck by the passivity of the female roles, even when in battle. The male characters in the game are allowed to be overtly violent, while the women, while often more powerful than the men, are kept at a distance from their attackers. This may suggest to her the expectations on men and women in our time; men are perhaps allowed to be more confrontational, while women should solve their problems equally completely, but still maintain a safe distance.

Another way in which Warcraft appeals to its audience visually is through dance. Each gender of each race has a specific dance that, when prompted by a real life person,

he or she will perform until told to stop by the real life person that character represents. Male characters, disco or shuffle their feet or do flips; some of them are humorous. Female characters, on the other hand, swivel and gyrate and roll their bodies to an imaginary beat. The female elf dance cannot be described in any way other than erotic. An archaeologist may conclude from these displays that the males are meant to be the comic relief, while the females are meant to be the real entertainment. This theory can be further supported through an analysis of the jokes the female elves and human males tell when prompted. The elf female will say “That’s right, I’m dancing again! I hope you and your friends are enjoying the show.” The creators of the game are practically admitting that this character was made to dance erotically in order to entertain onlookers. The human male has the capability of being a paladin, a holy warrior, who can cast a spell called protection, which is essentially a shield. When prompted to tell a joke, he will say “Of course I use protection, baby, I’m a paladin!” This can safely be interpreted as an allusion to practicing safe sex, and the two jokes are often juxtaposed. Our archaeologist may take another stance completely, and claim that since the male dancing involves more physical exertion, than men are assumed to be more physically coordinated than women, more athletically inclined, while women’s motions are more subtle, and naturally more sexual, bearing in mind that they would only be considered sexual when presented to the appropriate audience.

An important question that the archaeologist must ask herself first and foremost is whether or not the characters portrayed in Warcraft accurately represent what people were like during the game’s creation, or if they represent our ideal man (a muscular, murderous, disco dancing adventurer) or woman (a lithe, flirtatious, heavily armed
stripper). Another possibility is that these characters represent complete fantasy. The last explanation would be an unhealthy mixture of each option; to assume that the culture that created Warcraft, including those who contributed to it by participating in it, assumed things like elves have never and will never exist, but if they did, it is also assumed that the female elves would be sexy, and the male elves would be angry.

Now let us travel beyond the physical appearances and inner workings of each character to discuss NPCs (Non-player Characters), and their function in the virtual landscape. Their primary function within the game is to hand out quests, or jobs to real player characters to do, in order for them to make progress (by which I mean become more wealthy, more powerful, and to be come better equipped with armor, weaponry, etc.). I would like to use what I consider to be an ideal example: a husband and wife NPC, both of whom give quests when addressed by a real player character. The husband asks the real player character (hereon called the “adventurer”) if she could please go to his farm, which is now overrun by bandits (both male and female), and retrieve for him a family heirloom in the form of a watch. His wife, on the other hand, asks the adventurer if she would gather up some ingredients for a stew she wants to make for a friend of hers (another woman who lives in a farm nearby). Our archaeologist may interpret this to mean that the man represents the keeper of the family heritage, while the woman is in charge of more basic matters like cooking and keeping in touch with friends. Jacoby points out this important distinction using a “home front—battlefield”\(^{2}\) model:

\(^{2}\) Jacoby, 40.
“…home front—battlefield is a powerful interface of discourses and practices that designates particular roles to men and women in conflict zones.”

The archaeologist may compare this portrayal of the husband and wife relationship to the way the ancient Mayans’ portrayal of their spousal relationships has been interpreted. Women are portrayed on pottery doing household chores such as cooking and basket-weaving. Men were clearly the primary rulers of the ancient Maya cities, yet it is made clear in various scripts that the man is incomplete without a wife to cook meals, tend to ancestral offerings, assist him with ceremonies, and so on. Without his wife, the man is an incomplete ruler. This is how the evidence left by a civilization, given to us after hundreds of years is interpreted today. Based on gender relations in Warcraft, similar conclusions might be drawn about our own culture.

Perhaps the most fascinating part of Warcraft as far as the topic of gender is concerned is the chat window. Everyone online at the time can type in the chat window for anyone within a certain area to read. The conversation is usually game-based, but is not limited to topics of in-game items, events, monsters and so on. Even when discussing apparently genderless monsters like bears or cats, I was shocked to discover how gendered the “gamer slang” used by the vast majority of the players was. If a monster were to decisively wipe-out a player, he might type something like “I just got raped by that guy, that fag totally raped me.” This kind of language is more than common in gaming chat, it is practically expected. Now, our archaeologist might notice, if she did her research, that at least 99% of all people who talk this way in-game are male. She might ask herself what kind of society has men and boys who are reared to love their

3 Jacoby, 40.
mothers, sisters, and wives, who are comfortable using so strong and violent a word (on so many levels) as rape. She may conclude that the word rape had lost its significance for so many people to use it with such nonchalance; or that men had so come to dominate this society (having out numbered women a thousand to one) that words that depicted such a violent offense, known to mostly be committed against women, had, without a voice to correct the error, lost any real significance in this specialized gaming society.

Any conclusion our archaeologist can draw from Warcraft will still only be based on information from a specialized community, within a society which may or may not be misrepresented through these images and texts. The overall population may be completely different from those 4.5 million people world-wide who play this game for hours upon hours a day. These misinterpretations can be extended to our present interpretation of Maya images and glyphs, or even of the 1950s advertisements. The clear advantage we have in the case of those ads is to have access to first-hand accounts of what the era form which those artifacts came today. The key, then, is to keep careful records of our time, to constantly vigilant and introspective, to analyze why we say or do things one way and not another, and what that could mean in terms of race, class, or gender.

Abstract

Those were the days, my friend
We thought they'd never end
We'd sing and dance forever and a day
We'd live the life we'd choose
We'd fight and never lose
For we were young and sure to have our way

The wistful sentiment of lyrics of songs such as “Those Were the Days,” (Hopkin, 1968) has been expressed in musical genres ranging from classic country to contemporary rap. It may be surprising to learn that such a universal human experience has received little empirical attention in psychology. The term “nostalgia” was coined to refer to the phenomenon of longing for home by Hofer in his 1688 medical dissertation (Anspach, 1934), and the word retained its use first as a medical and then as a psychiatric disease into the first half of the 20th century. By the second half of the 20th century, the meaning of the word nostalgia had broadened beyond “homesickness” to “wistful memory or recall of an earlier time” (Burchfield, 1976).

Originally classified a disease, nostalgia has been conceptualized as maladaptive throughout the majority of its history. However, the universality of nostalgic sentiment suggests that the experience serves an adaptive function. Psychoanalytic theorists have suggested that nostalgia helps young adults accept the loss of their idealized childhood (Kaplan, 1984) and accomplish the important process of individuation (Neumann, 1949/1971; Peters, 1985). Other theorists have proposed that nostalgic reminiscence enables a person to assess personal change over time (Cavanaugh, 1989), adapt to discontinuity in life (Davis, 1979), and maintain a sense of self-identity and connectedness to others (Hertz, 1990; Mills and Coleman, 1994; Wilson, 1999).
Empirical tests of theories are few, given a lack of consensus with regard to operational definitions and appropriate methods of measurement. Stern (1992) makes a distinction between two types of nostalgia—historical, in which a distant past is perceived as superior to the present, and personal, in which a personal past is remembered wistfully. Defining nostalgia as “a preference (general liking, positive attitude, or favorable affect) toward objects (people, places, or things) that were more common (popular, fashionable, or widely circulated) when one was younger (in early adulthood, in adolescence, in childhood, or even before birth),” Holbrook and Schindler (1991, p. 330) developed a 20-item inventory on which respondents indicate their level of agreement with evaluative statements about the present and the past.

Restricting the term to feelings toward the personal past lived by an individual, Batcho (1995; 1998) developed a 20-item inventory on which respondents rate the extent to which they miss each of the items from when they were younger. According to Stern’s distinction, Holbrook and Schindler’s technique assesses historical nostalgia and Batcho’s inventory assesses personal nostalgia. The availability of surveys to measure the degree to which a person is predisposed to nostalgia has encouraged researchers to conduct empirical investigations of theories of nostalgia.

Batcho (1998) found that participants who scored high on an inventory of personal nostalgia recounted autobiographical memories in which other people played prominent roles. Similarly, Batcho (2002) found that autobiographical memories solicited by an explicit instruction to recall nostalgic memories were rated higher in nostalgia, love, and contentment than were memories elicited with a neutral instruction. In another study, Batcho (2004) examined the relationship of personal nostalgia to psychological change after three events and found that personal nostalgia was correlated with favorable changes in perceptions of continuity,
social connectedness, belonging, and identity. The pattern of findings across studies suggests that nostalgia can strengthen a person’s sense of self and connectedness to others.

Many theorists argue that connectedness to others is essential to maintaining a sense of self-identity (Hertz, 1990; Mills and Coleman, 1994; Wilson, 1999). Theories that emphasize the role of personal nostalgia in preserving a sense of self focus on two dimensions of identity formation—defining self in reference to others and sustaining continuity across changes over time. Each of these dimensions can be found in songs that express nostalgic feeling. For example, the integral connection between self and other is made clear in the contemporary song, “Who I Am,” in which Jessica Andrews (2001) sings “I am Rosemary's granddaughter, the spitting image of my father . . . I've got friends who love me and they know just where I stand. It's all a part of me and that's who I am.” The survival of self-identity despite dramatic changes with the passage of time is clear in the folk song “Those Were the Days” (Hopkin, 1968). The lyricist notes “the busy years went rushing by us; we lost our starry notions on the way. Just tonight, I stood before the tavern—nothing seemed the way it used to be.” The threat to self is clear as the lyricist continues, “In the glass, I saw a strange reflection. Was that lonely woman really me?” The sense of continuity is restored with the acknowledgement of an enduring relationship “there came familiar laughter. I saw your face and heard you call my name. Oh, my friend . . . in our hearts, the dreams are still the same.”

Given their power to evoke emotion (Stratton & Zalanowski, 1994), song lyrics constitute a rich vehicle for the exploration of the characteristics and psychological functions of nostalgic sentiment. The richness of lyrics, however, also presents serious methodological difficulties in distinguishing among the diverse elements and attributes inherent in creative works. Using original song lyrics composed for the study, Batcho (in press) explored the
relationship of nostalgia to lyrical emotion and social connectedness. Consistent with theories that relate nostalgia to social connectedness, participants who scored high in personal nostalgia preferred lyrics with other-directed themes. Although results suggested that identity was an important feature of nostalgic lyrics, identity had not been manipulated in the composition of the lyrics.

In the current study, lyrical content was manipulated to explore the relationship of nostalgia to identity and social connectedness. Four sets of original song lyrics were rated on seven characteristics by 96 undergraduates. All sets involved an individual’s recollection of childhood experiences but differed in their emphasis on the impact of those experiences on the lyricist’s sense of self and in the centrality of others. Two sets recounted experiences that influenced the author’s later sense of identity—one focused on time spent with a close relative, and the other focused on a memorable solitary achievement. Two sets of lyrics recounted childhood activities without mention of a later impact on identity—one centered on having close friends, and the other about solitary childhood play and the world viewed from the child’s perspective.

Participants completed Batcho’s (1998) inventory as a measure of personal nostalgia for the respondent’s remembered past and Holbrook’s (1993) inventory as a measure of historical nostalgia for a distant past perceived as superior to the present. Results are discussed within the framework of major theories of nostalgia (Batcho, 1995, 1998, in press; Cavanaugh, 1989; Davis, 1979; Holbrook, 1993; Mills & Coleman, 1994; Ross, 1991; Sedikides, Wildschut, & Baden, 2004).

‘Determinants of Prenatal Care use among Women in Peru’

Abstract

Objectives: This study examined the predisposing, enabling, need and healthcare systems factors of two patterns of prenatal care use (frequent prenatal care, early prenatal care) among Peruvian women.

Methods: Data from the 2004 Demographic and Health Survey (DHS) was used to assess the women’s use of prenatal care. All data was weighted, resulting in a sample of n=1771 women who had a live birth since January 1999. Bivariate chi square analysis and logistic regression were used to analyze the effects of the selected factors on prenatal care use.

Results: Speaking an indigenous language, having secondary or higher education, and high socioeconomic status (SES) were significantly associated to frequent prenatal care (four prenatal care visits or over). Women having five children or more, not being a member of the Maternal and Health Insurance, and having a mistimed pregnancy were significantly less likely to have frequent prenatal care. Women who were currently unmarried, who never had a history of abortions or stillbirths, and whose last pregnancy was mistimed and unwanted were significantly less likely to have early prenatal care. Using a modern contraceptive method was positively related to early prenatal care.

Conclusion: Although the Peruvian government made significant improvements in the health sector such as implementing Insurance for pregnant women free of charge for the poorest population, there are still efforts to be made in order to increase health services among underserved women (e.g. women with five children or more, with elementary or no education, unmarried, of low SES, of risk for an unwanted or mistimed pregnancy, of risk for abortion or stillbirths, not using a modern contraceptive method, not being a member of the maternal and health insurance).
I. Introduction

In countries with low maternal and infant mortality, prenatal care is a basic component of the maternal care services. Prenatal care alone may not solve all health care complications and mortalities related to pregnancy, however major efforts have been made especially in developing countries to assure that pregnant women have access to adequate prenatal care (Goodrum, 2001; De Brouwere, 1998). There are not many scientific researches about prenatal care effectiveness in the developing world but the World Health Organization recommends four visits for normal pregnancies (Villar et al, 2001).

Early Prenatal care may strive for early detection of obstetrical complications or high-risk pregnancies and, therefore, initiate prevention or intervention (Goodrum, 2001; Liu, 1998; Pisake, 2004; Villar, 2002; WHO, 2005).

Research in several countries has found many factors to be associated with prenatal care utilization e.g.: maternal education (Chakraborty et al., 2003; Elo, 1992; Vogl, 2004; Yu et al., 2001); health insurance coverage (Ciceklioglu et al.,2005); household wealth, (Van et al., 2006); marital status (Henze, 2004; Jaramillo, 2002; Mekonnen, 2002; Yu et al., 2001); area of residence (Kébreau, 2005); Ethnicity (Jaramillo, 2002), parity (Mekonen, 2002); intentionality of the pregnancy (Hulsey TM, 2001); distance to health facilities (Kébreau, 2005) Increasing maternal age has been associated with use of prenatal care, however, or older has been negatively associated with prenatal care use (Henze, 2004; Mekonen, 2002).

This study was designed to examine Predisposing, enabling, need and health care system factors of prenatal care use among women in reproductive age in Peru.
II. Methods

Data for this study comes from the Peruvian Demographic and Health Survey (DHS) 2004. The DHS is part of a program funded by USAID and implemented by Macro International Inc. In Peru, this survey has been applied at the national scale every four or five years, starting in 1986. To tackle the lack of information and follow ups during the intervals between surveys that did not allow timely implementation of new strategies or policies, a new, year by year rolling DHS was designed and started interviewing in 2004; interviews are conducted in a permanent way during nine months of each year. Data for the DHS 2004 was collected from December 2003 to September 2004. In 2004 the DHS surveyed a total of 6600 households and it is a representative sub sample of the total targeted sample of 33000 households to be implemented in five consecutive years (from 2004 to 2008).

The DHS includes a household questionnaire and a women’s questionnaire, the latter interviews women ages 15-49 found in the selected households. For this study we used the women’s questionnaire, focusing in the maternal and child-health component which among other information, obtained information on the use of health-care services by the mother during pregnancy for children born since January 1999. A multi-stage, cluster sampling procedure was used to select women to be interviewed by the DHS. In total, 6419 reproductive-aged women were eligible for the survey. Of the 6419 women, 6251 answered the questionnaire (INEI, Encuesta demográfica y de salud familiar 2004). The sample for this study was based on women who had their last child born alive during the five years prior to the interview date, including a total of 2053 births. Women who reported more than one pregnancy during the five-year period were asked to focus on the most recent pregnancy. It was necessary to weight the data to make the observations more representative. The weighted number of observations is n = 1771. All analyses were weighted.
The model of utilization of prenatal care used in this study is the health behavior model developed by Anderson and Newman. The original formulation included three types of factors that influence care use: **predisposing factors**, which includes sociodemographic characteristics and attitudes toward service use; **enabling factors**, that is, factors or means that facilitate the use of health services; and **need factors**, considered as the most immediate cause of health care use (Andersen and Newman, 1973). Subsequent revisions of the model added a fourth category, **healthcare system factors**, which includes health policy, resources and their organization in the health care system (Andersen, 1995).

The outcome variables were frequency of prenatal care and initiation of prenatal care. Frequency of prenatal care was dichotomized into 2 groups: 1: infrequent and no prenatal care (0-3 visits), and 2: frequent prenatal care (4 or more visits). Initiation of prenatal care was dichotomized into 1: early prenatal care (women who reported their first visit in the first to third month), and late prenatal care (women who reported their first visit in the fourth to ninth month).

Independent variables for this study included 1: **Predisposing factors**: Age at first birth (15-19, 20-34, 35-49); Parity (Para 1, Para 2-4, Para5+); household size, defined as the number of people living in the house (1-5, 6-10, 11+); ethnicity (Spanish speakers, indigenous language speakers); Number of children under five living in the house (0, 1, 2+), 2: **Enabling factors**: current marital status (married, not married); mother education (none or primary, secondary or higher); partner’s education (none or primary, secondary or higher); socioeconomic status (SES) (low/medium SES, high SES); whether the woman was currently working (yes, no); ever used contraceptive methods (traditional and no method, modern method). Intentionality of the last birth (wanted, mistimed or unwanted); member of the Maternal and health Insurance (yes, no); member of EsSalud (yes, no); getting money
needed for treatment (big problem, small problem); distance to health facility (big
problem, small problem); concern for no female health provider (big problem, small
problem); Final say on own health care (Respondent alone, Other than respondent). A
low /medium SES was defined as an SES in the bottom 3 quintiles of the wealth index.
Women who were affiliated to EsSalud include those who were affiliated with a
private insurance or to a public insurance system for formal workers, 3: Need factors:
history of abortion or stillbirths (yes vs. no), 4: Healthcare Systems Factors: Place
of residence (urban, rural area).

Bivariate chi-square analyses were used to determine the relationship between
prenatal care use and selected variables (predisposing, enabling, need and health care
system factors). Logistic regression derived adjusted odds ratios for prenatal care use.
Data were analyzed with the Statistical Package for the Social Sciences (SPSS).

III. Results

Table 1 presents the distribution of prenatal care utilization by the sampled
women’s characteristics using Pearson’s Chi Square analysis. About 90 % of women
had frequent prenatal care. Of those who used prenatal care, 74% reported having
initiated prenatal care early. The highest prevalence of frequent prenatal care occurred
among: women 35 years old or older (93.8%), women who reported having only one
child (92.1%), household size of eleven or more (92.3%), being Spanish speaker
(88.1%), having one child under five and no children under five living in the house
(89.5% and 88.7% respectively), women reporting secondary education or higher
(93.3%), women whose husband had secondary education or higher (91.8%), women
with high socioeconomic status (96.4%), women who had ever used a modern
contraceptive method (89.7%), women reporting their last birth was wanted (91.8%),
women who were affiliated to the Maternal and health Insurance (92.0%), women
who considered getting money needed for treatment as a small problem (91.6),
women who considered distance to health facility as a small problem (91.5), women who considered the absence of female health provider in the health facilities as a small problem (90.8%), women who decided to seek care on their own, women living in the urban area (92.7%).

Women reporting a higher prevalence of early prenatal care included: those in the 35 to 49 year age group (87.1), those who reported having only one child (74.2%) and 2 to 4 children (75.9%), those who were Spanish speaker (75.1%), having one child under five living in the house (76.4%), women reporting being married (82.9%), those reporting secondary education or higher (76.6%), those whose husband had secondary education or higher (77.6%), those with high socioeconomic status (81.9%), those who had ever used a modern contraceptive method (76.4%), those reporting their last birth was wanted (82.4 %), those who were not affiliated to the Maternal and health Insurance (76.6%), those who were not affiliated to EsSalud (78.7%), those who considered getting money needed for treatment as a small problem (82.1%), those who considered distance to health facility as a small problem (78.0%), women who considered the absence of female health provider in the health facilities as a small problem (78.8%), women who decided to seek care on their own (76.2%), those who had a history of abortion or stillbirths (84.2%), and those living in the urban area (78.7%).

Tables 2 and 3 present the odds ratios and 95% confidence intervals for significant factors of frequent prenatal care and early prenatal care, respectively, after adjustment for other variables from table I. Variables which were not significant in the bivariate analysis were not included in the multivariate analysis. Model 1 adjusts for predisposing variables; model 2 adjusts for predisposing and enabling variables; model 3 adjusts for predisposing, enabling, and need variables; model 4 adjusts for predisposing, enabling, need and health care system variables. In table 2, need factor was not included as it was not found significant in the bivariate analysis.

In table 2, model 1, women who were 19 or younger at the time of the last birth were significantly less likely to have frequent prenatal care (0.714; 0.522, 0.978) than women age 20-34. Compared to women who had only one child, women with five or more children were less likely to have frequent prenatal care (0.237 [0.144, 0.391]). In model 2, compared to women having only one child, women having five or more children were significantly less likely to have frequent prenatal care (0.515 [0.275, 0.963]). In comparison with Spanish speaker women, those who spoke an indigenous language had an adjusted odds ratio of frequency of prenatal care of nearly 2 (1.758 [1.115, 2.772]). Women who had secondary education or higher had an odds ratio of more than 2 (2.055 [1.313, 3.217]). Women with high socioeconomic status (SES) also had an elevated adjusted odds ratio of frequent prenatal care (4.126[2.433, 7.000]). Women who had a mistimed pregnancy were significantly less likely to have frequent prenatal care (0.511 [0.331, 0.788]) compared to those with an intended birth. Women who were not affiliated to the maternal and health insurance were 0.216 times (0.150, 0.311) less likely to have frequent prenatal care than to those who were affiliated to the maternal and health insurance. Women considering distance to health facility as a big problem when seeking any health care were less likely to have frequent prenatal care 0.654 (0.454, 0.942) than those who considered distance to
health facility as a small problem. In model 3, women with five or more children born alive were less likely to have frequent prenatal care compared to women with only one live birth, (0.529 [0.282, 0.994]). Women who spoke an indigenous language had an adjusted odds ratio of frequent prenatal care of 1.824 (1.149, 2.897) compared to women who spoke Spanish. Mother education remained significant, those with secondary education or higher were more than two times as likely to have frequent prenatal care as those with only elementary education or no education (2.047 [1.307, 3.205]). SES was significant, those with a high SES had an elevated odds ratio of frequent prenatal care (3.748 [2.155, 6.518] in comparison to women of low SES. Women who had a mistimed pregnancy were significantly less likely to have frequent prenatal care (0.511 [0.331, 0.789]) compared to those with an intended birth. Those who were not affiliated to the maternal and health insurance were less likely to have frequent prenatal care (0.210 [0.145, 0.303]) than those who were affiliated.

In table 3, model 1, early prenatal care was found to be significantly lower among those 15 to 19 years old (0.658 [0.517, 0.837]) relative to those 20- to 34-year age group. In model 2; not married women were significantly less likely to have early prenatal care (0.537 [0.405, 0.712]) in comparison with married women. Women using a modern contraceptive method had an adjusted odds ratio of early prenatal care of 1.395 [1.013, 1.920] compared to women using a traditional method or not using any method. Women who had a mistimed and unwanted pregnancy were significantly less likely to have an early prenatal care (0.539 [0.398, 0.730]) and 0.672 [0.481, 0.939]), respectively) compared to those with an intended birth. Women considering no female health provider as a big problem when seeking health care were less likely to have early prenatal care visit (0.768 [0.597, 0.879]) than those who considered it as a small problem. In model 3; not married women were less likely to have early prenatal care (0.545 [0.411, 0.724]) compared to married women. Women using a

IV. DISCUSSION AND CONCLUSIONS

This analysis revealed the association between the predisposing, enabling, need and health care system factors and two patterns of prenatal care use (frequent prenatal care and early prenatal care). In the multivariate analyses, we found that mothers aged 15 to 19 were less likely to have frequent prenatal care and early prenatal care but only in the first model which includes predisposing factors. They are not significant when we include the enabling factors. Young motherhood was found a risk factor for not having prenatal care and late prenatal care in the study by Stella (Stella M. Yu et al, 2001). Other studies report older age as a risk factor for no prenatal care (Henze, 2004).

Women who had five children or more were the least likely to have frequent prenatal care. However, for women who entered prenatal care, their parity was no longer a significant determinant of early prenatal care. Women with more children may feel more confident about pregnancy and not perceive the need for prenatal care; they may also have less time for seeking prenatal care.

While indigenous language speaker mothers were more likely to have frequent prenatal care in models 2 and 3, there was no difference for Spanish or indigenous speaker mothers to have early prenatal care. The notable result from the present data: the protective effect of speaking an indigenous language for frequent prenatal care could be a confirmation that policies and programs are having positive effects. The government has invested heavily and targeted to the most remote areas in recent years in order to expand primary health, including maternal health care services with no fees for the poor population (Ministerio de Salud, The seguro Integral de Salud success 2005; Cotlear, 1999) but efforts to the underserved Spanish speaking population should not be left unattended.

Women with secondary education or higher were more likely to have frequent
prenatal care but only in model 2 and 3, not in model 4 which includes area of residence. This positive association is not found for early prenatal care across any of the models. The role of education has been reported in several studies (Elo, 1992; Vogl, 2004; Mekonnen, 2002; Henze, 2004; Yu et al, 2001) Educated women may have greater autonomy to make decisions about their own health; they may also have more family and social support and higher socioeconomic status. However, education could be less important as a determinant of early prenatal care.

While unmarried women were not less likely to have frequent prenatal care, they were less likely to have early prenatal care. Women who are not married may have less support from their spouses or family than women who are married and it may delay attendance to early prenatal care.

High socioeconomic status was positively associated with frequent prenatal care, but was not associated with early prenatal care. Findings of positive association between high SES and prenatal care have been reported in other studies (e.g. Van et al, 2006).

Having a mistimed pregnancy was negatively associated to frequent prenatal care and early prenatal care, unwanted pregnancy was also negatively associated to early prenatal care but not to frequent prenatal care. Other studies show unintended pregnancies linked to inadequate prenatal care and late initiation or no prenatal care (Hulsey, 2001; Marston, 2003). It may reflect the woman unwillingness to recognize her pregnancy and as a result delay the initiation of prenatal care.

Insurance plays an important role for prenatal care access; women not having maternal health Insurance were less likely to have frequent prenatal care but insurance status did not affect for having early prenatal care. Health Insurance may help in reducing the woman financial burden and facilitate the use of prenatal care. Significant association between insurance and amount of prenatal care were found by
Women who considered distance to health facility as a big problem when seeking care were less likely to have frequent prenatal care but in model 2 only, there was no significance with early prenatal care in any model, this was just a subjective view of the woman, previous studies in Peru suggest that geographic barriers may be still hindering prenatal care use (Jaramillo Miguel, 2002; Vogl, 2004).

Among factors that were negatively associated with early prenatal care but not prenatal care use we have: not using a modern method, considering the fact that there is no female health provider as a big problem for seeking care and whether the woman had a history of abortion or stillbirth. Women using a modern contraceptive method may have different socioeconomic and behavioral background than those who use traditional method or no method at all and it may increase the likelihood of early prenatal care, also the adoption and use of contraceptives may facilitate more rapid adoption of health care use or vice-versa (Mosley and Ahmed, 1997). Women considering the unavailability of female health care provider as a big problem for seeking health care services serves as a proxy for the woman to seek prenatal care and her consideration about health provider gender, it may reflect that women from very private backgrounds may feel shame or fear to male health provider, this situation could be improved with educational programs for mothers to increase acceptance of male prenatal care provider and also for providers to be sensitive to cultural issues. History of abortion may reflect the woman experience of her previous health condition and consequently perceive the need to have early prenatal care (Ciceklioglu et al., 2005).

Peruvian government has made significant improvements in health care but there are still efforts to be made in order to increase health services among underserved women, e.g. women with five children or more, with elementary or no education,
unmarried, of low SES, of risk for an unwanted or mistimed pregnancy, of risk for abortion or stillbirths, not using a modern contraceptive method, not being a member of the maternal and health insurance. It is our hope that these changes will lead to improvement in health and access to healthcare as those who are advantaged. Also, further research that builds on this study is needed to provide information and suggest policies.

This study had several limitations. The Peruvian DHS 2004 was conducted in 2004. Women who had a live birth since January 1999 were interviewed. This could have introduced recall bias into the study. We are unable to examine important factors such as cultural acceptability of aspects of prenatal care, women’s knowledge and beliefs. We did not include some important enabling factors, for example distance to health facilities, but we did include area of residence and a question about whether the woman considers distance to health facility as a big or small problem which did not show significant association to prenatal care use, this limitation may not have significantly affected the results.

Introduction

It is important that colleges of education include assignments for students to discuss cultural diversity issues. All students, not just education majors, should have preparation programs which include knowledge, skills, and attitudes needed to interact effectively with individuals from diverse racial, ethnic, and social class groups. Cultural activities should be used to facilitate understanding diversity.

Athletic training students are faced with diversity issues on a regular basis. They spend long hours providing prevention, care, and rehabilitation of injuries to a diverse population of athletes. Therefore, students should receive formal training on multicultural education and diversity awareness to be better prepared to handle interpersonal and professional responsibilities.

Athletic training is now recognized as an allied health profession. Athletic training educators need to be aware of the overall scope of the educational mission. Educators should not only teach the aspects of athletic training necessary for passing the certification exam, but also prepare students to understand issues of race, discrimination, identity, and diversity. Athletic training
educators need to provide sensitivity training and sociocultural awareness according to the 2007 NATA *Athletic Training Educational Competencies.*²

Salili & Hoosain³ state that including multiculturalism in athletic training teaches students to accept, understand and appreciate culture, race, social class, religion, and gender differences and instills in them during their formative years a sense of responsibility and commitment to work toward the democratic ideals of justice, equality, and democracy.

Geisler⁴ recommended that two questions: “How might your personal cultural perspective affect your practice as an athletic training professional?” and “How might athletes from different cultural backgrounds interpret your language, comments, and behavioral patterns?” be included in didactic and clinical learning experiences for athletic trainers. The purpose of this paper was to examine how athletic trainers answered the two questions.

**Methods**

Over the last four years, graduate students (N=74) enrolled in a Pedagogy class from the Athletic Training Education Program at California University of Pennsylvania were asked to observe their work setting for two weeks to identify issues in diversity and respond to the two previously stated questions. A presentation on diversity was given to the students prior to their observation. The graduate students’ internship assignment required working 30 hours a week as an
athletic trainer in either a high school or college setting. They held an authoritative role and they were responsible for the environment in their athletic training rooms. They were told to let their athletes know that racist, sexist, homophobic, and other types of discriminatory remarks were not acceptable. For example, if a student made a discriminatory remark, the athletic trainer was to promptly speak up and state “That is inappropriate language and not welcome here.” Students and/or athletes need to know that disparaging comments would not be tolerated.

Results

Most of the students believed that their cultural perspective would have a positive affect on their athletic training profession. Some students commented their cultural perspective may have a negative affect on their athletic training practice. They may, without knowing, treat athletes differently and neglect their feelings.

The majority of the students reported that athletes may interpret their language, comments, and behavior in a negative manner. They stated that their actions and comments could be misinterpreted, and that self discipline, with respect to language, comments, and behavior, is the key for addressing diversity issues.
The following quotes were some of the responses to the first question:

“How might your personal cultural perspective affect your practice as an athletic training professional?”

- In my culture it is believed that you should work through your own problems and be tough through pain. I find that I may not be sympathetic to athletes that are more sensitive to pain. Therefore, this attribute affects my ability to treat the athlete’s injury in a negative way.

- At times as humans, we are drawn to those we feel most comfortable with and may tend to provide care for those individuals first. We must make sure that we provide equal care to all athletes in need. Care should be given first to those whose health needs are most critical.

- It makes a big difference knowing your athlete and their social status. I’m not saying to be nosey but just get the feel through observation. It makes a big difference with how the athlete deals with serious injuries and their attitude towards rehabilitation. You want to be able to talk to the athlete and understand their concerns and questions. If the athlete trusts you and finds you as a role model then you have a better chance of getting successful results as far as rehabilitation is concerned. Knowing your athlete is so important. It helps you make big decisions for the athlete and helps you interact with the person. It’s all about the athlete feeling comfortable about being themselves with you. Understanding different
cultures can only further your professional background as an athletic trainer.

Students stated the following for the second question: “How might athletes from different cultural backgrounds interpret your language, comments, and behavioral patterns?”

• **Athletic trainers need to be extremely aware of what is being said in the training room, on the playing field, and any other time athletes may be around. Language that could offend another individual should not be used. First, an athlete should feel comfortable around the athletic training staff. If improper language is being used that individual may feel tentative around you. This may also affect how the athlete trusts you as well. Another reason that improper language should not be used is due to the fact that an athlete may not come to you when an injury occurs if he or she believes they will not receive the proper treatment due to their different background or lack of trust in you.**

• **We must give instructions clearly and ask them for their feedback to ensure that they understand what we are trying to communicate. Sometimes different words are used for different items, thereby causing a barrier of communication.**

• **During a college cross-country invitational, I was called over to care for a runner from Kenya. He had intense pain in his lower back, and when I**
lifted up his shirt to look at his lower back, I saw a scar on the left side. I asked him where he had gotten it, thinking in my head it was some type of surgery or previous injury, and he said, “hunting”. To that reply I was confused and was not sure if I had heard him correctly so I asked him again. His reply was the same, “hunting”. At this point I could tell that he was starting to get a bit frustrated from the pain and from me not comprehending his previous injury, so I decided to inject a little bit of humor into the situation. I asked him, “Were you hunting or were people hunting you?” This being the most innocent of statements or I thought it was, he laughed. I gave the athlete ice and a few instructions to follow. The athlete was very polite when leaving and I got him to smile one last time. I discussed the situation with another athletic trainer. She told me how much fighting was over in Kenya at the time and he could have been “hunted”. I felt terrible at the mistake I had made, but luckily for me, the athlete allowed me to indirectly learn something new about his culture without taking offense to my innocent comment.

- Athletes from cultures placing a great amount of importance on showing respect may be somewhat insulted by the lack of respect in the behavior of some Americans. Additionally, those from cultures in which women have little power or voice may not take kindly to the influence American women have on everything from day-to-day life to the economy. For
example, an athlete from this type of country may not be pleased with a female athletic trainer making the decision of who is ready to play and who is not. Also, I tend to be rather laid back with a joking attitude. Athletes from other cultures, especially when English is not their first language, may not understand and take comments personally or in a way other than how they are meant.

- The way you dress says something about the way people will perceive you. When we go to work; our shirt should be tucked in, hair combed, and clothes ironed. If you dress and look confident; athletes will be more willing to come to you for assistance. If you have a dress down day at work, you may want to think about any wording that may be on your shirt. Someone may not find that same word or saying funny and may be offended.

- In the south home remedies are quite often used to treat illnesses and injuries. I have found that mothers will often perform these remedies on their children while receiving treatment from us. If you tell the mothers not to use the remedies they become irate and tell their children not to come back to us for treatment. If you do not embrace their culture or understand their culture you are more likely not to have them adhere to your treatments.
Differences in race, gender, social class, and sexual orientation are associated with power. Prejudices may be reflected based on the norms of dominant groups. Incidences of racial fear, discrimination, and avoidance still occur. The following situations were reported:

- **Being an African-American female I am often a minority as an athletic trainer.** As a woman, at times it can be difficult to work with sexist male coaches especially in football.

- **The junior high football team was scheduled to play an away game.** The coach said that there was a good possibility that the game would be canceled due to the fact that several of the parents didn’t want their children playing in the game because their opponents were primarily African American athletes.

Discussion

The topic of cultural diversity is complicated and some faculty and students are uncomfortable when discussing diversity issues. Students reported they observed facial expressions and body language which indicated discrimination. There were times when individuals stated they were not being acknowledged. Either a certain gender or race would dominate the discussion and exclude individuals from participation. These behaviors cause individuals to feel alienated.
Students commented that there were situations where they did speak up promptly to athletes who made offensive or insensitive remarks. They explained to the student who made the remark why the comment was distasteful. It helped them to establish a safer environment and they believed the athletes understood not to make any comments in the future. The graduate athletic training students may not have responded to offensive language if they had not received a lecture informing them to not allow that type of behavior in their work environment.

No student commented on a homophobic situation. Homophobia is not an issue people in sports want to address. Student-athletes are hesitant to talk about homophobia for fear of having individuals believe they are associated with homosexuality. Sport remains an area where homophobic attitudes and behaviors are developed.

Conclusion

Diversity awareness and multicultural education needs to be addressed somewhere in all curricula. The results for the assignment described in this paper identified that students reflected on their multicultural values, enhanced their awareness for diversity issues, and became cognizant of the need for professionalism with their language, comments, and behaviors in the athletic training environment. A combination of lecture, observation, and reflective
discussion helped the students to be socially conscious and critically aware of their role in society.

A Brief Abstract of Anthony P. Biduck’s paper: “Spirit Realizing Itself as the Embodiment of the Divine in Hegel’s Phenomenology of Spirit.”

This paper analyzes the tension invoked between the Christian doctrines of Christ, and Hegel’s critique of Christianity, which appears in the Manifest Religion section in chapter VII. By providing a critical analysis of Manifest Religion, the tension is resolved in three ways: i) to set forth an evaluation of Hegel’s critique of Christianity, ii) to show how this critique brings us to the ultimate point of the historical movement of the dialectic, and iii) to show how the content of Manifest Religion is the same content of Absolute Knowing except that religion portrays it through picture-thinking. The paper also argues that Spirit in its most fully developed form comprehends itself as God or the divine, Absolute Spirit. In order for this to happen, not only must Subject become aware of itself as Substance, but also the Phenomenology must show the reverse to happen, that is, the dialectic of Spirit must unfold by Substance becoming aware of itself as Subject.
“Spirit Realizing Itself as the Embodiment of the Divine in Hegel’s
*Phenomenology of Spirit.*”

G.W.F. Hegel’s (1770-1831) critique of Christianity is adduced in the claim in the
*Phenomenology of Spirit* (1807) that “the divine nature is the same as the human.”¹ For Hegel,
the embodiment of the divine Being was not only relevant for Jesus, who, as Christian doctrine
understands it, was virgin born more than 2000 years ago, and who is above and separate from
all other humans because he embodies the absolute, pure divine Being. Rather, Spirit itself, that
is, the human being, already possesses this absolute divine principle without any appeal to a
transcendent, metaphysical divine. The individual man, Hegel says, is the “immediately present
God (¶ 763).” The tension invoked here is created between the Christian doctrines of Christ, on
the one hand, and, on the other hand, Hegel’s critique of Christianity, which appears in the
Manifest Religion section in chapter VII, the penultimate chapter of the *Phenomenology*. For
Hegel, religion should not be thought about in a transcendent, metaphysical way, but rather, it
should be practiced and realized in an immanent and rational way in the community. By
providing a critical analysis of Manifest Religion, the aim of resolving this tension is threefold: i)
to set forth an evaluation of Hegel’s critique of Christianity, ii) to show how this critique brings
us to the ultimate point of the historical movement of the dialectic, which occurs in the final
chapter on Absolute Knowing, and iii) to show how the content of Manifest Religion is the same
content of Absolute Knowing except that religion portrays it through picture-thinking and,
therefore, has not actually attained the rational outlook contained in Absolute Knowing. Thus, if
or when religion drops its dependence on picture-thinking, Spirit is then on its way to realizing
Absolute Knowing. This latter claim raises the following questions: Is picture-thinking internal

¶ 763. Hereafter *Phenomenology*. 
to religion? Or, rather is picture-thinking itself a merely contingent concept and not a necessary one to realize the Absolute? To answer these questions, it will be important to examine the relation between religion in chapter VII and philosophy in chapter VIII in the *Phenomenology*.

The claim at the start of the paper may well enough lead one to ask the following question: If God becomes man, as is depicted in the Christian religion, then how is it possible, in Hegel’s account, that all human beings can actually realize the absolute, divine Being? Furthermore, how does the figure of Christ, who represents the divine Being in the human form, become universalized by representing all humans? Spirit must become aware of itself – through rationality and reason – as Spirit and take its own Self to be authoritative. In other words, Hegel’s ultimate aim in the *Phenomenology* – and this is how he goes beyond any other philosopher in the Western philosophical tradition – is to show that Spirit in its most fully developed form comprehends itself as God or the divine, Absolute Spirit. In order for this to happen, not only must Subject become aware of itself as Substance, but also the *Phenomenology* must show the reverse to happen, that is, the dialectic of Spirit must unfold by Substance becoming aware of itself as Subject.

**The Manifest Religion and the Rise of Spirit Becoming Absolute**

Religion portrays the Absolute with the concept of *Vorstellung*—perhaps the most important concept in Manifest Religion. Spirit, as in-and-for-itself, comprehends itself (Spirit) as Spirit (itself) in the form of *Vorstellung*. The use of picture-thinking was not previously discussed in the *Phenomenology*, and the full discussion of it first appears in Manifest Religion. *Vorstellung* is not portrayed through theoretical or conceptual thinking, but rather through parables, stories, images, and symbols. For Hegel, the teachings of the Bible, for example, are
not to be understood literally or as mere matter of fact. They are only a representation of conceptual truth. Picture-thinking itself does not take place at the level of the Concept (*Begriff*) or in rational thinking i.e., philosophy. In “The Othering (Becoming Other) and Reconciliation of God in Hegel’s Phenomenology of Spirit” Schönendorf writes, “Picture-thinking is a way in which content [(what is true and real)] and form [(what still contains a defect)] are separated for consciousness.”

Though picture-thinking is a mode of externality that is separate from the internal movement of the natural consciousness, the stories and symbols of picture-thinking can be seen to be analogous with the movement of the natural consciousness. Ultimately, picture-thinking must become identical with the natural consciousness, but in order for this to happen, the natural consciousness, which is Absolute Spirit in Manifest Religion, must overcome its use of picture-thinking that occurs at this stage in order to progress to the point where Absolute Spirit is conceptually grasped, which occurs in Absolute Knowing.

In Manifest Religion, God can be seen to move in a threefold descension, which at the end loops back around to the beginning. The first moment begins at the element of pure Thought or pure Substance. This first moment is analogous to the conception of God in the Old Testament as abstract and without form. However, since this abstract level remains imperfect the dialectic moves on because Spirit is not yet reconciled with its own Self. The second moment is Spirit’s descension from an abstract and selfless form to a becoming-human. This moment is analogous with the representation of Jesus in the New Testament. In this second moment, I will focus on the Incarnation (*Menschwerdung*), and the death of Christ, which represents the divinity’s reflection into Himself and the return to the Father. The natural consciousness at this

---

2 Schönendorf, Harald, S. J., “The Othering (Becoming Other) and Reconciliation of God in Hegel’s *Phenomenology of Spirit*” in *The Phenomenology of Spirit Reader: Critical and Interpretive Essays*, edited by Jon Stewart, (Albany: State University of New York Press, 1998); p. 377, (my addition in []’s),
stage sees God in the human form, and spirit becomes self-consciously aware of itself as Spirit. The third moment discussed is the resurrection, which represents the manifestation of Spirit in the community. This is the moment whereby Spirit takes its complete form as both in-itself – and – for-itself. This third moment is Spirit’s return from otherness, and Spirit at this stage becomes actualized in the community. Here Spirit becomes the universal self-consciousness, reconciled on both an individual and a universal level. Thus, the dialectic in Manifest Religion is reflective of the Trinity, which Hegel explicitly discusses. The dialectic of Religion progresses from the Old Testament to the New Testament to, finally, Hegel’s conception of Absolute Knowing.

“In the beginning God created the heaven and the earth (Genesis 1:1).” This is the first moment of picture-thinking in the Old Testament. This representation or conception of God in Christian eyes is not an immanent one. When God or heaven is understood as transcendent, it leads one to take flight from this world, thereby annihilating one’s existence on Earth and keeping one’s head clouded with a conception that is imaginative and invented by man. In the Old Testament, God is understood as an eternal and selfless Spirit. When religion understands God as a selfless and abstract entity lacking inwardness, he becomes wholly separate from the individual and, therefore, objective. Moreover, the world, too, lacks inwardness and a self. Hegel writes,

[T]hat which is posited as essence [i.e. the world] is simple immediacy or being, but qua immediacy or being lacks a Self, and, therefore, lacking inwardness is passive, or being-for-another. This being-for-another is at the same time a world (¶ 774).

Thus, picture-thinking sets forth God and the world as lacking a self.

---

3 The Old Testament depicts God as Spirit in Genesis 1:3: “And the Spirit of God moved upon the face of the waters” (my italics). God as eternal is found in Deuteronomy: “The eternal God is thy refuge, and underneath are the everlasting arms…” (33:26-27, my italics).
However, the opposite can be argued. According to Jean Hyppolite in *Genesis and Structure of Hegel’s Phenomenology of Spirit*, “God becomes self in the creation, but the world, insofar as it expresses this movement itself, becomes a finite self in-the-world.”¹⁴ This would mean that the moment of creation by God is also a moment where God becomes other, a thought picture-thinking cannot grasp. God’s act of creation is a negativity because God becomes other. Hegel writes:

But simple essence, because it is an abstraction, is, in fact, the negative in its own self and, moreover, the negativity of thought, or negativity as it is in itself in essence; i.e. simple essence is absolute *difference* from itself, or its pure othering of itself (¶ 769).

The abstraction or negativity of God is the Self (*for*-itself) (ibid.). The very act of othering is a becoming of the Self, and the world was created by God not for Himself, but for another. The world, Hegel says, is Being-*for*-another (¶ 774). But what does it mean to say that God is an other? “He is only an other insofar as he thinks himself. But he is thus at the same time identical with himself.”⁵ In the very act of thinking, God becomes other. This othering of God remains in pure thought. Thus, in the act of creation, God also becomes external to Himself. This act shows that God can think of Himself as object. The world, as the work of God, is an object created by God, which, at the same time, is different from Him. “It is the unfolding of everything that is contained in substance.”⁶ Schöndorf takes this one step further: “If God is other in Himself, He is also not only an object of knowing, but rather is Himself knowing.”⁷ However, what is lacking is that God needs to be known by other living, conscious beings.

According to Pinkard, in order for God to come to a full self-consciousness about Himself, there

---

⁵ Schöndorf, p. 379.
⁶ Ibid., p. 381
⁷ Ibid., p. 379.
requires recognition from another.\textsuperscript{8} Hence, for God to become \textit{known}, he needs to make human beings in the world.

God, as abstract and selfless, as is pictured in the Old Testament, is the way in which humans recognize God. However, God Himself is not complete because the dialectic of religion transitions, and at the beginning of the New Testament, God is known in the human form.\textsuperscript{9}

Thus, the movement from the Old Testament to the New Testament is a movement whereby the abstract, formless God dies, to a conception of the divine as now manifesting in and taking the form as a human being. In the New Testament, God is a living presence in the community amongst others, and God, therefore, is recognized by others. “In this religion the divine Being is known as Spirit, or this religion is the consciousness of the divine Being that it is Spirit (¶ 759).” When the Absolute Spirit, in its form as self-consciousness, becomes aware of the divinity in an actual man, a sensuous being living in the world, which is seen and heard, self-consciousness is not imagination but is actualized (¶ 757). Hegel writes,

\begin{quote}
Consequently, in this religion the divine Being is \textit{revealed}. Its being revealed consists in that it is known. But it is known precisely in its being known as Spirit, as a Being that is essentially a self-conscious Being (¶ 759).
\end{quote}

In the New Testament this divine Being is pictured in the figure of Jesus Christ, a God-man or man-God, who is self-consciously aware that he embodies the divine Spirit.

In the New Testament, moreover, man does not realize God through a withdrawal into the Self; rather, God becomes \textit{known} to man externally in the community. Man, therefore, sees God

\footnotesize
\begin{itemize}
\item \textsuperscript{8} p. 255.
\item \textsuperscript{9} In the prophecy of the coming of Elijah in the Book of Malachi, the Lord is mentioned in this closing passage of the Old Testament: “Behold, I will send you Elijah the prophet before the coming of the great and dreadful day of the \textbf{Lord}: And he shall turn the heart of the fathers to the children, and the heart of the children to their fathers, lest I come and smite the earth with a curse (4:5-6).” Later, and this refers directly to the passage above, in the New Testament in the book of Matthew, Christ says, “And from the days of John the Baptist until now the kingdom of heaven suffereth violence, and the violent take it by force. For all the prophets and the law prophesied until John. And if ye will receive \textit{it}, this is Elias, which was for to come (11:12-14).”
\end{itemize}
first in another human. The individual in the community sees the divine Being in only one individual human, namely Christ. This is clearly portrayed in the Gospels, who were written by Christ’s disciples. Thus, it is obvious that the divine-human Being is fathomable by other human beings. This is also how Spirit becomes aware of itself in the community (¶ 765), and the content of the community’s consciousness is the certainty of Spirit’s presence. The figure of Jesus, consequently, who is immediate or immediately present to the consciousness of the sensuous individual (¶ 762), is the first appearance of the Absolute Being revealed as Spirit.

However, the divine Being appearing only in one man is shown to be incomplete in the Phenomenology. In the last sentence of ¶ 762, Hegel claims that the problem in this first immediacy is that the individual is stuck at the level of perception. Moreover, Christ, as the incarnation of God, is understood by Christianity as something separate from the human being.\(^\text{10}\)

Hegel wants to show that the divine is not only manifest in one man, but rather, the divine Being is manifest in all human beings. In terms of picture-thinking, in order for this to happen, therefore, Christ must represent the entire community. In other words, and this is the incompleteness shown at this stage, the individual self-consciousness must reconcile itself with the universal self-consciousness.

Believing that God only manifested in the historical figure of Christ cannot be the claim to universality, nor the way in which its meaning gets established. Thus, the individual Self is not yet the Self of everyone—the universal Self (¶ 762). In order for there to be reconciliation

\(^{10}\) One place this becomes relevant in the New Testament is in John 14, where Christ says to Philip, “Anyone who has seen me [Christ] has seen the Father. How can you say, “Show us the Father”? Don’t you believe that I am in the Father, and that the Father is in me? The words I say to you are not just my own. Rather, it is the Father, living in me, who is doing his work. Believe me when I say that I am in the Father and the Father is in me (New International Version, my addition in [’s]).” This passage does not mention anything at all about human beings possessing a divine quality. The divine quality is only unique to Christ, which is merely one-sidedness because God (the Father) lives only through Christ (the Son), and not through all beings.
between individuality and universality, the divine principle must not be understood as merely contained in one individual. What Hegel wants to show, and this is his critique of Christianity, is that the divine principle that Christ is understood to possess is a principle contained in all individuals. I am a divine-human spirit just as you are a divine-human spirit. Hegel writes, “The divine nature is the same as the human, and it is this unity that is beheld (¶ 759).” God must become one with man. Consciousness must comprehend that it, along with every individual being, is the immediately present God (¶ 763). The kingdom of God dwells not only in Christ, but it dwells within all men.11

For Hegel, then, how does the human being come to realize that the divine Being is already manifest and identical with the human, finite being? In order for this to happen, the religious believer has to overcome the disparity that remains between him and God. The cause of this is due to only seeing Christ as the divine manifestation. Hegel does not reject that Christ was a historical figure; though, he is opposed to the belief that Christ was the only individual ever to possess the incarnation of God. For Hegel, the problem here is that the subject mistakes itself as something different from the Absolute divine Being. The Absolute divine Being, who is pictured as Christ in the New Testament, is ultimately the Self that is manifest in all men. Spirit taking itself (actual spirit) as object must become identical with the infinite spirit—its essence. In other words, the individual must reconcile its finite thinking with the infinite consciousness of the Absolute. To see God only in picture terms through Biblical stories is not the path consciousness can take to overcome the objective disparity that exists between the reconciliation of individuality and universality. The way in which this is overcome is by realizing that the

11 This is also alluded to in a passage from Corinthians: “Don’t you know that you yourselves are God’s temple and that God’s Spirit lives in you (1 Corinthians 3:16)?”
content religion uses to portray the Absolute divine Being through picture-thinking, is the same content that makes up the human individual Self. Thus, the individual must overcome picture-thinking and conceptually grasp the Absolute divine nature as its own Self. The notion of Vorstellung employed by Christian doctrine is a hindrance that keeps Spirit from fully and conceptually grasping itself as the Absolute. In overcoming picture-thinking, Spirit is then on its way to realizing Absolute Knowing, which is essentially the same content as religion. When this is comprehended, Spirit knows the divine is immanent, and all notions of God as separate and transcendent from the human being, as is the case in Christianity, are overcome. Thus, God must die again.

In terms of picture-thinking, the death of God, the second moment of the Trinity, is represented in the crucifixion—the death of Christ on the cross. In negating His finite sensuous existence by dying on the cross, Christ performs a voluntarily, autonomous act of free will, which is done in order to re-unite with the infinite Spirit of God, the Father. The crucifixion, therefore, is not an act of suicide, nor a turning away or a taking flight from the world. Rather, the crucifixion represents the Son’s return to the Father (Spirit’s return to pure Thought), which is also God returning into Himself.

The moment of the death of Christ is also the moment of the revelation of Spirit in the community. This is expressed pictorially in terms of the resurrection, the third moment of the Trinity. This is the representation of God as both the Spirit of man in the community and the notion of particular individuality—(Christ) dying away and becoming universality (the Spirit of the people). Hegel writes,

[D]eath becomes transfigured from its immediate meaning, viz. the non-being of this particular individual, into the universality of the Spirit who dwells in His community, dies in it everyday, and is daily resurrected (¶ 784).
The death of God, therefore, does not only represent the death of Christ, it also represents the position of Spirit as manifest in the universal self-consciousness of the community where it is resurrected there everyday. For Jesus is “the resurrection and life (John 11.25).”\(^{12}\) Hyppolite writes,

> This community is no longer Christ as a specific figure, but the Holy Ghost in which the Incarnation becomes eternal. The Christocentric point of view of the Bible tends to disappear to make place for this universal Christ which is the community.\(^{13}\)

Jesus represents eternally the universal self-consciousness of the community. With His physical presence now absent, his spiritual presence manifests in the community.\(^{14}\) At this stage, essence is reflected into itself and it becomes Spirit (¶ 780).

The threefold descension of religion, which is also circular, looks like this: God moves from abstraction (pure substance) to human actuality (incarnation), and back to abstraction (crucifixion and resurrection). Also, each of these movements is a negative movement, that is, a movement into otherness because a notion of otherness requires a notion of negativity. In the New Testament, the othering of God, which expresses negativity, is represented in the relation between Father (God) and Son (Christ). The otherness is shown in the act of negativity of God (Father) becoming other to himself by manifesting as the Son (Christ). God (Father) is wholly externalized in the form of the Son (Christ). God, as Christ, becomes self-consciousness in the

\(^{12}\) Jesus proclaimed this to Martha, Lazarus’ sister, to inform her that her brother “will rise again in the resurrection (John 11.24).”

\(^{13}\) p. 568.

\(^{14}\) Another way one can make sense of the claim that Christ died and went back to the Father, and then was resurrected is through the cultic community of the church. It is important to note that these claims about Christ’s Incarnation, his death, and his resurrection cannot be made sense of, held together under, and followed without the Christian church, which unites the community of believers as part of the congregation. Jay Bernstein explains that there is no meaning to Christianity without the church, whereby the church is understood to be a religious community—a community withholding the Spirit (\textit{The Bernstein Tapes}). The truth of Christianity, therefore, is carried out through the church and the community belonging to it.
body. In the body, God is other than His abstract essence and even has knowledge of His absolute otherness. The relation between the Father (God) and Son (Christ) is a relation that essentially has no difference. Fundamentally, they are the same; they only differ in form. Hegel writes:

In this *simple* beholding of itself in the “other”, the otherness is therefore not posited as such; it is the difference which, pure thought, is immediately *no difference*; a *loving* recognition in which the two sides, as regards their essence, do not stand in an antithetical relation to each other (¶ 772).

Spirit in the community precisely parallels the movement of the self-consciousness of the individual, the natural consciousness. Universal self-consciousness is represented in the return of self-consciousness into itself and its concrete particularity dying away in its universality. This occurs when self-consciousness reconciles itself with itself (¶ 785). Thus, the same three moments of God represented in the Trinity is analogous to the movement in Hegel’s conception of Substance becoming Subject. Through the act of negation, spirit becomes actualized, or Substance becomes Subject, because the very act of othering is a becoming of the Self. Hegel writes in the “Preface,”

Further, the living Substance is being which is in truth *Subject*, or, what is the same, is in truth actual only in so far as it is the movement of positing itself, or is the mediation of its self-othering with itself (¶18).

This would be to say, as Jay Bernstein argues, the notion of God, as otherness, is incoherent because God would be finite, and, therefore, dwell in death (*The Bernstein Tapes*). If Spirit knows itself as “other,” it could not know itself as universal—the Self of all (¶ 762). When Substance becomes Subject, Subject is actualized in the community as the universal self-consciousness. Hegel writes,
This knowing is the in breathing of the Spirit, whereby Substance becomes Subject, by which its abstraction and lifelessness have died and Substance therefore has become *actual* and simple and universal self-consciousness (¶ 785).

Though Substance becomes Subject, there is still incompleteness in the section on Manifest Religion. The imperfection here is expressed in the community because it does not yet posses a consciousness of what it is (¶ 787). The community is Spirit, but it does not yet know itself to be as such. It has not yet become one with God. At the level of picture-thinking, the community has reconciled itself with God, but it has not yet grasped this conceptually at the level of Thought; this is only known implicitly. The communities own relation between itself and God remains separate and distant. Hegel writes:

The world is indeed *implicitly* reconciled with the divine Being; and regarding the divine Being it is known, of course, that it recognizes the object as no longer alienated from it but as identical with it in its love. But for self-consciousness, this immediate presence still has not the shape of Spirit (¶ 787).

The reconciliation that has occurred for self-consciousness is in its heart. That is, consciousness only *feels* the eternal love, but it has not yet actually comprehended this immediate object within its own consciousness as the form of Spirit. Therefore, the individual’s consciousness “is still divided against itself and its actual world is still disrupted (¶ 787).” In other words, self-consciousness is not yet the object of its own consciousness; the consciousness of the community is still split between itself and its actual world (¶ 787). The spirit of the community must overcome its religious consciousness in order for the implicit reconciliation between itself and the divine Absolute to be fully realized (¶ 787). Hegel writes,

The Spirit of the community is thus in its immediate consciousness divided from its religious consciousness, which declares, it is true, that *in themselves* they are not divided, but this merely *implicit* unity is not realized, or has not yet become an equally absolute Being-for-self (¶ 787).
The content of religion is Absolute Spirit, and Spirit at this stage of Manifest Religion has not yet overcome this form of picture-thinking. However, picture-thinking is an important and essential device that can be employed by Spirit in order to guide it towards realizing Absolute Knowing i.e., pure speculative knowledge. All that Absolute Spirit must realize at this stage is that the only way to comprehend God in the pure speculative knowledge of Absolute Knowing is by dropping its use of picture-thinking. Thus, “all that now remains to be done is to supersede this mere form, or rather, since this belongs to consciousness as such, its truth must already have yielded itself in the shape of consciousness (¶ 788).” Religious consciousness must realize that the self-consciousness of the universal community itself and man’s place in it fully embodies the Divine, and it does so only in a truly immanent way. This is fully comprehended when the Absolute divine Being is no longer felt in love, but when its thinking is rational. Thus, it is only in philosophy – and thinking about the world and man’s place in it rationally – that Absolute Knowing is attained. Thus, Absolute Knowing already contained within religion. Picture-thinking is a religion’s, or more specifically for Hegel in Manifest Religion, Christianity’s, means to portray pure speculative knowledge. Hegel writes,

God is attainable in pure speculative knowledge alone and is only in that knowledge, and is only that knowledge itself, for He is Spirit; and this speculative knowledge is the knowledge of revealed religion (¶ 761).

Thus, speculative knowledge is already contained in Manifest Religion. Furthermore, Spirit at this stage is God, and God is Spirit—Absolute Spirit. When Spirit attains this knowledge, it realizes that pure speculative knowledge is divine. That the Divine becomes known to Spirit shows the divine is Spirit. God is Spirit and Spirit realizing itself as Spirit is God.

In chapter VIII (“Absolute Knowing”), pure speculative knowledge is comprehended by Spirit via the Concept. This is where the reconciliation of individuality and universality is
complete. The totality of the individual as Spirit is merely the individual himself—Spirit, who sees both himself and everyone else in the community as divine and spiritual. At the level of pure speculative knowledge, i.e. philosophy, the true shape of Spirit is the subject itself. The self-consciousness of Absolute Spirit comprehended in Absolute Knowing is speculative knowledge. The is the last shape of the *phenomenology of spirit*, and this is where the dialectic culminates, the place where Spirit is in the shape of Science and the time where Absolute Spirit manifests itself to itself in its own consciousness.

**Conclusion**

The most important concept discussed in Manifest Religion is picture-thinking. This is also the form religion uses to portray the Absolute. However, it does this only through stories and symbols, and not via the Concept, which is not comprehended by Spirit until Absolute Knowing. In terms of picture-thinking, the three major moments discussed in Manifest Religion is expressive of the Trinity—the Father, the Son, and the Holy Spirit. In the Old Testament, God is abstract and selfless, but when the dialectic of the Bible transitions into the New Testament, God becomes man. The Absolute divine Being – God – manifests in a human being, namely Jesus Christ, and becomes known by others in the community in human form. Jesus Christ – a God-man, man-God – is self-consciously aware of Himself as embodying the divine Absolute. Christ, therefore, is immediately present to the natural consciousness. The one-sidedness in this first appearance of the Absolute divine Being is that it only represents Christ, and not all humans. At this stage, the human being is not considered divine, and the conception the religious believer has of Christ is transcendent. Hegel’s critique of Christianity is to show that the divine nature is the same as the human nature. The natural consciousness must come to realize that it beholds the
manifestation of the divine Being, which is pictured in the figure of Christ. After the death of Christ on the cross, he is resurrected back in the community. Christ, as the Holy Spirit, is representative of the entire self-consciousness of the community.

This movement of the Trinity is analogous with Substance becoming Subject. Though the natural consciousness is actualized in the universal self-consciousness of the community, there is still incompleteness in Manifest Religion. Self-consciousness has not yet taken the shape of Spirit. The object of self-consciousness is known, but it is known only through the feeling of love. Furthermore, the Spirit of the community is divided from its religious consciousness. These two must be unified so that this unity becomes identical as absolute Being-for-Self. This occurs when religious consciousness supersedes its form of picture-thinking.

Though picture-thinking must be overcome, it is an essential and important way guiding Spirit towards realizing Absolute Knowing. When we reach the end of Manifest Religion, Spirit is still holding on to picture-thinking. This is what keeps Spirit from realizing pure speculative knowledge even though the content of Absolute Knowing is already contained in Religion, which Hegel mentions at the beginning of ¶ 761. All that Absolute Spirit must do is conceptually comprehended God via the Concept of pure Thought. This does not happen until the dialectic culminates in “Absolute Knowing.” Spirit must realize that not only its own self fully embodies the divine, but also, and this is the Hegelian critique of Christianity, the entire universal self-consciousness of the community—all human beings that make it up embody the divine Absolute. This is not fully comprehended until Absolute Spirit no longer feels this through the feeling of love, but only when it fully rationalizes this in the pure conceptual Thought of Absolute Knowing. At this stage, God is Spirit and Spirit is God. With this
realization, there is no more appeal to transcendence. God is fully realized as immanent because
the human being is seen as (the) divine.

When the individual consciousness realizes God as immanent, the divine reaches for the
human. This conception is radically different from all previous conceptions of God or religion
that Hegel discusses in the *Phenomenology*, whereby the human was reaching towards an above
and wholly transcendent, divine Absolute. Moreover, both the individual and the universal self-
consciousness of the community are considered divine when God is conceived of as immanent.
In this light, the individual not only reconciles the oppositions splitting its own consciousness,
but it also reconciles its own self with God. Through rational and conceptual thinking, the
individual consciousness overcomes the picture-thinking that religion uses to display the divine
Being. Thus, for Hegel, religion essentially is immanent and takes place in the community with
human beings as divine. In this light, the divine is humanized and the human is divinized.

Ultimately, there is no God in the Hegelian notion of philosophy in chapter VIII. Because
philosophy, which is the most developed form of Spirit, is placed at a higher stage than
religion in Hegel’s system, it does not mean that Hegel is trying to put an end to religion.
Religion is an integral stage in the history of Spirit, and what is implicitly present within it takes
place in philosophy. However, religion can never merge with the pure rational and conceptual
thinking of philosophy because it uses *Vorstellung* to realize the Absolute. It is only in
philosophy that Absolute Spirit is conceptualized and actualized in Absolute Knowing. This is
the culminating point of the dialectic in the *Phenomenology*—the point at which this shape of
Spirit is Science.

Reporting from the sidelines of sports journalism

The band is blasting the school fight song. Fans are on their feet, jumping and screaming loudly as the team takes the field for one last drive before the half. It’s game day in anywhere USA. From here to there, it happens all across the United States. In Honolulu, Hawaii, sits Lelia Wai, a sports reporter and columnist who works for the Honolulu Advertiser.

Wai is scrambling as the half is about end, jotting down notes and preparing to write a first-half recap. Hawaii drives the length of the field, scores and the crowd erupts. The clock runs out and there’s one half remaining. Fans begin streaming out of their seats and begin the long wait for an open restroom to satisfy nature’s unyielding call. Meanwhile in the press box, Wai has no wait and a single stall all to herself. Great news for Wai, right? Not so for women, however. This incident “… points out one of the more glaring faults of sports (reporting): There aren't enough women,” (Wai 2005, December 6).

Sports. Is it a game? Multi-million dollar contracts for athletes and league empires alike leave little doubt that sports are much more than sandlot antics. Sports are big business, and so is the task of covering them in the specialized field of sports reporting. Women who choose to pursue this career automatically are at a disadvantage when compared with their male counterparts, according to Hardin and
Women: Reporting from the sidelines

So why would a woman want to cover sports? The games played within the stadiums are done so on clearly marked territory. There are clearly marked boundaries indicating what is within or outside the limit. For the women who cover sports as journalism professionals, there are shadows of foul poles. Exactly what is and what is not outside the lines is vague, at best. Women sports reporters are outnumbered, often harassed both in and out of the locker room and continually must prove themselves to colleagues, editors/bosses, sources and readers/viewers, according to Hardin and (Shain, Fall 2005). Yet, women still must produce accurate, interesting and reliable information on deadline in the same fashion as male colleagues.

The disparity between the two sexes can be summarized by two words: tradition and credibility. Tradition is the vehicle for the disparity between the sexes in sports journalism, and credibility is the crutch that holds tradition up when challenged. Women have been a part of sports reporting from a point as early as 1870, but were ushered into prominence, relatively, in the 1920s, according to (Boyle, 2006). Women sports reporters have yet to be fully embraced, however.

When viewers see a play-by-play TV announcer calling a college or pro football game, they inevitably see a man. Same goes for radio viewers, who hear a man’s voice calling the action. Little is different in the pages of the morning paper, or even on the Internet. Predominantly, the story tellers of sports are men. Research from the 1970s, ’80s and ’90s indicated a possible scientific explanation for this gender preference. Readers/consumers were shown to prefer same-sex reporting in many instances, especially when the story topic was of a particular gender slant (i.e. sports
is a slant that is preferred reading for men, while fashion is preferred reading for women). Women journalists in sports reporting were shown to have an uphill climb, not only with getting a message across to the audience but also within the traditional male-dominated office culture.

**First down: Communicating with the consumer**

A main obstacle for women sports reporters is dealing with sources and readers who object to women covering male-dominated sports. Nevertheless, for women of the field, it is an unfortunate aspect of their work.

Wai returns to the office after a long day of reporting about the University of Hawaii football game from the previous day. The voicemail light on her office phone is illuminated. Wai thinks for a moment about what she wrote. Was it wrong? She tapped out a simple sidebar, a piece on fan reaction to the athletic department using a new type of music at the game. The piece had nothing to do with the game, nor had it ever intended to be about the game. Merely, it was a color piece to supplement the *Advertiser’s* coverage of Hawaii athletics. She listened to the voice mail and later wrote about the message in a column:

‘Oh, Leila, honey. I read your article online and … oh, honey, why don’t you leave the football to the men? Stick to covering women’s volleyball or tennis; leave the hard stuff for the men.’ … I spent a few days thinking about this message before finally deciding there was nothing I could do about it but move on. Yes, it was ignorant and spiteful. But it isn’t the first time it has
happened, and it won’t be the last for females in sports. (Wai 2004, November 9)

Whether watching a television broadcast, surfing the Internet or scanning through the morning’s headlines, consumers make constant judgments as they diffuse news and information. Women sports reporters are challenged inherently to bridge the gap between reporting and the perceived credibility they have with their audience and readers.

Research found that sexism was shown to be a factor in the evaluation of student newspaper editorials (Noel and Allen, September 1976). Though only the author’s name was changed on the editorial, not the content, Caucasian male readers preferred the work of male authors. In addition, race was a very strong indicator of perceived quality. Readers of Caucasian decent, regardless of gender, were more likely to misidentify an author’s message and to devalue his or her writing skill based on the name being associated with a minority, in this instance Mexican-American decent. Editorials that were given female minority names scored the lowest in both quality and message identity. The authors of the study considered that readers hold writers who have a greater stake in the topic to a higher standard than someone who is writing about a subject of less personal interest. Likely the political and cultural climates have changed sufficiently in the past 30 years to suspect that the findings may not replicate. Still, the findings indicated women reporters had more difficulty retaining credibility among their audiences and readers (Noel and Allen, September 1976).

A slightly more recent study tested whether a reporter’s perceived sex as
readers determine it from a byline had any effect on story evaluation, especially with regard to story topic (Shaw, Cole, Moore and Cole, Spring 1981). The authors found that stories associated with a particular sex (sports or fashion, for instance) were evaluated differently based upon the perceived sex of the author. Using a hard news story on the arrest of a rapist, test subjects scored a male byline as being more believable, informed and accurate. But overall, women’s bylines were determined to be dramatic and more interesting than male versions.

When it came to the fashion story, stereotypically a story of interest primarily to females, the male bylines were heavily degraded compared with a woman’s byline. The opposite was true of sports stories, stereotypically of interest primarily to males. The researchers also found that male test subjects were more stereotypical in general than females. This may cause difficulty for women sports reporters when trying to overcome stereotypes of large male audiences and readership groups.

In society at large, gender often is an issue to consider. Gender is a factor with regard to credibility in social-influence situations (Feldman-Summers, Montano, Kasprzyk and Wagner, 1980). In this study, test subjects conformed more readily with a gender-specific issue when the gender of the influencing group matched the gender of the issue. That is to say, with a gender-specific issue, such as women’s healthcare, test subjects were more likely to conform if the majority of the social group (played by confederates) matched the gender of the issue.

Overall, men were more likely to conform to women’s issues when in the minority and were less likely to conform to male-related issues. This research relates to the gender of a reporter and its potential affect on credibility among newspaper
readers. It must be supposed that readers of gender-specific stories will find greater credibility among reporters whose gender coincides with the story topic, which is parallel to the findings of Andsager and Mastin (1990) that readers prefer similar-sexed syndicated newspaper columnists.

Second down: Struggles in the locker room and beyond

Wai is back at it again, taking calls and writing briefs of local sporting events for the next day’s paper. The phone rings, and Wai answers. “Sports,” she says. The caller pauses. “I called sports, right?” The incident makes for another notation in a column:

I'm used to it, to the point that when I tell someone what I do, I gauge their reaction. Typically, it's kind of a widening (then a narrowing) of the eyes, a tilt of the head, a scrunching of the lips, and an inevitable quiz:

Sample: "Who's the quarterback for the Minnesota Vikings?"

Daunte Culpepper. Duh.

Shock follows when I know the answer. A sort of haughty ‘I figured’ look if I don't. (Wai 2004, November 9)

When the sports arena is enlarged beyond the local and non-professional sports, the stakes skyrocket for all reporters. Deadline pressure mounts, story counts rise, breaking news expectations climb and the time spent working a beat swells. An example – high school football seasons last but a few weeks, late August to November. Pro football teams are at work nearly year-round with off season mini-camps, training camps, a 17-week regular season schedule that begins in late August and ends in late December.
That is to say nothing of postseason, which could extend into February. Demands, both physical and mental, placed on a high school football reporter are far different than those carried on the shoulders of pro sports beat writers. The instances in which a reporter is required to cover male-dominated, professional sports are those that offer the greatest challenges to any journalist, male or female. But for the women reporting in the upper echelons of sports, the divergence between equality and fairness when compared with male colleagues is perhaps at its widest.

Hardin and Shain (Fall 2005) explore the male-dominated, locker-room and office cultures of sports journalism in the *Newspaper Research Journal*. Their article clearly relates a vast deficiency in the number of women who are reporting about America’s sporting events. In an informal 2001 survey of 50 high-circulation newspapers, women constituted 13 percent of the collective sports departments. Most often, women filled the roles of copy editor, clerk or reporter.

Beyond the mere filing of game stories on deadline and challenges of reporting in general, men were shown to climb through the ranks of sports departments. Women, on the other hand were left to prove themselves over and over and rarely found themselves moving up within an organization (Hardin and Shain, Fall 2005).

Male-dominated norms within the sports world also work against women in the field. An example of a norm: women don’t understand the rules of games or sports in general as well as men. Sexual harassment also is rampant. In a mail survey by 48 percent of women sports reporters said they were sexually harassed – often times by sources they covered (Hosino, 1998). Hardin and Shain (Fall 2005) also proposed that
women are less likely to be accepted within sports journalism. One of the reasons: Women are, according to the article, more family-oriented than males. Because of male-instituted pressure to work long hours without extended breaks or absences, even for family reasons, the craft of sports journalism is suggested to be more difficult and less enjoyable for women.

Disparity in newsrooms is nothing new for women. Reed is a 1999 Nieman Fellow and an Emmy winning broadcast journalist. In her article that appears in \textit{Nieman Reports}, (Reed, Spring 2002) urged women journalists to investigate and document the differences in gender among editorial staffs at U.S. newsrooms. This suggestion was made after Reed found herself in the midst of a wage shortfall of 40 percent when she compared her salary with males who had similar backgrounds and assignments and duties. Understanding the possibility of gender bias and strife within newsrooms may help paint a more accurate picture when assessing the affect gender has, if any, on credibility and the ability of women to be effective in the news industry.

Another point to consider is access, especially as it relates to reporting. (Fuller, Spring 1992) discussed the access issue for women sports reporters who cover professional U.S. sports teams. In a similar fashion to what (Hardin and Shain, Fall 2005) found with regard to gender issues within a newsroom and in the locker room, Fuller explained through reporter accounts how women often confront access barriers to the locker room and a litany of additional conflicts once they are inside. While the article is dated, it’s important to understand women sports reporters still do face issues that are separate from their male counterparts. For example, (Hardin and Shain,
Fall 2005) reported that players sometimes would masturbate in front of women reporters or throw jock straps at them.

All women reporters also must contend with the ill-conceived and nonprofessional actions of other women in the field. A fictional account took place in the baseball movie, *Mr. 3000*, in which a female TV reporter sleeps with a source. Although purely fictional, the reaction from Joane C. Gerstner, president of The Association for Women in Sports Media and a sports reporter for the *Detroit News*, was swift as recounted in a *SportsIllustrated.com* column (Deitsch, October 1, 2004):

… if you're not in the business, I don't think people understand what we do. The first question I get asked from people if I'm out on a speaking engagement is: 'What's it like in the locker room? Are you there for the athletes?' They don't get what we do. We're still females coming into a male bastion. So when there are things out there that are so far beyond the norm, it is damaging.

Wai also has experienced this sort of misunderstanding of her job, though not from colleagues. While giving a student tour of the *Advertiser*, Wai was asked if she ever used her "feminine wiles to get better quotes from the male athletes." Another of the girls present in the group said, “I would.” responded in her column:

I said no, that I play things straight. Because if I wanted to be taken seriously, I needed to hit my subjects with questions my male counterparts wouldn't hesitate to ask. That requires knowledge, not hair twirling. (Wai 2005, December 6)
Third down: Making a case

While there are many bleak signs for women in sports journalism, all is not lost. (Wai 2004, November 9) admitted that despite the occasional sour encounter with chauvinism, her career mostly “has been a blast.” She continued to say that, “most of the people I encounter are extremely helpful, and acceptance of women in sports has improved.” Research has shown that women are sometimes viewed equally compared with their male counterparts, and in some instances, superior to them.

Burkhart and Sigelman (Autumn 1990) found that bylines of a gender-neutral nature tended be evaluated somewhat lower than those of a specific gender. Additionally, there was little difference in how readers judged bylines between males and females. Using what they termed “unsophisticated news readers,” Burkhart and Sigelman found women’s bylines were rated higher than men in categories such as accuracy, writing style and trustworthiness. That finding is contrary to earlier studies, such as Noel and Allen (September 1976).

When women move up the corporate chain, it seems to indicate positive results for news organizations in terms of both diversity and coverage. Craft and Wantan (Spring 2004) preformed a content analysis of 30 Web sites from news organizations that boasted high ratios of female editors compared with those that did not. Most notably they discovered a difference in tone, as the male-dominated newsrooms generally reported news that was more negative, which is similar to the findings of reporting trends discussed later by Rodgers and Thorson (2003). Also, in the case of male-dominated newsrooms, Craft and Wantan found that news beats
were more likely to be distributed according to gender.

Perhaps as news outlets further embrace digital technology and Web-based news channels, women may benefit the most. A Web-related experiment was conducted by Flanagin and Metzger (November 2003). They found that viewers of the study’s Web sites rated opposite-sex sites with more credibility than they did same-sex sites. For the study, Web sites were created with a particular gender in mind. Both men and women subjects then assessed the sites from several angles such as message, sponsor and credibility. In general, men found the sites significantly more credible than women, regardless of the gender assigned to the material on the Web site. The finding contradicts what has generally been found in studies of print media such as the one conducted by Andsager and Mastin (1990). Many print studies have shown a positive effect when a same-sex source reads work by a same-sex columnist.

When it comes to the essential standards of journalism, women may be better able to adhere to the guidelines and ideals. Rodgers and Thorson (2003) researched whether or not there is a difference in news gathering based on gender at three U.S. daily newspapers of varying circulation. There was a difference. Female reporters tended to stereotype less, were found to use more diverse sourcing and were more positive in content when compared with male reporters. Their research did not indicate what types of stories were evaluated, however. Story topics that are stereotypically associated with a particular gender, or females in this study, may help explain why articles written by women differed in positivism and stereotyping from those written by men.

Zoch and Turk (Winter 1998) focused on the reliance of official sources
(mayors, council members, managers, etc.) to report news in daily newspapers of varying circulation size and how reporter gender affected the types of sources selected. As was the case with the research conducted by Rodgers and Thorson (2003), Zoch and Turk found there was a difference between gender and that women reporters were more likely than their male counterparts to quote female sources in stories.

Zoch and Turk concluded that a newspaper staff composed of more women reporters than men likely will result in additional women being quoted. A lack of feminine sourcing is something their research illuminated because men reported a majority of the news and tended to quote men more exclusively. With relation to sources and credibility, the tendency of reporters to select like-sex sources also could affect the tone of an article and the way in which readers of a particular gender identify with its message and value.

**Fourth down: Time to punt?**

With research indicating credibility is an issue and an entrenched male system of norms and evaluation, should women forgo the world of sports journalism altogether? Should women omit their names from the list of opportunity to become senior leaders in sports departments and be satisfied simply with working the phones, constructing pages and reporting on various beats? Should Wai, a woman under 30-years-old who likes her work, be satisfied as a reporter who occasionally runs into a chauvinistic hiccup? No. Research isn’t infallible and pioneering change in a tradition-rich environment such as sports journalism takes time and dedication.
Earlier research may have pointed to a credibility gap between genders in sports writing, but there is enough evidence to the contrary to kick the crutch out from under tradition. There no longer is a reason, scientific at least, to indicate a woman will not make for as successful a sports journalist as a man. Certainly, there are challenges, a myriad as noted by Hardin and Shain (Fall 2005).

Starting with Flanagan and Metzger (November 2003), their findings about the Web and that same-sex sites are not as popular among either males or females, may bode well for women. And considering the contrary findings, the extent to which a reporter’s gender may factor in source credibility also could be dependent upon the means of publication (print vs. virtual). The virtual world, perhaps because it is devoid of tradition, might be the environment in which women sports journalists will thrive. After rounding the bases of chauvinism, lack of credibility and sexism, women sports reporters may find the Internet is home plate. It could be the place, at last, where sports journalists stand on equal footing.

Regardless of what is reported and where, access will always be a paramount concern for women sports journalists. It is especially critical to note the way access may affect source credibility, Fuller (Spring 1992). If a reporter is denied access or is constantly berated on the basis of gender, one must assume that reporting will be a more a difficult task. Thusly, the product may suffer. Readers/consumers likely will not understand the differences in the tasks of male vs. female sports reporters and will judge credibility on the article produced, not the effort required to produce it. Similarly, editors and bosses may grow tired of hearing excuses as to why women reporters are unable to write the same “types” of stories as their male counterparts.
Access must remain a non-issue in order for credibility to be fairly judged.

Further expanding on the notion of credibility difference between genders was a study by Rogers and Thorson (2003). They found positive results for women, such as women tended to stereotype less than men. When ascertaining credibility of a news product, it’s important to understand if there is an inherent difference in article quality as produced by reporters of opposite gender. Burkhart and Sigelman (Autumn 1990) showed that women tend to score higher in certain reporting categories than men, but their research is contrary to the findings of others, such as Shaw et al. Still, audience evaluation is an important aspect to journalists, from any medium or beat.

With relation to sources and credibility, the tendency of reporters to select like-sex sources, as found by Zoeck and Turk (Winger 1998), also could affect the type of article written and the way in which readers of a particular gender identify with its message and value. Both men and women reporters, not just in sports but those covering any beat areas, need to be encouraged to diversify sourcing to include an equal representation of both sexes in stories.

Most recently, research conducted by Andsager and Mastin (Spring 2003) found that women columnists scored higher than men, overall, which is contrary to many earlier findings. Perhaps as women have become more readily visible in the news industry, sports and other beats included, the audience perception of them has adapted when compared with test groups of the 1970s, ’80s and ’90s. Incidentally, Andsager and Mastin (Spring 2003) found that the highest scoring of a group of five columnists tested was an African American woman:

This suggests that, despite the under-representation of people of color and
women in the syndicated column business, the disparity is not due to audience bias (p.68).

This finding is an important step forward for women. It is a dissenting voice in the argument that credibility is an issue for women journalists.

The research of Craft and Wantan (Spring 2004) found that news beats in male-dominated newsrooms were broken more by gender (i.e. men wrote sports and courts; women wrote fashion and features). One could argue, however, that the breakdown is a factor of tradition more than an intentional bias on the part of male editors. While it is easy to excuse the breakdown in such a way, it’s not accurate. In the case of female-dominated newsrooms, Craft and Wantan found no such distinction. What types of news a reporter covered was most dependent on the gender of that reporter’s editor. Newspaper readers, especially those who are trained by news outlets to perceive news from a male-dominated newsroom, may also perceive articles differently and more along gender lines than audiences exposed to a gender-neutral news outlet. This is especially true if stories are produced strictly in a gender-slanted way (men only write sports; women only write fashion, for example). If that is the case, readers are apt to interpret the particular gender slant in some way relating to credibility.

Credibility is the currency of a journalist, yet women sports reporters are even in more need of guarding their monetary wares. Associations of women sports journalists are a starting place for this protection. These groups offer support and advice to women of the craft, but are vital for many other reasons. First, associations will be beneficial in weeding out the non-professional reporters from the masses at
work in newsrooms around the country. Accreditation programs could be offered to help raise the level of perceived credibility among readers and viewers. Still, as tirelessly as the associations work and the women within them, perseverance is the key to outlasting the traditional male-instituted norms of sports culture. Associations can help women to better endure these situations and to speak out against wrongdoing within the field.

With credibility in their pockets, women sports journalists can begin to chip away at the traditions of a male-dominated sports culture. And women journalists, such as Wai, may emerge from the sidelines of sports reporting to take an integral and commanding role in the business of sports reporting.

Abstract of Paper

This study explores the relationship of a variety of factors to the six-year persistence of students seeking bachelor degrees at 4-year institutions and analyzes the impact of race and ethnicity on these relationships and on the degree of persistence toward bachelor degree completion. The study utilizes the Beginning Postsecondary Student (1996/2001) longitudinal data set from the National Center for Education Statistics (NCES) that followed a nationally representative sample of beginning postsecondary students for six academic years irrespective of whether they had remained at their initial institution, transferred, temporarily stopped out, or departed from higher education altogether (“system persistence”). The weighted sample of 1,090,182 students includes only those who had began their postsecondary education at 4-year institutions and had as their initial goal the completion of a bachelor’s degree. Of this group, 71.8% was White, non-Hispanic; 11.4% was African American, non-Hispanic; 9.4% was Hispanic; 6.7% was Asian/Pacific Islander; and 0.7% was “Other”. Descriptive and multivariate statistical techniques were utilized to determine whether there were any significant differences based on race and ethnicity in the relationship of selected factors to the successful progress toward bachelor degree completion.

The results revealed that after six years, 72% of the total group of students had persisted by either completing their bachelor’s degree (60%) or by maintaining enrollment in a 4-year institution (12%). Differences in the persistence rate of each racial/ethnic subgroup were as follows: Whites (75%), African-Americans (59%), Hispanic (63%), and Asian/Pacific Islanders (78%). The variables gender, educational aspirations, aptitude test scores, parents’ education level, delayed entry, plus first year GPA, academic and social integration, satisfaction levels, hours worked while enrolled, percent full-time attendance, and incidence of transfers all had varying degrees of impact on six-year persistence. The relationship of many of these factors to persistence differed across racial/ethnic groups. The results from this study will be useful to administrators, advisors, and faculty in 4-year institutions who are seeking ways to enhance and promote bachelor degree completion in various groups of students.
Determinants of Formalized Retirement Plan Participation: Community, Family, Demographic, Economic and Perceptual Factors

Determinants of Formalized Retirement Plan Participation:
Community, Family, Demographic, Economic and Perceptual Factors

Abstract:

Pension plans are giving way to individual contribution plans; Social Security faces an uncertain future; and, trends toward consumerism and use of credit are seducing consumers away from long-term planning. These counteracting trends call us to investigate the factors that impact retirement savings in the current historical period, particularly participation in formalized retirement plans like 401(k)s, IRAs and Keogh plans that provide tax incentives for making contributions toward retirement.

Using data collected from a sample of 1269 adults aged 18-64 in Michigan’s Upper Peninsula we create logistic regression models to determine the predictive value of five sets of variables on different types of savings behavior including saving in a formal retirement plan. The categories of variables range from macro level community circumstances to micro-level individual characteristics such as family status, economic situation and attitudes.

Key Words: savings, retirement, family adaptive strategies, economic decisions
Determinants of Formalized Retirement Plan Participation: Community, Family, Demographic, Economic and Perceptual Factors

Introduction

Popular reports of savings behavior among American households provide alarming accounts of the near total absence of savings. (Velde 1999) Savings is an important means to security in the event of catastrophe (unemployment, hurricane, disability, ill-health), for retirement, and for children’s economic social mobility through higher education. Therefore, it is critical to consider who is and is not saving, and to discover the significant determinants of savings behavior. Past research in the social sciences on savings behavior has been undertaken primarily within the fields of economics and economic psychology. A sociological lens applied to this research topic will add new dimension to the development of predictive models along with adding important interpretive power.

All human behavior including savings behavior is socially embedded. Individuals’ consumption and spending decisions are made within the social structure and the historical moment in which they find themselves, and the current historical period is one beset with large scale change. The meanings of savings, the motivations for savings, and the strategies and opportunities for savings are impacted by these large scale changes. Thus, we believe it is not only important to add sociological theory and analysis to the topic, but also to readdress the topic using previously considered economic variables to determine their current impact and salience in the new millennium.

Increases in affluence in the United States during the post-World War II period created an unprecedented number of individuals and families with discretionary income and therefore with choices regarding consumption and savings. The watershed changes
in the economy during the mid 20th century lead Katona (1980) to examine how the macro-structural situation in society interacted with micro-level individual motives, attitudes and expectations as well as cultural attributes to explain savings behavior. This research will follow and expand on this multi-level explanatory model.

With deindustrialization, globalization, and the technological revolution we are now experiencing another watershed period of changes that will impact individuals’ needs, motivations, and choices with regard to savings and consumption. In particular, the ways in which individuals and families support themselves during the period after they leave the labor force is changing. No longer do most individuals rely on family to support them in their elder years; no longer do most employers offer employees prospects for lifelong income; and, no longer can we be certain of a future with adequate governmental provision of social security as a safety net. The changes are not absolutes, and they are occurring over a transitional period of decades, but they do portend the need for changes in individual savings behavior for retirement.

The predominant sources of retirement income in the United States in recent history have been Social Security, personal savings and employer-sponsored retirement plans. We are seeing meaningful changes, however, in the character and viability of all these retirement sources for current and future generations due to demographic shifts and political and ideological shifts in the role of the state and the employer in individuals’ economic livelihood. Social Security is facing an increasing strain as the baby-boom generation ages and there are fewer workers contributing to a system that supports more and more beneficiaries. The long-term viability of the system is in question and the
balance has shifted from social and institutional responsibility to personal, individual responsibility.

Personal savings rates are at an historical low, and are, in the aggregate, disappearing. In fact, in June 2006 the personal savings rate stood at a negative 1.5% of overall disposable personal income (Economic Forecast...Outlook 2006:241). Research shows that the typical babyboomer household is saving well below the rate necessary to sustain their current standard of living past their retirement (Engen, Gale and Uccello 1999; Laibson, Repetto and Tobacman 1998). Consumer culture and the availability of consumer credit are two contributing factors in this downward trend in personal savings. “Lifestyle expectations, perceptions of luxury and need, norms regarding the acceptability and management of debt, and strategies of controlling family finances are all in flux” (Livingstone and Lunt 1992: 113).

The predominant form of employer-sponsored retirement plans have changed as well with movement away from defined benefit plans to defined contribution plans. (McCourt 2006:1) Defined benefit plans are plans (eg. pension plans) where an employer manages monies and commits to providing a predetermined level of retirement benefits. Defined contribution plans (eg. 401Ks) are plans where employers manage or oversee an investment process but the level of retirement benefit is dependent on the success of the investments over time. As shown on Table 1, from the period 1975 to 1999, there was a large increase in the number of defined contribution plans (DC) and a significant decline in the number of defined benefit plan (DB) sponsors. Only state, local and federal governments have remained stable in their provision of defined benefit plans (Ibid: 2). (Table 1 about here)
Defined benefit plans and defined contribution plans each can take on a number of manifestations, but there are important differences between the two. “Under a defined benefit plan, the employer takes on the risk that assets may not produce sufficient investment returns to support a promised level of benefits” (Ibid). With a defined contribution plan the individual employee bears the risk. Additionally, “401(k) plans, which make up the bulk of defined contribution assets, require employees to invest their own retirement assets” (Ibid:4). Hacker (2006) calls the trend in the shift of responsibility for managing economic risk from government and employers to individuals and their families the defining economic transformation of our times.

Based on a 2002 survey, “fully half of American workers have made ‘negligible’ contributions to their retirement plans while an estimated 15% have saved nothing at all” (Cassel 2003). Outside of an employer-employee relationship, individuals can participate in ear-marked, tax-advantaged retirement plans like Individuals Retirement Accounts (IRAs) or Keogh plans, but in these cases the saver must seek out and establish the plan his/herself.

With these gradual changes in the structure and viability of our traditional sources of retirement income and the prevalence of formalized contribution plans, it is becoming more and more critical to examine the factors that contribute to retirement savings decision making. Also, with individuals taking on more and more of the investment risk associated with retirement plans, their levels of risk aversion and their abilities to factor time into savings and consumption choices becomes more pivotal. For those who are unemployed or are not offered an employer-managed plan, individual initiative and
investment management becomes even more critical for the security of their economic future.

*Savings - Definitions*

The social science literature offers a variety of definitions for the concept of savings. Early economists (e.g., Keynes 1936) regarded savings as what is left of disposable income once consumption is deducted. This economic definition is now considered insufficient because it ignores the deliberate nature of saving and the way people modify either disposable income or consumption for the sole purpose of saving.

Some economists conceptually interpret savings as a process used to maximize consumption utility over the lifetime and/or to smooth out the income stream over time (e.g., Miles 1997). Some argue for the inclusion of spending on durable goods as savings because these goods are consumed over a long period of time (e.g., Friedman 1957, Fernadez-Villaverde and Krueger 2002, Economic Forecast...Outlook 2006). These approaches, while meaningful in accounting practices or theoretical models, do not sufficiently capture the ordinary conceptualizations of actual savers whose behaviors and decision making strategies are substantially less sophisticated (Laibson et al 1998, Kennickell et al 1997).

Katona (1975), a pioneer in linking economic research to individual perceptions and beliefs, offered alternative definitions that considered how ordinary people think of savings. In making that connection, he developed the following three savings categories: contractual saving such as mortgage payments and other installment payments; discretionary savings whereby one deliberately saves spare income; and residual savings or monies that are by default leftover at the end of an earning period. Warneryd (1999)
describes three distinct motives for savings that he considers persistent and enduring through time: the precautionary motive, the bequest motive and the investment or profit-making motive. DeVaney and Chien (2001) argue that savings for retirement through tax-deferred savings plans fall within the precautionary motive because the amount saved in these types of plans is not withdrawn until a person retires.

_A New Conceptualization_

There are many possible ways to examine savings and to operationalize savings in the research process. We offer an alternative 3-category conceptualization that has relevant distinctions for research on savings. It is a modification of Katona’s concepts adjusted to reflect the current investment structure. The categorization is as follows:

- **Formal Savings Plans** - Plans that are earmarked by the intermediary managing organization for long-term goals like retirement or education and where participation is encouraged through tax benefits, such as 401(k), IRA, Keogh, state-sponsored college savings plans

- **Personal Savings** – Deliberate savings, either regular or sporadic, in financial savings vehicles where intentions and requirements are defined and determined by the saver his/herself. This category would include funds held in accounts that are not formally earmarked or favored in any way for their long-term nature and can be for purposes that may or may not include retirement, such as savings accounts, stock, bond, mutual fund purchases.

- **Residual savings** – Leftover monies that are not funneled into a means for saving and are liquid and available for consumption at any time, eg. money remaining in regularly accessed accounts (like checking), wallets or cash.
We recognize the existence of other assets and investment forms in an individual’s total portfolio such as the primary residence, other real estate, art, and collectibles, but for purposes of analyzing savings and not necessarily wealth, we believe that the above, more limited categorization is meaningful. Our analysis will concentrate on the first category, formalized savings, with the assumption that explanations and determinants of formalized savings will differ from personal and residential savings. Of the various types of formalized savings, we will focus on formalized retirement plan participation.

*Theories of Savings:*

Social science theories of savings fall loosely into two categories – a) formal explanatory models rooted in economic theory and b) exploratory and descriptive approaches focusing on strategies. The explanatory models fall on a continuum from the most basic econometric conceptualization of savings as a means for maximizing lifetime consumption utility based on income to more sophisticated models that are either pure in their commitment to economic rationality or incorporate other social, cultural and psychological determinants.

The economic model of optimizing lifetime consumption based on income expectations fails to support economists’ assumption that intentions and actions are always consistent. Consumers in the aggregate neither save at the rates that would maximize their consumption utility nor do they even save at the rates they, themselves, believe they should to achieve this goal (Laibson et al 1998:91, Bernheim 1994).

To address the discrepancy between the economic theory of utility maximization and actual savings behavior, recent economic research has developed models with
additional theoretical considerations and more explanatory power (i.e. Laibson et al 1998, Miles 1997, Engen et al 1999, Bernheim et al 2001). We will highlight a few recent examples of this economic approach that offer theoretical foundation for our own approach and variable selections. (See section entitled Analytical Plan.)

As an example of an economics-based study that expands on the basic principle of utility maximization, Miles (1997:2) includes a measure of uncertainty to “shed light on the [debate] as to whether precautionary behaviour can account for the apparent discrepancies between actual consumer spending patterns and the path of expenditure consistent with optimization of a lifetime utility function”. Miles also enters residential asset appreciation into his model as an explanatory variable, and finds that uncertainty does matter but changes in housing prices do not have a meaningful effect on savings.

The precautionary savings hypothesis argues that one saves due to uncertainty about future income. Specifically, it proposes that individuals and families will save more in conditions of uncertainty “when they face substantial uninsurable labor income risk and need liquid assets to smooth their consumption” (Laibson et al 1998: 92). Engen and Gruber (1995) note that the 1995 Survey of Consumer Finances showed precautionary savings as the most frequently reported motive for saving. Their work suggests the importance of the consumer’s perception of his/her future financial situation in the savings decision.

Laibson et al (1998) provide another example of savings research that attempts to move beyond the basic economic notion of utility maximization. They point out that actual savings behavior “contradicts the standard economic model of the maximizing consumer… and…[they] try to make sense of the apparent conflicts between attitudes,
intentions, and behavior in the domain of saving” (ibid). Their econometric model argues that consumers have hyperbolic discount rates, or demanded rates of return which are extremely high in the immediate term, but lower in the longer term. This leads to “short-run preferences for instantaneous gratification [that] will undermine a consumer’s effort to implement long term optimal plans” (ibid). They deduce from their model that hyperbolic consumers will save more using defined contributions plans than with self-directed savings (ibid:110). Likewise, we hypothesize that formalized savings are predicted and explained differently than personal savings or overall savings.

Models of savings behavior have evolved to include social, cultural and psychological variables as well as other economic variables (Lunt and Livingstone 1991, Joo and Grable 2000, DeVaney and Chien 2001, Warneryd 1999). The inclusion of these new variables adds not only new dimensions but also intuitive, contextual and explanatory power to the ideas already assessed through economic models alone. For example, an analysis of our current consumer culture and the norms surrounding the use and acceptability of credit help to explain the discrepancy between short and long-term discount rates discussed by Laibson et al (1998). The speed and availability of consumer credit in today’s economy makes it particularly hard for consumers to resist short-term temptations. And, consumer culture contributes to temptation for dissaving, or the situation when “current consumption exceeds current income and when total resources decrease”. (Beverly et al 2003:144)

Savings, consumption and attitudes all have socially embedded meanings that are relevant to how individuals act (Katona 1975, Douglas and Isherwood 1978). Savings behavior has been found to be positively related to optimism about personal
circumstances and the economy (Lunt and Livingstone 1991). This finding, on the surface, appears to contradict the precautionary savings hypothesis that argues savings increase in conditions of uncertainty and concern. Lunt and Livingstone (1991:633) argue that the relationship between optimism and savings is a function of an individual’s locus of control and belief in hard work and fair outcomes. We argue instead that the contrary findings of optimism and precautionary savings are attributable to the differences among economic situation and individual characteristics, and we hypothesize that the differences and relative importance of optimism and precaution will be separately revealed in analyses that consider categories of savings. Specifically, we expect that income uncertainty (precaution) would increase liquid, personal savings while decreasing contributions to formalized savings plans that are not liquid or impose penalties for early access. Those with optimistic views of the mid to near term would be more likely to contribute to inaccessible, long term plans. DeVaney and Chien (2001) argue that retirement savings would fall into the category of precautionary savings, and though this argument has some merit we see a substantial difference between the savings actions that would be undertaken for long term preparedness compared with short/mid term precaution. To tease out the differences, we look at both who participates in a plan and whether or not they contribute the allowable maximum.

Lunt and Livingstone (1991) also find that savings is not a unitary notion, and different factors discriminate between savers vs. non savers in general and the total amount of one’s savings. Specifically, they find that social and psychological variables like optimism, access to support and information regarding finances, and simplified strategies of handling finances were meaningful discriminators between savers and non-
savers. Psychological variables, however, were relatively poor predictors of total savings. Rather, total savings was predicted by demographic and economic variables like having higher income, being male, being older and having fewer children. We include similar family, demographic and economic variables in our model to ascertain their impact on formalized retirement savings.

Unlike the economic models that seek to explain why consumers do not act optimally, the exploratory/strategy-based literature assumes consumers will act sub-optimally. It takes for granted that saving can be challenging and requires effort and self-control, and it assumes that saving is important and desirable in the current economy. Research of this type appears both in academic literature (Beverly et al 2003, Kennickell et al 1997, Lyons et al 2003), and the popular media (Cassel 2003, Harris 2003, Domino 2005).

While our research will fall more closely into the former category of explanatory models, exploratory research draws important distinctions between different savings vehicles and the motivations and strategies likely to surround them. Beverly et al (2003) provide a concise discussion of strategies for saving that gives theoretical substantiation to behaviors that appear irrational. For example, they explain how a behavior such as deliberately selecting a bank account that charges per withdrawal is an economically rational, not irrational, behavior for someone who is concerned with spending temptations. The consumer is seeking to jump the hyperbolic curve, if you will. Similarly, one might increase one’s federal withholding and thus forego the time value of their money because it forces them to save. Beverly et al (2003) argue for the importance of “pre-commitment constraints” like federal tax withholdings and payroll deductions as
important means of savings. Also, they identify the significance of “windfall” income (like tax refunds, inheritance and work bonuses) rather than regular income in savings planning. Different social circumstances and motivations result in different savings strategies facilitated by different economic and savings processes and vehicles. Thus, the savings process is composed of different stages and psychological and behavioral strategies. Importantly, Beverly et al (2003) recognize the deliberate action of increasing one’s income to facilitate savings, not merely “putting away” a portion of what one happens to earn. The process of securing one’s financial situation is multi-faceted and subject to multiple influences.

Moen’s (1992) work on family adaptive strategy complements Beverly et al’s (2003) work by pointing out that action is most definitely socially situated and that families devise actions for “coping with, if not overcoming, the challenges of living and for achieving their goals in the face of structural barriers” (Moen 1992: 234). Retirement and retirement savings are different today and mean something different today than they did even 10 or 20 years ago. Opportunities for earning, saving and spending have changed both in practice and in meaning. We believe that the type of savings, the goal of savings and the role of government in offering incentives for saving have meaningfully changed how we can account for savings behavior and decisions.

**Contribution of the Study**

The current study makes a unique contribution to the savings literature offering a new operationalization of savings as falling into distinct categories that we propose will be predicted differently and are socially relevant given the present day structure of investment options. In particular, this paper will examine explanatory models in one
savings category, Formalized Plans, concentrating on a particular subset Formalized Retirement Plans. The formalized plan is a savings process constructed through social policy to motivate savings for goals determined to be socially and economically important by government bodies. Our approach, therefore, examines who is favorably influenced by savings policies.

We also expand upon previous social science research on savings by applying a sociological lens both to the development of our analytic strategy and to the interpretation of our results. We pay close attention to the social significance of the savings categories in today’s economy and to the meanings associated with consumption and savings in different social locations. We distinguish family characteristics as an important subset of variables and consider the strategic nature of family decision making given structural boundaries.

Finally, our study will add new variables describing the community context surrounding our respondents. We will model the impact of the actual economic structure of the respondents’ communities by including data on unemployment rates, median income, and predominant employer types and occupations within the community. These variables offer an additional window beyond demographic characteristics into the social location of the respondent. They provide a picture of the reference group that surrounds the respondent and the way savings decisions are influenced by social context. We include data on both respondent perceptions of community financial health and actual measures thereof, which, we hypothesize, will allow us to differentiate between social psychological motivations and economic structural motivations to saving.

Methods
Our data were collected from April through September 2004 via a telephone survey of residents aged 18-64 in Michigan’s Upper Peninsula (UP). In that time a total of 1270 interviews were completed including 1129 interviews with individuals randomly selected from the UP general population using random digit dialing, and 141 interviews that made up an oversample of Native Americans achieved through a supplemental dialing within census tracts known to have high proportions of individuals in this category. For purposes of this analysis, we are not interested in looking at a subsample of Native Americans, so the data have been weighted to account for the oversample. Population probability measures were used to determine the weights. After applying weights, the final number of interviews included in the analysis was 1269.

Using the outcome disposition categories of the American Association of Public Opinion Researchers’ Standard Definitions and the accompanying formulas for calculating outcomes, the overall response rate for the survey was 43.5%, the refusal rate was 21.6%, the cooperation rate among eligible households was 66.9% and the contact rate was 93.7%. Within households containing at least one eligible adult, the respondent was selected randomly using the Trohldal-Carter technique. The average interview lasted approximately 20 minutes.

Respondents provided zip code data that were subsequently used to match their responses with regional Census zip code aggregate data from the 2000 U.S. Census. This allowed us to include the community variables of unemployment rate, median income, population, percent of zip code residents employed in different occupational categories, and percent of zip code residents employed by different types of organizations. All analyses were conducted using SPSS 14.0 for Windows.
The survey topics included a variety of questions on attitudes and behaviors. For purposes of this research we are focusing on questions about respondents’ participation in savings plans in general, tax-advantaged retirement plans specifically, and level of contribution to tax-advantaged retirement plans. Also, we utilize responses to questions on respondent perceptions of the community’s future business conditions and their own family’s future financial conditions, preferences regarding the timing of receipt of an unexpected financial windfall, and basic demographic characteristics. The financial windfall question is part of a larger battery of questions that investigates temporal preferences and discount rates, and it offers the options of receiving an unexpected inheritance in the form of $20,000 immediately or $32,000 in 5 years for a 10% rate of return. See the appendix for specific wording of questions used in this analysis.

Finally, in our analysis, we control for interviewer gender based on findings from a previous research project that suggests interviewer gender may lead to social desirability bias in survey research. This survey gathered data on interviewer gender and resulted in a nearly even distribution of surveys conducted by males and females. (See Whitaker et al 2006)

Analytic Strategy

Our analysis of savings behavior centered on the responses to three consecutive questions on respondents’ participation in savings plans (See Appendix). Using the three questions, we were able to identify four distinct groups and to make comparisons between groups and sets of groups as suggested by our literature review and hypotheses. There were 79 cases in our sample where the respondent did not respond to the savings
questions, leaving 1191 valid cases to be used in our analysis. The categories of respondents were as follows:

1. Individuals who do not participate in a savings plan (33.7%, \(n=401\))

2. Individuals who participate in a savings plan but not a tax-advantaged retirement plan (13.5%, \(n=161\))

3. Individuals who participate in a tax-advantaged retirement plan but do not make the maximum allowable contribution to that plan (32.1%, \(n=383\))

4. Individuals who participate in a tax-advantaged retirement plan and make the maximum contribution. (20.7%, \(n=246\))

Only categories 3 and 4 speak directly to formalized plans as we have defined them. Category 2 participants characterized themselves as participating in a plan, but we did not ascertain the degree to which those plans were earmarked or tax-advantaged for a purpose other than retirement (eg. education savings, vacation savings, christmas club accounts).

Because there are multiple determinants that go into savings decision-making, we constructed three multivariate analyses in the form of binomial logistic regressions to determine the relationship between 5 sets of independent variables and different types of savings behavior. The variable categories progressed from macro to more micro inputs and were entered into the model in a stepwise manner in order to determine the incremental importance of each. The sets were as follows:

- Community characteristics (unemployment rate, population, percent of community employed by a manufacturing company, percent of community employed by an educational institution or social service organization, percent of
community with managerial jobs, percent of community with service jobs, percent of community who are self-employed, community median income);

- Family characteristics (number of adults living in the household, number of children under 17 living in the household, respondent marital status);

- Individual characteristics (Age, sex, education level);

- Economic situation (labor force participation, respondent’s own and household member’s membership in union, income);

- Economic perceptions (perception of community business conditions in the coming year, perception of family’s financial conditions in coming year, attitude toward an unexpected financial windfall).

The community variables offer a picture of the actual economic well-being of the respondent’s community as well as a picture of the reference group that surrounds the respondent. Employer types within the community and occupations held by community members suggest the availability and access to types of defined benefit and defined contribution plans for the reference group. For example, as indicated by the research on trends in defined benefit plans, education and social service employers would be more likely to offer traditional pensions than would private employers. The self-employed could initiate formal retirement plans in the form of IRAs or Keogh plans but would not have access to 401(k) plans which are employer-sponsored. Within economic variables we were interested in union membership to the degree that union members are more likely to have favorable access to retirement plans (either DB or DC) with good information on the advantages thereof. We did not include race in our model only because our sample was generated in an area with little racial diversity (96% white).
In our first equation (Liquid Save v. No) we attempt to uncover any unique determinants between those who do not save in any form of plan and those who save in a plan of some sort, albeit not a formalized retirement plan. (Group 1 compared to Group 2). We make the assumption here that the formalized retirement plan is the form of plan with the most specific long term purpose and longest period of illiquidity. Thus, the relevance of this equation is based on the assumption that savings within a non-retirement plan may be a more liquid or flexible step within savings behavior. We believe it may be important to determine how and what transitions someone into this step. It is a limitation that we do not know what form of savings program the respondent has, other than knowing that it is not a formal retirement plan.

Our second equation (Retirement v. No) looks at those who have a tax-advantaged retirement plan compared to those who do not. As discussed previously, retirement plans have become more and more important to an individual’s and family’s long term stability in this era than in past eras when pensions and social security were more common and more secure. (Groups 1 & 2 compared with groups 3 & 4)

Our third equation (Max Out v. No) looks at those who are involved with formalized retirement plans and contribute the full amount allowable compared with those who do not contribute the full amount. (Group 3 compared with Group 4)

Findings

We start with a summary of the explained variation across each model. In each of the models, the categories of variables we included, along with a control for interviewer gender, offered an explanation of between 26 and 46 percent of the variance in the dependent variables. Each category of variables makes a different level of contribution to
each unique savings decision. Community, family and economic variables make the highest level of contribution to the decision to save outside a formal retirement plan only, while economic and family variables were most highly influential in the decision to engage in a formal retirement plan. Community and perceptual variables had the most predictive power on whether or not one makes the maximum contribution once they are involved in a formal retirement plan. See Table 2 below.

(Table 2 about here)

These findings reinforce our argument that formal retirement plans are a unique mode of savings, differently predicted than other forms of savings and that the social context of the consumer/saver is relevant to his/her decision making in the savings arena. Further it demonstrates that both macro-structural factors and perceptual factors significantly influence savings decisions. A closer look at the impact of specific variables presents a more comprehensive picture.

Comparing the multivariate analyses for each of the three different savings behaviors reveals that each savings behavior is differently predicted. See Tables 3 and 4. Only five of our twenty-two independent variables offered a statistically significant contribution to the prediction of liquid savings behavior as we have defined it for this research, (that is, participating in a savings process but only outside of a formal retirement plan) compared with having no savings plan. Economic criteria were the most important predictors in this model with liquid savers earning more than non-savers. Part-time workers and those not in the labor force were less likely to be liquid savers than those working full-time. Additionally, respondents in manufacturing communities and communities with higher levels of service work were more likely to save in non-
retirement plans than to not save. Finally, more adults in the household was significantly positively related to liquid savings behavior.

(Tables 3 and 4 about here)

Participation in formal retirement plans was predicted very differently and was primarily a function of an individual’s economic situation and their individual characteristics. The single most important predictor of participating in a retirement plan was labor force participation. (Wald statistic 71.717, p=.000). Income was a highly significant predictor as well (Wald statistic 59.551, p=.000), but employment itself, controlling for income, had the strongest effect. Compared with those who work full time, those who are not in the labor force had a significantly lower likelihood of retirement plan participation, a finding that is intuitively logical given that access to and education regarding formalized plans is facilitated by employers. Part-time workers, who are often not offered benefits, are less likely to participate than full-time workers as well. Employers that offer 401(k) plans do so upon employment and often through annual open season, primarily to full-time employees only. Thus employees are faced with a decision to invest along with information on the advantages of the plan. Non-workers and part-time workers without benefits may initiate plans like IRAs on their own, but they need to be aware of the advantages and to independently act on this information. People are more likely to save when the process is easy, even passive. For example, Harris (2003) reports that when workers must open their own 401(k) plans, the participation rate for workers with less than 12 months of tenure is 50 percent, compared with 90 percent when employees are enrolled automatically but may opt out. Iyangar et al (2004) discovered that choice plays a meaningful role in plan participation, with plan participation highest
among those whose 401(k)s offered the least number of options and thus the least amount of personal research and active choice. Clearly, the non-working have a significantly higher barrier to entry into formal retirement plans with more active requirements compared with workers whose companies offer a plan.

Income was the second most influential variable on retirement plan participation. Surprisingly, income was not a statistically significant predictor of making the maximum contribution to the retirement plan. Labor force participation was significantly related to maximum contributions but had the opposite effect than on participation in a retirement plan. Though non-workers were less likely to have a plan, once they took active steps to participate, they were even more likely to take full advantage and make maximum contributions.

Attitudes significantly explained retirement plan participation, though attitudinal variables were less important than the effects of individual and economic variables. Those who had optimistic views of the community business conditions in the coming year were more likely to participate in a formal retirement plan. At the same time, those who felt their own family’s financial situation was declining were also significantly more likely to participate in a formal retirement plan. The findings support both the optimism and precautionary savings hypotheses.

Attitude toward the family’s future financial condition was not a significant predictor of savings outside a retirement plan (liquid savings, by our definition), but it was a predictor of savings within a retirement plan. Together these findings refute our hypothesis that precautionary savers would be less likely to save in a long-term illiquid plan and more likely to save in some other savings vehicle.
Optimism about community situation was also significant in the model on
collection levels within a retirement plan. Those who anticipate good community
business conditions are more likely to contribute the maximum. Community context
variables reveal the effect of actual economic conditions compared with perceived
conditions. In areas where individuals face higher unemployment, participants are least
likely to maximize their contributions. The role of perception of one’s family financial
situation is not statistically significantly related to maxing out contributions to a
retirement plan.

The precautionary savings hypothesis, then, yields unusual and somewhat
contradictory results where people who are concerned for their own financial futures do
tend to save in formal retirement plans, but actual indicators of earnings instability lead
them to place less money in the plan. Overall, though, optimism about business
conditions is significantly likely to lead to long-term savings.

These models also include data on individuals’ attitudes toward a potential
financial windfall. Respondents were presented with a hypothetical scenario where they
could receive an unexpected inheritance of $20,000 now or $32,000 in five years.
Temporal preferences for receiving a windfall do not significantly affect an individual’s
likelihood to be a liquid verses a non-saver or to be a retirement plan participant.
However, individuals with a higher propensity toward instant gratification (would prefer
the inheritance now) were more likely not to contribute fully to their retirement plans.
This was the single most predictive factor in the model of maximizing contributions, and
the findings resonate with Laibson et al.’s (1998) discussion of hyperbolic discount rates
and the allure of instant gratification.
The characteristics of one’s community were not significant predictors of participation in a formal retirement plan, but they were important to the determination of how much one would contribute within one’s plan. Individuals living in communities with higher proportions of workers in education and social service organizations (those likely to have pensions) were less likely to take full advantage of tax breaks and savings in formal plans, but those living in areas with higher proportions of managerial workers were more likely to set aside the maximum. As mentioned, as unemployment rate went up, the likelihood of contributing the maximum declined. Surprisingly, those in lower median income areas and in lower population areas were more likely to contribute the maximum allowable under their plan.

Many of the family and individual determinants of retirement plan participation were consistent with past research findings on determinants of savings in general. Specifically, those who have higher incomes, are older, married, and more highly educated are more likely to invest in a formal retirement plan. Contrary to past findings (Joo and Grable 2000, Lunt and Livingstone 1991, Badenhop et al 2003), our research revealed that women are significantly more likely to save in retirement plans than are men. Historically, women have fared poorly in retirement due to 1) their disproportionately higher level of responsibilities for child and elder care which cause them to interrupt if not forego labor force participation; 2) the wage gap that has left them with smaller amounts of income for saving; and 3) their tendencies toward risk aversion and conservative investment styles (Bajtel and Bernasek in Women and Retirement 1999). Our findings with regard to gender show that, controlling for labor force participation and income, women are significantly more likely than men to be liquid
savers than non-savers, to be retirement plan participants than non-participants, and to contribute the maximum to their retirement plans than not. Women’s labor force participation rates have increased and the wage gap has improved, but we consider changes in cultural norms as potentially at the root of this new finding.

We suggest that changes in the recent past have not simply offered women more money with which to save but have shifted cultural norms regarding women’s responsibility for their own and their families’ economic well being. Higher divorce rates, the higher incidence of female heads of households, and higher levels of education among women have resulted in an increased emphasis on women’s self-sufficiency in providing economically for themselves and their families. When this need combines with an overall higher rate of risk aversion among women (Sunden and Surrette 1998, Joo and Pauwels 2002), we see a motivation to save, rather than to spend. In our current economy, women may perceive investing as the less risky rather than the more risky behavior.

Our research does not reveal whether dollar for invested dollar women and men earn different average rates of return, but it does reveal that women no longer fit into the stereotypes depicted in the following description from a web-based, financial product marketing organization. “Women [are] trained to nurture and seek acceptance, view money as a means to create a lifestyle. Women spend on things that enhance day-to-day living. Theirs is a now-money orientation. Men [are] trained to fix and provide, view money as a means to capture and accumulate value. Men don't spend, they invest. Men don't want something, they need it. Theirs is a future-money orientation.” (Bankrate.com
Policy makers and financial service professionals should be aware of the fallacy in these gender stereotypes as they construct methods to motivate savings into the future.

The research findings ran counter to our expectations in several ways. There were several variables that we believed would be of higher importance in the predictive models than they were. We expected union membership to significantly impact plan membership and contribution levels because union membership generally indicates access to favorable benefit plans and education on benefits. In explanation we consider that the negative impact on retirement plan participation one might expect from the existence of a strong union-offered DB plan was cancelled out by the positive impact of having good education about and access to a DC plan. This possible explanation is supported by the finding that having a household member in a union was significantly negatively related to a respondent’s retirement plan participation. The effects of either a spouse’s good DB plan or good DC plan would have the same directional impact on the respondent’s plan participation choice – the choice to forgo participation because retirement needs were being taken care of elsewhere.

Our findings show the presence of children does not determine whether someone participates in a savings plan (formal retirement or otherwise), though it does cause a reduced level of contribution to an existing plan. Undeniably, the existence of children drains resources in the present, and would, on average, affect available funds for contribution.

Finally, we were surprised that the prevalence of self-employed individuals in a community did not impact any of the savings behaviors we considered. Such communities may be more rural (where there are many family farms) and may have a
high number of individuals whose investments are caught up in their businesses rather than financial savings programs. Also, the self-employed would have the same high barrier to formal plan participation that non-workers have, given that they would have to seek out a plan on their own. Lunt and Livingstone (1991) found that savings information and advice from friends and family are important to savings decision making. Based on our research, the proportion of self-employed individuals in one’s community did not systematically affect that information and advice in a way that would impact on retirement plan participation or retirement plan contribution levels.

Conclusion

Individual savings has become a more important means to livelihood in retirement than it was in previous generations when pension plans were more prevalent and social security was more stable. This research provides findings that are important to consider when creating savings plans and policies designed to increase the level of retirement plan participation and the amount of savings within retirement plans. Looking at three different savings behaviors, we found that each was predicted differently, a finding that supports our hypothesis that savings is not a unitary notion and formal savings plan behavior can and should be looked at separately.

Moen and Wethington (1992) discuss the idea of Family Adaptive Strategies or actions that families engage in to deal with the barriers they face through structural forces. This framework sees families as flexible, decision making units who are constrained in their options by the social structure. Our work here supports the conception of families as adaptive decision making units with regard to their savings in several ways, but our work also reveals that savings can be a passive action that needs to be more central and strategic in individuals’ and families’ decision making. Future
amendments to savings policy and savings plans may need to place participation
decisions more squarely in front of citizens on an ongoing basis. Campaigns that
regularly notify individuals of the tax and personal advantages of savings and suggest
participation or increases in contributions would make this topic top-of-mind at regular
intervals through the life-course.

In support of the view that people are active in their choices, we found that
women are significantly more likely to save in a formal retirement plans and contribute
the maximum to their plans than are men. This is a change from past findings and from
stereotypical conceptions of women as uninterested, uninvolved and secondary in long-
term financial planning, and we credit this change to women’s active adaptation to
changes in marriage, divorce, single-parent child-rearing, and labor force participation.
As a result of these structural changes, women have taken on a more responsible and
active role in their own and their family’s financial stability.

Other indicators that individuals are active and strategic in their savings decision
include findings that income is significantly positively related to savings plan
participation and that individuals are more likely to participate in a retirement plan if they
are concerned about their family’s financial condition in the future. They are, however,
less likely to contribute the maximum to a retirement plan if they have more children at
home and if unemployment in their community is higher. Finally, individuals whose
spouse’s were members of unions and thus likely to have favorable retirement plans,
were less likely themselves to participate in a formal retirement plan.

Other findings show that savings behavior is more passive and based on
individual characteristics rather than being based on a proactive, strategic response to the
structural situation. The strongest predictor of participation in a retirement plan was full-time employment. Because this relationship was revealed with a control for income, we conclude that it is the access and opportunity for plan participation facilitated by employment that leads to higher levels of participation. Full-time employment is more likely to be accompanied by benefits, and it is also most likely to accompany plan participation. Individuals who do not have access to an employer-sponsored plan can still initiate a plan on their own, but they are less likely to do so. Put simply, people are more likely to engage in a plan when it is easier to do so.

Retirement plan participation is also significantly related to being older and married. With the age of marriage increasing and the life span increasing, it may be important to educate individuals on the importance of long-term planning earlier in their lives and outside of marriage. Also, families must consider the long-term costs of delaying higher contributions to retirement until their children are older. Those with optimistic attitudes about the economy in their community are more likely to participate in a retirement plan and contribute the maximum. There is little policy makers can do to affect this other than institute policies that will create a genuinely favorable economic future for Americans in all social locations.

Finally this research revealed that though many individuals participate in formal retirement plans, consumers/savers have difficulty dealing with desires for short-term or instant gratification. They are often impatient for returns and likely to indulge in the present rather than delay consumption until a later date. Respondents’ attitudes about whether they would want an unexpected financial windfall now or would wait for it for 5 years with a guaranteed 10% annual rate of return was the most predictive variable in
whether they contribute the maximum to their retirement plan. This finding supports the literature discussing short term desires and it puts our consumer culture front and center in any discussion of motivating savings.

Community context did not predict savings plan participation but it did offer significant explanation for savings outside of formal plans and for amount contributed within a plan. Income itself was not a significant predictor of contribution levels, but the economic context surrounding the respondent was. Once again, it may be important for all communities to receive common educational information on the benefits of savings and plan participation, and to receive it on an ongoing basis so differences in employer-provided and family/friend provided advice on savings won’t compromise some individuals’ opportunities to create a secure future for themselves and their families.

This study offers new information and a new perspective on savings but it also has several limitations that might be addressed and improved upon in future research. Specifically, in the future we would be interested in analyzing savings behavior in a national sample rather than a regional one. The study area for this research, the Upper Peninsula region of Michigan, is a limitation because the region is a fairly rural and limited-resource area. Another limitation is that the study region and thus our sample are predominantly white, which did not allow us to consider the impact of race or ethnicity.

We also suggest that future research on savings behavior gather more specific data on the types of savings vehicles people are using and the goals associated with their saving. We continue to advocate the analysis of formalized savings plans, or plans with tax advantages designed to promote a specific long term savings goal. It would be
informative to differentiate between types of formal retirement plans and to consider formal education savings plans or healthcare savings plans as well.
Appendix

Survey Questions

1. Do you participate in any type of savings plan such as a 401K, IRA, educational savings plan, supplemental retirement plan, employer matching plan, Cds, bonds or stocks?

2. Are you using a plan that allows you to delay paying taxes on your savings until after retirement?

3. You said you are using a plan that allows you to delay paying taxes on your savings. Are you contributing to that plan to the maximum extent possible under the guidelines?

A. Now turning to the business conditions in your community, do you think that during the next twelve months you community will have good times financially or bad times?

B. Thinking of the example of the unexpected inheritance and your given financial situation, when would you prefer to receive the inheritance? (Right away for $20,000, 5 years from now for $32,000)

C. Now looking ahead, do you think a year from now you and your family living there will be better off financially or worse off financially?

Promoting Transformative Community-University Partnerships

Effective university engagement efforts result in meaningful and often transformative outcomes for faculty, staff and community collaborators. Since 1999, a university-wide coalition at Michigan State University called FACT – the Families and Communities Together Coalition, has supported university-community engagement projects that both 1) are responsive to public issues and community concerns and 2) are furthering faculty scholarship and professional goals. A recent survey of community partners on the impact of these FACT engagement efforts find relatively high levels of expected and achieved benefits to the community, positive-satisfactory evaluations of collaboration and strong inclinations to continue partnerships. Faculty partners report strong academic and scholarly outcomes from these partnerships in terms of publications, external research funds, and policy and program innovations.

This presentation will review the reported outcomes and impacts of these partnerships. In addition, we will examine how collaborations address the challenges of bringing together partners with very divergent points of view to bridge the gaps between community agents and university scholars. To be sustainable, research-based outreach collaborations must integrate disciplinary knowledge and research with the needs and expectations of the community partner to make authentic and timely progress toward community goals. We will present a model of transformative engagement for sustained impact and discuss methods of measuring that impact in meaningful ways for all partners.
Title: Factors Influencing the Provision of Quality Psychosocial Services in Washington State Skilled Nursing Facilities

Topic area: Social Work

Presentation format: Paper session

Author: Robin Bonifas, MSW, LICSW, PhD(c)

Department and affiliation: School of Social Work, University of Washington

Mailing address: 4101 15th Ave NE Seattle WA 98105

e-mail address: rpb3@u.washington.edu

Phone number: 425-482-1825
Abstract:

Although psychosocial needs such as depression, anxiety, and behavioral symptoms are widespread among persons living in American skilled nursing facilities (SNFs), the scope and quality of services provided to address those needs appears insufficient. Indeed, substantial evidence indicates SNF residents’ psychosocial needs are generally not met (Tirrito, 1996; O’Neill & Rosen, 1998; Parker-Oliver & Kurzejeski, 2003; Department of Health and Human Services (DHHS), 2003). Social workers have been recognized as the primary providers of psychosocial services in SNFs, and both workload and practice knowledge barriers have been identified as factors that impede their ability to provide necessary services (Tirrito, 1996; O’Neill & Rosen, 1998; DHHS, 2003, Parker-Oliver & Kurzejeski, 2003). However, specific factors that either enable psychosocial care or reduce the barriers to service delivery have yet to be explored. Furthermore, little is known about the connection between service provision and resident outcome-related indicators of facility quality of care. The social work profession has affirmed that research addressing each of these areas is vital to achieve a higher standard of psychosocial care for vulnerable persons living in SNFs (Vourlekis, Zlotnik, & Simons, 2005).

This paper session will present findings from a research project that utilized a three-category quality assessment framework to address these gaps in the social work knowledge base. A cross-sectional survey design was utilized to link two sources of data, one from a self-administered questionnaire completed by social services directors in SNFs across Washington State, and the other from three-years’ worth of resident-centered facility state inspection results. Analysis centered on determining the independent and combined effects of organizational structure, organizational processes, and individual social work characteristics on resident psychosocial outcomes. Results indicate that four factors have the most influence on the provision of quality psychosocial care services: the degree of facility ownership turnover, the extent of social worker’s practice experience, the social worker’s level of identification with the helping role, and the facility’s overall values related to incorporating residents’ individual differences into the plan of care. Potential interventions to enhance psychosocial services in SNFs suggested by these findings will be discussed.

Title: Racial and Ethnic Differences in the Accrual of Functional Impairment Over Ten Years: The Role of Health Care

Author: Mary Elizabeth Bowen
Wayne State University, Institute of Gerontology, 87 E. Ferry St., 226 Knapp Bldg., Detroit, MI 48202 mbowen@wayne.edu

ABSTRACT

This study examined the accumulation in functional impairment among white, black, and latino Americans over time within a CD advantage model and the relationship between medical service utilization and functional impairment. Ten years of data from the Health and Retirement Survey (HRS), 1992-2002, was examined using hierarchical linear modeling techniques. The HRS is a prospective, multi-stage national probability cohort study. The subsample included adults aged 50 years old and older at the baseline year 1992 (n= 8,442). Blacks had higher rates of functional impairment accumulation compared to whites across the subsequent years (P<.001) after controlling for time-varying medical conditions (hypertension, diabetes, cancer, and lung disease), health insurance coverage, and socioeconomic position (SEP). Compared to whites, physician visits (P<.01) and hospital and nursing home stays (P<.001) were associated with more functional impairment among blacks while hospital and nursing home stays were associated with more functional impairment among latinos (P<.01) after adjusting for demographics and time-varying medical conditions, health insurance and SEP.

Nationally, blacks and latinos begin older adulthood with more functional impairment, and blacks continue to accumulate more impairment than whites in later years. Medical service use among blacks and latinos was associated with more functional impairment after considerations of comorbid medical conditions and other instrumental health factors. The results support the cumulative disadvantage model such that disparities in health continue to accrue for racial minorities into older adulthood. These results are consistent with reports that disparities in medical care negatively impact the health of older blacks and latinos.
Developing Interpersonal Bonding Relationships in the College Classroom

Educational Psychology: Poster Presentation

Abstract

This qualitative study was designed to explore interpersonal relationships in the college classroom, i.e. the bonding relationship between teachers and students or among students themselves. The major purpose of this research was to understand the nature of classroom interpersonal relationships, discover their patterns, and identify the conditions for developing the kind of bonding relationship which most benefits learning in the college classroom.

Interpersonal relationships, especially bonding, are closely related to students’ learning. There is considerable evidence that a positive student-teacher relationship positively influences many desirable instructional behaviors, including student motivation to learn and willingness to talk (Menzel & Carrell, 1999), student fondness for the teacher and the teacher’s instruction (Moore, Masterson, Christophel, & Shea, 1996), and teacher credibility (Thweatt & McCroskey, 1996). Both Mead and Vygosky believe that human cognition is inherently social and develops when external social interactions are internalized (Valsiner & Van der Veer, 1988). Lack of interpersonal relationships in class can heighten students' distress (Hara and Kling, 2000) and hinder students’ potential for learning (Knowlton, 2005). In spite of this evidence, few qualitative studies have investigated classroom interpersonal relationships (Rawslin, 1985). Therefore, conducting qualitative studies on classroom interpersonal relationships is urgent (McMcroskey, 2006).

This study used a grounded theory method with an emergent design. Two research methods were used: participant observation and individual interview. The research site was in the E department at V University. The class observed was a graduate class with twenty Caucasian students. One year (two semesters) was spent observing one professor’s teaching (fourteen weeks a semester, three hours a week). Observations of the professor’s classroom teaching were collected every week, and individual interviews with the professor and three students from each class were also obtained. All observations and interviews were videotaped with permission.

This study discovered that in order to create bonding between two people, three conditions need to be met: familiarity, commonness, and significance. Familiarity refers to how much these two people know about each other. This knowledge can be anything, including one’s appearance, background, experience, education, knowledge, personality, hobbies, etc., and it can be obtained through three different ways: a) direct interaction with the person; b) indirect knowledge from some specific resource (e.g., someone who had direct contact with this person); or c) indirect knowledge not about this specific person but the general group which this person belongs to (e.g., country, culture, race, or school) from secondary resources (e.g., movies, books, education, stereotypes, rumors, people talks etc.).

Commonness indicates how many of the issues involved in this familiarity (i.e. the topics known about one another) these two people share in common. Commonness does not have to be something they possess themselves but can be “shared” in three different ways: a) they share it themselves (e.g., I am from China, too.); b) someone they know shares it (e.g., My aunt is from China, too); or c) nobody specific they know shares it, but they have learned about it from secondary resources such as movies, novels, media, ads, gossip, religion etc. (e.g., I just watched a movie about China.)
Significance is the last and also the most important condition in developing bonding relationships. Significance means the two people both perceive the commonness (i.e. shared experience) between them as being significant. Significant does not necessarily imply a positive evaluation of what is shared, but merely that it is viewed as important by both people (e.g. divorce). The more significant they both perceive the commonness to be, the more bonded they will feel with each other. Otherwise, if only one or neither perceives it as significant, little or no bonding will develop between them.
DESCRIPTION OF STUDY

This study examines the partisan division of seat shares and changes in seat shares, to develop a theory of partisan control and change in State Legislative politics. The models analyzed in this study consider national level forces, internal determinants, and other conditions influencing majority legislative status, including a common assumption that partisan outcomes in American State legislatures are determined by top-of-the ballot forces. The theoretical framework encompasses seven dynamic hypotheses for explaining the formation of majority coalitions in legislatures’ accounting for: a random walk in the form of swings or drift in legislative elections (Stokes-Iverson), perfect duopoly competition (Downs), trend stationary time series (Key), election cycles (Alesina), a bicameral equilibrium model (Tsebelis-Money), a model of disequilibrium adjustment (Kramer-Schofield), or the existence of a critical election (Burnham). Generally, the empirical findings confirm the importance of electoral cycles, gubernatorial coattails, and state trends, in the determination of the outcomes in elections for state legislatures. This study finds significant internal trends in twenty-eight states, with gubernatorial vote percentages highly related to partisan seat divisions in all states. These findings suggest that an aggregate outcome in these elections is not simply a random walk fluctuation from election to election. Another basic finding is that the outcomes in gubernatorial elections are more evenly divided than legislative shares, with all states excepting Alaska and Montana having at least one chamber significantly different from perfect competition. Even though the primary findings are with regard to state level effects, there is evidence of two, four, and eight-year election cycles, after controlling for significant national trend and gubernatorial coattail effects. For longer historical periods, the estimates indicate that the Democratic Party was the majority party in sub-national politics during the initial four phases of study (from 1936 to 1990). These findings also reveal the absence of any critical election over this seventy-year time horizon, although there were a few years with larger Democratic Party majorities. Whereas the Republican Party gained seats in some individual states and elections during the most recent period (from 1992 to 2006) to substantially increase the overall level of competition toward an even partisan division in American politics.
Currently, in the less neglected world of state politics, there is greater attention concerning the role of political parties in state politics. Perhaps this is due to the changes in party control in state gubernatorial elections and state legislative majorities since 1994. With more policy responsibility and federal decentralization, the increases in the number of Republican governors and changes in partisan control of gubernatorial offices have become a more visible, and a practically relevant fact, as meetings of the National Governors’ Association and the related changes in party affiliation are reported as variables shaping public policy and national elections. Even when this number reached a peak of thirty-two in 1996, for the 1954 to 2006 period, there were notable defeats in the 1998 elections for the Republican Party, in California and Iowa. The latter case represents a particularly interesting example because this was the longest serving Republican administration, from 1968 to 1998, and because the public opinion polls favored the Republican candidate throughout the campaign. The inability of the Republican Party to win three-in-row in these states, combined with the losses for the Democratic Party in other state elections is suggestive of the greater volatility in statewide elections.

Similar increases in instability are reported for changes in partisan control, and electoral competition to control, state legislative majorities. Part of this increase involves the regional transformation of the South, where there is widespread evidence of electoral realignment and two-party competition in both gubernatorial and state legislative elections. While changes in partisan control of legislatures are less frequent than rotations in gubernatorial offices, there are more examples of shifting legislative majorities since 1994, than before the post-1994 Congressional Republican majority. In 1994, Republicans held legislative majorities in twenty-seven states’ senate’s and twenty-six house majorities. Similar to the level of control of
gubernatorial offices, these outcomes represent maximum levels of partisan control for the Republican Party since 1952. With the exception of 1946 and 1952, the 1994 through 2006-decade is similar only to the 1942 through 1952 elections in terms of an evenness of partisan division in control of state governments. Since the 1992 elections, the Republican Party has controlled approximately one-half of the state legislatures, but because there are only six elections to study during this time frame, there is insufficient evidence to determine whether this constitutes a permanent shift toward the Republican Party or simply an increase in partisan competition.

The ability of the Democratic Party to win gubernatorial elections, and the related failure of the Republican Party to maintain or to gain legislative majorities in several states suggests that neither the trends at the regional nor national levels are completely unidirectional, favoring one party across the board. While gubernatorial elections produce Presidential candidates, state legislative candidates are prospective Congressional candidates. In state politics, the focus on apportionment and redistricting, state level fiscal policy, and the change in partisan control of Congress, contributes to an increase in the attention paid to partisan control of state legislatures. This in turn produces a greater effort by the national political party organizations to win state legislative majorities. By assessing state legislative elections, this study examines the increases in the scope and reduced variation in party competition within U.S. Domestic Politics. The evidence suggests there is greater party competition, hovering closer to fifty-fifty shares, in the levels of party control through more frequent changes in party control in recent elections. However, the short durations of evidence, the recentness of the elections, and the general acceptance that both state politics and partisanship appear to be changing, all confirm the importance of state level partisan competition.
LITERATURE ON STATE ELECTION OUTCOMES

The literature on state elections focuses on party competition, critical elections, divided government, and changes in state government, including those changes in both state gubernatorial and legislative elections. Since the 1950's, the adoption of new constitutions and reforms to existing state institutional arrangements have increased the value and the cost of running for public office. These organizational incentives incorporate consequences for both politics and policy reform.

Electoral change has further reinforced this pattern of organizational development by increasing competition. Where measurements of party competition confirm increases and changes in the level of party competition, these changes correlate with a decline in traditional patronage, jobs and contracts, party machines and increasing partisan organization around state and candidate-centered electioneering. The new style of campaigning has reduced partisanship as a voting bloc, while increasing the importance of parties as suppliers of election consulting services to candidates. At the same time, the diminishment of partisanship in the electorate has not eliminated the importance of partisanship to voters. While candidates may run their campaigns away from references to party politics, with signs listing only their names and an American flag in some regions of the country, two-party affiliation of governors and state legislators is at an all-time level. The absence of significant representation for third parties, the elimination of fusion ballots in almost all parts of the country, the alignment of candidates at the state level with the national political parties, and the extensive use of single member districts have all reinforced the predominance of the Democratic and Republican political parties.
The critical election and divided government literatures provide further evidence of this expansion in both short and long term partisan competition. At the national and local levels there appears to be a dealignment taking place, as evidenced by declining voter’s partisan identification, declining traditional party organization (Mayhew, 1986), and a continued erosion of the New Deal coalition (Rabinowitz, Gurian, and MacDonald, 1984). At the same time, regional realignments appear to be taking place in the South with national political parties and the decline of the Civil War cleavage in American politics. These contrary patterns suggest some combination of realignment and dealignment imply more uniform levels of party competition throughout the United States. This pattern is similar to the two party competitions before the Civil War, between the Democratic and Whig parties, rather than after (Aldrich, 1995). From 1936 to 1992 and the present, the continuing declines in unified partisan control of state government and the greater frequency of party change at the state level further supports this transition from one-party dominance to two-party competition throughout the United States.

More generally, the literature on state elections considers both election results and reform of electoral institutions (Jewell, 1994). The importance of the changes in apportionment, the instances and cases concerning gerrymandering, the changing roles of political parties in redistricting, and the change from multiple to single-member districts have all had a profound effect on state elections. The creation of single member districts, with plurality rule and unique partisan affiliation of the candidates, further reinforces a two-party system. As evidence, the only independents or third (or fourth, for that matter) party candidates elected to state legislatures in recent years have been elected in multi-member districts.
Greater use of single member districts also appears to have led to incumbency advantages in state legislatures. While reelection rates are still below rates for Congress, campaign strategies and costs, the creation of safe single member districts, and greater legislative organizational capacity have all served to increase incumbency advantages at the state level. In some states, this generated demands for term limits, and in some cases, these movements produced term limitation constraints on state legislatures, distinct from those longer in-practice term limits and succession rules for gubernatorial elections.

All of these electoral reforms changed the value of running for office and the potential for either sustained partisan control or frequent partisan change. The consequences of these reforms are captured by the empirical measures of partisan competition documenting increases in electoral competition. But these reform effects are also estimated by votes to seat relationships (Gryski, Reed, and Elliot, 1990), changes in the votes-to-seat coefficients over time, and the evidence suggesting greater proportionality, and therefore, less partisan bias, in these ratios. While speculative, it is possible that the cumulative effect of state constitutional changes, organizational development and incentives, and election reform produces a more efficient aggregation of voters’ candidate and partisan preferences into legislative representation. However, this increase in proportionality also reinforces two-party politics, resulting in greater competition in some state contexts while increasing the potential for greater instability, in the form of shifting voting majorities.
ON THE STABILITY OF PARTISAN CONTROL

The tension within democratic elections between agenda control for a dominant political party and destabilizing electoral success for other major parties is essential for understanding how state elections are influenced by political parties and voter preferences. Statewide elections consist of more heterogeneous constituencies than most single member districts, whereas the tendency for single member districts to reinforce two-party competition is an important determinant of divided partisan control. Because statewide constituencies, and other at-large elections, may be more volatile than district or ward constituencies, the existence of both types of constituencies creates greater potential for differing majorities, and thus, the greater probability of divided partisan control or divided government.

According to Joseph Schlesinger the very definition of a political party entails a distinct entity from voters. While voters may be, and often are, incorporated into the study of political parties, neither voting nor voters’ are the sole features of a political party. As Schlesinger argues (1991) political parties are decentralized organizations for contesting elective offices, supplying candidates to voters.

In this process of a contestation, the potential exists for sustained periods of one party control or rotations between the political parties at the office level. While Schlesinger argues that candidates for legislatures do not run for majority party status, majority party status does appear to influence the quality of the candidates, and therefore the level of contestation for legislative majorities. Since minor parties confront difficulties recruiting any candidates for single member districts, the size of a legislative majority reduces the potential for changes in partisan majorities. Furthermore, distinct minority political parties in state legislatures often cannot provide an
effective opposition with enough membership votes to cover committee assignments. In these situations, the magnitude of a majority reduces the ability of the minority party to contest subsequent elections. In the comparative nations literature, large majorities reduce the effective number of political parties, where exact calculations can be made to estimate this number, given the ability of minor parties to compete in elections (Taagepera and Shugart, 1989). The result of this analysis produces relatively dominant one-party politics, in most of the United States over the past one hundred and forty years. Since the Civil War, state election results confirm this stability with many states’ containing effectively 1½ political party for large numbers of elections.

As a general theorem, the existence of two-party competition produces majority outcomes at each point in a sequence of elections or votes. Any reduction in the effective number of parties at two or fewer political parties increases the stability of election outcomes over a history of elections. Conversely, increasing the effective number of political parties above two both introduces and increases the potential for voting paradoxes, and therefore, greater intransitivity and instability of election outcomes.

In a single election, the existence of three or more effective partisan alternatives, usually divides vote shares below a simple majority. In these cases, intransitive election results may occur for branches of government or individual offices. The facts that individual’s may cast separate ballots for separate branches of state government, including for the governor’s office, a state senate district, and a house district, enable voters’ to split their tickets and produce intransitive collective outcomes. While we tend to describe these outcomes in terms of partisan divisions, or separate partisan control of institutional arrangements, the existence of separate branches of government creates the possibility for different majorities and divided government. In the latter
case, concerning individual offices, split ticket voting by constituencies can produce divided representation in legislatures. Unlike a unicameral legislature or some type of parliamentary system (Tsebelis and Money, 1997), there are frequently instances of divided representation with a state senate seat controlled by a different political party from a state house seat.

This section describes some of the fundamental conditions generating these intransitive or unstable outcomes in a single election. First, the literature suggests multiparty or multi-candidate competition can produce vote or seat shares below a pure majority rule outcome. Situations involving single member districts, plurality rule, dominant voting preferences for one party, entry barriers for third and fourth parties or candidates, unique partisan affiliations ruling out independent candidacies, and either fusion candidates or uncontested offices, may all reduce the effective number of political parties to a range between one and two. By May’s theorem, the existence of two alternatives guarantees the existence of a pure majority rule winning alternative. The negation of these conditions, such as multi-member districts, proportional representation, at-large elections, divergent voter preferences for parties, no entry barriers for minor parties, and substantial numbers of independent candidates serve to increase the number of partisan-candidates, and thus, increase the potential for collectively intransitive outcomes. Second, the historical provisions in colonial and state constitutions involving apportionment formulas established a tradition of varying constituencies, reforming representation systems, and changing electoral institutions. The regular manipulations of boundaries, criteria for allocating seats in state legislatures, and reduction in the percentage of state seats elected under at-large, multi-member districts, have all socialized voters’ to divided government. Regardless to whether voters’ prefer divided government, a point debated in recent studies, the long historical precedence for separate
constituencies and electoral districts creates an incentive for voter’s to consider splitting their ticket. Third, while the explanations for vote choice may be complex for individual voters’, the existence of a bicameral legislature and statewide elections for governor provide the opportunity for divided government. With varying levels of two-party competition, this opportunity structure allows for competitive advantages for incumbents’, dominant parties, and statewide versus local majorities. The existence of gubernatorial, senate, and house candidates, voted on in a single election, in pair-wise comparisons, creates the potential for a voting paradox in the form of divided government.

The next section describes the varying conditions shaping transitions from one election to another. These may be considered multiple votes at a single point in time, or a trajectory, path, or sequence of votes. The sequence itself may involve a whole package or agenda of decisions or simply two points in time. The characterization of these sequences can be in thought of as an adjustment process, or more precisely, the properties associated with an adjustment process. The properties of adjustment processes to consider are that the adjustment process involves a dynamic, time-dependent, set of partisan outcomes for each state and that the movement from one election to the next may or may not involve a stable series of partisan changes.

**ON THE STABILITY OF PARTISAN CHANGE**

While partisan control of government involves a static, single election outcome, partisan change involves a series of election outcomes. Most studies separate these phenomena into distinct theories, models, and data analysis. Discussions concerning partisan control examines the division of party control of state government, the decline of unified government (Bibby, 1992, p.
some discussion about voter preferences for candidates, and finally, the policy consequences attributable to having divided control over either the legislature or the legislative and executive branches of government (Fiorina, 1992). These consequences include stalemate’s in bill-making or failures to address certain issues, like budget deficits or redistricting plans, where third reading approval of a bill requires more than a simple majority vote. The complexities for executive and legislative relations have also been examined in the context of vetoes, supra-majority voting rules, appointments, and either interpretations of legislative intent or administrative rule-making.

Theories of partisan change concentrate on changes in the electorate. These theories assess qualitative changes or transformations in electoral variables and outcomes, including changes in the levels of electoral competition. Other party change variables include changes in voter participation, vote shares for the parties, the introduction of new parties or candidates, and changes in seat shares. The basic gist of these party change theories and models is that party change involves either a qualitative transformation or a normal deviation from one election to the next. Non-critical events produce only incremental deviations or regular patterns of change away from an initial outcome. In contrast, critical events produce qualitative changes in the sequence, with emphasis on new or different variables.

To paraphrase William Riker, politics, rather than economics is the dismal science since there is an inherent disequilibrium to politics. Voting in committees’ or electorate’s may produce inconsistent results, with no unique equilibrium selected; specifically, the nonexistence of a unique equilibrium winning alternative has been shown for pure majority rule voting more than three or more alternatives, for general assumptions about individual preferences (McKelvey, 1979). The absence of voters’ located near centrist positions has also been shown for voting on issues,
candidates, or political parties (Hinich, 1977; Boatright, 1999). The fact that pure majority rule winning alternatives, such as a Condorcet outcome or a grand median in n-dimensions, do not generally exist for complex voting decisions suggest that voting in sequences may produce outcomes with little connection to an initial electoral outcome or status quo election results. Unlike a market setting, where prices restore supply and demand conditions over time, voting is not equivalent to a pricing mechanism. Elections do not always restore equilibria, nor can they always produce convergent election sequences.

In a market setting, supply need not always equal demand, or vice-versa. Prices or auctions or bargaining through property rights can all serve to equate supply and demand. The length of time required for this convergence may vary, depending on contextual variations specific to a particular market. Patterns of convergence may also vary, where adjustment processes can involve swift linear trajectories or slow nonlinear patterns. The infamous cobweb model, consisting of spiral loops slowly converging to the status quo is one example of a stable adjustment process (Gately, 1998). Another variant of this dynamic hypothesis, suggested by Dennis Mueller (1989, p. 185), could be termed the sawtooth hypothesis. Under this hypothesis, adjustment in partisan control resembles a saw-edge, with a rotation between each party every election. Successive elections produce changes in party control, but this change represents a regular election cycle for a discrete variable, versus the cyclic rotation described by the cobweb model for a continuous measure of election outcomes. In party politics, the use of a term limit or cooperative norms, such as one party forming a government for one or two elections, produces this stable adjustment process over a sequence of elections, which may appear to involve unstable transitions between any two individual election results. In this process, convergence may not
occur because other external determinants or shocks may further disturb the outcomes away from an initial set of conditions. A model describing this form of disequilibrium is similar to market models positing a random walk from one election to the next (Stokes and Iverson, 1966, p. 187). For this reason, some argue that sequences of election outcomes do not generally restore equilibria, and that these sequences themselves, may not be in equilibrium.

Some models of party change argue there is a period of stability, punctuated by a change, leading to another period of stability. Others argue that neither short-term, single election outcomes, nor the adjustment processes connecting one election to the next are in equilibrium. Still others argue that single election results are inconsistent, but repeated votes and a long series of elections may produce consistent results (Kramer, 1977). In this model, the consistencies of the election outcomes vary with the number of alternatives and elections, but similar preference configurations and a two-party system could produce centrist outcomes for more than twenty or so elections. In contrast to this view, theories exist demonstrating that a sequence of pure majority rule votes do not settle-down into stable paths or trajectories (Schofield, 1978), suggesting that both the outcomes and processes associated with pure majority rule are in disequilibrium (Riker, 1980). Unlike markets, equilibria fail to exist in complex voting situations; when equilibria exist, voting fails to produce a unique outcome; and, even if a pure majority rule voting outcome exists, there are no equilibrium processes to restore or sustain these as an electoral equilibrium. To restate Riker’s disequilibrium thesis, elections can be chaotic in both the short and long-run.

This view contrasts with critical election theories and models showing relatively lengthy periods of stability alternating with brief periods of instability (Bibby, 1992, p. 39). Often the
debate in critical election theory centers on whether a single election qualifies as a critical or transforming election. According to Burnham (1970), a critical election involves a qualitative change in the sequence of elections, a breakpoint with new or different quantitative effects of variables. For example, there may be a change in the level of competition and vote turnout, or in the relationship between vote and seat shares. But the evolutionary natures of two-party competition between the same two political parties, produces a dynamic adjustment process between two parties to contest seats, mobilize voters, and organize constituencies. The evolutionary stability of duopoly competition entails that single election outcomes are dominated by the major parties with two-party competition structuring the outcomes over long periods of time. Critical elections occur when new issues arise, dividing the coalitions supporting the two major parties. This can lead to the replacement of one or both of the major parties, marked changes in candidate recruitment or office contestation, and dramatic changes in voter identification with the parties. Critical elections may produce partisan change in a single election or a brief sequence of elections, for a transition, from one party system to another. To restate this hypothesis, based on Key’s theory of critical elections (1955), elections are stable for both short and long-periods of time, but critical events exist which qualitatively distinguish one period of time from the next with an unstable transition period in-between.

Since both critical election theory and spatial models of elections imply disequilibrium, this would appear to be an area ripe with agreement. However, the discussions concerning disequilibrium have tended to focus on the properties of government institutions (Shepsle, 1986), rather than the mediating effects of having the same two parties compete over a long sequence of elections. The evolutionary versus revolutionary nature of this context are illustrated in market
analysis of bargaining games with two parties, or competition between rational duopolists over the long-run (Rubinstein, 1982). In this bargaining context, the major parties compete with each other, while creating informal and formal rules for reducing potential competition, from third parties or independent candidates. Competition exists between the two major parties for control of government, and party change occurs relatively infrequently or involves stable shifts back and forth between the political parties. This shifting may involve a few or many seats in the legislature, depending on the relative proportion of marginal districts within the legislature (Bibby, 1992, p. 57). In general, rational duopolists attempt to reduce potential competition from third or fourth parties, or from independent candidates. They also attempt to reduce the chances of critical events occurring to change the basic fabric of a two party system, since competition evolves to produce a relatively stable opportunity structure for candidates. The major parties also seek to avoid the resulting uncertainties for the two major parties of electing third party or independent candidates for statewide offices, because the election of Jesse Ventura as Governor of Minnesota on the Reform Party ticket, Alaskan Independent nominees, and independents such as Angus King (Maine)/Lowell Weicker (Connecticut) creates dilemmas for legislatures organized and controlled by majorities affiliated with the national Republican and Democratic parties.

This third view of party change predicts divergent initial election outcomes with convergent sequence of elections. Again, each of the election outcomes involving more than two candidates or political parties, or the votes for separate branches of government, may still produce unstable or intransitive collective rankings. It is quite possible for individual elections to produce voting paradoxes, while still involving stable transitions or minor-incremental changes from one election to the next. In support of this theory of party change, Gerald Kramer (1977)
argued that competitive elections with two alternatives converge to centrist positions over a long sequence of votes. Others have shown that under somewhat restrictive conditions, centrist positions exist in the form of a yolk or a dynamic win-set, where the paths from one point to the next are contained within a relatively narrow-centrally located range out of the total area (Johnson, 1998).

Finally, the evidence from the study of critical elections suggests that most dynamic change occurs in incremental transitions, from one election to the next, for a large number of elections. This may occur because either the relative proportions of partisan identifiers or registrants remains stable. Other reasons for the stability of partisan bases may be the existence of two or fewer effective numbers of political parties. While the relative success of incumbents’ may change over time, the existence of the same two major political parties at both the national and state level’s provides a certain stability in alternatives, regardless to variations in the level of competition, the number of candidates, the organization capacity of the parties, or the complexity of party platforms or candidate agendas (Budge, 1994; Hinich and Munger, 1997). Instead, electoral reforms and laws have generally served to reinforce the major parties and two-party competition. Specifically, the shift to single member districts, drawn by legislatures, guarantees a certain stability for the major parties invoking Duverger’s law (Riker, 1982). By pairing candidates in elections drawn by the major parties, redistricting often produces effectively fewer than two parties (Weber, Tucker, and Brace, 1991). These outcomes may be reinforced by ballot requirements for third parties or independent candidates, or by dominant partisan preferences in regions of states or regions within states. The existence of local majorities diverging from
statewide majorities is a significant, and often neglected, parts of the history and traditions of state politics.

**DYNAMIC MODELS AND HYPOTHESES**

Theories of partisan control and partisan change imply that two party competitions’ exhibits both stable and unstable components. The stabilizing elements may be dis-aggregated into constant and trend components. For example, concepts such as perfect party competition imply a constant fifty-fifty vote and seat share-election outcome, where these constant effects produce stationary time series. Trend effects include vote or seat share drift, or adjustments, over a series of elections. A time series may be considered trend stationary, sans a moving average, if when a trend effect is subtracted from a time series the remaining time series is stationary (Key, 1966, p. 35).

Any remaining variation in party competition can be decomposed into random variation, single election break points, period effects, and nonlinear patterns of adjustment. Among these nonlinear patterns, there may be evidence of either stable cyclical patterns or stable incremental adjustment processes. In the former case, these are some combination of sine and cosine functions in wavelet patterns of adjustment (Niemira and Klein, 1994). In the latter case, disequilibrium adjustments are produced through growth paths, with the stability of paths contingent on the amount and the angle of adjustment from one point to the next. Under this scenario, gradual changes generate stable, if non-stationary, election time series.

**[TABLE 1.0 ABOUT HERE]**
A summary of these hypotheses are elaborated in Table 1. The hypotheses derived from the literature are tested, in the next section, to examine the properties of legislative competition in level and difference form. Competition in legislative seat shares provides a direct test of partisan competition for majority party status or partisan legislative control. In difference form, changes in legislative seat shares provide a direct measure of the stability of electoral adjustment from one election to the next, throughout state electoral histories. The time frame for this study is from 1938 through 2006, employing the percentage Democratic vote share for gubernatorial elections (Congressional Quarterly Reports, various years) and the partisan affiliation of state legislators described in The Book of States (Council of State Governments, various years).

**EVIDENCE REFUTING SOME OF THE HYPOTHESES**

The first set of results pertains to the evenness of the shares of partisan votes for Governor and seats in the State Legislatures. As revealed by averages and difference of means tests, the findings indicate that most state politics is significantly different from a model of perfect duopoly partisan competition for the control of state government. For gubernatorial elections during a sixty-year period, the average vote was a 53-47% division favoring the Democrat candidate. Yet only seven states are insignificantly different from a $\frac{1}{2}$ division indicating that more than four-fifths of the states had varying degrees of competition for the chief executive office in state government.

*TABLE 2.0 ABOUT HERE*

With regard to partisan legislative control, the division of seats in State Legislatures has been generally more competitive overall than gubernatorial elections were on-the-average.
Approximately twenty states could be classified as simple majority rule. Unlike gubernatorial elections, the State Legislature either was minimally winning or had dominant Democrat Party majorities significantly above simple majorities. In gubernatorial politics, over a majority (twenty-seven to be exact) of state wide votes rendered pro-Democratic election mandates, whereas only sixteen states had Republican partisan advantages in statewide elections. Based on these findings, it is somewhat surprising that the combined state legislative results are as competitive as they are, given the normal advantages for one of the two major candidates. If the gubernatorial electoral politics has any effect on legislative majority control, the connection seems to be that competitive or slightly Republican statewide majorities are consistent with even divisions of partisanship in the State Legislatures.

[TABLE 3.0 ABOUT HERE]

The empirical analysis in Table 3 replicates the basic findings established in V.O. Key’s examination of critical elections in a time series (Key, 1966, pp. 28-57), with partisan bases measurable as intercepts and partisan change estimated as slope increments. Unlike the averages presented in Table 2, the estimates in Table 3 correct for trends in the partisan base during the time series. The model in Table 3 estimates both the sequences of partisan change and the stability of these paths from an initial partisan majority. In most instances, the intercept is either safely Democratic or marginally Republican and competitive, indicating where the state’s electoral history began when the New Deal Democrats became the national majority. The directional estimates of the slope increments indicate that all of the states with a dominant majority party are evolving directionally toward a duopoly political party system. Even though only a few states’ gubernatorial elections have seemingly converged to a state of perfect electoral
competition, most of these states exhibit a stable path of partisan change that is consistently moving toward the same outcome at varying rates of acceleration. For the two major political parties, the erosion of the partisan base in the safe Republican Party controlled states seems to have taken place earlier and faster during the history of state elections from the 1930's to the present. By examining five periods (1938-54, 1956-1970, 1972-1980, 1982-1990, and 1992 to 2006), these results suggest that none of partisan changes were linear, because of the variance in the decline of the post-Civil War, state majority’s political parties. As evidence of these significant partisan changes, more than forty of the legislative seat shares are significantly trending, as estimated in Table 3 for legislative vote shares (i.e., the percentage of seats held in the legislature by Democrats) and for the proportion of the vote share Democrat in gubernatorial elections. Further evidence is suggested by comparing the first two columns (adjusted) $R^2$ statistics and an analysis of the significance of the variation and trending estimated by the F-statistics.

With respect to the hypotheses in Table 1, the results confirm the existence of a realignment taking place in a majority of state legislatures: findings consistent with the decline of the Democratic Party in the south and west, and a decline in the Republican Party in New England, the Great Lakes, and Plains states. Because these trends are not exactly offsetting, they explain how dealignment patterns may exist at the national level, even though there are distinct regional realignments taking place at differential rates of adjustment.

All of these results confirm Key’s basic hypothesis that state level competition tends to drift in different directions with the breakup of various national winning coalitions and partisan changes in electoral cleavages. From a methodological perspective, the evidence demonstrates
that vote and seat shares are not always stationary variables making the argument for inclusion of trend variables in any statistical model or de-trending the data: a point worth remembering when creating either an index or explaining variations across states in a panel design. When these variables are, however, stationary or trend stationary, the findings indicate \textit{stability in either the partisan base or rates of partisan change.}

The findings in Table 3 are also consistent with both the random walk and perfect duopoly competition thesis, given the absence of trends in somewhere between fifteen to twenty states. The existence of slight random movements, by gubernatorial and legislative election, confirms the importance of the fifty-percent vote and seat share outcome suggesting that these states had already attained some degree of evenness in party competition. As further evidence of only random deviations from even shares, in many of these states the estimated intercept is within the forty-five to fifty-five percent ranges. The minor trends and stable adjustments in most of the rest of the states simply underscore the fact that competition did not begin to substantially increase until the 1980's.

Currently, the states with increasingly Democratic state legislatures are randomly dispersed throughout the United States (in states like California, Connecticut, Hawaii, Iowa, Kansas, Maine, Michigan, New York, North Dakota, Oregon, Rhode Island, Vermont, and Wisconsin). These states represent long run, or at least longer term, examples of a significant shift toward the Democratic Party. While this does not completely account for some of the recent gains by Democrats in New England, the contrast between a recent period versus a longer time series corresponding to the overall decline, suggests that coalition realignments have been taking place throughout the New Deal and post-New Deal period. Data for Hawaii and Alaska includes
territorial election providing additional comparable data for Hawaii (and Alaska) with the other forty-eight states. The transitions from the strongly pro-Union Republican Party, from near one-party dominance to monopoly Democratic control in Hawaii (1954-1962) and a competitive (two and sometimes three) party system in Alaska, suggests the slow, longer term, adjustments from the Republican Party in these states began during the 1930's in the North.

In contrast, the states with recently increasing Republican delegations were almost all located in the South (in state like Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, and Virginia). Each of these states’ politics began the 1972-1980 time frame with one-hundred to more than ninety percent monopoly control of the state legislatures; the exact base \(B_0\) results are estimated with an intercept (Table 3, column six for the gubernatorial vote shares and column seven for legislative seat shares). Since that time, one-party dominance has diminished too marginal Democratic control. The decline from one-party rule has been precipitously evolving over a series of elections including the earlier 1952, 1964, and 1970 elections, while strongly trending from 1980 to the present. The cumulative effect of this Southern realignment has been to decrease Democratic seat share majorities from ninety-five percent to around sixty-seven percent, although the rate of adjustment has generally been stable and in the range of 1-2% erosion per-election. By the 1998 legislative sessions, Florida, North Carolina, South Carolina, and Virginia had either Republican majorities in one chamber or very close to even partisan shares for the first time since Reconstruction. In other states, such as Georgia and Texas, there were sequentially large increases in the size of the Republican delegations after the 1992 reapportionment. The quick rate of adjustment across the South, and in a few states in the West, is best understood when
comparing what the historical partisan base looked like at the state legislative level before these changes. Prior to this recent acceleration to majority legislative coalitions, among these states only the Tennessee had a Republican legislative majority, prior to the 1990's, even though stable (1/3 to 1/5) Republican factions existed in Kentucky, Tennessee, and North Carolina throughout the post-Civil War histories of these states.

The recent evidence also suggests that legislative competition is evolving more quickly into closer, or more even, seat shares. But with trends in only fourteen states, the comparable results for gubernatorial vote shares confirm that

- Republican candidates for statewide office already had a larger partisan base;
- The trends in gubernatorial elections occurred in the same direction, in the same states;
- Gubernatorial elections have had more competition for changing legislative majority status.

The only states with trends in both gubernatorial vote shares and legislative seat shares were in the South, with the exception of Arizona, Hawaii, Oregon, Vermont, Wisconsin, and Wyoming. In the case of Vermont, this represents a sizeable shift toward the Democratic Party as a distinct case worthy of separate study. The rise of the Republican Party in Arizona also corresponds with the increase in the state population after WWII, with the development of the Phoenix area, the change in apportionment from counties to population, and the decrease in the relative share of seats allocated to both Northern Arizona and the Tucson area. The reduction in the number of so-called “Pinto” Democrats being elected occurred in both Arizona and New Mexico, along with other states in the West, including Utah, Montana, Colorado, Wyoming, Nevada, Alaska, and parts of California. The findings for these states, encompassing the recent increase in Republican
seats share to near two-thirds majorities in some of the Rocky Mountain states, suggest that the decline in the populist, Little Texas, western-Democrats predated the decreasing numbers of boll-weevil and Dixiecrat Democrats in the former states of the Confederacy.

**[TABLE 4.0 ABOUT HERE]**

The next set of findings considers the proportionality of representation in state’s upper and lower chambers. Given the differences in constituency boundaries, population sizes, single versus multi-member districts, terms, and term limits we should expect divergences between partisan seats in state senates’ versus state houses’. The adjusted R²’s are all significantly below one, all of the coefficients estimated for senate seat share effects on house seat shares are positive, and significantly above zero, except for Nevada. The findings that twenty-three states have slope estimates of proportionality equal to a 1:1 ratio imply election rules had little influence on partisan control or change in these legislatures. For the other twenty-six states, there are statistically significant differences in the coefficients below one, suggesting electoral outcomes diverge on a consistent basis between chambers. Evidence which confirms the practical significance of bicameralism, since a bicameral equilibrium in seat shares may diverge from proportionality, rather than converge to a unicameral outcome.

**[TABLE 5.0 ABOUT HERE]**

The last set of results provides information concerning election cycles, critical events, and whether the adjustment process contains a unit root or not. The models are estimated for the pooled sample, consisting of a combined sample to estimate an LSDV model (least squares set of year-to-to variables), period effects (1938-1954 base period, 1956-1970, 1972-1980, 1982-1990, 1992-2006), election cycles (trend and trigonometric components), a gubernatorial coattail effect
(from the inclusion of the statewide partisan vote for Governor, controlled for election cycles), and effects of cyclical voter turnouts (1960-2004).

The findings indicate a strong relationship between the statewide vote for Governor and State Legislative seat shares, controlling for the significant, though marginal effects of national swings, path dependence over periods of time, stable adjustments, or voting and election cycles. The stability of this partisan base, in vote and seat shares, provides a generally stable base to contest statewide elections and to potentially construct a legislative majority coalition. Whether any particular electoral outcome comprises a mandate, depends on the consistency of the results for the specific election, and the contextual effects of dynamic random components that can be analyzed separately. Using partisan change as the basic measurement, the findings indicate vote and seat shares are stationary variables for most states. For those states where they are not, partisan changes in legislative seat shares are trend stationary and significantly related to vote mobilization, indicating a stable linear adjustment in the transfer of partisan control through vote mobilization from one of the majority political party’s to(ward) the other.

The estimates for the LSDV model indicate significant national swings occur from election to election. These results are consistent with those estimated for period effects, although the period variables account for more of the variance than the year-to-year variables over the range of elections. Both models are statistically significant, yet only marginally account for the dynamic variation in the partisan base, in comparison to gubernatorial coattail effects from statewide voting shares. However, this effect is only related to the static determination of outcomes for contemporaneous elections and sessions: an explanation which is adequate for states in a period of stable partisan control. But this represents an inadequate explanation for state’s in some form of
partisan transition, generally from monopoly control and one-party dominance to greater
competition. The findings are that statewide election outcomes for Governor are strongly related
to the size of the majority partisan coalition in the State Legislature, but vote mobilization and not
coattail effects are the determinants of partisan changes in the seat shares.

Given the known cyclical patterns associated with voting cycles, the election cycle model
estimates legislative seat shares as a function of linear trend and trigonometric components. The
latter variables capture significant wavelet patterns for two-year, four-year, and eight-year
election cycles, for sinusoidal measurements of one, two, and four election-year voting cycles.
The significant coefficients for four and eight year election effects confirm a cyclical hypotheses,
arguing that there are ebbs and flows in seat shares, so that once de-trended, there appear to be a
certain proportion of competitive districts within states which regularly swing back-and-forth
between the two major parties.

Rather than chaotic patterns, the panel regression model estimates stable adjustment of
State Legislative seat shares. In this model, the percentage change in seat shares is used to
measure partisan change. For estimation purposes, partisan change in seat shares is posited as a
function of partisan control of seat shares and a linear trend component. The form of this model
is termed a disequilibrium adjustment, which is somewhat a misnomer, since the coefficient
estimated for the influence of the variable in level form on the variable in difference form is
hypothesized to be strongly negative. Strongly negative coefficients arise from time series
without a unit root, indicating a stationary, nonmoving-average series. For the State Legislatures,
the unit root hypothesis may be rejected confirming the existence of a stable partisan base and
linearly convergent model of partisan change.
IMPLICATIONS FOR A MODEL OF PARTY CONTROL AND CHANGE

The findings in this study demonstrate that state politics may be described as a stable and competitive duopoly for seat shares in state legislatures. The nature of this seat share competition is evolutionary, with two party cooperation against minor parties and independent candidates and increasingly strong two-party competition between the parties. The relative evenness of seat shares is increasing, paradoxically, at the same time the proportion of competitive seats are decreasing. More regular and frequent shifts in seat shares, or more regular election cycles in seat shares, produce this cyclical model of partisan change.

The panel findings also confirm a dealignment at the national level. The temporal constancy implied by a stationary panel time series confirms some general random walk interpretation of state “swing” effects. Among the states, specific regional transitions are emergent suggesting offsetting national effects. Some of this may be due to the decreasing importance of the Civil War and New Deal coalitions, but another interpretation may simply be that the greater evenness of seat shares implies greater partisan competition for legislative majorities in all states. Recent anecdotal stories concerning new majorities are consistent with the overall pattern of realignment taking place in New England and the South. These realignments may also reflect longer adjustment processes, further along in Western and Mid-Atlantic to Great Plains states.

Given the preponderance of stable adjustment and trend stationary time series, there is little evidence of a critical election in the 1936 to 2006 study time frame. However, the results do support a random national walk, a competitive duopoly equilibrium approaching fifty-fifty partisan shares, significant regional and periodic trends, and a bicameral divergence effect. Finally,
election cycles explain some long wave patterns in competition, including a general election vote mobilization and coattail effect from Gubernatorial elections, supporting an evolutionary model of duopoly partisan competition.

The evidence for election cycles is compelling since these contrary to a settling down equilibrium process predicted by either selection of a voting equilibrium concept through two-party competition or repeated elections with the same two alternatives. The inclusion of stable cyclical and trend variables account for some of the adjustment instability possible under this form of pure majority rule voting. Yet the evidence for stable components suggests that even if there is a random drift or cyclicity between elections, the major two parties restore some semblance of partisan balance through successive elections. By competing with the same two major parties, the sequence of elections is slowly converging toward greater partisan competition. While partisan change also exhibits path convergent adjustments, episodically temporary minimal winning coalitions in state legislatures only serves too slow convergence. Since few states have actually converged to equal shares, over a long series of elections, competition cannot be considered perfect.

The duration and shape of partisan change resemble some of the more interesting dynamic market and growth rate models. In these models, adjustment involves either slow, circular movements, or regular patterns of cyclical convergence and divergence. The consistency of the results suggests a Presidential versus A Congressional midterm cycles, a Presidential term cycle, and a Presidential administration cycle. Each conforms to variations and trends in voter turnouts generated by these alternations in a contestation for the Presidency.
What explains this stability in individual elections and the sequence of elections? Part of the answer concerns the impact of bicameralism, and a bicameral tradition, on the apportionment, redistricting, and greater use of single member districts. The stability of the divergence between senate and house results implies that partisan competition for bicameral legislatures does not produce exactly proportional representation because the strong correspondence between senate and house seat shares belies the remaining differences in seat percentages. The rest of the answer is simply that by increasing the effective number of political parties closer to two throughout all fifty states, for both gubernatorial vote shares and legislative seat shares, there is greater evolutionary stability toward two-party competition. So that repeated elections produce stationary time series in partisan shares, with only stationary trends in the direction of increasing partisan competition in any state transition of majority status.

DESCRIPTION OF STUDY

Do American State government’s respond to economic conditions, for the purposes of manipulating the effects of growth on business cycles in state economies? The principal findings are with regard to influences of political business cycles, or misery, in form of inflation and unemployment rates that are generally considered exogenous outcomes from state control. In this study, other economic factors, such as a state’s comparative advantages are controlled for to account for the unbalanced cyclical effects of development and rates of growth. Besides these additional exogenous factors, state expenditures and tax burdens are also included in the specifications to determine how much influence an endogenous state policy decision may have on the incentives to sustain development. By controlling for both the level and type of fiscal policy instrument, this study contains a comprehensive set of control variables to estimate strategies for sub-national management of economic conditions. The primary variable of interest measures variations in the package of incentives offered by each state for local development. The empirical analysis estimates the relative effects of misery, the size of economies, economic growth rates, and fiscal policy on strategies for economic development planning. The model is then re-estimated for each policy decision to dis-aggregate the strategies implemented, into individual choices to enact legislation for promoting state economies.
INTRODUCTION

As the saying goes, “it was the best of times, and it was the worst of times” for the United States economy from the 1960's until the runup of the 1990's. It has been the best of times for general development and growth, but for specific industries and individual states, it has also been the worst of times for employment conditions. For businesses, the states have sometimes been the best friends for those industries because of their instincts to protect both the tax base and future job markets. At the same time, states have never been leaders for national industrial policy, even when those policies might protect the interests of state economies.

Instead, state governments have tried other strategies to provide marginal incentives to relocate new investment and growth. In some cases, this is just to provide an incentive: any type of incentive, to see whether the upshot is a marginal improvement from adding a small amount to the tax base. In other cases, incentives are designed to provide long-run subsidies to slow the loss of a sectoral base, while other sectors are given a chance to expand, in attempting to plan for the general diversification of state’s economy. In still other cases, the intended effects are to, compensate parts of the economy for either rates of taxation or projected shares of development. The compensatory theory of state policy mitigates and reduces the costs of government, without eliminating basic services. Rather than directly subsidize an activity, the incentives provided compensate for burdens on transactions on an increasingly service oriented economy.

Incentive programs may influence some pricing policies of businesses because these programs subsidize costs, encourage additional investment, or shift the burden of taxation. With a competitive pricing policy, the value of goods and resources is equal to a ratio of prices. All incentives represent distortions from this ideal, even though many taxes and government
regulations intentionally correct failures in the marketplace. By reducing location costs, even in a small amount, incentive programs may continue business activity past a time when they are most profitable until transactions only cover the costs of a business. Given price setting in a world economy, different locations experience varying levels of competition, so there are potential reasons for seeking government protections against international competition or whenever past taxation policies were excessive because of the value of investment and real estate property.

From the government perspective there are short and long-run forces limiting government tax expenditures on non-basic services, such as economic development programs. For this reason, most economic development budgets represent very small portions of government expenditures. Even public investment expenditures that are far more substantial may comprise only very amounts because of the limited amount of funds available for capital improvements and other spending on what may be generously termed-investments. It is also the case that when state governments can afford to provide incentives, the government doesn’t want to because they appear unnecessary to assist successful businesses. Conversely, when businesses need incentives, the state government oftentimes cannot afford to provide them because of the severity of the conditions in the state economies. Instead of ruling out ever providing incentives, the logic of tax expenditure policy is to establish some limited form of assistance that may provide some protections against rapid increases in competition, incentives from other locations, or just the practicalities associated with new investment in technology. Because corporate doctrines go far beyond just competitive pricing policies, incentives also refer public information to alter business practices, in order to warn businesses in industries targeted as vulnerable to market conditions including those subject to world prices and quickly increasing costs.
When governments try to alleviate market corrections, there are usually motivations for doing so, such as attempting to minimize what has been called a cyclically additive index of inflation and unemployment rates. When either rate is outside of an efficient range, the adjustments to the economy are considered temporary, so that these are indications of a transition in the markets. At the state level, the variance in inflation and unemployment rates is substantial enough to suggest that there are competitive advantages at some locations versus, because some states persistently have significantly greater unemployment rates or costs of living. Misery is usually a part of the business cycle, greater in some periods than others, and lasts for longer durations under some economic conditions.

Factors that matter over the long-run involve advantages some locations have over others. The persistence of low rates of unemployment and inflation, for example, tends to be associated by location with specific economic conditions. By examining a shift-share analysis, it becomes important to separate those conditions that are location-specific from an analysis of growth rates. Although both factors exhibit a longer period and duration of influence on state economies, measurements are used to distinguish between location effects (i.e., location quotients) from growth effects (i.e., alternative measurements of rates of growth).

Lastly, for enacting state legislation, a distinction should be made between exogenous and endogenous factors. Exogenous factors influence conditions within state boundaries, but the state government has neither the capacity nor the authority to change or manipulate conditions to make them more favorable for local business and labor. Some exogenous factors affect prices and income, so that these conditions may be said to determine the cost of living within state’s. Other factors such as world price setting and cost increases influence the competitiveness of business
and industry production. Because the microeconomic conditions are within state boundaries, the state governments are motivated to assist residents, even though this level of government has no authority to regulate interstate commerce or to implement macroeconomic policies that might be beneficial to local markets. As a consequence, the conditions are local, but the factors determining them are external or exogenous. Outside of the direct constitutional jurisdiction of state government to regulate or implement policy.

What can state’s control? The endogenous factors generally concern the financial capacity of state government: 1) budget and expenditures; 2) tax structure; 3) economic development incentive programs. Most of the budgets are spent on the costs of basic public services: those public goods which are considered primary as necessities for the functioning of society as a whole and local government in particular. Because these items generally involve human resources, most of the cost of provision is for labor, rather than for investments in capital or technology. Although the latter budgets may be more important for some government services than others; furthermore, these portions of the budget have been increasing with the demands for additional government services.

The rest of the budget is spent on local public goods, including development incentives, that are considered non-basic. The secondary goods frequently receive lower priorities during periods of sustained recession. Sometimes in the midst of temporary downturns, budget cutbacks reduce substantially what can be spent on luxury goods, so that these secondary goods oftentimes fend for themselves in the form of relatively small programs. Because of their marginal effects on macroeconomic conditions, it is likely that any cost-benefit analysis of their impact would support the elimination of most state government legislation to support businesses through incentives.
Under these circumstances, how can The States attempt to take control of the economic agenda? This study specifies and tests a combined model of policymaking that includes exogenous and endogenous variables determining the amount of state intervention in economic conditions. The how part, is answered by the enactment of legislation to provide economic development incentives. How many, are measurable in terms of the number of laws enacted; which is, at best, a measure of the scope or dimensionality of what state governments tries to cover of the policy space when enacting individual legislation to provide inducements for business. Because these state conditions and policies evolve differentially over time, it is important to estimate a regression model, in reduced form, for panel data that combines state time series.

**HYPOTHESES**

Beginning with the exogenous factors first, we expect:

- the greater the level of misery the more likely states are to intervene in the economy.
- the larger the economy, the greater the advantages the state will have for government intervention.
- the faster the rate of growth, the less states will intervene in the economy.
- a positive correlation between state level rates of unemployment and incentive provision.
- a positive correlation between regional rates of inflation and state incentive provision.
- a larger correlation between short-run versus long-run factors on incentive provision.

Directionally, inflation and unemployment are likely to have the same effect on the willingness of state government’s to respond to economic conditions. Longer-run outcomes are less likely to
produce a crisis mode of intervention, although the more substantial incentives are factored in over lengthy time horizons.

With regard to the misery index components specifically, the impacts may be differential so it might not always make sense to add the two rates together. However, the availability of data and testing for lagged effects tend to support the hypotheses that additive effects should be ruled out first, before more advanced measurement and statistical techniques are used to further elaborate any relationship between, what is generally, cyclical and temporary indicators of economic performance. The use of Regional CPI data is problematic, but so too are cost of living measures based on metropolitan areas. There is also some non-comparability in the time series, as different items have been introduced and removed from the listing of those in the bundle of purchases consumers are likely to make in a typical year.

The public opinion data also indicates that consumers place a greater emphasis on job security and the threat of unemployment, than any concerns about inflationary pressures. Individuals generally place greater weight on unemployment than inflation, but the salience does not track that consistently with actual macroeconomic rates of either measure. Other measures such those involving job creation, employment growth rates, and wage rates also appear to be poorly correlated with public concerns about the economy. Although concern about the misery index components is related too how much confidence consumers’ have about the economy.

For the states, misery minimization implies that government responds to worsening conditions by doing something. However, most of the misery index results estimated in section four of this study indicate just the opposite that states did not have sufficient capacity to respond when conditions worsen. Rather than misery maximization, this finding suggests an alternative
hypothesis of expected misery minimization: states reduce or eliminate incentives, whenever market conditions worsen because of the severity of the market conditions and the risk associated with the opportunities available for investment. At the very least, states may consider their incentives programs insufficient to offset excessive losses associated with changing world prices, declining advantages, and other industry-specific concerns.

Yet most of these business concerns determinate long-run factors, such as the state’s share of the United States economy and the rate of state economic growth. In the former case, the size of the economy is relative to value of goods and services produced in the United States. The concentration in any state is a location quotient indicating a state’s relative advantages. Larger state economies are just different from small economies, even though the larger states are more similar to the national economy because they comprise a larger share. The largest state economy, California, is however, very different in many ways from the national economy. Besides having unique features, the state has a much larger agricultural and service economy than the composition of the national economy. Other states, like New York, Pennsylvania, Ohio, Florida, and Illinois also have uniquely differentiated shares of the economy in financial and manufacturing industries. In comparison the small state economies tend to be less differentiated, and somewhat more interdependent in prices and production with national and world markets. The smaller economies are just different from the larger state economies, although global penetration in local markets may have the same effect whether the impact is in a small or large state.

The larger state economies have more resources, but are less likely to intervene in their economies. There is simply less justification for government intervention because of the greater complexity of the problems in these economies, and the fact those state shares of the United
States economy remain very stable in the short-run. The concentration of development in these larger states is indicative of advantages that are not easily transferred by location or comparison to other states. With generally stable resources, changes in shares over time can be substantial as state economies attain paths of prosperity to a “conglomerate” status.

In contrast to state shares’ of the economy, shift analysis examines the flow of rates over time, completing the analysis of differential rates, in percentage changes of state (GSP) levels economic development. Similar to the concept of a location quotient, a rate of growth is a general measure used to compare rates for national, regional, state, and local economies. At the state level, in comparison to other effects, the rates of growth tend to be lower than those at other units for analysis. The larger economies tend to be wealthier, have higher costs of living, and to grow more slowly than smaller states. The smaller states have more variable rates of growth, from very slow to rapidly expanding economies. Along with a few of large state exceptions, the fast growth states tend to remain expansionary for intermediate time horizons (for greater than five years and fewer than twenty to thirty years). Fast growth states are less likely to intervene in their economies to promote even faster, additional development. And when they do, the state may attempt to provide incentives for managing growth: by either increasing the costs of development to slow growth or targeting specific industries (etc.) for additional investment in an attempt to redirect growth. In contrast, small states with fast or slow growth may not be in a position to fully fund incentives, even though the slow growth states are the communities with the greatest interest in development and growth promotion activities.

A shift-share model organizes the analysis of two distinct concepts: 1) a location advantage with 2) a path of growth. Shift-share analysis is adduced from theories of economic
adjustments, because of the persistence of comparative advantages in explaining rates of growth.

The term disequilibrium adjustment is used to describe situations when prices are insufficient to simultaneously clear markets and there are varying rates of convergence in supply and demand.

Rates of growth may be considered adjustments that evolve into distinct patterns that are generally stable, if not equating to other sustaining factors. So far, the logic disequilibrium adjustment hypothesizes differential rates of growth predicated on the size of the state economy:

- Small state economies exhibit a greater variance in rates of economic growth.
- The rates of growth are lower in larger state economies.
- A shift-share analysis of state economies explains differential rates of adjustment.
- A disequilibrium adjustment model predicts (stable) rates of state economic adjustment.

Other macroeconomic theories have more credence for explaining long-run conditions and the consistency of the timing decisions in the marketplace. But time series and regression methods have been developed to estimate disequilibrium adjustment models, with specifications that economies of scale determine rates of growth. The logic of this can easily be extended to shift-share analysis of variance, so that economic development in level form accounts for the rate of growth (or development in difference form).¹

¹ The four factors are: 1) state level unemployment rates, 2) regional rates of inflation, 3) state (percentage) share of the United States economy, 4) (percentage change) in state economic growth. The first two provide indicators of short-run and cyclical (over five years or fewer) economic conditions at the state level. These two measures are added together to compose an index of misery. The second two measures are considered indicators of long-run conditions that require estimation over twenty or more year time horizons. These latter two concepts of shift-share analysis comprise the specification for explaining rates of adjustment in state economies.
In comparison to these four exogenous factors, state governments can manipulate their financial capacity to generate more revenue. Among the endogenous variables, taxation is the primary determinant selected for analyzing the provision of incentives, because

- the absence of a tax structure is the greatest incentive for economic development.
- taxation distorts competitive pricing, so that incentives may ameliorate some of the greater negative effects of taxation on economic growth.
- public tax revenues determine the rate of public spending.

For these reasons, the empirical analysis generally includes state tax, rather than, expenditure decisions. On the taxation side, these represent decisions to enact tax legislation to impose basic taxes, such as state gasoline taxes, personal or business income taxation, sales taxation, and what is sometimes called sin taxes on cigarettes and alcohol. For these six taxes, an index of tax structures was constructed that measures the dimensionality of state taxation. Some states have historically greater diversification of revenue than others, although currently two-thirds of the states have enacted legislation to cover all six of these dimensions. In terms of the dimensionality of taxation, there are economies of scope such that more diversified structures generate more revenue. Because of these economies of scope

- the more diversified the tax structures the more likely the state will provide incentives.
- the greater the amount of taxation, the more likely the state will intervene to reduce the effects of taxation on businesses by providing incentives.

More generally then, tax prices paid for public goods are positively related to the level of state government intervention to mitigate the effects of the tax structure on the economy.
The tax structure index captures the multi-dimensionality of taxation, but does quite
describe the evolution of state tax structures from minimal taxation to the current system where
most states have all the same taxes. Beginning with gasoline taxes, as a luxury tax for automobile
owners, state enacted consumption taxes first, before the economic crises of the 1930's resulted in
legislation and rate setting for income and sales taxation. Inasmuch the experience of the 1930's
created a much larger role for state government in the economy. Related to the economies of
scope in taxation is the constant long-run search for alternative revenue sources, rather than
increasing the rates of existing taxes. Although states’ are more likely to increase the rates of
sales and consumption taxes (for gasoline, cigarettes, and alcohol) instead of increasing rates for
income, business income (or franchise fees), and local property taxation. In the more recent past,
this search for revenue includes enactments of lotteries, gaming licences, local option sales
taxation, user fees for business related spending, and other special user fees or consumption-based
taxation. As the demand for public goods increases the composite tax price paid not only
increases in amounts, but also by the number alternative sources of revenue.

Some of the increases in tax prices are attributable to the increasing rates of the costs of
government. As the key variable, the revenue paid per-capita represents the amount of cost
sharing for the provision of public goods. This tax price also measures the willingness to pay for
public goods, with this study using a logged estimate with regard to revenue to measure tax price
elasticity to substitute incentives for taxation.

The burden of taxation is really twofold. Firstly, an average tax bill paid for some of the
costs of providing public goods and services. Secondly, a tax burden may also be expressed as a
percentage of income. Thus, separating a composite good, like disposable income, from the costs
of a bigger government. As a measure of effective tax rates, the percentage of income paid in
taxation is the standard variable used to compare tax burdens across countries. Yet for most
analyses of U. S. Domestic finance, state and local burdens are measured in a dollar amount, even
though this underestimates the efficiency of the tax structure, may overestimate the tax burden,
and fail to equate tax revenue per-capita with the average costs of public goods. As a
consequence this furnishes a measure in amounts, but eliminates the justification for taxation as
either a tax price or cost sharing mechanisms.²

DATA AND METHOD

In this study, the basic dependent variable is the proportion of incentives enacted by (all
fifty of) The State Legislatures. There are fifty-nine total incentive programs, tracked with some
missing data from 1966 to 1994, with the full time series a twenty-seven-year time horizon.
Enough time to estimate the differential effect for a shift-share analysis and to allow for a
sufficient number of misery index cycles to evolve under control of state political administrations.
The time frame of the study corresponds with a buildup of state capacity to address economic
development and growth issues before the expansionary national economy of the mid-1990's to
the millennium (1994-2000). During the time frame of this study, tax prices increased

² There are two major kinds of tax reform that could occur in the presence of excessive
taxation. First, tax simplification is preferred by many, because this represents a reduction in the
number of taxes. A related reform is too eliminate tax preferences, expenditures, or incentive
programs that require a separate method of revenue collection. Second, tax rates may be changed
so that same set of tax alternatives are revenue neutral. The manipulation of tax rates is
considered an imperfect policy tool for reducing tax burdens because revenue collection may
diminish for other reasons. For budgeting purposes, states’ have preferred stable revenue
sources, such as income and property taxation over sales and consumption taxes. States also
adjust rates gradually to shape expectations about future taxation, too smooth any transition from
over-reliance on some revenue sources.
exponentially for state government services. As estimated in Chart 1.0, the distribution of these incentives is insignificantly different from a normal distribution, with an average equal to almost sixty percent with fifteen percent variance in the risk of states adopting incentives.

The summary statistics for the dependent variable and independent variables are reported in Table 1.0. Again, indicating a normal distribution of the dependent variable, for the purposes of regression analysis. Among the exogenous independent variables, the misery index crests at about fifteen percent, on the average, during the worst periods of inflation in the 1970's. The decline of inflation then reduces this index so that state unemployment rates are by the far the largest component of the index, for most states, in most of these years. Ex hypothesis misery minimization would imply indices somewhere around six to eight percent, within a four percent standard deviation of the mean, yet the almost twelve percent average indicates the length of the troughs of these business cycles in terms unemployment and inflation, before the 1994-2000 period.

The summary statistics reveal the long-run exogenous factors, measuring shift-share analysis, are not normally distributed. The shares of the U. S. Economy are concentrated in a few large state economies, rather than dispersed randomly over the fifty states. A finding that confirms the small group of large states grew at a faster rate than the rest of the smaller state economies. On-the-average, state economic growth rates were close to nine percent a year for this almost thirty-year time horizon. The large amount of variation and concentration of growth in a subset of the states indicates that growth was not evenly distributed across the states.

3. Note: Misery Index = State Rate of Unemployment + Percentage Change in Regional CPI.
6. Note: The tax structure index ranges from 0-6; in frequency terms, 1/3 of the states regulated 5 or fewer dimensions, two-thirds have regulations for all six of the major areas of state taxation.
The latter three variables provide the information necessary to construct the measures of endogenous variables. The distribution of the tax structure index varies of the time frame of this from a very flat, uniform, distribution to a bimodal distribution with a few states not enacting all of the tax alternatives. The diffusion of the enactments was in long waves of legislation, similar to the conditions present in the exogenous variables. Currently, almost all states have enacted all of the major taxes, so that the abatement theory of incentive provision is consistent with the increasing proportion of incentive legislation enacted until the present during this time frame.

Although tax revenues are used in the regression analysis, the correlation between spending and revenue per-capita is insignificantly different from a perfect correlation. These results indicate the cost of government is normally distributed across the states, averaging more than a thousand dollars with a substantial amount of the variance over states and time. Setting the tax price equal to average cost establishes a framework for understanding how states “control” these endogenous variables. The states control these variables by enacting legislation by either regulating dimensions they have the scope of authority over or setting rates to determine prices.

Tax burdens are measured with two indicators. The average tax price paid for state government services equated to the average cost of public goods provision. The second measure is an effective tax rate, constructed as a ratio of the tax price to income. This latter indicator suggests the effective tax rate of state government is approximately ten percent of personal income. The range within a deviation is from eight to twelve percent, contingent upon the existence of state income taxation, one of the dimensions in the state tax structure index.

Panel regression methods are used to estimate the model specified from the exogenous (short and long run) and endogenous factors analyzed in this study. The basic unit is the state
government that makes legislative decisions concerning taxation and the provision of economic development incentives. The sample is a combined state time series, so that the estimates generalize across the states to explain variation in the willingness of sub-national governments to intervene in their economies. To grow the size of the governments, in order to regulate and in some cases stabilize their macro-economies. Unlike the federal government, the primary policy tools available involve changes in the tax structures and rate setting. Some states have a local policy tradition of over-assessing the valuation of commercial property, whereas others compete in partisan terms of alternative tax and economic development policy goals. Under an abatement or compensatory theory, the enactment of incentives for businesses is generally to mitigate the interaction between a status quo tax policy and what is considered unfavorable market conditions.

RESULTS

The basic study findings are reported in Table 2.1. Additional findings are estimated in Tables 2.2 and 3.0 for comparison purposes. The findings indicate about a half of the variation in state incentive provision is explained by the factors in this study. Each of the factors significantly determines some of the variation in the supply of business incentives. Almost all of the findings are consistent with the hypothesized: 1) directional, 2) magnitudinal, and 3) durational effects.

The states with a greater share of the U. S. Economy were more likely to intervene in their state economies, whereas states with faster economic growth have been far less likely to provide additional development incentives. The results are consistent with an economy of scale interpretation, suggesting the larger states can better afford to further promote their economies with tax expenditures. Conversely, the smaller states with faster growth rates were much less likely to intervene in their economies. Basic shift-share results which indicate the importance of
exogenous factors in shaping divergent choices over the set of tax and economic development policy alternatives.

States with higher taxation are far more likely to provide business incentives. The estimated rate of abatement is approximately equal to the effective rate of taxation: the elasticity of substitution of tax revenue for proportionate rates of incentive provision is sixteen point three percent. States with all six of the major taxes were one point two percent more likely to proffer incentives.

Of course, this form of tax reduction represents a secondary distortion to the initial tax-related distortions. One argument would be that it would be better to grant full incentives to subsidize the full costs of promoting the kind of economic development or growth rates sought. A second argument is simply that it would be better to repeal taxes to provide a full incentive effect, rather than some minor adjustment through rate setting, pricing policy, or incentive provision. Every other reform requires some incremental adjustment, in between tax reform and fully funding tax expenditures with market subsidies.

The finding indicates states adjust taxation to fit economic conditions. The adjustments may be incremental and have only a marginal effect on changing these exogenous conditions. So that this represents a layer of distortions upon distortions, generating a dissipation of incentives and little or no impact on business cycles and declining industry conditions. For what they can control, states offer incentives in the hopes of influencing exogenous factors such as long-run development and growth or cyclical short-run misery. The findings suggest the state response with incentives is a sustained effort to reduce taxation, instead of a direct public investment or subsidy program to regulate economic conditions.

There are three findings somewhat to directly contrary to effects hypothesized for the independent variables. The first two involve the estimates of slope coefficients, in the model presented in Table 2.1. The third methodological issue concerns the size of the standard errors estimated for each of the coefficients.

The estimates for the misery index and one of the state tax burden measures run counter to the hypothesized effects. In the first case, the greater the misery indexes, the less likely the states were to provide more incentives to business. Instead of responding to short-run conditions, the states in these worsening economic conditions were less able to respond. Because some of the effects of high inflation and unemployment persisted beyond the timing of short duration business cycles, these states were simply less able to afford to intervene in their economies leaving these interventions to others with either a larger economy or faster sustained growth rate. In the second case, the proportion of income paid in state taxation remains relatively close to a flat rate of taxation. The findings reported in Table 2.1 indicate that as the proportion paid in state taxes increases, there were fewer incentives provided to business. The consistency of this finding is somewhat remarkable given multiple state time series with exponential growth in revenues, from 1950 to the present. Yet the resulting tax burdens indicate something about the cost, and therefore, size of state government regardless to the economy. At the individual level, personal income tax revenues comprised the largest and fastest growing revenue source for the time frame of this study.³

³ In the past decade, alternatives to the major revenue sources have been steadily increasing as a proportion of the total revenue. Additionally there has been a concerted attempt to further diversify tax structures by extending sales and consumption taxes. As a result, these taxes have become more important revenue sources vis-a-vis state income taxation and local property taxation.

</table>
The standard errors for the slope coefficients are generally underestimated because of the existence of a trend component. After multiple diagnostic testing of the variables and the residuals, the correct specification is a trend component. Although there are other techniques for including this effect, the use of a trend line provides a test of the arms race hypothesis: incentives increasing at a rate faster than predicted by economic condition or tax policy. In this model, other specifications were tested ruling out an acceleration hypothesis consistent with an arms race. After controlling for the independent variables in this study, we can rule out that the level of state provisions is the result of unstable competition among states. But the inclusion of the trend component increases the size of all of the estimated coefficient standard errors. However, none of the basic results are changed from this re-estimation.

The last sets of results are presented in Table 3. To construct this table, logistic regression models were estimated with the enactment of state legislation as the dependent variable. The independent variables are the same as those presented in Tables 2.1 and 2.2, whereas the dependent variable measures of the risk of adopting business incentive legislation. Because there are significant trends in the probability of enacting legislation, the linear trend variable was included in the model for estimation purposes. Only nonzero correlations at the .05 levels are reported in Table 3. In Table 3, instead of listing the estimated coefficients, standard errors, and equivalent t-tests and beta coefficients for fifty-nine logistic regressions, correlations are reported between independent and dependent variables for each estimated equation. The information contained in this estimated correlation is sufficient to describe any directional and magnitudinal effects. These dis-aggregated findings are generally less statistically significant, but consistent with the results for the distribution of incentives (shown in Chart 1.0).

Among the excluded correlations, almost all of the misery index slope coefficients were positively, but not significantly, related to the adoption of legislation.

The findings in Table 3 indicate there is great deal of targeting of incentives. Because some business incentives cost the government more than others, this result suggests there may be an effort to maximize the incentives and minimize costs. Among the variables, the rate of growth in the economy appears to be least significant in targeting incentives. So if the intent is to promote economic growth, this appears least correlated, after multiple testing of the possible timing of the interaction between rates of economic growth and rates of enacting incentive legislation. The effects of the misery index persist along with the incentive legislation, so that neither can be genuinely said to have been produced by short-run business cycles. The fact the trend component is both positively and negatively significant reinforces the hypothesis of endogenous state control over economic development legislation. This control of development

---

6 The findings indicate states attempt to alleviate tax burdens by targeting incentives. Like the aggregated results, the individual level choices reveal a tax pricing decision and what the states can afford to provide.
policy may result in a targeting of incentives that is both responsive to economic conditions and the type of circumstances affecting businesses. So much so that based on the mixture of trend coefficients, the findings indicate legislation may be enacted and repealed in an attempt to moderate the business climate over the long-run.

**DISCUSSION**

The basic results are presented in Table 2.1 estimating a model for explaining the level of government intervention in state economies. The findings indicate states are likely to provide incentives whenever they can afford to do so and that they respond with their tax pricing policies to reduce prices. It is unlikely this is the best mechanism for promoting development and growth because both taxation and incentive legislation, in sometimes intentional ways, distort new investment and growth in valuation.

The findings also suggest that misery *does not always* love companies. The usual fable considers misery matters’ in the trough of a business cycle coupled with high unemployment and a declining industry. In this situation, states are expected to “do something” because firms have large numbers of employees and workers in industries which are organized to vote in their own interests. Unfortunately, the fable substantiated in this study is that misery persists for longer than what would be defined as a short-term business cycle. At the same time, there is contemporaneous evidence state legislation did runup the level of business incentives (Table 2.2), although the states may have been strategic in their selection among the alternatives (Table 3.0).

Another story of development is also quashed by the consistency of the results. In the shift-share analysis the findings are strongly consistent in revealing the importance of the location quotient and not the rate of growth. For analysis based on anecdotes, the big story is that state
advantages persist over the long-run. Larger state economies have lots of problems, but they also have resources from which to commit for continually promoting development. Unlike the story of a growth machine, organized around the interests of maximizing economic growth rates, development promotion is far more likely to involve a reinvestment in a state’s advantage. Back into the basic industries, and for any other advantages a state might have, rather than for the pursuit of growth. The states with the fastest growth ironically do the least, so it appears their incentive is to *not do something* which might slow the growth machine of the economy.

The results suggest there is very little support for the arms race hypothesis, Wagner’s law of the growth in government, or many of the other size of government models that imply an extension of spending or regulatory authority into the economy. Instead, *the rate of incentive provision is directly related to taxation*, with this consequence *derived from the endogenous attempt to reduce the burden of taxation on businesses, not individuals, during periods of unfavorable long or short-run exogenous conditions*. Because personal income tax revenues affect individuals, the results strongly suggest that these programs are intended as business incentives and not a reduction in general taxation. Incentive provision does, however, contribute to the growth of government in the economy because tax prices are related to the cost of state government, the regulatory authority too set rates, and most important, the legislative authority to establish and organize a tax structure. Yet there is little evidence suggesting the states are trying to do anything more than reduce any distorting effects on business from taxation.

In times of duress, the states have enough of a struggle to collect sufficient revenues to fund basic services, without managing adjustments, expectations, or other investments *for* the market. If the states have a growth management policy for long time horizons, it is likely this
 favors planning over maximizing growth rates, shares of the U. S. Economy, or misery rate minimization. In the states with stronger economic development organizations, the priorities are still not there to fully fund incentive programs. For many states these development and growth promoting activities are just considered a luxury add-on, and not a commitment for something required to attain long-run development and future growth in a state economy.
The Precaution Principle: a Strategic Tool for Redesigning (Sub)-Politics

The precaution, its principle and its framework seem to appear from nowhere like a sort of spontaneous « socio-political » generation we find necessary to define, to precise and to understand. Concerning the precaution principle, this exercise of delimitation is all the more indispensable that the concept largely overtakes the scientific sphere. Indeed, public authorities, citizens, economic and social actors are all directly concerned by its concrete applications or its translations. Following the historical perspective proposed by François Ewald, and helped by the concept of modern risk developed by Ulrich Beck, we present the precaution as a strategic tool, a political response to the emergence of a new flow of societal uncertainty, mainly directed towards the hesitations of the scientific world. Starting from the concept of “technonature” of Philippe Roqueplo, we inscribe the precaution approach in a framework we call “politico-natural”, which redefines the way of managing uncertainty in a society characterized by the disappearance of the borders between the political and sub-political actors. With the application of the precaution principle becomes visible a line of fracture which reduces the decisional capacities of some sub-political entities and/or urges other on acting more. Nevertheless, for most (sub-)political actors, modern risks are paradoxically an opportunity of expansion that also has to be taken into consideration from the active citizen’s point of view, mobilized to defend the cause of a world we might said to early it was disenchanted.

Child Care Choices and Job Retention Rates of TANF Mothers

Alan Burke
University of California, Los Angeles

My study proposes to investigate the link between the job-retention rate of TANF (Temporary Assistance for Needy Families) mothers and the type of child care they use. I plan to divide child care providers into three categories: unpaid informal care, paid informal care, and formal care. I classify informal child care as care that is exempt from state licensing and monitoring, and formal care as licensed care. I hypothesize that mothers who utilize unpaid informal care will have a lower job-retention rate than mothers using formal or paid informal care.

The logic behind my hypothesis is that unpaid informal care is a voluntary service provided to the TANF mother by a relative or friend and is therefore less reliable. For unpaid informal caregivers, the cost of denying promised care is only the negative social cost to the relationship between the caregiver and the TANF recipient. If the caregiver could receive a higher utility from abandoning child care responsibilities, then they will refuse on that occasion and the TANF recipient will miss work to care for her child. In Holzer, Stoll and Wissoker (2004), 27% of all employers surveyed reported that one problem encountered in hiring welfare recipients was child care-related absenteeism. Absenteeism could also serve as significant ground for job dismissal. Paid child care, whether formal or informal, might offer more reliability to TANF mothers. If reliability of child care is correlated with job-retention, then the variation between the reliability of care should manifest itself in the job-retention rate of the mothers.

Previous Literature:

Current literature on TANF employment looks separately at the effect of child care subsidies on employment rates or job-retention rates of TANF participants. Studies have shown positive effects of child care subsidies on increasing the employment rate of TANF mothers, up to 32 percent (Berger and Black 1992; Blau and Tekin 2003; Gelbach 2002; Meyers, Heintze, and Wolf 2002). The availability of child care plays an important role in whether a TANF mother will earn or retain employment. Differences in criteria for measuring child care between existing studies and the difference in reliability between the take up of types of child care may explain some of the variation of results between studies.

The job-retention rate of TANF participants is critical to moving them permanently off of assistance. Low income families with low job-retention rates typically work fewer weeks per year, which negatively affects their future employment possibilities through gaps in employment, skill depreciation (Long and Martini 1991), and lower training (Royalty 1996). Hershey and Pavetti (1997) report average job durations of 9 months, and Holzer and Lalonde (2000) find median job durations of 6 months of TANF participants. High turnover poses costs to the employer, government, and individual. My research will help explain one facet of turnover rates.

Data Sources:

I will use the National Longitudinal Survey of Youth (NLSY) and the Survey of Income and Program Participation (SIPP) as data sources for my study. Because TANF is a state block grant and states have wide flexibility on how they implement TANF, my goal is to exploit state
variations in child care policy. There is significant variation between the states and within the states over time. Between 2001-2005, the U.S. Government Accountability Office reports that 22 states changed their child care policies. The National Women’s Law Center has a database chronicling these changes.

**Conclusion:**
My proposal fills an important space in the current literature by specifically looking at how the choice of child care might affect absenteeism and thereby affect job-retention rates. This study can help resolve policy questions about the most effective type of child care subsidies in relation to improving employment levels. It will also add to our knowledge about the job-retention rate of TANF participants and circumstances behind termination of employment. Moving families out of cyclical unemployment to permanent employment is a primary challenge of welfare reform.

Abstract

The development of Canberra was about defining the moral and political ‘fabric’ of Australia, articulating its sense of self. The physical form of the city is inextricably linked with issues concerning democracy, social values, sense of community, civic engagement, economic life and the terms in which people conceive their (national) identities. While Canberra’s design illustrates the relationship between thought and environment, architecture and democracy, it is also a product of tensions between two specific town-planning movements, the Garden City and City Beautiful. It has thus encapsulated the tensions between the various projections and understandings of Australia as democracy and nation, and between the participatory democratic ideal and the (liberal individualistic) pastoral idea of withdrawal.

By examining the connection between the development of Canberra as an idea, a physical plan and the construction of political identity we can gain valuable insights into the essential democratic principles upon which Australian society is based. The city was intended to shape and reflect the national, political and cultural identity of Australia. With the exception of the last decade, there has always been a bi-partisan federal political commitment to a vigorous national public sector. This was reflected in high proportions of Canberra civil servants able to give action to this sentiment.

The city now has a generation who, born in the early decades of the twentieth century, has begun to die there. A major longitudinal cancer study conducted in the 1990’s in Canberra confirmed some unique socio-demographic characteristics reflecting employment patterns. Remarkably high numbers reported good psychological health in their final months and years. This paper explores how the drama of the evolution of Canberra translates into a life well lived as expressed by this data.

Protecting Rural Communities: Good Neighbor Agreements and Concentrated Animal Feeding Operations

Katelyn Bush

Abstract Submission, Hawaii International Conference on Social Sciences
January 24, 2007

Good Neighbor Agreements (GNAs) represent a promising approach to addressing the oftentimes conflictual relationship between Concentrated Animal Feeding Operations (CAFOs) and surrounding rural communities, offering a powerful tool for both parties to foster sustainable and environmentally responsible economic growth. CAFOs, agricultural operations that raise thousands of animals in a confined space, are proving to be a significant environmental, economic and social burden for surrounding communities in the state of Michigan. GNAs are an understanding between industry and neighboring communities, and can include such provisions as commitments to local hiring, proper waste management, and regular inspection of industrial facilities by local officials. Examining GNAs within the mining, electric and petroleum industries, interviewing CAFO owners, city officials and agricultural scholars, and investigating alternative negotiation strategies demonstrate both the possibilities and obstacles of implementing GNAs within the agricultural arena.
Problem Children or Children with Problems?

Sixth Annual Hawaii International Conference on Social Sciences

May 2007
Abstract

This paper explores the core constructs of basic needs, mental health, substance abuse, health and education services as they relate to homeless youth. Researchers connect research and recommendations in the field with a local homeless youth program initiative.

Researchers conducted an analysis of a collaborative social service delivery program which provides services to urban homeless youth in the Northeastern United States (n=211). Demographic data of the youth involved in the program suggest that 47 percent are engaged in advancing their education and 37 percent are employed. Data also suggests that 82 percent of homeless youth are homeless for less than 6 months. This paper confirms that youth problems with homelessness can be temporary and with the right supports and access to services youth can have positive changes in their lives. The data also suggests the right combination of evidenced based services will attract and engage youth in a positive and supportive manner.
Introduction

Homeless children tend to garner more compassion and public will to solve their problems than their older counterparts. However, compassion and will often fade rapidly in the face of defining homeless, child and the myriad of individual, societal and familial risks and barriers that precipitate and perpetuate a young person stepping into the world without the skills, comforts and resources that most adults in the United States consider essential. How do we begin to study, address or solve a problem when we struggle for common definitions?

Greenblatt and Robertson (1993) describe adolescent homelessness as a process rather than an end. That may be the heart of the problem and the core challenge to designing appropriate, effective programs and interventions. While researchers strain to identify the population and compare studies, we should not be surprised that agencies and providers face even bigger obstacles. The homeless youth continuum encompasses youngsters shuttled between relatives because a parent is unavailable (e.g. incarcerated, in the military, working out of state, in treatment, etc.), adolescents moving between friends’ homes where an adult is present, young children staying at a homeless shelter with their parents, teenagers couch surfing in the apartments of emancipated youths and young adults in treatment programs, group homes, motel rooms, shelters and sleeping on the streets. At what point is an individual homeless? Many young people identify themselves as homeless while they are in Department of Health and Human Services custody, have a home but are afraid to go there, are in treatment programs or are incarcerated. Clearly the presence of a bed and walls does not equal a home. Jails,
treatment institutions and abusive families provide housing but they should not be mistaken for homes.

This research project is focused on unaccompanied youth who identify themselves as homeless or at risk of homelessness. The National Coalition for the Homeless cites homeless children as the fastest growing segment of the homeless population (2001). The National Alliance to End Homelessness estimates that one out of eight homeless persons is an unaccompanied youth aged 16 to 24 (2005). In 2002, the Family and Youth Services Bureau, Administration on Children and Families estimated that there were between 500,000 and 1.3 million homeless and runaway youth. The Center for Adolescent Health and the Law estimates that there are one to two million homeless youth (2007). Another study calculates that 7.6% of adolescents in the United States (1.5 million young people) were homeless at some time during the previous year (Ringwalt et al, 1998).

The range in estimates has several possible explanations. The most obvious may be differences in defining the youth age group: under 18, under 21, under 24 or 14-24. Some studies are point in time surveys and others ask individuals if they have been homeless at any time during the previous year or years. Research that was completed in New Hampshire and Maine illustrates the importance of clearly defining the targeted problem. Two surveys were conducted using two distinct definitions of homeless. When high school teenagers were asked if they had been homeless during the past year, 5% indicated that they had been. However, when the definition was broadened, 20% of the teens reported that they had regularly stayed with others during the past year. Those authors recommend that social service agencies target housing distress rather than
homelessness to avoid under reporting and under serving vulnerable youth (Vissing & Diament, 1995). This approach increases the number of identified youth and allows for earlier and potentially more effective interventions.

Each homeless individual has a unique story but there are often common threads. The Center for Adolescent Health & the Law identifies three causes for youth homelessness: 1. Abused or neglected 2. Forced out or thrown away 3. Exit from state custody (2007). Many homeless youth experience all three as stages in the homeless process and carry with them the accumulated trauma of those experiences.

The research literature on homeless youth includes numerous surveys of youth and social service providers. These are consistent in identifying family dysfunction as a primary factor in youth homelessness. The studies cite; neglect, physical and sexual abuse, parental substance abuse and mental illness as contributing factors experienced by many, perhaps most, homeless youth during their childhoods (Cauce, Paradise, Ginzler, Embry, et al., 2000; Broadhead-Fearn & White, 2006; Halcon & Lifson, 2004). In Washington 364 homeless adolescents were surveyed. A majority reported that their mothers (55%) and fathers (52%) had a substance use problem. The youth reported that 84% of their mothers and 70% of their fathers had legal problems. A majority (51%) reported being physically abused and 60% of the girls and 23% of the boys reported being sexually abused prior to leaving home (Cauce, et al., 2000). A Chicago study interviewed 400 youth and 80% stated that a bad relationship with family or disagreement with family was a significant factor in their homelessness (Levin, Bax, McKean & Schoggen, 2005).
Forced out, thrown away or runaway, it is hard to ascertain who made the decision that precipitated the youth’s homelessness. In the Washington study, when asked: *Whose decision was it to leave home?* 44% of girls and 30% of boys said they made the choice. Given the high rates of abuse reported in the same study, the descriptors: *forced out* and *runaway* merge meanings. Other responses included 34% who said their parents asked them to leave, 9% stated it was a mutual decision and 18% reported being removed from their parents by a public official (Cauce, et al., 2000).

The childhoods that these studies describe warrant the intervention of state Child Protective Services and that is what often happens. Unfortunately, “Removal from the home by state authorities was, in fact, a pathway into street life for a significant number of youth,” (Cauce, et al., 2000, p.236). Nationally within two to four years of exiting foster care 25% of youth will experience homelessness (United Community Services of Johnson County, 2005). In Washington, a third of the homeless youth surveyed had been in foster care and had experienced an average of 3.3 placements (Cauce, et al., 2000). The National Alliance to End Homelessness studied the relationship between foster care and homelessness and concluded that there is an over-representation of individuals who were in foster care in the homeless population. Multiple placements increased the risk of becoming homeless later in life. Additionally those who were in foster care tend to become homeless at younger ages and remain homeless longer. They conclude that, “Children who are moved from home to home over an extended period of time learn to deal with problems by leaving them behind” (Roman & Wolfe, 1995, 58).

Unfortunately those problems travel with the young person into the streets where a homeless lifestyle contributes to and/or intensifies mental and physical health risks. As
a result of often traumatic childhoods, homeless youth have a high rate of psychiatric disorders. Additional trauma occurs once they are homeless with 26% reporting being the victim of a burglary, 13% reported being robbed, 43% of boys and 29% of girls reported being assaulted and 15% of girls reported being raped (Cauce, et al., 2000). A Canadian survey of homeless youth concluded that 81.9% had been victims of a crime in the previous year with 79.4% reporting multiple incidents. Additionally, 31.9% of the young people reported being victims of a sexual assault (Gaetz, 2004). Given this pattern of repeated trauma it is not surprising that two-thirds of homeless adolescents meet the criteria for a mental health diagnosis. These included post traumatic stress disorder (PTSD), conduct disorder, oppositional defiant disorder, attention deficit disorder, mood disorders and schizophrenia (Cauce, et al., 2000).

Psychiatric disorders and substance abuse often co-occur at high rates. Adults in substance abuse treatment whom also had PTSD ranged from 20 to 59% (Triffleman, Carroll& Kellogg, 1999). In a Minneapolis study 51.7% of homeless youth reported having five or more drinks per week, 37.2% had 15 or more drinks per week and two thirds reported using illegal drugs (Halcon & Lifson, 2004). Similar results were found in the Washington study with 35% of the youth reporting drinking ten or more times in the previous three months. Twenty-seven percent used marijuana and 10% used hard drugs as frequently (Cauce, et al., 2000). For many, substance abuse often leads to unsafe sex and for others survival sex leads to substance abuse. In the Minneapolis study 58.7% of the males reported recent sexual intercourse with 1/3 of the men stating that they had not used a barrier method. For the females the statistics were bleaker. More than three-fourths reported recent sexual intercourse and half of those females did not use
a barrier method. Over 20% of the youth reported exchanging sex for money, drugs, clothing, food or shelter (Halcon & Lifson, 2004). This exchange of sex for a commodity is referred to as survival sex. This high rate of unprotected sexual intercourse increases the youths’ risks of contracting sexually transmitted diseases and becoming pregnant. Substance abuse, mental and physical health problems complicate the challenge for homeless youth struggling to find and maintain housing.

Educational deficits, unemployment and the time consuming struggle of daily subsistence living are interrelated and contribute to a lack of social collateral necessary to move from crisis to stability. Homeless youth under the age of 18 are often not enrolled in school or attending. In one study 71% of this homeless age group identified themselves as high school dropouts (Cauce, et al., 2000). A study in California found 52% of this population to be out of school. More than a third of these students reported that they were not in school because they had to work. While close to another third stated they did not want to be in school and 4% had been suspended or expelled. However, more than a third reported wanting to graduate from high school and another third had educational aspirations beyond high school (Monterey County Homeless Census and Homeless Youth/Foster Teen Survey, 1999).

With limited education it is hard to get a job. In a California survey of homeless youth a little over half reported that they had jobs and a majority of those youth reported working more than 30 hours per week. However a quarter of the youth earned less than minimum wage. Their median income was less than $7.00 per hour and only 11% received any medical benefits (Monterey County Homeless Census and Homeless Youth/Foster teen Survey, 1999). “... most homeless youth are not avoiding work...
When they do find work it is often in short term, dead-end jobs or in unregulated work on the margins of the economy” (Gaetz, 2004, p.428). Subsistence living in an unsafe environment forces youth to be present-centered. (Thompson, McManus & Voss, 2006). The lack of an education, address, phone number, mentors and references excludes many homeless youth from the formal economy. Instead they often meet their immediate financial needs through prostitution, panhandling, drug dealing and other risky quasi-legal and illegal activities (Gaetz, 2004).

How can the social service sector effectively address the problems of homeless youth with extensive trauma histories, physical and mental health needs, educational deficits, limited job possibilities, criminal records and few, if any social supports? Coordination of care, continuity, accessibility, partnerships, and collaboration are the recurring themes in research based best practice (Kidd & Davidson, 2006; Van Leeuwen, 2004; Levin, et al, 2005; English, 2007). Homeless youth have multiple, interrelated needs and limited means for locating and traveling between service providers. A wide variety of services need to be available at one accessible location (Levin, et al, 2005). These should be presented as a continuum of care that includes: outreach, food, clothing, emergency shelter, medical care, family planning and reproductive health care, family reunification services, substance abuse assessment, counseling and treatment, mental health services, education and employment assistance, transitional housing and case management (Van Leeuwen, 2004; English, 2007). The immediate short term needs of the youth (food, clothing, shelter) may draw them to the service provider and serve as a gateway to other supports and resources (educational, substance abuse counseling, job
training) that they may not have known were available or been ready to access (Levin, et al, 2005).

Given the extent and complexity of these young people’s problems it is important that program evaluation have more dimensions than simply counting the number of youth who are housed each year (Kidd & Davidson, 2006). For each young person there will be a different measure of success. It might be accessing substance abuse treatment, using contraception, wearing clean clothes, ending a destructive relationship, preparing a resume, developing a trusting relationship with an appropriate adult or finding a safe place to sleep each night. An effective program for homeless youth must be prepared to meet this myriad of needs while tracking multiple, often subtle, measures of program success.
Methodology

The questions which we chose to investigate for this study are positively correlated with the robust literature in the field which identifies social, systemic and interpersonal problems related to addressing the issue of youth homelessness. As such we were interested the overarching issue of social supports and the confounding nature of the “problem” of youth homelessness. As we have titled our paper, is it “problem children or children with problems?”

Through our exploration of the research in this area we identified four questions. Our first question which we investigated was the demographic of the youth who access services at the community partnership center.

Second, we were interested in the effectiveness of housing supports and its impact on the ancillary and danger issues associated with homelessness. Specifically, within the demographic of youth who access services at the center, what percentage of the population have mental illness, substance abuse, education and legal issues.

Third, we questioned if the issue of homelessness for youth is chronic and long term or a short, temporary issue.

Our fourth question is are there any differences between different subgroupings of age and gender.

As suggested in our introduction, there are several difficult factors which need to be operationalized in order to assess effectiveness of homeless youth programming. For our research we used concepts from Cauce, et. al., 2000, Ginzler and Embry, 2000 and Gaetz, 2004 and Halcon & Lifson, 2004.
A large, well staffed, homeless youth resource center located in an urban center in the Northeastern United States was the population used for this study. The center includes social service providers from five different social service agencies which are connected to a larger social service delivery structure through an intricate and effective partnership of services.

Services provided directly at the center include basic supports such as food, clothing, job coaching and employment services, mental health services, a health and wellness clinic, substance abuse treatment, housing assistance and education assistance including on site classes and GED preparation. As part of the resource center concept, all five organizations use a similar screening and record keeping system. The center is essentially set up as a low barrier drop in location that provides a noontime meal and access to services as the youth chooses. While staff encourages youth to take advantage of the services provided, there is no expectation that they engage. As such, some of the youth can frequent the center for a noontime meal and participate in none of the other services offered.

Data collection

Data was collected from intake records, progress notes and record updates from the five community social service organizations operating in partnership at the center. The data collection tool was developed and identified 62 different variables. The following constructs were linked to the existing literature and data in the field: mental health, substance abuse, education and physical health Ginxler and Embry, 2000 and

The second author trained two graduate social work students in the use and procedures for using the tool to gather the data from the records. A total of 84 records were included in the training and testing of inter-rater reliability during two sessions spaced a week apart. Inter-rater reliability for the two graduate students was calculated at .91 and .94 respectively. Data was collected on 211 youth who accessed services over the course of 24 months between 2004 and 2006. Data was analyzed using SPSS software.

Results

The mean age of youth who participate in the center programming is 17 with a range of 14 to 21. As table 1 suggests and consistent with Cauce, et. al. 2000 and other’s findings that basic needs are the most important for homeless youth. As the table illustrates basic needs such as food, employment and housing ranked the highest in terms of reasons for attending the center.

Ninety one percent of the youth who come to the teen center report that food is the most important factor, seventy eight percent report housing is the main concern, forty one percent report the clinic is the most important, seventy two percent come for educational services and eighty two percent report employment.

Data suggests that over the course of the 24-month data gathering period, youth place greater emphasis on the use of the clinic and employment services. In fact the requests for these services by the youth have doubled since the first year that data collection began. This new trend is consistent with Greenblat and Robertson, 1993, findings which suggest that homelessness is a process, or temporary moments in time and thus needs will constantly change and develop as issues in their lives stabilize and relevant supports are in place.

Sources of income

As table 2 highlights, nearly 38 percent of youth who access services are employed and another 10 percent receive some type of income assistance.

<table>

</table>
As suggested in the literature, youth homelessness is not only a temporary issue and more an issue relating to social problems and associated connections to those problems. As such, employment provides youth with a certain amount of power to change their current situation. This combined with other pro-social factors such as positive relationships with others presents some compelling strengths for the youth who are engaged in services.

**Homeless demographics**

As Vissing and Diament, 1995 and Greenblat and Robertson, 1993 suggest, youth homelessness is not a chronic condition which is generally seen in the adult homeless population. Our data, presented here in table 3, confirms that a majority of homeless youth are homeless for less than 6 months.

**Table 3: Current housing situation and length of time homeless**

</tbody>
</table>

Eighty-four percent of youth have been homeless for less than 6 months. As for the reasons for homelessness, 62 percent report that they were kicked out of a family or friends house. This is consistent with Cauce, 2000, and McKean and Schoggen, 2005, data that suggest that bad family relationships or problems with social supports are factors in youth homelessness.

**Mental illness**

Mental health data is consistent with the construct that suggests many of the issues faced by homeless youth are the product of their environment or family issues rather than organic issues or problems which they themselves created.

As table 4 shows, PTSD is one of the most frequent diagnoses. As Ginzler and Embry, 2000, highlighted, and is evident within this data, family trauma contributes to the reason for homelessness but also creates a context for other issues, such as mental health related problems which have the potential to exacerbate other issues relating to employment, education, substance use and overall wellbeing.

This table also suggests that psychotropic medication can provide a level of stability and support for youth who suffer from mental illness. As the table suggests seventy-three percent of youth report being on psychotropic medication at some point during their lifetime. Thirty-nine percent are currently on medication. Stability in addressing mental health issues provides the youth with the option of accessing other programming and services such as education and employment.
Substance abuse

Table 5 highlights the fact that youth who have substance abuse issues also identify positive points in their social networks which can provide support for a reduction or a clear break from substances. While 92 percent reported that they had friends who did use substances, 92 percent also reported that they had friends who did not use substances. As such, this connection to peers who do not use substances can provide a link for development of an intervention with youth who are ready which focuses on pro-social bonding and healthy peer relationships.

### Education

Table 7 continues to identify the trend that homelessness and youth are a brief moment in time and that with appropriate supports, they may continue to invest in themselves. As the table illustrates, 37 percent of youth are currently enrolled in some educational program. Additionally, 20 percent of the respondents reported completing their GED. While the mean grade completed is 10th grade, this suggests that there is some evidence of a foundation of educational preparation which can be built upon if the youth continues to pursue higher education.

*Service engagement*

The data suggests that there is a clear matching which is occurring between what is articulated by the youth as services they need and have actually engaged in. That is, youth who come to the center are actually provided with the services which they request.

This construct is divergent from Mowbray, Holter, Stark, Pfeffer, and Bybee, 2000, who found that fidelity to the service model had greater importance than meeting the needs of the client.

### Table 8: Collaborative Agencies Initiated by Youth

<table>

<td>67%</td>
</tr>
</tbody>
</table>
Retention rates for the youth who are engaged in services were high. Seventy-two percent of the youth who were referred for services were in fact engaged in services within the partnership within 3 months and sixty-two percent were involved in services at the six month mark. Fifty-nine percent remain in services at the one-year mark.

This suggests two important points evident in the process of providing services in a collaborative manner. First, the process of low barrier engagement and development of services that are relevant and meet the needs of the client is compelling (Thompson, 2006). Secondly, as tables 8 and 9 suggest, a clear link between the types of service offered and the high level of access to these services is consistent with Cauce, 2000 and Gaetz, 2004 findings. Thus, creating programming based on evidence and data has a greater ability to meet youth needs.

Gender and age trends

Youth who are most successful in programming are youth who have been homeless less than 6 months. These youth tended to report being employed, pursuing an education and engaging in other services offered at the center. The data suggests that mental health services and supportive counseling are areas of greatest difference between the males and females.
The length of time being homeless seems to be a factor in program engagement. Youth who have been homeless for longer than six months tend to be engaged in less than two services provided by the partnership. In contrast, of the youth who are homeless more than 6 months 12 percent of them are engaged in pursuing a higher education, 15 percent use the clinic and 16 percent access mental health services.

Older youth, those between the ages of 17 and 20 reported their highest need in the areas of education and employment. Youth under the age of 16 reported their highest needs as food, clothing and housing.

Conclusions

The literature posits that adolescence is a difficult stage of development with significant pressure to succeed, self doubt, feelings of stress and confusion (Clough, 2001). With all of these internal and external stressors, the need for adequate and appropriate support and resources is critical to healthy development and overall success. This is even more important for homeless youth who, we have discussed, have trauma histories or are faced with issues of unstable housing and social supports.

The literature suggests that pro-social supports and connection to relevant services can create significant opportunities for youth to develop protective factors for homeless youth including positive social orientation, pro-social bonding, and clear and positive standards of behavior (Howell, 1995, Catalano and Hawkins, 1995).

The data presented here strongly suggests that the strengths such as clean and sober friends, a track record of employment and education, access to basic needs, mental health and physical health services is aligned with the identification of the prevalent
issues facing adolescents as well as predictors of programming and overall success for these youth. The data also suggests that the partnership program works to strengthen the protective factors highlighted in the literature. The literature and our findings also suggests that youth who participate in homeless youth programs gain from the experience personally and have access to the resources necessary to truly make homelessness and the associated issues relating to it a temporary, short term problem.

Taiwanese traditional temples · Wall finishing · cultural expression

Abstract

Taiwanese traditional temples have been built by Chinese immigrants from Southern China and constructional materials and techniques are similar to temples in Chinese hometown. The main structure of a temple was a combination of a wooden frame and weight-supporting walls which share weight of temple’s roof and separate inside from outside in a temple.

Walls were piled up with bricks, cobs or both of them. Craftsmen brush lime mortar as finishing material to look well and prevent walls from rain. They also pasted wall with earthen tile to be a protection at some cases. During Japanese Period (1895-1945), lime mortar was replaced with cement and tile that were popular architectural materials at that time in Taiwan. Some new forms of wall’s finishing were devised, Such as “Water Washing aggregated stone” · ”Terrazzo” · ”Colored Tiles” and ”Mosaic Tiles” which were placed together on walls in Taiwanese traditional temples. Some of the finishings were decorated with religion themes which became media for temples to show new cultural characteristics.

The “Culture Heritage Preservation Law” was enacted in 1982 in Taiwan. Some traditional temples were preserved as the ”monument” and become National heritage. But how to preserve the original characteristics of traditional walls became a serious question. This article will discuss the changing of materials and form of wall in Taiwanese traditional temples, and argue the valuable and historical parts on the wall should be preserved.
1. Introduction

Taiwanese traditional temples have been built by Chinese immigrants, as they moved from the Chinese Mainland, the folk religion and folk belief followed and settled down about 400 years ago.

The building of traditional temple link up the Taiwanese immigrants of the Hans and melts in the society, and gradually become a part of the cultural fields of the Hans culture for over 400 years. Traditional temples became a belief center in city centers and villages. They are most common and unique architectural elements in both cities and villages. And they are also the witness to the living, history and culture. It would become the best subject matter to study the traditional space and cultural property in Taiwan.

The “Culture Heritage Preservation Law” was enacted in 1982 in Taiwan. Some traditional temples were preserved as the”monument” and become National heritage. The latest statistical data show that there are 610 monuments in Taiwan, and among them 167 (about 27.4%) are temples. It pointed to the importance of traditional temples on culture heritage in Taiwan.

The wall’s constructions of traditional temple were not unalterable for over 400 years. Some traditional temples heritage were quite various in construction and materials over the past 20 years. We can observe that there were a corresponding form the development of history and society. When Ming and Ching Dynasty (1662~1895), constructional materials and techniques are similar to temples in Chinese hometown. People used local materials to build temples with the form of residence in the former township. The main construction was weight-supporting walls at those times. During Japanese Period (1895-1945), craftsmen
from Southern China were introduced and they adopted magnificent wooden frame systems in temple buildings.

In both weight-supporting walls system and wooden frame system, walls shared weight of temple’s roof and separate inside from outside in a temple. Some constructional materials such as the earthen blocks, stone and brickwork continue to be use for over 100 years. Generally speaking, wall construction could be regarded as the heritage of the temple building culture of the Han People, and shows the diversity of cultural expressions in temple building.

When we observe wall’s finishing of these old temples in the historic site, lime mortar and tiles were still fitted up on walls in a small number of monuments. Most old temples had been changed or replace their wall’s finishing materials with new materials such as water washing aggregated stone, terrazzo, color tiles and mosaic tiles etc. in Japanese Period (1895-1945) and Post-War (1945-) Period. With these new materials, these temples have new appearances.

The main reason for old temple to change their wall’s finishing materials is in order to easy to maintain, strengthen protection, improve damp proof condition, fire prevention and clean issue of hygiene etc. But the new-old mixed appearance of old temples was attacked by some defenders of traditional building form and had become the focus of arguments.

In the past 400 years of Taiwan, the Hans immigrants have brought different cultural form and then changed with the modern society. This text presents the viewpoint of that plural culture should be respect and whole history should be preserve. The reason why
materials changed in terms of the function and form of wall’s finishing will be discussed and its value for cultural preservation will be explored.

2. Form and development of traditional wall’s finishing

2.1 function and form

So called ‘finishing’ can be regarded as the surface of the building, or regarded as a “medium” contacted between people's life and building structure. This medium itself protects the structure body, and offer the cordial interface that human body contacted. Different finishing of building contains various constructional methods and materials, and also fulfills abundant cultural symbols. Therefore, some characteristics will be point out emphatically, such as protect and cover performance, beautiful look and follow-up maintained. Any construction work should have fit up “finishing” then will be really “finished”.

![Traditional Wall and Wall’s finishing in Taiwan](image)

Walls, whether regarded as the spatial compartments or as weight-supporting structures, should play an important role in the building. They are the focal points of finishing to fit up, called ‘wall’s finishing’ or ‘fitted up wall’. Wall’ finishing, because of its locations, can be categorized as “inside wall’s finishing” and “outside wall’s finishing”.

As regards historical development of the structural materials of the building, most traditional walls were piled up with earthen blocks, bricks, stones, etc. Earthen blocks are extremely easy to be collided to damage. Brickworks and stonework are too coarse to level.
Besides, there exist external living beings, the aqueous vapor of environment, temperature, gas and collision of artificial article, etc. They will also cause damages with dissimilar degrees. Some finishing had been conduct to protect, isolate wall to keep from damages for a long time. Therefore, wall’s finishing materials themselves need to be firm, durable; also it can defend worms and protect buildings from damp. Some finishing should consider their artist outlooks and ornamental functions.

Generally speaking, wall’s finishing can offer two valuable functions.

(1) Protection properties: prevent wall against external weathering damages and people’s collide, and improve durability of wall bodies’ construction.

(2) Decorating properties: Use different materials, colors, patterns to beautify the wall, express the visual art and in order to establish spatial attributes.

Following will discuss the characteristic and development of wall’s finishing and focuses on temple’s demands and finishing’s positions and functions, and the characters of different wall’s finishing in Taiwanese temple.

2.2 Various wall’s finishing in Taiwanese temple

Lime mortar

The traditional lime mortar of wall’s finishing was used most frequently for a long time, Lime is a kind of traditional and old material, and it was commonly used by the Han’s immigrants person in Taiwan. Eventually, this lime mortar finishing had become the main form of the traditional temple’s wall in Taiwan in the past.

The material comes from the limestone or coastal shell; those should be burned and grounded into the powdered condition. Its cohesiveness is strong, can be the best material of finishing on the surface of wall. To increase the stability of construction and prevent cracks,
‘the straw’, ‘the rice husk’ and ‘hemp fiber’ will frequently be added.

Lime mortar finishing in Daxin temple (Tainan county)

Sticking tiles wall

Paste tiles up the wall as to protect the wall. It is another traditional wall’s finishing which used most frequently in Taiwanese old building. The general method is to stick pottery, earthen tile to wall with the lime mortar, then nail into with the wooden bamboo to cohere with the wall closely. The appearance looks like the wall wears the clothes. Generally called “wearing tile shirt” in Taiwan. The position to stick tiles is generally outdoors, and to defending wall from the external rainwater, reduce the degree of the degradation day by day. Because of the material’s characteristics and red color, it increases artistic feelings of the wall.

The wall’s finishing outside the of Longshan temple
Cement

Cement was introduced in Taiwan during the Japanese Period (1895-1945). Oriental architecture has adopted lime as the glued material and finishing materials for a long time. When cement started to be used in Japan, it also regarded and use as lime mortar. But cement is easy to dry up, fire-resistant and waterproof. Because of its damp-proof efficiency and termite-proof, it was used to replace traditional lime material gradually and become the modern finishing materials.

Water washing aggregated stone and Terrazzo

Water washing aggregated stone and Terrazzo started to be used as wall’s finishing materials during the Japanese Period (1895-1945) in Taiwan. The basic constructional method of Water washing aggregated stone is firstly to mix modern cement mortar with small stones, then spray water to wash surface of cement, make small stone to appear and keep the coarse texture of the surface. Terrazzo (also called Rubbing stones) has the same procedure as the Water washing aggregated stone in the first place. However, is polished after cement mortar becomes solid, making the surface smooth.

Water washing aggregated stone and Terrazzo could also be called ‘artificial stone’ or ‘the artificial stone brush’. They are materials developed after the cement was invented. Similar
to the authentic stones, they can provide buildings with beautiful look and protection wall’s structure. They were used after the World War II (1945) in Taiwan. However, their use decreased gradually in recent years because of environmental pollution during the process. When using on traditional temple’s wall it is difficult to be acknowledged and accepted on cultural aspects by some people. So when the temple of monument was repaired, they were tended to be eliminated or replaced.

Mosaic and Color Tiles

Mosaic and Color tiles as wall’s finishing prevailed in 1970s. Mosaic is suitable for sticking covering it on the surface of various kinds of walls, and utilize the way of piecing together will shape different form and pictures. Color tiles, imported by Japan in the past. And invite Taiwanese craftsman to draw article pattern on it, and piece together on wall, it also called ‘tile paint’ in folk people. Advantages of Mosaic and Color Tiles finishing are waterproof, smooth and easy to clear up and maintain. When piece together and arrange differently arranges, they are easy to form special ornament themes and produce artistic appearance.
3. Conclusion

As to the history wall’s finishing, we can easily find that single wall’s finishing can not completely meet the needs of various types of walls. Different social and cultural demands have different materials and workers. By doing varied replacements and additions in different material development in different eras, sorts of wall’s finishing were appeared in difference forms.

The traditional patterns of old Taiwanese temples have changed through the development of nearly 400 years. The abundant appearances of wall’s finishing can be observed. Some still adopt old material as “the lime mortar” and repeat the constructional process because of constant damages. Some temples were finished with new materials to achieve a new appearance.

3.1 ‘historic addition’ as an ‘evidence’ of history

In Taiwan, nearly all traditional temples’ original wall’s finishing were replaced or altered. There are also no relevant documents and drawings preserved. The original mark has
been erased and no longer existed. The original wall structure is now covered with new finishing materials, or added different old material in different era. They could be considered as ‘the historic addition’. By these additions, we can differentiate the priority order and judge their qualities from different eras.

So, these different wall’s finishing has become the entity ‘evidence’ to differentiate and judge, the more these evidences are left, the more we can know intact the past clearly. If ‘evidence’ is lost, we will lose parts of history in spatial cultural form. History and culture rupturing will bring us a non-oriented state of life. Reduce intervention of or stop changing these ‘evidence’ will be the first step for cultural preservation.

3.2 Cultural expressions and preservation

As a communication bridge between building construction and people's body, consciousness, wall’s finishing can be an ‘interface’ or ‘media’. People create these media intent to protect and pack buildings by fitting up some finishing, then keep the buildings alive. On the other hand, buildings declare there role through the media too. Some old buildings through the” media “of finishing transmit a lot of message and idea of how to be built in the past to next generation. This is the best annotation and explanatory of culture.

People create all kinds of culture because of needs of life, to become communication interface between People, God, Earth, and then these cultural forms become cultural development foundations of future generations. We can say that “media” of finishing is one of the total cultural expressions. No matter what kinds of the finishing materials and expressions, they could be regarded as the media of cultural expressions. These are so precious that all of us should respect and preserve them, in order to be the foundation as the next stage development.

• Introduction

Schizophrenia patient, accounting for all about 50-60% of acute, chronic sick beds of psychiatric department clinically. Becoming chronic or relapsing, or degradation of organs' function would make a schizophrenic patient to visit the hospital repeatedly or even to get long stay. Become the chronic ward and take the supreme diagnosis ethnicity of the bed rate. This issue costs not only a lot in medical expenditure but also in consuming public resources.

Some patients unnecessary taking up the psychiatric beds in hospital for a long time causes the sick bed unable to use, and some patients can not to be admission, The income of the hospital is also influenced. Law of mental hygiene Patient's condition is stabilized or recovered, there are no ones that continue treating in hospital in case of necessity, Deserve to handle and leave hospital, can't leave and put patients without reason. The patient is in hospital for a long time, It is unable to enjoy the warm care of living with family, Cause family's function to disintegrate, The relation among the patient and relative is estranged day by day, The patient's daily life function may degradate, Produce the ' institutional phenomenon '

The majority is in hospital the patient, ' when can I leave hospital the question paid attention to most is? ' Often unable to achieve one's goal to leave hospital, and the unstable situation of mood appears, And then
influence a patient and receive treatment and reply the will that is strong in.

Objectives

The purpose of this study was to discover the factors that would influence the leaving or staying hospital of schizophrenic patients.

Methods

The data for this study were based on a sampling survey of 401 patients from a psychiatric hospital in central Taiwan who were diagnosed as “disease 295.xx” in the time span of 2004-Jan-1 through 2004-Dec-31. A binary logistic regression was performed by using the assigned conditions by the doctors for the acute patients (leaving hospital or move to chronic ward) as the dependent, and gender, marital, age, frequency of hospitalization, tendency of violence, sleeping problem as covariates.

Results

The result shows that the patients with older age, single, earlier onset of the disease, less ability of self-care, and the key care persons of the patient were not parents or spouse were more likely to be assigned to stay at hospital for further therapy. There is no significant evidence to show that patient’s gender, economic status, compliance the medical order, frequency of hospitalization, tendency of violence, family history of schizophrenic, are related to stay at hospital for further therapy.

Conclusion:

The study shows that marital status, age of being hospitalized, time of onset of disease, ability of self-care, and recent job condition of patient are
related to if patient should continue the treatment at recovery sickroom or not. It is recommended that the hospital improves the facilities of recovery sickrooms and enhances the training to concerned staffs in taking care of the patients with older age and lacking of self-care ability. It is also recommendable that the hospital provides proper work training environment and sufficient trainers specifically for patients with diverse working ability.
Beyond Literacy Ability: 
Another Way to Explore the Impacts of 
Media Literacy Education

Abstract

Different from most studies which investigated the effect of media literacy education by examining subject’s changes in media literacy ability, this study intended to explore the impact on viewers’ emotion since it was suggested by the limited capacity model of media processing that emotion could influence information processing like encode, decode and memory storage. By using pretest posttest quasi-experimental design, the current study examined how media literacy education influenced viewers’ emotion toward music television (MTV) with high sexual content.

Based on two dimensional emotion theory, subjects’ emotional responses were measured in two categories (appeal & arousal) with nine variables (music appeal, visual appeal, happiness, anger, sadness, terror, anxiety, sexuality, and aggression). Data indicated that media literacy education did not have a strong impact on subject’s emotional responses when they confronted the MTV with high sexual imagery. Among the nine variables, a significant difference appeared on the assessment of visual appeal and anger between the experimental group which accepted the treatment of media literacy education and the control group without treatment, but no difference on the assessment of the other seven variables.

INTRODUCTION

Background

In the 19th century, many sociologists such as Tönnies and Durkheim pointed out that industrialization and specialized division of labor would lead to isolation and individuality. “Close and intimate ties between individuals are reduced, hence restricting influences from interpersonal communication, leaving the individual vulnerable to influences from other sources.” (Merskin, 1999) Today, the main source of social influence on people was the media. Media saturated our lives so heavily that we relied on them for providing information, making daily decisions as well as learning social values, norms and ethics. Media did not just influence our culture, but formed our culture as had been proved by studies on media culture, media effects and learning theory (Bennet, 1982; De Fleur & Ball-Rokeach, 1989; Schramm, 1971) However, most media messages were constructed with certain ideology for commercial or political sake. Therefore, it was not surprising “what being literate in the 21st century will mean is capturing the imagination of those outside the traditional literacy community as well” (Alvermann & Hagood, 2000). It implied the importance of “media literacy”.

Media literacy education was to “empower” and “liberate” students from media impacts in order to become democratic citizens in the future. “The fundamental objective of media literacy is critical autonomy in relationship to all media.” (Aufderheide, 1993, p.9)

Rock music television (MTV), a new format of television programming, started in the early 1980s. Currently, there are three types of music video network – rock, country, and contemporary Christian. MTV has grown especially fast and become one of the most popular television programs for college students (Sherman & Etling, 1991). MTV has also been the target of
public criticism ever since it started because of extensive uses of sexual and violent content. The National Coalition on Television Violence as well as the American Academy of Pediatrics referred to MTV as “unwholesome viewing for young people” (Hansen & Hansen, 1990). Many studies have concluded that there were significant sexual and violent images in MTV (Brown & Campbell, 1986; Hansen & Hansen, 1989; Pardun & McKee, 1996; Sherman & Dominick, 1986; Sommers-Flanagan & Davis, 1993; Waite & Paludi, 1987). Two empirical studies have also indicated that rock music videos with higher level of sexual content were more favored by youngsters (Hansen & Hansen, 1990; Zillmann & Mundorf, 1987).

The present study was grounded on the limited capacity model of media processing which was a theoretical approach rooted from many traditional information-processing models over the past 30 years (Lang, 1995; Lang, 2000; Lang & Basil, 1998). This model had two major assumptions. First, people were information processors who perceived stimuli and allocated capacity to decode, process, encode and store messages. Second, the ability (resource) to process information was limited. This model has been broadly applied to investigate how people process mediated messages (Lang, 1990; Lang, Geiger, Strickwerda, & Sumner, 1993; Thorson & Lang, 1992; Lang, Dhillon, & Dong, 1995; Lang, Newhagen, & Reeves, 1996; Newhagen & Reeves, 1992). Additional studies further combined the limited capacity model and emotion theory to investigate how emotional contents or viewers’ emotional responses influenced the information processing because of the limited capacity (Heurer & Reisberg, 1992; Newhagen & Reeves, 1992; Lang, Dhillon, & Dong, 1995).

**Purpose and Research Questions**

Since MTV involved highly emotional content to attract audiences and
emotion had influences on the processing of information, the purpose of this research was to explore whether there was a difference in viewers’ emotional responses to MTV with sexual content between those who were exposed to media literacy education and those who were not.

Here, emotion was defined based on the two dimensional theory which conceptualized emotion as having two primary dimensions: valence and arousal (Lang 1985; 1984; Lang, Bradley, & Cuthbert, 1997; Bradley, 1994). “The valence dimension is conceptualized as a continuous affective response ranging from pleasant (or positive) to unpleasant (or negative). The arousal dimension is defined as a continuous response ranging from ‘energized, excited, and alert’ to ‘calm, drowsy, or peaceful’.” (Lang, Dhillon, & Dong, 1995, p.314) Within such a framework, the purpose of this study was further inducted into two specific research questions:

Q1: Was there a difference in subject’s appeal to MTV with sexual content between those who were exposed to media literacy education and those who were not?

Q2: was there a difference in subject’s arousal by MTV with sexual content between those who were exposed to media literacy education and those who were not?

LITERATURE REVIEW

Media Literacy Education

The consensus definition of media literacy education was developed in 1992 when the Aspen Institute assembled leaders working in this field at the National Leadership Conference on Media Literacy to discuss directions and strategies for the emerging field with diverse approaches. The conference finally decided to conceptualize media literacy as the ability to challenge and question media – but not to be passive and vulnerable. (Thoman, 1999) Based
on the concept, Renee Hobbs (cited in Thoman, 1999) proposed five questions that media literate students should be able to answer:

1. Who creates this message and why?
2. What techniques are being used to attract my attention?
3. What lifestyles, values, and points of view are represented?
4. How might different people understand this message differently?
5. What is omitted from this message?

The majority of research on media literacy education concentrated on epistemology or instructional strategies (Alvermann et al., 1999; Hart, 1997; Michie, 1999). Research was limited that evaluated the impact of media literacy education on the cognitive or critical thinking skill of young people. Dorr et al. (1980) conducted a study and concluded that children’s ability to distinguish between the real and fictional element of a program improved after accepting media literacy training. Similarly, Anderson’s study (1983) indicated the influences on students’ identification of genre and syntactical structure.

Health researchers were interested in knowing the effects of media literacy instruction on students’ interpretation of alcohol advertisements and their decision to consume alcohol (Austin & Johnson, 1997). Two studies focused on commercials found that children had a better and critical comprehension about advertisements (Chen, 2003; Verkaik & Gathercoal, 2001). However, both studies also pointed out the concern that students’ attitude toward the product was unclear or unchanged even though their literacy ability of the commercial became critical.

Music Television (MTV)

Music television (MTV), developed out of radio formatting, started in the United States in 1981. It was a new format of television program by playing music videos 24 hours a day. Some data indicated that MTV did successfully
reach its targeted audience, with 83% of the viewers being between 12 and 34 years of age (Gardner, 1983), and MTV also turned out to be the most watched cable channel by college students (Sherman & Etling, 1991).

As rock videos became a popular form of entertainment for adolescent and young people, MTV’s extensive use of sexual and violent images became the subject of much criticism (Gore, 1987). Many studies done by content analysis confirmed the presence of significant sexual and violent content. Shermon and Dominick (1986) found that more than 75% of music videos sampled contained sexual behavior. By using a more stringent coding system, Baxer et al (1985) reported 60% of videos had sexual imagery. Based on the same coding procedure, Pardun and Mckee (1995) found 63% of music videos with sexual imagery, which remained as high as the rate in Baxer et al’s study done ten years earlier, even though much public criticism had strongly protested against this phenomenon. Researchers have also reported that between 15% and 50% of videos sampled contained violence (Baxer et al., 1985; Brown & Campbell, 1986; Greeson & Williams, 1986; Gow, 1990; Sherman & Dominick, 1986). Even though various coding definitions or sampling procedures were applied among studies, the results concluded that the presence of sex and violence or combined imagery in rock videos was significant.

Increasing concern about MTV noted the enculturation or socialization effects on young viewers due to the highly sexual content as well as the ambiguity in meaning, (Bennett & Ferrell, 1987; Sherman & Etling, 1991). Many studies have confirmed MTV effects on adolescent’s attitude toward sexuality. Greeson and Williams (1986) found that high school students had more liberal sexual attitudes and accepted premarital sex as a socially normative behavior after viewing randomly selected music videos when
compared with a control group. Calfin, Carroll and Schmidt (1993) surveyed
college subjects and yielded similar results. On the other hand, some studies
suggested that family communication pattern was also a significant predictor of
adolescent’s sexual attitude besides MTV exposure (Strouse,
Buerkel-Rothfuss, & Long, 1995; Thompson, Pingree, Hawkins & Draves,

People might assume that the over dose of sexual behavior in MTV was
simply because of the common sense “sex sells”. Some researchers have
focused on how sexual content in MTV influenced the appeal of
undergraduates. Hansen and Hansen (1990) found that visual sexual
depictions in MTV increased the viewer’s appeal and positive mood, but
violence decreased viewer’s appeal. A similar finding was also concluded in
the research by Zillmann and Mundorf (1987).

**Limited Capacity Model**

This model defined massage recipients as information processors. In
order to make sense of a message, recipients constantly engaged in the
information processing which involved the parallel cognitive subprocesses of
encoding, storage, and retrieval. People’s mental resources for operating
these continuous and simultaneous subprocesses were limited. Information
processing also involved the allocation of limited resources to the cognitive
processes. In general, the message recipient controlled the overall allocation
of processing resources based on his or her own interest and characteristics.
Involuntary or automatic allocation of processing resources happened when
the recipient’s “orienting response” (ORs) were elicited. Taking television as an
example, structural feature like cuts, editing, or flashes of light could elicit ORs
(Lang, 1990, Lang et al., 2000). Form this viewpoint, the limited capacity model
also unveiled an answer to the long-term argument of passive audience or
active audience.

A great majority of research concerning media effect has been conducted based on the limited capacity model. One branch of the research especially inspired the current study utilized a combination of the limited capacity model and emotion theory to investigate the relationship between information processing and emotion elicitation (Heurer & Reisberg, 1992; Newhagen & Reeves, 1992; Lang, Dhillon, & Dong, 1995). It was concluded that emotion-eliciting messages were recalled better but the specific information contained in a message was remembered less. This implied that “if the emotion-eliciting content results in additional resources being allocated to storage, this would result in fewer resources being available to be allocated to encoding.” (Lang, 2000, p. 62) How exactly emotion elicitation influenced information processing was not the concern of current study, but these studies illuminated a logical new way to inspect the effect of media literacy education.

METHOD

Samples and Procedures

Samples were undergraduates enrolled in the” Elementary Science Education” course offered at two campuses Coeur d’Alene and Moscow of the University of Idaho but instructed by the same professor. Because randomized assignment to treatment groups was impossible due to location and class schedule, students at the Coeur d’Alene campus were randomly assigned as the control group and students at the Moscow campus were the experimental group.

This research used a pretest-posttest quasi-experimental design. Subjects of the control group were exposed to a rock music video with a low level of sexual content and then asked to complete a questionnaire in their class. Following a two week interval, students watched another video with a
high level of sexual content and completed a questionnaire. Before watching
the music video, subjects were informed by videotaped instructions explaining
that the study they were about to take part in concerned the enjoyment of rock
music videos. The videotaped instructions also informed subjects about sexual
imagery before they were shown the MTV with a high level of sexual content
and told them free to leave if they felt uncomfortable.

Subjects of the experimental group watched the same two music videos.
Meanwhile, they were also treated with three fifty-minute-long tapes focusing
on the literacy aspects of MTV. The experimental group was also given the
videotaped instructions before watching the music video and afterwards was
asked to complete the questionnaire.

Music videos were randomly taped in multi-hour blocks during two days
in late August 2004 from broadcasts of MTV or MTV2 channel. This procedure
produced a 9-hour taping with nineteen videos. Many of the videos appeared
more than once, so eleven videos were actually coded by the author alone.
Sexual acts in each video were coded according to the listing by Baxter et al.
(1985): “provocative clothing; embrace or other physical contact; dance
movements of sexually suggestive nature; non-dance movements of sexually
suggestive nature; date or courtship (male-female); kissing; male chasing
female or vice versa; use of musical instrument in sexually suggestive manner;
sadomasochism; date or courtship (homosexual or lesbian); sexual bondage.”
(p. 338) Other types of programming, such as a reality show or a special report,
were not included in the coding.

In controlling the effects of violent imagery, violence in each video was
coded based on the Incident Classification and Analysis Form (ICAF) – a
system designed for analyzing the content of TV programs. According to ICAF,
vio
result in harm to life or to valued objects. Violence involves harmful or anti-social consequences. Violence involves behavior which violates, damages, or abuses another person, animal, or valued object(s).” (Wurtzel & Lometti, 1984, p.92)

After coding, two videos were selected for pretest and posttest: one was the video with the lowest level of sexual content as well as violence, and the other one with the highest level of sexual imagery and lowest violence. In order to reduce variances, both videos featured a female singer.

**Treatment**

The treatment used for the experimental group included the viewing of three media educational video tapes which totaled three hours. The three tapes were professionally produced by the Media Education Foundation. Media Education Foundation (MEF) was founded in 1991 and had produced approximate 50 videos for educational resources that critically examined the media. One of the tapes used as the treatment was *Dreamworld II* which “critically examines MTV, the music industry, and music video representations of women and their sexuality” (MEF, n.d., Study guide section of *Dreamworld II*, ¶ 1). Another tape was *Money for Nothing: Behind the business of POP Music* which “traces a high-regulated musical culture in which sensation has replaced talent, marketing has replaced aesthetics, and the historical power of music to change the way people look at the world has been harnessed to turn people into more efficient consumers.” (MEF, n.d., Study guide section of *Money for Nothing*, ¶ 1) The last tape *Representation and the Media*, a lecture by media scholar Stuart Hall, focused on the concept of “representation”—specifically, on understanding how media does not portray but represent reality. (MEF, n.d., Video section of *Representation and the Media*)

These three tapes were deemed appropriate for teaching young
adults about MTV programs because they addressed all the five relevant media literacy questions defined by Renee Hobbs (1998). *Dreamworld II*, for example, fully addressed the following questions:

1. Who creates this message and why?
2. What techniques are being used to attract my attention?
3. What lifestyles, values, and points of view are represented?
4. How might different people understand this message differently?
5. What is omitted from this message?

*Money for Nothing: Behind the business of POP Music* shed light on the questions:

1. Who creates this message and why?
2. What techniques are being used to attract my attention?
3. What lifestyles, values, and points of view are represented?
4. How might different people understand this message differently?
5. What is omitted from this message?

As for the last tape *Representation and the Media*, it provided detailed explanation for the question:

Instrument

The instrument was a four-part questionnaire. The first part assessed subjects’ gender, consumption of MTV, and whether the signer in the music video was one of their favorites. The second part contained questions which required subjects to rate the visual content on a 7-point bipolar scale, and each subject’s ratings were summed and averaged to yield a composite visual appeal. The third part asked subjects to rate the music and lyrics on the same scale, and each subject’s ratings were summed and averaged to yield a composite music appeal. The final (fourth) part assessed subjects’ arousal in the categories of happiness, anger, sadness, terror, anxiety, sexuality, and aggression after watching the music video on a 5-point Liker scale. A pilot study assessing the reliability of the questionnaire was done with twenty-four subjects. Results indicated a highly satisfactory reliability as measured by Cronbach’s alpha which was .91 for both visual and music appeal (the second and third part), and above .76 for the arousal questions (the fourth part).
Data Analysis

The statistical method for analyzing the research questions was ANCOVA if the pretest was not different between groups. Otherwise, ANOVA on gain scores was applied. Data analyses were conducted by using the Statistical Package for the Social Sciences, Version 11.0 (SPSS 11.0, 2004), and the alpha level was set at .05.

RESULTS

Demographics

The experimental group totaled 24 students. Two of them were male and the other twenty two students (91.67%) were female. Ages varied mostly between 20-24 (91.67%). One student was under 20, and one student aged between 25-29. Twenty students (83.34%) were single and four students were married. Ten students (41.67%) did not watch MTV, and seven students (29.12%) watched MTV for less than one hour and 1-2 hours each week.

The control group had 32 students. Seven of them were male and the other twenty five students (78.13%) were female. Twelve of them (37.50%) were between 20-24 years of age. Four students (12.50%) were between 25-29, six students (18.75%) between 30-34, and ten students (31.25%) were 35 or above. Eighteen of them (56.24%) were single and thirteen students were married. Seventeen of them (53.13%) reported that they did not watch MTV, twelve students (37.50%) spent less than one hour, one student (3.13%) watched MTV for one to two hours, and 2 students (6.25%) watched MTV for more than two hours each week. Table 1 summarized this information.

Dependent Measurements

The result of music appeal was not significant, \( F(1,50) = .46, \ MSE = 1.87, \ p = .50, \) partial \( \eta^2 = .01. \) There was significance for visual appeal, \( F(1,50) = 8.47, \ MSE = 1.91, \ p = .01, \) partial \( \eta^2 = .15. \) It indicated the experimental
group was less likely in favor of the visual content of MTV with high level of sex
than the control group. As for arousal, a significant difference appeared only on
the assessment of anger, but not on the other variables like happiness,
sadness, terror, anxiety, sexuality, and aggression. Table 2 summarized the
information of dependent measurement.

**DISCUSSION**

**Conclusion**

The findings of this study revealed that:

1. Subjects’ appeal to the music itself was almost the same between the two groups. However, subjects of the experimental group were less likely in favor of the sexual video content than the control group.

2. Among the seven items of arousal evaluated, six items indicated no differences between the two groups. That is, subjects’ arousal of happiness, sadness, terror, anxiety, sexuality and aggression were reportedly equal between the groups. On the other hand, subjects of the experimental group
had more arousal of anger after watching the MTV with high sexual content than the control group.

With such evidences, it was concluded that media literacy education had a slight impact on viewers’ emotion toward MTV with high level of sexual content, but not strongly. Especially for the arousal of aggression which had been one of the most serious concerns about media effect, the data showed no difference between the experimental group and the control group.

Limitations

Limitations of this study were concluded into the following four points:

1. Because of the constraints of class schedule, the subjects came from two intact groups which were different in sample size and demographic categories. Therefore, external validity was threatened.

2. The experimental group was treated by watching professionally produced instructional tapes regarding MTV. One study proved that instructions by two fifteen-minute films induced a significant effect between groups of elementary students (Robert, Christenson, & Gibson, 1980), while another study concluded that the curriculum using role-playing effectively taught kids critical viewing of commercials (Desmond & Jeffries-Fox, 1983). Therefore, the current results had to be interpreted with the premise of the particular treatment employed in the study.

3. Arousal was measured by heart rate or skin conductance in some designs (Bradley, 1994; Hopkin & Fletcher, 1994). The current data obtained from only subjects’ self-report might have potential bias due to the individual difference in feelings.

4. Considering the result might be influenced by subjects’ admiration of the singer in MTV, one question in the questionnaire asked subjects if the singer was one of their favorite. The number of “No” was dramatically larger
than “Yes”, so analyzing the difference between the “Yes” and “No” groups was not feasible.

**Suggestion for Future Research**

This result might offer a clue to the question proposed by previous research that subjects’ interpretation of commercials became critical but attitude toward the products seemed unchanged. However, the direct relationship between viewers’ emotional responses and attitude was not proved in the current study. Future research might focus on mapping out the relationship among media literacy education, viewers’ emotional responses, and related attitude. Such research would be especially helpful for some health instruction which, for example, intended to improve youngsters’ interpretation of alcohol advertisements and their attitude toward alcohol consuming.

Hybridity—an end of the journey

Exploring the course of cultural identity-shifting

Pin Chen

University of Northern Colorado

Abstract
By systemizing the former academic scholars’ thoughts on cultural identity in the fields of communication and psychology; this research discovered the cultural identity-shifting process that occurs when people speak two different kinds of language. To further examine the depth of this topic, three factors that could have a significant impact on foreigners’ second language acquisition process are determined: 1) discrimination; 2) the proficiency in their first language; 3) and the level of affinity with the heritage group. When a newcomer struggling between cultural values and logics, there is no need to make choice among different cultures; instead, a hybridity will emerge in the end of cultural identity-shifting process; and this mixed identity will be composed by advantages of both cultures.

Language is the source of misunderstandings.
Imagine that there are two rivers, two fountainheads, one is in the Eastside, and the other is the Westside of the earth. With different geographical routes, they separately provide the life of the earth in a silent but powerful way. There are totally different landscapes in each riverside. The river in the Eastside grows plum blossom trees, cherry blossom trees, and bamboo trees on the riverside. The river on the Westside grows cedar trees, Douglas fir trees, and helianthus along the riverline. As time goes by, these two rivers flow into a low-lying land somewhere deep in the mountain, every drop embraces each other and thus creates a huge lake. The whole changing process goes in a secret, gentle, and slow way everywhere. Suddenly, a new land is formed by the mighty power of water and the landscape is no longer the same as before. This is a land that people call “hybridity.”

The idea of hybridity (Gloria Anzaldúa, as cited in Littlejohn and Foss, 2004, p.332) is not only true when applied to indicate the cultural borderland that exists in the global village, but is also true when we use it to describe the ending stage of a bilingual speaker’s inner psychological transformation when struggling between two varied cultural value systems. Usually, the identity-shifting process is secretive but not necessarily slow and gentle; it could be fast and harsh as well. As the Sapir-Whorf hypothesis explains, people from different cultures would form different kind of logics to understand the world (Mandelbaum, 1951, p.591). For instance, there is no tense in the Chinese grammar system, thus, English speakers can not understand why Asians constantly make mistakes when they
describe time. Based upon this notion, foreigners must struggle to adapt to a new culture, not because of their language skills, but because of the misunderstanding that could be evoked by various cultural values and logics. By systemizing the former academic scholars’ thoughts on cultural identity in the fields of communication and psychology; this research would discover the cultural identity-shifting process that occurs when people speak two different kinds of language. In order to understand these concepts, it is necessary to explore the idea of globalization.

**Globalization**

*Whether people fear globalization or not, they cannot escape it.*

Alexander Downer, Australian Foreign Minister (2004)

The 21st century is an epoch of Western domination, and a historical period when non-native speakers will largely exceed native speakers. The reason for this phenomenon is globalization. According to Marshall McLuhan (1962), “The new electronic interdependence recreates the world in the image of a global village” (The quotation page, retrieved November 26, 2006). The rapid growth of the Internet and Hollywood movies, which originated in the United States, is considered as two crucial factors that constantly push Western hegemony and brainwash people from the other parts of the world to accept Western ideologies. The following quote is an observation concerning the ongoing
Cultural identity-shifting 6

phenomenon of Western domination from the book *Postcolonial Studies and Beyond*:

Until the destruction of the World Trade Center changed the U.S. priorities, Western dominance over the global economy was affected largely through trade and technological imbalance, with international financial and banking systems, including the World Bank and the International Monetary Fund, adding to and enforcing structural disparities put into place during the long years of imperial rule (Loomba et al., 2005, p. 15).

Therefore, it is natural that the majority of people from third world countries believe that English is an imperial imposer of cultural values that can only benefit Western countries (Kayman, 2004, p.13). To defend for English speaking countries, Kayman (2004) argues that “the success of English is presented as the result of the world’s desire for a language in which to communicate, not just with Anglophone nations, but with each other” (Kayman, 2004, p.4). However, regardless of the positive and negative perspectives regarding English, it is an undeniable truth that people from Eastern countries, such as China, Japan, Taiwan, and Korea, are deeply influenced by Western ideologies because of the Internet and Hollywood movies. Further, most Asians view the fluency of speaking English as an essential asset to take advantage of in job hunting. Based on the above description, the beginning quote of this section could be paraphrased as: “Whether people from the East fear English or not, they cannot escape it.” In general, English education would start before fifteen years of age and mainly take place in junior or senior high school in Asian countries. Some countries like Japan and Taiwan even start earlier; in private
institutions, children learn how to speak basic English starting at age nine.

Nonetheless, Lindemann conducted a study in 2005 to discover how native English speakers construct social categories for foreigners. The result of this study indicates that among various non-native speakers groups (including Mexico, China, India, Russia, Germany, France, and Italy), Mexico and China were the most negatively evaluated groups. To concentrate on the Asian group, Lindemann reports comments regarding how native speakers view the way that Asians speak English, an excerpt of these comments is listed as follows:

1) This country speaks very fast; I don’t know how they understand each other; the only way you know if these people are cursing you is if their voice rises.

2) Asians tend to speak choppy, high toned English and often leave out predicates in sentences; they speak English, but sometimes leave out some words.

3) Difficult to understand, hard time pronouncing many words w/r and l, many times forget to put plural “-s” on ends of words.

(Lindemann, 2005, pp.199-200)

Where have these comments come from? Why do Asians spend so many years learning English but still fail to be understood by native speakers? As Jensen (2003) indicates, “One’s cultural identity subsumes a broad range of beliefs and behaviors that one shares with members of one’s community” (p.190). An identity-shifting process would be initiated because of the misunderstandings that are evoked by different cultural logics. Imagine that you are participating in a language correction program. The main object of this program is
to help you remove all “-s” (the plural) in the end of every noun when you speak and write English. How many days, months, or even years do you think you can fully adapt to this kind of speaking style without making any spoken or written mistakes? If you are a native English speaker, extra effort is absolutely needed because you have already used to specify plural and singular when you use nouns in the sentences. How long does it take to change your speaking habit after you’ve already use it for twenty, thirty, or even more than forty years? The process of language learning is not about improving your speaking skills, but about adapting to the values of the host cultures. You have to immerse in a given culture and then you can be able to speak its language naturally; you can use its logic to view the world. Mead (1934) explains his idea on this perspective:

A person learns a new language and, as we say, gets a new soul. He puts himself into the attitude of those that make use of that language. He cannot read its literature, cannot converse with those that belong to that community, without taking on its peculiar attitudes. He becomes in that sense a different individual. You cannot convey a language as a pure abstraction; you inevitably in some degree convey also the life that lies behind it (p.254).

Further, corresponding to the notion of the Sapir-Whorf hypothesis, Christophersen (1973) claims that “nobody can know a language perfectly without associating himself to a large extent with the people who speak it” (as cited in Lamy, 1979, p.24). To further explain his idea, Christopersen states that language influences the minds of those who speak it; consequently, people using different language logic to classify their experiences and have
different world pictures (p.24). In addition, he asserts that “vocabulary of a language is a good indicator of the culture of its speakers, their interests and beliefs and scale of values” (Christophersen, 1973, p.25). In a sense, by speaking different kinds of language; people set the racial boundaries among nations to stress the uniqueness of their own identity. Marx Weber’s (1964) believes that “it is only with the emergence of a consciousness of difference from third persons who speak a different language that the fact that two persons speak the same language, and in that respect share a common situation, can lead them to a feeling of community” (pp. 138-139). To know how people from different geographical areas form different kind of logics to explain the world and how a bilingual speaker gets a new soul when adapt to another culture; the identity formation process during socialization is a vital perspective to understand when answering these questions.

Language and Identity

“Belladonna, n.: In Italian a beautiful lady; in English a deadly poison. A striking example of the essential identity of the two tongues.”

Ambrose Bierce, American Writer, Journalist and Editor, 1842-1914

In the first few years, the process of how a newcomer understands people in the host culture is comparable to completing a jigsaw puzzle. By collecting information piece by piece, eliminating misunderstanding, and trying to explain meaning clearly during
conversation, it might take several years to totally understand the host culture’s members talking and conveying their own thoughts in response to conversations. According to Peirce (1995), “It is through language that a person negotiates a sense of self within and across different sites at different points in time” (as cited in Miller, 1999, p.151). Based on this view, language constructs not only a person’s cognitive schema but also his/her social identity. Moreover, identity can be considered as a mutable process, as says by Ruth Wodak et al. (1999), “It is largely constructed through discourse practices which are continually redefined and negotiated within and outside the communities” (as cited in Carli et al., 2003).

The process of acquiring new linguistic, social and cultural practices has been described by Pavlenko (1998) as “self-translation.” When entering a new culture, a stage of self-transformation would emerge, this is “through discourse necessary for discursive assimilation, in which one is heard and read by others” (as cited in Miller, 1991, p. 151). To further explain how a foreigner adapts to the new environment, Miller continues, “For non-English speaking background speakers, the link between audibility and identity should be understood in the context of the multiple disruptions and discontinuities that have occurred in their lives, and also in relation to ethnicity” (p. 151). Partington and McCudden’s (1992) idea illustrates the difficulties a non-English speaker might go through when they encounter culture shock, they claims: “The great physical distance from the home country, linguistic change, often a change in social status, a disruption in social and family ties, cultural upheaval, and of course new educational, political and social systems”
(as cited in Miller, 1999, p. 152). Nevertheless, sometimes things go worse, as asserts by Farrell (1996), “Language variation has been shown to be potent means of discrimination within institutions” (as cited in Miller, 1999, p. 152). Discrimination that is formed by stereotype and prejudice could bring stress and anxiety to a foreigner, discourage them to speak the second language, and eventually impede the language improvement during the culture adaptation process. Under these kinds of situations, newcomers might briefly show symptoms of communication apprehension. That is, they might lose their confidence to speak the new language and fear conversation with host culture members.

Crabtree (2006) asserts that language competency “implies something about how useful a speaker’s skills are in a given language” (p.44). Symptoms that are caused by language incompetence include five categories: 1) Language problems (i.e., understanding of only the beginning or ending of a message.); 2) Hearing problems (i.e., partial understanding of messages); 3) Problem with speech clarity (i.e., speech being difficult to understand); 4) Fluency disruption (i.e., speech may sound “cluttered” or “jumbled.”); and 5) Voice disorders (i.e., feeling fatigued easily when he or she speaks.) (pp. 45-47). It is until some fluency is achieved that a foreigner can clearly convey his/her inner voice and eliminate the possible misinterpretations. Before this can happen, discrimination poses difficulties for an out-group member of a given culture. Based on the definition that is provided by Klinvex et al. (1999), discrimination is “making distinctions among people; unfavorable or unfair treatment of a person or class of persons” (pp. 16-17). What’s more, they also claimes that “while discrimination is usually viewed as deliberate, it does not
necessarily require malicious intent” (p. 17). Generally speaking, discrimination is often being exhibited in a subtle way. The one who possess prejudices or stereotypes towards foreigners does not usually realize that they are performing an act of discrimination. Dyer (1997) points out a common phenomenon that is usual in the United States today, he states, “Whereas Whites may speak of the race of their friends and colleagues in a friendly and accepting manner, they do not mention the Whiteness of the White people to which they refer…Whites are people, whereas other colours are something else” (as cited in Bahk & Jandt, 2004, p. 59). Following the above notion, McIntosh (1994) labels this phenomenon as “white privilege” (as cited in Bahk & Jandt, 2004, p. 59). Under white privilege, Bahk and Jandt states, “Non-Whites may be much more conscious of White privilege than Whites” (p. 59).

Furthermore, when the time comes, host culture members need to speak to a new arrival, they do not know when they make negative comments regarding his/her language speaking ability or accents; due to the diversity of cultural logics and speaking habits, such problems can not be solved in a short period of time. This is not a problem that a newcomer can solve immediately, because all they need is just more time to practice in order to express a different cultural logic. However, if the newcomer was discouraged in the beginning of cultural adaptation process, he/she might loss the motivation to improve the language skills and this will likely turn an extroverted person to an introverted one.

Similarly, a newcomer’s plight could also occur to a competent bilingual speaker. The mistakes of grammar and pronunciation would be amplified even if there are no
misunderstandings that take place at all. One story involves the way that people misunderstand each other even when the two parties of the conversation are both native English speakers. This story was provided by Striphias (2006); before the story, he asked the readers to consider the actual meaning of “on the up and up.” He indicated that these four words could signify two meanings: “on the level” and “on the increase.” What happened when a couple brings this phrase into their morning conversation? The story goes as follows:

But when [my colleague] asked his wife about it, she said that for her, that was the only thing it could mean. She didn’t know it could mean “one the level.” And what made it odder still was that they’d been married for twenty years, and both grew up in southern California. I had this image of the two of them sitting at the breakfast table. He asks, “Is your brother’s new business on the up and up?” And she says, “No, but he’s making do.” And they go on like that, with neither of them ever realizing that they’re talking at cross purposes (p.237).

In this sense, a stranger has no choice but to accept the negative comments due to a lack of language fluency and proficiency, but only because of his/her nationality. Regarding the strategy that can be applied to cope with discrimination, Peters’ (1997) insists that we do not have to worry too much about discrimination and just get ahead with the job. Most importantly, he encourages the new arrivals to look at the bright side of human beings, suggests that “when you do run into discrimination, it is often unconscious discrimination by someone who would be willing to change if you ask him” (p. 288). Therefore, a
foreigner should not put all the blame on the members of the host culture regarding the delay of his/her language acquisition process. Despite the negative judgment regarding a foreigner’s frequent speaking style; it is also possible that a newcomer would distort the host culture members’ attitudes toward him/her as an act of discrimination. To illustrate, an international student may believe that his/her classmates do not want to talk to him/her because of discrimination. However, as a matter of fact, these classmates may not possess enough experiences and knowledge of how to interact with a foreigner; they are not performing an act of discrimination, they are just simply worrying about being impolite to this international student, because they do not understand his/her culture.

How do foreigners deal with the double misunderstanding of circumstance and finding their voices in a new culture? Is it possible that the newcomers’ voices would gradually fade away when they fail to fit in the host culture? To provide the answers for these questions, the identity-shifting process that is evoked by the course of cultural adaptation should be considered as a critical angle to look at.

*The course of cultural identity-shifting*

*Language learners both lose and reconstruct their identity in the second language.*

James P. Lantolf, professor of the Pennsylvania State University (2000)
In order to develop a well-defined theory regarding the topic of cultural identity study, Gee (1996) devised a model to illustrate three elements that can have impact on cultural identity-shifting process; the original figure of this model is listed as follows:

Identity, Gee argues, is enacted through a three-way simultaneous interaction between: 1) language use, which refers as a particular social language or mixture of them; 2) contexts, which refers to a particular context; and 3) social memberships, which refers to the social or cultural group members that around a newcomer. Based on this model, identity is equal to the notion of “who we are and what we are doing” (as cited in Miller, 1999, p. 152). Any change to one aspect of this model will flow to the other aspects. In other words, each new context will have consequences in terms of social practices, memberships and language acquisition and use.

Moreover, Gardner and Smythe (1975) provide a clearer picture to the same topic.
Their model emphasizes four classes of variables, which are: 1) social milieu, which reflects the cultural beliefs concerning the importance, relevance, assumed determinants of success, and expected results of second language learning; 2) individual differences, which are represented by intelligence, language aptitude, motivation, and situational anxiety; 3) second language acquisition contexts, including both of the formal language training situations, like the language classroom and any other informal language experiences; and 4) outcomes, this variable can be divided into two categories: linguistic and non-linguistic. For instance, linguistic outcomes involve any aspect of achievement in the language, such as the development of some particular linguistic skill, the acquisition of some linguistic knowledge, improved fluency, etc. Meanwhile, the other one is the so-called “nonlinguistic outcomes,” could be referred to any other consequences of the language learning experience, including an interest in using the language, an open appreciation of the other language community and/or other group in general, increased motivation to learn more, etc. (as cited in Reynolds, 1990, pp. 48-49).

Further, from the point of the first language’s impact on the process of second language acquisition in academia, scholars such as Bankston and Zhou (1995) believes that a person who possesses “proficiency in a heritage provides the cognitive benefit of transferring language skills” (as cited in Maloof et al., 2006, p. 258). However, proficiency in the first language is one thing, speaking it overly in a given new cultural environment is another; Krashen (1981) asserts that “the use of the first language has been considered to interfere with the acquisition of the second language“ (as cited in Kim, 1988, p.122). To
clarify this idea, Krashen further explains: “The first-language users are likely to ‘fall back’ on old knowledge when they have not yet acquired enough of the second language” (P. 122). Hitherto, research concerning the topic of the first language’s impact on the second language acquisition is still barren in the field of communication and psychology, because the trend of cultural identity study turned into a focus on the ethnic group affinity at the end of 1970s.

Those who researched the topic of ethnic group affinity believes that the heritage group can help a newcomer in the very beginning; however, if this newcomer spends too much time with his/her heritage group fellows, these members would impede his/her adaptation process in the long run. Milroy (1982) provides an observation regarding the beginning stage of a international student’s need for psychological support, he points out that “a close-knit network structure was an important mechanism of language maintenance, in that speakers were able to form a cohesive group capable of resisting pressure, linguistic and social, from outside the group” (as cited in Kim, 1988, p. 122). To further explain the following stages of cultural confrontation, scholars such as Maloof et al. (2006) argues that the more a stranger emerges into his/her heritage group, the harder it will be for him/her to immerse in the environment of the host culture (p. 258).

Regarding the idea of ethnic group affinity, Kim (1988) made her comments based on her own experiences as an international student in her early years in the U.S. and currently as an international instructor in an academic institution; she claims:

Even though ethnic interpersonal relationships are helpful to new arrivals by giving
them access to information, emotional support, and other tangible material assistance, they may discourage strangers’ direct participation in the host communication processes, and, accordingly, slow down the process of adaptation to the host society (p. 123).

Ideally, it is good for a stranger to have a deep relationship with both groups. However, as a matter of fact, this might not happen. As claims by Gardner and Lambert (1972), a skilled bilingual speaker might feel somehow a loss of belonging to both groups because “bilingualism could be accompanied by deep-seated and vague feelings of no longer fully belonging to one’s own social group nor to the new one he has come to know” (as cited in Lamy, 1979, p. 26). In this sense, Schutz (1964) states that those who internalized another cultural schema of interpretation and expression to the point of being able to use it as the scheme of their own expression would, if one of the other were not opted for, become a cultural hybrid on the verge of two different patterns of group life, now knowing to which of them he belongs (as cited in Lamy, 1979, p. 24). To settle the feeling of uncertain identity, Clark and Gieve (2006) suggests that a foreigner’s new identity is better “shaped by what will be of relevance to new community, which lies in a third place between the cultural practices of home and abroad” (p. 67). As mentioned by Kim (1988), gradually, strangers’ habitual patterns of cognitive, affective, and behavioral responses undergo adaptive transformations. It is through the processes of deculturation and acculturation that some of the “old” cultural habits are replaced by new cultural habits. To further illustrate, she says, “Strangers acquire increasing proficiency in the host communication system, becoming
better able to express themselves and more effectively engage in spontaneous social transactions” (p. 138).

In summation, LaFromboise et al. (1993) believe that there are six skills needed for bicultural competence, which are: 1) knowledge of cultural beliefs and values, including an understanding of the basic perspectives of a given culture; 2) positive attitude toward both groups, in which the individual recognizes bicultural competence as a desirable goal in its own right; 3) bicultural efficacy, it is the belief, or confidence that one can live effectively, and in a satisfying manner, within two groups without compromising his/her sense of cultural identity; 4) communication competency, refers to an individual’s effectiveness in communicating ideas and feelings to members of a given culture, both verbally and nonverbally; 5) role repertoire, could be considered as the range of culturally or situationally appropriate behaviors or roles an individual has developed; the greater the range of behaviors or roles, the higher the level of cultural competence; and 6) groundedness, a person who is successful at managing a bicultural existence has established some form of stable social networks in both cultures (pp. 403-407). By using these six skills, a new identity can thus be shaped in a bicultural (or even multicultural) sphere. There is no need to choose values or logics between the heritage culture and the host culture. A mixed identity will emerge at the end of a cultural confrontation journey; and this new identity would be composed by advantages of both sides.

*Hybridity—an end of the journey*
Life is like an ever-shifting kaleidoscope - a slight change, and all patterns alter.

Sharon Salzberg

Here is the hybridity: A land that signifies an end of the journey. We all live in the 21st century global village. It is inevitable that we have to face the dilemma that is evoked by cultural diversity. To cope with this dilemma, the only rule a foreigner should follow is to embrace the differences. The whole process could be peaceful or restless, depending on various variables that were previously proposed in this research. Gradually, a stranger’s cognitive schema would change; and the way he/she views the world would also be entirely different. For future research direction, two subjects are suggested: 1) the first language’s impact on the second language’s acquisition; 2) how the foreigner’s personality influences the acquisition of the second language. The topic of cultural identity-shifting in the field of communication and psychology is a fertile land for exploration; it holds promise for qualitative researchers because of its nature; but for the lack of significant quantitative studies available limit the credibility of this field, that is, the beauty of hybridity should be represented not only by words, but also in numbers.

Screening for the co-occurring disorders of mental health and substance abuse has been recognized as a best practice (SAMHSA, 2005). Universal screening, however, is far from being a reality. This presentation will be the first public report on the analysis of a newly developed rapid-response screen designed to identify the co-existing disorders of mental health and substance abuse (the AC/OK Screen for Co-Occurring Disorders). The findings are based on the responses of 3,608 people who were screened between June and December of 2006. The participants were seeking treatment from one of four mental health centers, one of three substance abuse treatment providers, or one of two programs that treat people with a co-occurring disorder. The analysis of the data paints a disturbing picture of the treatment experiences for the 1,250 people who presented with the symptoms associated with a co-occurring disorder of mental health and substance abuse. The findings also illustrate the difference 5 minutes can make when it is used to screen for a co-occurring disorder.

The need for better treatment options for people with a co-occurring disorder received critical support when the 2002 National Survey on Drug Use and Health in the United States reported that over 22% of adults with a serious mental illness and those who abuse alcohol or other drugs have a co-occurring problem of mental health and substance abuse. A recent study of 23,000 people, admitted to a mental health or a substance abuse treatment program in Oklahoma, found that some 35% could be diagnosed with a co-existing mental health and substance abuse disorder (See OK-COSIG Year-End Report, 2006 at: http://faculty-staff.ou.edu/C/Andrew.L.Cherry-1.Jr/okcosig_project.htm).

The interest in developing a better infrastructure for treating people with a co-occurring disorder reached a critical mass politically with the report to Congress on Co-occurring Disorders (SAMHSA, 2002). Using the momentum generated by the report to Congress SAMHSA has been able to acquire the money to fund Co-occurring State Incentive Grant (COSIG) projects in 17 states. Hawaii has a COSIG state grant (See: http://coce.samhsa.gov/about/index_right.aspx?obj=7).
To provide increased and upgraded treatment options for people with a co-occurring disorder, one of the first steps is to identify people at risk. Screening is defined as a brief process that collects only enough detailed information to determine if the person needs a full, more sophisticated assessment. The screening process can also provide important information to potential consumers that can assist them in clarifying their own position regarding treatment (Health-Canada, 2002).

One of the major barriers to identifying people with a co-existing disorder has been the cost involved in assessment. This process has typically required two assessments. One assessment focused on mental health disorders. The second focused on substance abuse disorders. To eliminate part of this burden, a rapid-response screen was developed. The AC/OK Screen for Co-Occurring Disorders (Mental Health, Trauma & Substance Abuse) is intended to help determine if the person requesting help needs to be clinically assessed for a co-existing mental health and substance abuse problem.

The process used to determine the psychometric properties of this screen was first to verify that the questions in each of the subscales (mental health and substance abuse items) were conceptually related and if they could be reduced in number. The Factor Analysis Extraction procedure helped answer these questions. The Varimax rotated two factor solution indicates that there are two clearly separate conceptual dimensions and the number of items in the two scales could not be reduced. The factor solution also accounted for 57.25% of the variance among those being screened. Second, Cronbach Alpha coefficients were used as a statistical measure of the internal consistency of each of the two subscales. The Cronbach Alpha for the Mental Health screen was very good ($\alpha = .79$). The Cronbach Alpha for the Substance Abuse Screen was excellent ($\alpha = .89$).

Sensitivity and specificity were examined against the Client Assessment Record (CAR) assessment, the Addiction Severity Index (ASI) assessments, and the Axis I primary and secondary diagnoses (see Table 1). In this population, the AC/OK Screen (which takes five minutes to administer) agreed with the CAR Substance abuse scale in 90.5% of cases that the individual needed to be fully assessed for a co-occurring disorder. The AC/OK Screen agreement with the ASI Psychiatric scale was even more impressive. The AC/OK Screen agreed with the ASI Psychiatric scale in 96% of the cases that the individual needed a full assessment for a co-occurring disorder. Finally, the AC/OK Screen (which takes five minutes to administer) agreed with the DSM-IV diagnosis of a co-occurring disorder in 91% of the cases.

The AC/OK Screen also has a high level of sensitivity. As a result, the subscales produce a fair number of false positives. However, because the intent of the screen was to miss very few people who presented with symptomology associated with a co-occurring disorder, a higher number of false positives are considered acceptable. It is far more costly to miss a person needing treatment than it is to assess a few extra people. In practice, the AC/OK Screen will identify about twice as many people that will need a full assessment than will later be found to have a co-occurring disorder. If the AC/OK Screen becomes part of an intake protocol, 70% of those seeking services will need to be fully assessed for a co-existing disorder.

<tr>
<td><strong>Specificity:</strong> AC/OK Screen Agreement with the</td>
</tr>
<tr>
<td>CAR_sa, the ASI-psy, and the DSM-IV DX</td>
</tr>
</tbody>
</table>
The AC/OK Screen identified approximately 72% of all people screened as needing a full assessment to determine if the person has a co-occurring disorder. This is estimated to be twice the number of people who will be diagnosed with a co-occurring disorder after a full clinical assessment for both a mental health and substance abuse problem.

Although many of the barriers to universal screening for a co-occurring disorder are still intact (training, time involved, cost, and an infrastructure where everyone seeking mental health or substance abuse services is screened), the lack of a rapid response, co-occurring screen that is accurate, takes little training, and is easy to administer—has been eliminated. The statistical analysis of the AC/OK Screen has shown that this screen is highly reliable, valid, very sensitive, and has high levels of specificity.

What difference can 5 minutes make to a person who is seeking help for a co-existing disorder? Determining that a person has a co-existing disorder when he or she first asks for help can save an average of four and a half years of that person’s life. There is over a four year (4.4 yrs) difference in the average age of people in this study seeking treatment in a substance abuse treatment program (32.87 yrs) and those seeking help from a program providing treatment for a co-existing disorder (37.31 yrs). This could be the most valuable 5 minutes in the clinical experience of a person seeking help, considering the costs to the individual and the cost to society when a co-existing disorder goes unrecognized. Qualitative and quantitative findings from this study will be used to illustrate these assertions.

* A paper copy of the AC/OK Screen for Co-Occurring Disorders (Mental Health, Trauma & Substance Abuse) will be provided with Instructions to all participants. A website where an electronic copy of the Screen can be obtained will also be provided.
Individually-tailored health intervention messages have been shown to be more effective in inducing behavior change than "one-size fits all" persuasion and intervention messages. This has been shown in several health-related domains, including smoking cessation, increasing fruit and vegetable consumption, and mammography screening. Also, the degree of tailoring seems to matter as well, i.e., highly-tailored messages were found to be more effective in producing behavior changes than low-tailored messages. The present study examines whether or not the brain responds differentially to various types of health intervention messages, using functional magnetic resonance imaging technique. 24 smokers were scanned in a 3-Tesla fMRI scanner while listening to high vs. low tailored smoking cessation messages. We found that smokers receiving high-tailored smoking cessation messages (compared to low-tailored cessation messages) showed greater medial prefrontal cortex (MPFC) activation, consistent with the role of MPFC in processing self-relevant material. The results of these studies will begin to identify specific pathways for optimal message tailoring to make the largest impact on health behavior change.
Music, a Universal Language: Case of Playing a Classical Thai Song in Jazz Band

A Paper Presented in
6th Annual Hawaii International Conference on Social Sciences
May 30 - June 2, 2007
Waikiki Beach Marriott Resort & Spa,

Title Music, a Universal Language: Case of Playing a Classical Thai Song in Jazz Band

by Mr. Tontao Chuaiprasit
Music is accepted as a universal language by being a universal communication leading to the mutual understanding. It transcends time and any country’s imaginary border. The music of certain region has its own uniqueness since its musical instruments and its style are harmoniously rhymed. Such music can traverse the other side of the globe such as from the Southeast Asia to the West or vice versa. However, when one tries to play a western song with Southeast Asian musical instruments such song may not be truly realized. For example, the bamboo xylophone is invented for playing Thai songs. To use the bamboo xylophone to play a western music style requires a lot of effort to infuse one culture to the other.

Since the world is getting smaller, musicians from different cultures can perform together to create a masterpiece. It will be a challenge for them if they use their own local musical instruments. The bamboo xylophone can be included in a Jazz band and can transfer the eastern spirit to the western music perfectly.

When used to play a eastern music with western style, an eastern musical instrument has to be adjusted in terms of 1) pitch and frequency and 2) ensemble and teamwork. These two characteristics distinguish the eastern musical instruments from the western ones.

Though they are different, since music is a universal language, the eastern musical instruments have to adopt the spirit of the western music completely. This thesis proposes the use of the bamboo xylophone in a Jazz band. The reason why the Jazz band is chosen because it features the drum kit, the electric bass and the electric guitar. It represents modern music.
The following changes are made to the soprano bamboo xylophone so that it can be used to play “Khang Kao Kin Kluay”.

1. The score for each musical instrument is written.
2. The Jazz band is assigned as accompaniment.
3. The soprano bamboo xylophone plays the major part.
4. The pitch and frequency of each instrument is adjusted.
5. The improvisation part of each instrument is assigned.

When the aforementioned process has been carried out, a musician can perfectly translate a classical Thai song into the western style through Thai and western musical instruments. This is considered a true definition of music, a universal language.

College Students’ Evaluations of the Current and Future Effects of Heavy Drinking: The Influence of Drinker and Rater Characteristics

Abstract

Episodic heavy drinking is a highly prevalent and persistent problem for U.S. college campuses; associated negative consequences for college drinkers, non-drinkers, and campus climate have been well-documented. Despite the considerable personal and institutional negative impact of college student heavy drinking, research has shown that most college students do not view heavy drinking, by themselves or their peers, as problematic. This study was designed to investigate factors that influence college students’ perceptions of the positive and negative effects of heavy drinking. Undergraduate students evaluate fictitious persons’ drinking behavior and its effects as described in standardized vignettes. Drinker age, gender, and role (student versus employee) are manipulated using a randomized 2 x 2 x 2 (gender by age by role) between-subjects factorial design. Other than these manipulated aspects of the vignettes, identical wording is used to describe the nature of drinking behavior and negative effects. After reading one of 8 vignettes, study participants generate open-ended responses to queries of what they perceive to be the important: a) positive effects of the person’s drinking now; b) negative effects of the person’s drinking now; c) positive effects of the person’s drinking in the future; and d) negative effects of the person’s drinking in the future. Open-ended responses will be content-coded, and then analyzed to test for potential differences in perceived current and future effects based on the drinker’s characteristics. We hypothesize that study participants will generate fewer current/future negative effects and more current/future positive effects for drinkers depicted as college students than for drinkers depicted as employees, and that a parallel pattern of differences will emerge for drinkers depicted as younger versus drinkers depicted as older in the vignettes. Secondary analyses will then test whether rater characteristics (college student age, gender, current alcohol use, and lifetime alcohol consequences) influence student perceptions of drinking effects. We hypothesize that younger students, heavier drinkers, and those with more lifetime negative consequences of drinking will view the drinking described in the vignette, regardless of vignette type, as having more positive and fewer negative effects. We do not have directional hypotheses about gender but will explore gender effects of both drinker and rater characteristics. Planned study enrollment of 200 students (current N=40; 47.5% male; 90% Caucasian) is scheduled to be completed this semester, with final data analyses available for the conference presentation.

Abstract

Heavy drinking and related consequences present a persistent challenge to college administrators. Prior research has shown that most college students accept much higher drinking levels than experts do when defining a drinking problem. This study was designed to investigate factors that influence college students’ judgments about heavy drinking. Undergraduate students (N=40; 47.5% male; 90% Caucasian) evaluated fictitious persons’ behaviors described in standardized vignettes. Students read one of eight vignettes that described either a male or a female, either 20 years old or 35 years old, who was either employed full-time or enrolled as a full-time college student. Each vignette represented one cell of a 2 x 2 x 2 (gender by age by role) between-subjects factorial design. Other than these manipulated aspects of the vignettes, identical wording was used to describe the nature of drinking behavior and negative effects. By holding these factors constant, responses to the vignettes determine the extent to which college students were influenced by individual and contextual factors when evaluating whether drinking is problematic. Analyses showed that contextual factors, more than demographic factors, accounted for how students evaluated the drinking behavior. Specifically, respondents rated drinking as significantly more problematic when an “employee” was doing the drinking compared with a “student” engaged in the same pattern of drinking, regardless of the age or the gender of the drinker (p<.05). College students rated the employee’s drinking as more in need of intervention, as having more negative effects, and as portending worse outcome in the future (all p’s < .05). Attributions about the employee’s drinking behavior were also rated as more internal and global compared with the student’s drinking (p’s < .05). Implications for future research and practical suggestions for college administrators are outlined. Data on the full sample of 200 students will be included in the conference presentation.

College Students’ Evaluations of Problem Drinking Behavior:  
A Test of the Theory of Reasoned Action

Drinking alcohol to excess is common for many college students. Heavy drinking is associated with academic underachievement and negative social and physical consequences (Hingson, Heeren, Winter & Weschler, 2005). College officials and others often express concern about the impact of heavy drinking on those students who drink to excess and their peers who are not alcohol abusers (Task Force on College Drinking, 2002). Notwithstanding the concern of officials and the fact that heavy drinking college students experience and report negative consequences of their excessive drinking, those college students do not, by-and-large, express concerns about their drinking or drinking’s consequences. Nor do they negatively evaluate their excessive drinking (Colby, Colby, LaChance, Raymond, & Bosack, 2002).

College student evaluations of others’ excessive drinking is not as benign. Indeed, research by us and others indicates that college students are quite critical of parents and professionals who drink excessively after college (Colby et al., 2002). College students may be relatively uncritical of their heavy drinking because of the perceived benefits of drinking while in college: Students report that drinking is an important social facilitator, especially in new social situations. When college students are asked to talk about the benefits and negative consequences of heavy drinking after college they continue to promote alcohol use as a social facilitator. However, as they talk about the prospect of a career and parenting, the potential for excessive alcohol use to cause problems in their lives emerges as a worrisome theme.

Several researchers have reported that the transition out of heavy drinking is likely to be driven by cognitive processes including student’s perceptions of real world exigencies (Schulenberg, O’Malley, Bachman, Wadsworth, & Johnston, 1996). Our recent work corroborates those expectations. Our work also suggests that student’s beliefs about a person’s self-worth can be an important cognitive determinant of drinking patterns. As our prior college cohort noted, it is permissible, even normative, for college students to drink excessively and maintain personal integrity. However, for persons who are parents or career professionals, drinking heavily is a reason for disdain (Colby et al., 2002; Colby, Colby, & Raymond, 2004).

The belief and expectation that drinking will facilitate social relationships in college leads, it would seem, to the decision to drink heavily in college. Expectations about roles and responsibilities after college and the consequences of not fulfilling role responsibilities because of heavy drinking tips the balance toward a decision to drink more moderately after college. This analysis points to a rational (if flawed) cognitive basis for college students to drink heavily or not, and is consistent with the predictions of the Theory of Reasoned Action (Fishbein & Ajzen, 1975).
January 24, 2007

In this study, after we obtained informed consent for participation, we measured student’s assessments of fictitious persons’ behaviors described in standardized vignettes (cf., Alexander & Becker, 1978). A random sample of undergraduate college students read one of eight vignettes that described either a male or a female, either 20 years old or 35 years old, who was either employed full-time or enrolled as a full-time college student. Thus each vignette represented one cell of a completely crossed 2 x 2 x 2 (gender by age by role) between-subjects factorial design. Other than these manipulated aspects of the vignettes, identical wording was used in all vignettes in order to hold constant the nature of: drinking patterns (“about three nights per week, usually four or more drinks per night, sometimes quite a bit more than four”); negative physical effects (“sometimes has trouble remembering things he/she said or did the night before”); negative social effects (“occasionally has arguments with friends after drinking”); and negative effects on role functioning (“too hung over to make it to [classes/work] the next day”). By holding constant the amount of alcohol consumption described and the specific effects experienced, use of these vignettes can determine the extent to which college students are influenced by individual factors (age and gender) and contextual factors (employed versus in college) when evaluating whether drinking is problematic.

Based on recent studies of college students, including our own work, we predicted that the respondents would have more negative attitudes and more negative expectations about the consequences of the heavy drinking when the individual described in the vignette was older, working, and/or female. We further predicted that students’ negative evaluations of drinking behavior would be mediated by the extent to which behavior described within the vignette was perceived to be non-normative compared with “typical” members of the vignette individual’s referent group.

Results

Participants. Planned enrollment for this study is 200 undergraduate students, with an expected completion date of April, 2007. Preliminary data are presented for the first 40 participants. Participants to date include 19 male (47.5%) and 21 female undergraduate students enrolled full-time at a private Catholic college in the northeastern United States. Students were randomly selected from the Registrar’s list using a random numbers table to ensure representativeness of the sample. They range in age from 18 to 22 years old. All participants reported being non-Hispanic, 1 is Native American/Alaskan Native, 2 are Asian/Pacific Islander, 1 is Black/African American, and the rest are White/Caucasian, representative of the college population as a whole. Fifty percent of respondents reported engaging in no paid work during school; on average, students reported working 9 hours per week for pay. Asked to report on alcohol consumption in a typical week, 3 students (7.5%) reported no alcohol use; overall, students reported consuming 0 to 57 standard drinks per week (M = 13.7, SD = 11.5).

Hypothesis Testing. Based on limited power in this preliminary sample, analyses focused on testing main effects of the three independent variables related to the individual described in the vignette: gender, age, and role. Two-tailed alpha of 0.05 was selected a priori to determine significance of effects.
Gender. Independent t-tests were conducted to test whether student respondents evaluated drinking and consequences differently based on whether the vignette described a male or female. No significant effects were found for any of the dependent variables.

Age. Independent t-tests were conducted to test whether student respondents evaluated drinking and consequences differently based on whether the vignette described a 20 year old or a 35 year old. Students judged the 35-year-old’s drinking to be significantly more non-normative compared to his/her referent group (“typical” 35 year olds of the same gender and role as described in the vignette) than the 20-year-old’s drinking behavior, \( t(37) = -2.42, p < .05 \). Students estimated the 35-year old in the vignette to exceed his/her referent group by 10.7 drinks per week (SD = 8.7) on average, while the 20-year-old was estimated to exceed his/her referent group by 4.6 drinks per week (SD = 6.8) on average.

Role. Independent t-tests were conducted to test whether student respondents evaluated drinking and consequences differently based on whether the vignette described a full-time employee or a full-time student. Numerous significant effects were identified, with students judging the employee’s drinking more harshly than the student’s (identical) drinking.

Compared to the student’s drinking, the employee’s drinking was seen as more problematic, \( t(38) = -2.30, p < .05 \), as more in need of intervention, \( t(38) = -2.67, p < .05 \), and as having more negative effects now, \( t(38) = -3.42, p < .01 \). Regarding expectations for the future, respondents expected the employee’s drinking to lead to more negative effects in the future than the student’s drinking, \( t(37) = -2.49, p < .05 \), and believed it would be more difficult for the employee to change his/her drinking in the future compared with the student, \( t(38) = -3.73, p < .01 \).

In making attributions as to the cause of the drinking behavior, respondents rated the student’s drinking as being the result of more external (environmental) factors compared with the employee, whose drinking was more likely to be attributed to internal (personal) factors, \( t(38) = 3.38, p < .01 \). Respondents also rated the employee’s drinking as having more global effects (i.e., affecting all areas of his/her life) than the student’s drinking, \( t(38) = -2.23, p < .05 \).

Discussion

This study used standardized vignettes to test the hypothesis that college students evaluate drinking behavior and related consequences based, in part, on characteristics of the drinker and the context of the drinking behavior, independent of the amount of alcohol being consumed or the specific consequences being experienced. Two individual characteristics of the drinker (gender, age) and life context (employee vs. student) were manipulated while drinking patterns and consequences were held constant. Preliminary analyses found that contextual factors accounted for how respondents evaluated the drinking of an individual more than demographic factors. Specifically, respondents rated drinking and consequences as significantly more problematic when an employee was
doing the drinking compared with a student engaged in the same pattern of drinking, regardless of the age or the gender of the drinker. College students rated the employee’s drinking as more in need of intervention, as having more negative effects, and as portending worse outcome in the future. Attributions about the employee’s drinking behavior were also rated as more internal and global compared with the student’s drinking.

These findings enhance our understanding of prior research that has consistently shown that acknowledged pervasive heavy drinking and serious negative consequences among college students do not lead to problem identification or treatment-seeking for college students or their peers. College students have been shown to accept much higher drinking levels than experts do when defining a drinking problem in a peer, and a substantial minority resist labeling even very dangerous behaviors as indicative of a drinking problem (Posavac, 1993). The current study is the first to demonstrate that the potential reason for the discrepancy between expert and student ratings is the contextual factors that students are taking into account when making judgments. While experts focus on alcohol use patterns and number and severity of consequences experienced when making clinical, diagnostic judgments, students appear to weigh these criteria in the context of an individual’s life circumstance. College student drinking is seen as environmentally driven, having less pervasive effects, and being easier to change in the future. The quantitative findings from this randomized experiment are consonant with our prior qualitative findings that college students view college years as a “time out” from real-world responsibilities. Within that context, behavior and consequences that would ordinarily be judged as unacceptable are considered acceptable. Our focus group findings suggested that this evaluation was not specific to drinking but rather extended to risk-taking generally (Colby, Colby, & Raymond, manuscript in preparation). Students contended that one could take risks during college that would be unacceptable afterward because in college effects of risk-taking would only affect the individual, whereas after college effects would potentially impact a broader network of people (spouse/partner, children) and/or present a serious threat to career success. Indeed, students articulated rather elaborate decision rules for when behavior and consequences (including alcohol-related behavior and consequences) “mattered” or didn’t; all of these centered around the extent to which one’s transition to adulthood and the “real world” of career and family had been completed.

The current findings advance the field of college student drinking in providing additional insight into student resistance to changing drinking despite negative consequences. The methodology used also provides a paradigm that could be used to evaluate college student decision making and judgments related to other aspects of alcohol use and other risk-taking behaviors. For example, future studies could establish which specific types of consequences, and at what level of severity, greater levels of concern are elicited from college students related to college student drinking.

In terms of what these findings mean for college administrators, several conclusions can be made. First, it is essential for college administrators to understand that many college students perceive their college years to be a time out from the real world. Students see
January 24, 2007

college drinking as a right of passage, and heavy drinking to be developmentally
appropriate and the norm on campus. Our current findings showed that it does not appear
to be the students’ age so much as the context of college life that accounts for
permissiveness toward heavy drinking. This is consistent with epidemiological data that
show college students tend to be heavier drinkers than same-age peers not attending
college (Substance Abuse and Mental Health Services Administration, 2005).

Logically, one might reasonably argue that making college more similar to the real world
may lead students to change how they evaluate drinking and other risk behaviors that
occur in college. If so, this is the challenge to college administrators: How can we
fundamentally change student perceptions of college? We propose the following
suggestions and hope to evoke a discussion of others:

Students defend engaging in risk behaviors, including heavy drinking, during college
when they are responsible only to themselves. Students are less accepting of heavy
drinking after college if that drinking will impact negatively on one’s family or employer.
Thus, increasing students’ responsibility to others may reduce risk taking. One way to
accomplish this is through meaningful volunteerism in the community outside campus
boundaries. In fact, college campuses with higher rates of volunteerism have lower rates
of binge drinking than colleges with lower rates of volunteerism (Weitzman & Kawachi,
2000). Interestingly, this is not a finding at the individual level (e.g., # hours volunteered
by an individual student is not closely linked to how much that student drinks). Rather, it
is a finding at the campus level, suggesting that campuses with large numbers of
volunteering students may have a campus culture that is inconsistent with maintaining a
norm of heavy student drinking.

Students consider consequences on class performance as less important than
consequences on work performance; moreover, they perceive little connection between
classroom learning and future career applications (Colby, Colby & Raymond, 2004).
One strategy that could be employed by instructors is to make classroom learning
conditions more similar to “real-world” work conditions. For example, students suffering
from a prior night’s drinking can get by in class when inactivity in class is
inconsequential. The use of active learning strategies better approximates work
conditions by requiring consistent student participation for achievement. Similarly,
career-related internships build skills that students perceive as relevant to future career
success.

Finally, adults may unintentionally contribute to perceptions about college being
students’ last opportunity to have a good time before transitioning to the stressors and
responsibilities of the real world. Students in our focus group study quoted comments
from parents and classroom instructors that legitimized heavy drinking in college (Colby,
Colby, & Raymond, 2004). Thus, a relatively simple strategy would be to inform faculty
and parents about the impact of comments that promote widespread heavy drinking.
Raising consciousness about such comments may serve to limit them, so as not to
reinforce the perception that heavy drinking among college students is acceptable, even
expected.
January 24, 2007

Limitations. Conclusions based on this study must be considered within the context of several limitations. First, the data collected for this study were drawn from a representative sample of undergraduate recruited from a private Catholic college in the Northeastern U.S. with a largely Caucasian student body. Findings will not necessarily generalize to all college campuses. Second, the current sample size (N=40) is small. While large enough to detect numerous significant main effects, the current sample is insufficient to conduct formal mediation analyses or to test interaction effects. The planned sample size is 200 which we anticipate obtaining by April 2007. Another consideration is our decision to use standardized vignettes. The use of vignettes is widespread in social sciences research and, as this study demonstrates, has the advantage of enabling the researcher to manipulate certain variables while holding others constant. They can be particularly useful for determining factors that influence attitudes and decision making. However, how students respond to a written vignette does not necessarily reflect how they would respond to a real-life situation. In the case of the current study, convergence between our findings and prior research using other methodologies supports the validity of the current methodology.

Abstract: For the past several years the Department of Psychology at Texas Christian University (TCU) has been experimenting with a variety of motivational activities that could be used for the treatment of probationers receiving substance abuse treatment. These experiments, conducted as part of the CETOP project (Cognitive Enhancements for the Treatment of Probationers) [1] have involved the design and development of a variety of motivational games and activities used to improve early treatment engagement for probationers and an examination of each treatment’s corresponding differential effects on males and females.

To date, upper-division computer science students from the TCU Department of Computer Science have automated two of these activities. One such activity, “Downward Spiral” [2] (a board game similar to the game of Life®, but with the squares laid out as a spiral) is shown in Figure 1. A second, “Under Construction” (a four-part series of activities designed to motivate participants to effect changes in their lives) will be the focus of this paper.

Key words: psychology, self-esteem, computer science, substance abuse, probationers.

I. INTRODUCTION

Motivating people to initiate and sustain personal change is an exceedingly difficult undertaking [3,4]. “Although people have a vast capacity for personal change, they often do not do
it, even when well aware of the benefits.” [5] Motivational interviewing is one way to facilitate and foster personal change in an individual [6]. A second, promising approach has involved the use of motivational games and activities. To this end, the TCU Department of Psychology has worked to develop a variety of strength exploration activities for the purpose of motivating individuals (substance abusers) to undertake personal changes through self-exploration and self-regulation [7,8]. The purpose of these activities is to allow participants to better understand their strengths and weaknesses and to see how their strengths can be used to accomplish positive personal changes in their individual lives.

Many individuals have undertaken behavior changes only to suffer relapses – frequently after only very brief periods of time. To be truly successful, behavior change requires continual commitment and requires considerable time and energy. Behavior change is typically regarded primarily in terms of getting started — having long been recognized that meaningful changes must “come from within.”

As already mentioned, many individuals have the capacity to effect changes in their personal lives, yet fail to do it — even knowing the benefits. Research has shown that successful change requires:

1. Awareness of a need (or benefit) of changing,
2. Thinking about what one needs to do to make it happen,
3. Engaging in behavior directed toward the intended change (or goal), and
4. Maintaining this change over time [9].

Effective use of self-exploration and self-regulation plays a large role in an individual’s success in each of these areas. “Since both inappropriately high self-esteem and poor self-esteem have been shown to be problematic” [9], the TCU Psychology Department has worked to create a variety of engaging, mood enhancing, and self-esteem "calibrating" activities. One such activity,
“Downward Spiral” (see Figure 1), was designed to address the inappropriately high self-esteem problem by illustrating the downward spiral that an individual’s life can take when poor choices are made. A second activity, “Under Construction”, was designed to address the problem of low, or inappropriately high, self-esteem by allowing a participant to modify their self-esteem by making an assessment of personal resources and then by selecting areas of desired improvements [10].

II. UNDER CONSTRUCTION

“Under Construction” [11,12] was designed as a series of four interconnected activities/components (“The Tower of Strengths”, “Parts of You”, “Building Block Quotes”, and “Putting It Together”). The overall activity was designed to facilitate the development of a personal inventory of strengths while maintaining a perceived need for change. As mentioned earlier, it has been used primarily as a part of a set of activities to motivate clients in a mandated substance abuse treatment facility. However, the tool has utility in any setting where it is necessary to calibrate self-esteem and encourage people to use their strengths to make positive personal changes. This includes a wide diversity of treatment areas and includes both academic and business settings (such as career counseling and team building). Although it was designed as an adjunct to substance abuse treatment, “Under Construction” would also be useful in other clinical areas such as the treatment of eating disorders, alcohol abuse, compulsive behavior, and avoidance of unsafe sexual practices.

In particular, “Under Construction” includes activities that have been designed to:

1. Facilitate self-exploration into personal resources that individuals have (e.g. strengths, skills) or resources they can work on developing.

2. Facilitate self-regulation so that individuals can determine where they are now, where they want to be, and to develop personal goals for personal change.

3. Bring about an increased awareness of personal resources and/or strengths of individuals in an attempt to increase motivation and enhance self-efficacy.

As a stand-alone exercise, “Under Construction” is a four-part pen, paper, and board game activity that includes the “Tower of Strengths” (a self evaluation task in which individuals select strengths they have and strengths they desire), ”Parts of You” (another strengths assessment tool),
“Building Blocks” (selection and generation of motivational quotes that will help individuals focus on desired strengths), and a “Putting It Together” map (which clients can use to see how to apply their strengths and quotes to resolve a personal problem).

During the past several semesters, the TCU Department of Computer Science has collaborated with the Psychology Department and the TCU Institute of Behavioral Research (IBR) to create computerized versions of both “Downward Spiral” [13] and “Under Construction”. The purpose was to produce computerized versions that would be easier to distribute since all of the content for the games and their forms would be packaged as separate computer applications recorded to a compact disc (as opposed to their original physical form). The second advantage to having both activities in computer format is the greater maintainability and storage of data garnered from their use in rehabilitation centers. Rather than having to keep track of a large amount of paperwork and game pieces, all information needed for playing either game, completing the forms and processing the results is contained in an attractive virtual format that greatly mitigates the burden placed on rehabilitation administrators. Finally, it is important that various activities in each game be performed in a specified order. The computerized version of both games ensures that the “rules of the games” are followed; whereas previously a councilor/monitor was required to prevent cheating. Figure 2 shows the first window that an “Under Construction” user sees on “startup”.

A. The Tower of Strengths

“The Tower of Strengths” provides a method to take inventory of existing personal strengths and those that are desired. The activity involves identifying existing strengths from six different dimensions of self (Social, Thinking, Health/Performance, Emotional, Motivational, and Life View), as well as selecting strengths that the individuals would like to gain or develop. It is a self-evaluation task that asks an individual to select 10 strengths (from a list of 60) of which the person already possesses (existing strengths) and 5 desired (yet to be achieved) strengths. Based on these choices the individual fills
out the “Tower” map, and processes the chosen strengths more fully by considering what “Parts of You” the strengths came from and when in the past the strengths were useful. Figure 3 shows a sample of a filled-in “Tower of Strengths” map (which may be printed by the participant in order to allow discussion with a counselor).

B. Parts of You

In this activity (see Figure 4), participants choose what they believe to be the category of strengths in which they are strongest and weakest. Once this is completed, participants are then shown which categories they are truly the strongest and weakest in based on their responses to the Tower of Strengths form. Following this, the participant moves on to Building Block Quotes.

C. Building Block Quotes

In this activity, clients are instructed to make selections from a list of Building Block Quotes (each of which is intended to be pro-social and potentially useful both during and following treatment). Clients are instructed to choose quotes that will remind them to use their existing strengths or gain ideal strengths. They are encouraged to choose motivational quotes as a memory technique to allow them to focus on positive changes they would like to make (i.e., either gaining new strengths or setting new goals). The computerized version displays 100 quotes and allows the participant to pick four of them (a mechanism is also provided allowing the participant to insert his or her own quote). At the conclusion, the four selected quotes are displayed on the screen (or alternatively printed out). This interaction is illustrated in Figure 5.
D. Putting It Together

The overall “Under Construction” activity concludes with a Putting it Together worksheet used to help clients visualize how to apply their strengths and quotes to solve problems. In this module, participants choose a problem (or goal) to accomplish from different categories of problems/goals.

The client is then directed to choose one of their previously defined strengths (as specified in the Tower of Strength activity) and describe, in their own words, how the strength could be used to solve the problem or to achieve the goal just selected. The participant is asked to picture how that strength could help solve the problem or help reach the goal, and is then instructed to write about what he or she has pictured. Additionally, participants select which quote chosen in the Building Blocks module would help in the selected problem/goal and describe how this could be accomplished. As with the preceding activities in “Under Construction”, participants are guided through the process of filling out the forms in a prescribed order. In addition, as with other components, a mechanism is provided to print out the final form in order to facilitate discussion with a counselor. Figure 6 illustrates the final Putting It Together process.

Figure 5. “Building Block Quotes”

Figure 6. “Putting It Together”

III. SUMMARY

Although “Under Construction” was designed as a set of activities, the four components can be used separately. Members of the TCU Psychology Department believe that “The Tower of
Strengths” along with “Parts of You” would be appropriate mood enhancing and self-esteem boosters. The “Building Blocks Quotes” are also an enjoyable activity that blends nicely with the idea of positive affirmations, and “Putting It Together” gives participants the opportunity to practice using strengths and quotes on problems or goals. It can be used separately from the other activities, if participants have done some other type of strength and quote-based activity. Because of this requirement, it is the most difficult to implement by itself.

While the computerized version of “Under Construction” appears to have good “face” validity in terms of its correspondence to the original version, empirical tests of its effectiveness have yet to be conducted. However, given the success of the original version we are optimistic that the computerized version will maintain its effectiveness while facilitating transfer, distribution, and actual use of the intervention in treatment programs targeted to increasing a person’s self-esteem. Experimentation on the computerized version is expected to be initiated with college students in a coming semester. We believe that the computerized version will be rated as very engaging, and similar to earlier research with the pen and paper version, and that it will lead to increased internal motivation for change of clients receiving substance abuse treatment.

Many of the anticipated benefits of having a computerized version of “Under Construction” can be classified as improvements in the game’s management or improvements in its effectiveness. A major management benefit has been in the distribution and maintenance of the game. With the automated version a potential user could easily download a free version of the software from a server. Additionally, updates, such as new quotations, sounds, and images, can be handled in a similar fashion.

Abstract

The present study examined the psychological effects of racism on Asian and Pacific Islander Americans (APIs). Racial identity theory was used to examine how members of various API ethnic groups may be differentially impacted by racism and racism-related stress. Results from this study indicated that the generalized, stereotypical notion that all APIs are free of racism and devoid of mental health risks may not always hold true. Some APIs appear to experience racism in ways indicative of higher distress levels and decreased psychological functioning. The findings of this study may offer clues on how racism and racial discrimination differentially impact APIs and provide implications concerning mental health services, research, and institutions catering to the API community.
AFRICANS IN AMERICA: TESTING THE APPLICABILITY OF THREE MIGRATION THEORIES *

Topic Area: Sociology

Presentation Format: Paper Session.

AFRICANS IN AMERICA: TESTING THE APPLICABILITY OF THREE MIGRATION THEORIES

ABSTRACT

Data from the 2000 population census is used to assess how well three theoretical arguments account for differences in earnings among self-identified Black and White Male and Female “persons of African Origins” (African-Americans, African and Caribbean immigrants) in the United States. Findings of the study suggest that selectivity and cultural explanations are weak, and, insofar as the findings pertain to demand side arguments, the two immigrant groups appear to reap no advantage as they should according to theory. By contrast, the evidence indicate that race and gender, net of other variables such as education and nativity, are powerful predictors of earnings. Implications of the findings on the current debate on the continuing significance of race and gender for socioeconomic attainment in contemporary U.S. society are discussed.
AFRICANS IN AMERICA: TESTING THE APPLICABILITY OF THREE MIGRATION THEORIES

While the enduring significance of race and gender for socioeconomic attainment in the United States continues to be debated (Farley 1984; Wilson 1989; 1980; Jacobs 1989; Roos 1990; Tomaskovic-Devey 1993; Cancio, Evans, and Maume 1996), recent studies on the migration experience of black immigrants in the United States appear to suggest that both remain important variables for success in contemporary U.S. society (Butcher 1994; Corra under review; Dodoo 1991a-d, 1997; Kalmijn 1996; Model 1991, 1995). For example, in exploring “race differences in earnings between black and white Africans in America,” Dodoo and Takyi (2002) report “sizeable differences among immigrants who have relatively similar human capital.” (P. 913). They find that “Whites have annual earnings 80 per cent higher than their black counterparts, and the gap in hourly wage is almost 48 percent.” Notably, they report that “more than half (53 per cent) of the race difference in wages remains unexplained by earnings-related attributes such as education, occupation, and hours worked.” (Dodoo and Takyi 2002: 913). More recently, Corra and Kimuna (under review) found sizeable earnings difference between Black Males and Females (both immigrant and native-born) with similar levels of human capital.

By focusing on black immigrants in the United States, that research further highlights the added significance of immigrant status to the effects of race and gender on socioeconomic attainment in the U.S. and suggests that African immigrants fare worse than other immigrant groups in the United States. Dodoo’s (1997) study of the earnings attainment of male African-Americans, African and Caribbean immigrants in the U.S. labor market, for example, revealed
Africans initially indicating average hourly earnings that were higher than both Caribbean immigrants and native-born blacks. Controlling for “relevant earnings-related endowments,” however, revealed that “the African earnings advantage is erased and the Caribbean earnings is elevated above those of the African immigrants and the native-born blacks” (p. 527). Notably, Dodoo finds “a substantial African (but not Caribbean) disadvantage, wherein university degree holders … receive little, if any, reward for their degrees” (1997: 527).

Surprisingly, however, after more than a decade of research, much of the literature on black immigrants in the United States remains limited in scope. This is so because previous studies have either exclusively focused on one of the three noted main explanatory variables (immigrant status, race or gender) or only included a second as a proxy measure (See Corra under review; and Model 1991 for exceptions). In fact, relatively little research has treated gender as a main explanatory variable. And, for those that focus on immigrant status and/or race as main explanatory variables, analyses have frequently been limited to the experience of males (See Model 1995 for an exception): The attainment of African and/or Caribbean male immigrants, for example, compared to those of native-born blacks (Butcher 1994; KALMIJN 1996; Dodoo 1997); or immigrant black males compared to their white counterparts (Dodoo and Takyi 2002).

It follows that, while the effects of race, gender, and immigrant status on the earnings attainment of black immigrants in the United States (as compared to their native-born counterparts) have been previously studied, relatively little research has investigated the influence of the three jointly. Here I bring the three together by investigating the earnings attainment of self-identified black and white Male and Female African immigrants in the United States, their Caribbean counterparts, and native-born African-Americans.
Because migration theories suggest an immigrant advantage for the two immigrant
groups (Glazer & Moynihan 1963; Lewis 1983; Sowell 1978, 1981; Butcher 1994; Chiswick
1979; Foner 1985; Hossfeld 1994; Waters 1994a), I begin with a review of theoretical
explanations of the basis of such immigrant advantage in the section to follow. I then describe
the study and report its results. I conclude with theoretical and practical implications of the
findings and suggestions for future research.

THE IMMIGRANT ADVANTAGE: SOME THEORETICAL EXPLANATIONS

Traditional functionalist and human capital theories propose that familial and individual
resources are major determinants of individual skills, occupational attainment and labor market
earnings. Yet, despite the substantial evidence in support of this proposition, once relevant
human capital variables are controlled, immigrants and natives still typically exhibit differences
in earnings and related measures of socioeconomic attainment. The residual effect of group
membership as such has generally been attributed to one of three phenomena: The selectivity of
migration, premigration cultural legacies of country of origin, or differential treatment in the host
country (hereafter, demand-side). As discussed below, each of these three perspectives has some
relevance in delineating the attainment of “persons of African origins” in the United States (as
defined above). In the three subsections to follow, I review, albeit briefly, each of these three
theoretical perspectives.

Selectivity of Migration

Proponents of “Migration selectivity” argue that persons who migrate have markedly different
qualities from those who do not. The initial assumption was that migrants (especially economic
migrants) were more ambitious, diligent, and motivated than their non-migrant counterparts. It
follows that if traits are evenly distributed, then, on the average, persons who migrate ought to
exhibit more positive traits than those at the point of origin and at the point of destination.

More specifically, the selectivity perspective attributes immigrant success to a human capital advantage, which is said to be traceable to “migration selectivity” (Chiswick 1979; Butcher 1994). Migration selectivity is the proposition that migrants generally constitute a highly selected group, with positively valued traits that make them highly marketable in a competitive labor market. In turn, these favorable attributes are said to translate (after a period of adjustments) into post-migration success (Chiswick 1979).

In the case of black migrants in the United States, the most frequent comparison has been that between Caribbean immigrants and native-born blacks (Butcher 1994). Drawing on the selectivity thesis, for example, both Harrison’s (1992) and Waters’ (1994a) statistical analyses show a relative advantage in attainment for Caribbean immigrants over their native-born African-American counterparts.

Extending the selectivity thesis as such to African immigrants, one testable hypothesis is that Africans who immigrate to the United States are an even more selective group than Caribbean immigrants (Dodoo 1997). Given the duration and cost of their migration, both of which point to a greater likelihood of selectivity, African immigrants should exhibit greater levels of selectivity than their Caribbean counterparts.

Yet, as indicated above, some researchers have found, at least for males, an African immigrant disadvantage in earnings relative to Caribbean immigrants (Dodoo 1997). Since much of that research has almost exclusively focused on males, however, the place of gender as a main explanatory variable remains unclear.

Furthermore, some scholars have argued that recent immigrant flows from developing countries to the United States are of a poorer stock than their earlier counterparts (Borjas 1985);
and, consequently, have a reduced chance of success in a competitive labor market like that of the United States. Proponents of the “poorer stock” of recent immigrants from developing country argument point to the 1965 “family reunification and refugee act: The U.S. immigration law that encouraged family and refugee-based migrations; which, it is argued, give way to less positively selected migrants with reduced chances of success in the U.S. labor market (Borjas 1985). Borjas, for example, points to the lower “duration of stay effects” of more recent immigrant groups as an indicator of waning immigrant quality as such.

Dodoo (1997), however, argues that the case of African immigrants might be particularly different in this respect. He notes that “Although much of the African immigration to the United States has occurred since the passage of the 1965”“family reunification and refugee” law, it has spawned one of the highest educated of all migrant streams to America.” And that “immigrant” quality” has remained high despite increasing refugee activity on the African continent.” (P. 528).

Not withstanding Dodoo’s observations, however, his own research (1997) has found an African male immigrant disadvantage in earnings as compared to male Caribbean immigrants. Again, a question for the current study is the place of gender in this respect; and how each of race, gender, and immigrant status independently influence the process of attainment among the three groups of African origins as identified above.

**The Cultural Argument**

Proponents of the cultural perspective pose that migrating groups differ markedly in their cultural value-orientations. Some cultures nurture individualism, industriousness, commercialism, and the like, while others foster collectivism, familism, etc. These differing cultural value-orientations are said to manifest themselves into differing attitudes toward family,
education, work, and relocation itself (Sowell 1994).

From the cultural perspective, therefore, differing pre-migration cultural value-orientations among groups as such are said to be crucial determinants of post-migration group outcomes. Individuals with pre-migration cultural values that emphasize commercially useful traits, the argument goes, succeed more than those that do not. Hence, group post-migration outcomes are said to be attributable to pre-migration cultural legacies.

Some scholars, for example, note that some nations with a predominantly catholic orientation discourage business and commercialism (Sowell 1994). By contrast, some have praised the value-orientation of Catholicism (Greeley 1976).

Extending the foregoing to the labor market experiences of Blacks in the United States, some have argued that differences between black immigrants and their native-born counterparts are due to cultural factors, both historical and contemporary, which favor immigrant success (Glazer & Moynihan 1963; Sowell 1978, 1981; Lewis 1983). Such scholars attribute the relative success of Caribbean immigrants in the U.S. labor market, for example, to a purported greater achievement-orientation and work ethic; both of which are ascribed to their socialization in a favorable cultural environment--one in which they were the racial majority.

Again, a central question for the current study is whether or not the cultural argument holds true for African immigrants. In light of the reasons given for the professed success of Caribbean immigrants (socialization in a society where they were the racial minority and one free of the legacies of a U.S. style slavery), African immigrants should equally (if not more) exhibit the psyche of achievement orientation purported to be present among Caribbean immigrants. In comparison to Caribbean immigrants, African immigrants are from a cultural environment with greater racial homogeneity than Caribbean immigrants.
**Demand-Side Arguments**

Demand-side arguments attribute group differences in attainment to differential treatment in the host country. Some groups are desirable by members of the host country and others are not. Hence it is the differential treatment of members of groups as such that determine group outcomes.

Queuing theory, for example, conceives the labor market as an imaginary line of potential workers, arranged in such a way that members of the most desirable group are at the beginning of the queue and members of the least desirable are at the end (Hodge 1973; Lieberson 1980). Desirability may be a function of a number of social attributes, including race, nativity, and national origin. Gender is not a factor in the queue because men and women are assumed to occupy separate queues.

- “Queuing, or the relative position a group holds in the eyes of employers, comes to the fore when otherwise similar workers compete for the same reward. Employers are expected to give first preference to members of the group they esteem the most, moving down the queue as the supply of more favored groups dwindles … In a single labor market at a single moment in time, queuing is simply a way of describing the amount of discrimination or favoritism particular groups encounter.” (Model 1997:540).

From the discrimination/demand-side perspective, then, the so called “success” of Caribbean immigrants in the U.S. labor market is said to be due to a purported favorable perception that whites and employers have of immigrants as persons with “good” work ethics (Foner 1985; Hossfeld 1994; Waters 1994a).

Do Africans also benefit from this purported favorable impression of immigrants? Or are there other stereotypes of African immigrants that out-weigh such so called “favorable employer
impressions” of immigrants over native-born workers? Indeed, there is some evidence that suggests that African immigrants believe they face substantial discrimination (Scroggins 1989; Takougang 1995; Apraku 1996). While the extent of such discrimination is yet to be known, “It is not inconceivable that Africans may be received differently, and perhaps less favorably, than both Caribbean and American blacks.” (Dodoo 1997:530). Likewise, given the history of race relations in the United States, it is equally conceivable that black immigrants will be received less favorably than their white counterparts from the same region of origin. In fact, as noted above, at least one study found a race disadvantage for black immigrant males (Dodoo and Takyi 2002) and a second found that to be true for both Males and Females (Corra under review).

**HYPOTHESES**

Several hypotheses can be drawn from the foregoing discussion, including the four tested below:

Hypothesis 1: The earnings of the two immigrant groups will be significantly higher than those of their native-born counterparts.

Hypothesis 2: The earnings of African immigrants will be significantly higher than those of their Caribbean counterparts.

Hypothesis 3: The earnings of males will be significantly higher than those of their female counterparts.

Hypothesis 4: The earnings of whites will be significantly higher than those of their black counterparts.

**DATA AND METHODS**

This section describes the data and measures used for the analysis to follow. The data are taken from the 2000 census of the U.S. population: With the sample consisting of self-identified black/white African immigrants, their Caribbean-born counterparts, and native-born African
Americans included in the five-percent Integrated Public Use Microsamples (Hereafter, IPUMS), who were employed in 1999, were within the age range of 25-64 years, were not enrolled in school, and who reported positive annual earnings.

The selection of the two immigrant groups (African and Caribbean) for the study included self-identified black/white respondents who noted their birthplace in any of the African and Caribbean countries, respectively, stipulated by the census. The African American component of the sample includes those who identified themselves as black or white, were born within the United States to American parents, who do not report a specific country other than the United States as their ancestry. Following Dodoo (1997), the African-American sample was further restricted to a ten-percent sample, randomly drawn from the five-percent IPUMS (In contrast to Dodoo’s analysis, however, this restriction was only limited to the descriptive statistics presented in Tables 1&2; the multivariate analysis included the entire African-American sample in the 5% IPUMS). The resulting reduction of the number of African-Americans in the sample brings that number closer to per with those of the other two groups.

With the foregoing restrictions, the study sample includes 48,187 African Americans, 32,352 African immigrants, and 31,361 Caribbean immigrants. Of these, 5,494 indicated that they were white, 106,406 indicated that they were black, 53,128 were males, and 58,772 were females.

Variables

The study uses multivariate analysis to assess variations in logged hourly earnings, with three main explanatory variables: Following Dodoo (1997), a three-category “group-origin” variable

---

1 Much of the analysis below follows Dodoo’s (1997) and Dodoo and Takyi’s (2002) analyses, which examine the earnings attainment of black males and black and white males in the United States, respectively. The current study endeavors to somewhat replicate these two studies with the addition of black and white females. Hence, much of the variable selection and method for the current study followed the two analyses therein.
(African-American, African Immigrant, and Caribbean immigrant), created from the original census ancestry variable, delineates respondents’ migration status. The other two main explanatory variables were Respondents’ race and gender. Measures of human capital, spatial location, marital status, and respondents’ year of immigration to the United States (if not native-born) were the other independent variables. The human capital measures include respondents’ years of schooling, their labor market experience, their English language proficiency, and a dummy variable measuring whether or not respondents have a college degree. The spatial location variables include a binary metropolitan/nonmetropolitan variable and region of residence—west, Northeast, Midwest, and South. In light of previous research suggesting employer preference for married employees (Roos 1990), a dummy variable controls for marital status. Finally, paralleling Dodoo’s (1997) analysis, a five category variable controls for period of migration to the United States—Post 1990s, 1985-90, 1975-84, 1965-74, and pre-1965. Each of these variables has been previously linked to the earnings of our selected groups (Butcher 1994; Dodoo 1991a-d, 1997; Dodoo and Takyi 2002; Kalmijn 1996; Model 1991, 1995; Roos 1990).

Characteristics of Sample

Table 1 presents the variables described above and characteristics of the sample, as defined by those variables.

[Table 1 about here]

As indicated in table 1, the selected sample was predominantly Southern and Northeastern residents, with Southern residents constituting about half of the sample (49.77%) and northeastern residents constituting just under a third of the sample (27.28%). By contrast,

2 Following Dodoo, potential experience (age minus years of schooling minus six) and its squared term are proxies of labor market experience (Mincer 1974).
about 10% (9.92) lived in the West and a little over 13% (13.03) lived in the Midwest. Furthermore, individuals in the selected sample were clearly metropolitan residents. Over 90% (90.14%) of individuals included in the sample were metropolitan residents. A greater number were single (50.84%) and female (52.64%), whereas most indicated being black (95.009%). The mean, median, and modal age of the sample all hover around 40-42. Looking at their migration pattern, most immigrants clearly migrated to the U.S. in the 1990s; with almost 80% migrating to this country during that time period. By contrast, very few immigrants migrated to the U.S. prior to 1965 (about 1.06%); with the combined migration to the U.S. from pre-1965 to 1990 being less than 20%.

Exploring the human capital measures reveals mean years of education of 12.76, which is a little less than the median and modal years of schooling of 12. Almost 20% of our sample had a college degree (19.65%), with most not having had a college degree (80.35%). Not surprisingly, then, the sample includes individuals with extensive labor market experience. In fact, it appears that most began working right after high school and continued working up to the time of the survey. Note the mean and median/modal years of labor market experience of 23.36 and 22, respectively, for the sample. Most also indicate their English speaking ability to be quite proficient. Only 0.33% indicated their English speaking ability to be none and only 2.34% indicated poor English language ability. Most indicated that they speak English very well (79.76%).

The work-related measures reveal some interesting patterns about the sample. Many worked almost round the year, 40 hours a week, 52 weeks in the year. For example, the median and modal hours of 2080 indicate that individuals working that amount of hours in the year on the average worked 52 weeks in the year, 40 hours a week. This evidence is born by the median and
modal usual hours worked per week of 40 and the median and modal weeks worked in 1999 of
51.1 and 52.0, respectively. By contrast, the mean hours worked in 1999 is 1887.63, which is
193 hours less than the median and modal hours of 2080.

Finally, the earnings measures reveal a much lower median wage and salary income for
the sample than both the mean and mode. As indicated in Table 1, the modal income for the
sample is $30,000, which is a little less than the mean income of $30,891.02, both of which are
higher than the median income of $25,000. By contrast, the modal hourly (1999) earnings for our
sample was $9.62; which is considerably less than the mean hourly earnings of $18.31; but
closer to the median hourly earnings of $12.98.  

SELECTED MEASURES OF DIFFERENCE: EARNINGS AND RELATED VARIABLES

Table 2 displays earnings and related measures for the seven groups under study and reveals
some notable differences among the comparison groups. For example, there is a sizeable
earnings difference between African-Americans and the two immigrant groups (Caribbean and
African), with both showing average earnings higher than the former. Notably, the average
earnings difference between African-Americans and African immigrants is $3,717.8, whereas
that between African-Americans and Caribbean immigrants is $2,894.14. In contrast, there is an
even greater earnings difference between males and females, with males on average earning
$8,232.42 more than females. Most notably, the highest earnings difference is between blacks

---

3 Note that in either measure (annual wage and salary income and hourly earnings), the mean is higher than the
median, suggesting that the income measures are somewhat skewed. In fact, results of the univariate procedure (not
reported here, but available upon request) revealed that the income measures are highly skewed. To minimize the
impact of the skewness of our dependent variable on the results of our analysis, logged hourly earnings is used for
the multivariate part of the analysis below.
and whites. The $49701.87 earnings of whites is $19736.16 more than the $29965.71 earnings of blacks.

[Table 2 about here]

Exploring the human capital variables also reveals some noteworthy differences among the comparison groups. Most notable among these is the percent of whites with a college degree, as compared to that of blacks. Whereas almost 49% of whites had a college degree, only 18% of blacks did (this may account for some of the earnings difference between blacks and whites noted above). Also noteworthy is the fact that the percent of college degree holders is higher for both immigrant groups than their native-born counterparts, with African immigrants showing the highest percent of college degree holders among the three groups (27% versus 14.25% and 18.76%). Not surprisingly, the number of years of schooling for African immigrants is greater than those of the other two groups, with Caribbean immigrants and African-Americans having virtually identical numbers of years of schooling. Most interestingly, although the table shows a sizable earnings difference between males and females, there is virtually no difference in the number of years of schooling for the two groups (12.77 for females versus 12.74 for males); as well as the percent with a college degree (20.01% for males versus 19.50% for females).

The marriage variable reveals a higher percentage of married individuals for Caribbean immigrants than for African immigrants and African-Americans; with African-Americans showing the lowest percent of married persons among the three. Likewise, there were more married males than females (55.02% versus 44.12%, respectively) and more married whites than blacks (72.57% versus 48.08%, respectively).

The rest of the measures reveal similar patterns for the seven sub groups as those for the entire sample. For example, as with the entire sample, the spatial location variables indicate
similar patterns of residency for the seven subgroups. Most were metropolitan residents and resided mostly in the south and northeast. Similarly, most indicated being black, were around the average age of 40-42, and most immigrants immigrated to the U.S. around the 1990s.

In sum, the descriptive statistics presented in table 2 appear to reveal some clearly discernable patterns of difference among the seven comparison groups under study. Three of these are of particular interest to the current study: First, the two immigrant groups (African and Caribbean) indicate average earnings that are noticeably higher than that for their native-born counterparts (although that earnings advantage is also accompanied with a human capital advantage for the two immigrant groups). Second, while there was no variability in human capital between males and females, males exhibit a sizeable earnings advantage over females. Third, there is a sizeable earnings advantage for whites over blacks, although that earnings advantage is also accompanied with a human capital advantage.

Whether these patterns hold against further statistical scrutiny is the subject matter of the multivariate analyses presented in the section to immediately follow.

MULTIVARIATE ANALYSIS RESULTS

Table 3 presents OLS regression results for four models testing three of the four hypotheses noted above (The complete results of a fifth model, available upon request, are omitted; discussions in the text are restricted to findings related to the comparison in question—African immigrants versus Caribbean immigrants—because all other estimates are identical to those of Model 4). Model 1 measures the effects of each of our three main explanatory variables (group-origin/immigrant status, race and gender) on logged hourly earnings. Model 2 controls for year of immigration, as well as the three variables controlled in Model 1. Model 3 adds the human capital variables to the four variables controlled in model 2, whereas the forth model controls for
the net effects of all of our independent variables (including interactions between each of our three main explanatory variables and the college degree measure). Note that in Models 1 – 4, African-Americans are the reference category to African and Caribbean immigrants; whereas Females and Blacks are the reference categories to males and Whites, respectively. Finally, a fifth model controls for all the variables controlled in Model 4; but for the fact that African immigrants are the reference category for the group origin variable rather than African-Americans. For brevity, the few differences between estimates of that model and those of Model 4 are discussed in the text; the complete list of estimates are omitted because of similarity with results of Model 4.

It follows that Models 1 - 4 collectively test Hypotheses 1, 3 and 4; whereas Model 5 tests the Hypothesis 2.

[Table 3 about here]

As shown in table 3, results of model 1 indicate that each of our three main explanatory variables (race, gender and group-origin) had an independent and statistically significant effect on variations in hourly earnings. Looking at the estimates for Model 1, we see that African and Caribbean immigrants had a 5% and 9% earnings advantage, respectively, over their African-American counterparts. By contrast, females and blacks had hourly earnings that were 12.2% and 2% lower than Males and Whites, respectively.

Controlling for year of immigration in model 2 depresses the immigrant advantage by 2% and 6% for African and Caribbean immigrants, respectively. By contrast, while the earnings difference between Males and Females is unchanged (a 12.2% earnings disadvantage for Females), controlling for year of immigration in model 2 accentuates the earnings difference between Blacks and Whites by 14%: As indicated by the estimates for race in Models 1 and 2,
the earnings disadvantage for Blacks jumps from 2% in Model 1 to 16.4% in Model 2.

Furthermore, results of Model 2 suggest that the average hourly earnings of immigrants are considerably depressed by recent arrivals. For example, Compared to their pre-1965 counterparts and the native-born, immigrants arriving in the period of the 1990s had a 23.4% earnings disadvantage; whereas those arriving in the decade 1965-74 had earnings that are not significantly different from pre-1965 immigrants and the native-born.

Interestingly, after controlling for the human capital variables in model 3, the immigrant advantage completely disappears for both immigrant groups. In fact, results of model 3 indicate that, for African immigrants, the earnings advantage not only disappears; but the estimate becomes negative: The estimate for African immigrants in model 3 indicates that African immigrants now have earnings that are 5% less than African-Americans. Conversely, results of Model 3 indicate that the earnings of Caribbean immigrants are no longer significantly different from those of African-Americans. In other words, results of Model 3 clearly indicate no immigrant advantage for the two immigrant groups as suggested by migration theories; in fact, the results show an earnings disadvantage for African immigrants.

By contrast, the earnings difference between Males and Females is slightly accentuated in Model 3; whereas that between Blacks and Whites is dramatically decreased. The estimate for Model 3 shows the earnings disadvantage for females to slightly increase by 0.06 from Model 2 to Model 3 (12.2% versus 12.8%). Conversely, the estimate for Blacks decreases by about 11% from Model 2 to Model 3 (16.4% versus 5%). These findings are important in and of themselves; in that they clearly suggest that, for Females and African immigrants, the possession of superior human capital did not enhance their hourly earnings (an observation that is incidentally consistent with the descriptive statistics presented in Table 2).
When all of our independent variables are controlled in model 4, the earnings disadvantage for African immigrants is further accentuated; while the estimate for Caribbean immigrants remains positive but not statistically significant. Relative to African-Americans, results of Model 4 indicate a 17.4% earnings disadvantage for African immigrants (a 12% increase in earnings disadvantage from the estimate for model 3 to that for model 4).

Similarly, the earnings disadvantage for Females is also accentuated; whereas that for Blacks slightly declines. Rather than a 12.8% earnings disadvantage for Females (as in Model 3), Females now indicate a 14.4% earnings disadvantage to Males.

Given the professed centrality of education in upward mobility in the United States, model four also investigates the interaction of each of group origin, race and gender with college degree. As shown in table 3, results of model 4 indicate a highly significant negative (9%) coefficient for the African immigrant-college degree and Black-college degree interactions, while that for the Caribbean immigrant-college degree interaction is negative but not statistically significant. Note the highly significant (<0.0001) estimates for the African-College degree and Black-College degree interactions for model 4. The finding that African immigrants and Blacks appear to be rewarded less for their educational attainment is particularly noteworthy; given the professed value of education in American society and the continuing debate on the significance of race for socioeconomic attainment in contemporary U.S. society. By contrast, Female college degree holders had a relative earnings advantage over their Male counterparts. Note the highly significant (<0.0001) estimate for the Female-College interaction for model 4. In other words, while Females as an entire category were relatively disadvantaged in earnings as compared to their Male counterparts; Female college degree holders had a relative edge over their Male counterparts in hourly earnings.
Finally, contrary to suggestions from migration theories (See above), results of Model 5 (not shown in Table 3) indicate a relative earnings advantage for Caribbean immigrants. Results of that model show that Caribbean immigrants had a 2.7% earnings advantage over African immigrants ($P=0.0004; \text{sd}=0.00745$). Likewise, results of model 5 indicate that Caribbean immigrant college degree holders had an eight percent earnings advantage over their African counterparts ($P=<0.0001; \text{sd}=0.01415$).

Taken together, the results presented in Table 3 proffer strong support for two of our four hypotheses; while offering evidence contradicting the other two. Contrary to the Hypothesis 1, the two immigrant groups appear to reap no advantage as they should according to theory; that is, after controlling for earnings related measures. Similarly, African immigrants show no earnings advantage over Caribbean immigrants as they should according to the Hypothesis 2. By contrast, results of the multivariate analysis presented in Table 3 proffer strong support for the Hypotheses 3 and 4. The evidence indicate that race and gender, net of other variables such as education and nativity, are powerful predictors of earnings; suggesting the continuing significance of race and gender for socioeconomic attainment in contemporary U.S. society.

CONCLUSION

This paper has investigated the effects of immigrant status, gender and race on the earnings attainment of “persons of African origins” in the United States. Utilizing data from the 2000 population census, multivariate analysis was used to examine the earnings attainment of self-identified black and white African immigrants, their Caribbean counterparts and African-Americans. In doing so, the paper assesses how well three theoretical arguments account for differences in earnings among these three groups (see below).

Predictions drawn from migration theories suggest an immigrant advantage for the two
immigrant groups (Glazer & Moynihan 1963; Lewis 1983; Sowell 1978, 1981; Butcher 1994; Chiswick 1979; Foner 1985; Hossfeld 1994; Waters 1994a); and, likewise, implications from those theories also suggest an edge in socioeconomic attainment for African immigrants over Caribbean immigrants. Finally, the significance of race and gender for socioeconomic attainment in the United States is, of course, well noted in the literature (See Kerbo 2000 for an extensive review).

Hence, I predicted that 1) the two immigrant groups will show hourly earnings that are significantly lower than those of their native-born counterparts; 2) African immigrants will show hourly earnings that are significantly higher than Caribbean immigrants; 3) Females will exhibit hourly earnings that are significantly lower than Males; and 4) the hourly earnings of Blacks will be significantly lower than that for Whites.

With respect to these hypotheses, analysis of the study are somewhat mix. Two of the Hypotheses were supported and two were not. More specifically, results of the analysis revealed four notable findings:

1. While the earnings of the two immigrant groups initially exceed those of their native-born counterparts, controlling for earnings related measures erases the immigrant advantage and elevates the earnings of African-Americans over those of African immigrants; such that part of the African immigrant disadvantage in hourly earnings remains unexplained by those variables.

2. The analysis revealed an interaction between each of immigrant status, race and gender and college degree; such that the evidence suggests that African immigrant and Black college degree holders were rewarded less for their schooling than their African-American and white counterparts; whereas Female college degree holders were rewarded more than Male college degree holders. Such interaction shows no effect on the hourly
earnings of Caribbean immigrant college degree holders, as compared to their African-American counterparts.

- 3. Net of the effects of all of our independent variables (including relevant human capital variables such as education and labor market experience), the hourly earnings of females is shown to be considerably lower than that of males.

- 4. Compared to whites, the hourly earnings of blacks is shown to be significantly lower, with the earnings difference remaining even after controlling for earnings related measures.

Implications of these findings on the three theoretical positions discussed above, therefore, also remain mix. Which of the noted factors better explain the findings? Selectivity factors? Cultural factors? How about demand side factors?

For example, the findings clearly suggest that selectivity and cultural explanations are particularly weak. The two immigrant groups appear to reap no advantage as they should according to theory; that is, once relevant earnings related measures were controlled. In fact, one of the immigrant groups (Africans) are shown to be disadvantaged by their status.

By contrast, the evidence indicates that race and gender, net of other variables such as education and nativity, are powerful predictors of earnings. While the current data is not suited for an affirmative evaluation of demand-side arguments, therefore, discrimination remains a plausible explanation for the observed differences in earnings between these groups.

---

4 Importantly, the three theoretical positions, not withstanding the limitations of them noted below, say very little about the influence of race and gender on socioeconomic attainment in the United States. Hence they offer little, if any, insights into the earnings difference between Males and Females of our sample, nor do they offer any for those between blacks and whites.
It follows that evidence from the study is clear on one point. That point is that race and gender remain important variables for socioeconomic attainment in contemporary U.S. society. That is to say, blacks and females remain relatively disadvantaged in the United States. Hence, rather than just focusing on immigrant status as a main explanatory variable, the current study suggests that more attention should be focused on gender and race as important explanatory variables.

A fruitful direction for future research, then, is to more fully disentangle the net/independent effect of each of our three explanatory variables (race, sex and group-origin) on the earnings of our selected groups. What are the main/direct effects of each on earnings? What are the indirect effects? Which variable is mediated by others? More complex structural equation models may shed light on these and related questions.

Furthermore, a useful addition to the comparisons in this paper may be one that differentiates the groups by race, gender and group-origin: African-American Males and Females versus African and Caribbean immigrant Males and Females; Black Males and Females versus White Males and Females; and immigrant Black Males and Females versus immigrant White Males and Females. Because race and gender intersect in unique and intricate ways in the United States, members of each of these groups may have qualitatively different labor market experiences than those of the other groups.

6. Abstract
Cowpeas are of vital importance to the livelihood of several millions of people in West Africa. It sustains the livelihoods of rural households for food, feed, and incomes. The demand for cowpeas in West Africa has been increasing because of high population growth, mainly from the urban areas, and also because the demand for low cost food and weaning food. Cowpea has a high potential for yield increase and lower crop losses if biotic and socio-economic constraints are addressed. Pest pressure on cowpea is the most important source of crop losses and can reduce yields to almost zero. Beside yield losses in the field, cowpea grains can be damaged by storage pests. Traditional methods and chemical insecticides have not been successful in controlling insects. Beside higher cost and availability, insecticides require sprayers, proper protection practices through training for effective use and lower health and pollution hazards with dangerous consequences. Biotechnology may offer a cost effective solution and significant opportunities for higher production and incomes. Cowpea insect pest (Maruca vitrata) is sensitive to Bt. Progress has been being made in developing a reliable genetic transformation of Bt. Bt proteins active against Maruca vitrata are being identified at Purdue University with support from the Bean/Cowpea Collaborative Research support program. The development of GMOs in general including Bt cowpea raises also controversial arrays of ethical issues and scientific risk assessment through testing becomes necessary before the release of biotechnology products.

To document the potential impact of biotechnology on cowpea productivity, incomes and welfare of cowpeas producers, consumers and other end-users involved in the value chain in Sub-Saharan Africa, a regional socio-economic survey was carried-out in Benin, Niger, Nigeria, Burkina-Faso and Mali in 2006. The study aims to assess producers’ and consumers’ preferences, acceptability, willingness-to-pay and adaptability of transgenic cowpea to local conditions in West Africa. Samples of farmers (788) and consumers (1120) were selected based on stratified random sampling, respectively in the main cowpea growing areas in each country and the main cities where cowpea trade is highly developed. Field surveys were conducted in rural and urban areas using structured questionnaires completed during face-to-face interviews.

The results show that:
(1) Information exchange and awareness are important for the adoption and large diffusion of Bt cowpea.
(2) Cowpea growers would prefer Bt to conventional cowpea seeds in the sense that they are willing to pay a higher price for Bt cowpea seeds.
(3) Given the potential of reducing health hazards by lowering the use of toxic synthetic pesticides, both farmers and consumers are willing to pay a premium price for Bt cowpea as an alternative to harmful cotton pesticides. The opportunity costs of using cotton insecticides include the economic losses encountered by the farm household when a family member is sick due to the misuse of chemical insecticides.
(4) Urban consumers in regional markets believe that Bt cowpea may be safer than conventional cowpea treated with chemicals.
(5) Bt cowpea will raise incomes substantially at the farm, household, community and regional levels.
ABSTRACT

Means of mass communication convey the news under the male dominance and within the male discourse. This situation prevailing all around the world is not different in Turkey. Women cannot have a say in the management of the mass media and mostly work in lower positions. Women take part in the news either as a mother or as a wife and these news are only about violence, harassment, rape, accident, illustrated magazine, health, nutrition, child etc. They are not the ones who are being consulted or whose ideas are requested.

This study is restricted with national daily newspapers POSTA, ZAMAN, HÜRRİYET, which have the highest circulation rate, and CUMHURİYET published with different viewpoint. The issues of these daily newspapers in a week, which compose the sampling in the study, are going to be examined by content analysis method and only the news about women will be discussed.

The aim of the study is to determine the position of the women who are employed in the staff which prepares the newspapers and to determine how the women are dealt within news articles.
In the light of this aim, in the sample national daily newspapers;

- The sex distribution of the people (reporter, journalist) who took part in the news production process,
- The topic distribution of the news in the newspapers,
- Under which topics men and women are mentioned in the newspapers,
- The sex, age and social position of the people mentioned in the newspapers,
- Whether the people mentioned in the newspapers are victims or survivor in respect to their sexes,
- The sex, age and social position of the individuals who were consulted on the news topics will be examined.
WOMEN IN NATIONAL NEWSPAPERS IN TURKEY

The concept of “social gender” is one of the most important concepts used in women’s studies. Two different gender concepts are found in the literature of social sciences. One is biological sex, and the other is the concept of social gender. Biological sex means the classification of people as “men” and “women” depending on their physical differences. Social gender, on the other hand, defines the different roles and behaviours of men and women within the society (Suğur, 2006, p 3).

The patriarchal understanding prefers to perceive being a woman and being a man as opposite ends, and tries to differentiate gender roles with a clear-cut separation. As a rule, there is a list of expectations for men consisting of “do”s and “be”s while the same list of expectations consists of “don’t”s for women. Similarly, what women are expected to do/be, men are forbidden to do/be. Men are expected to be tough, dominant, powerful, judging, determined, successful, independent, ambitious, active and effective solution finders, while women are expected to be benign, accommodating, weak, obedient, irresolute, unsuccessful, dependent, helpless and passive. This system has, for the sake of predetermined gender roles, divided into two those characteristics which make all of us a whole in terms of being human beings, assigning one half to men and the other to women, and thus, making us limited individuals lacking the other half of themselves (Navaro, 1996, p 29).

Every individual experiences the process of socialization to become a member of the society (s)he lives in, to fit in that society and to earn himself/herself a position in it. The individual gains/forms an identity through this process of socialization, in which the family, friends, the social environment, the school and means of mass communication all play a role. The socialization process assigns different identities to men and women in terms of their gender roles. One of the most basic elements of socialization is communication. The means of mass communication, which we all are involved with during our daily lives, play an important role in the socialization process as well.

Means of mass communication encompass various codes and indications related with the process of communication. These codes and indications, which are related with the value
judgements establishing the cultural content of society, are held together thanks to tradition, and meanings are built through traditions as well. Means of mass communication provide examples to the society, offer alternative perspectives, socialize people according to these perspectives, and reflect the society which they live in. Each of these means (newspapers, the radio, the television, the cinema, magazines and the Internet) has different features of their own; yet, what they have in common is that they are all available for mass access/utilization (Burton, 1995, p 39).

We all have a social gender, which is influential on every aspect of our lives. Those processes which produce and reproduce social genders never come to an end. Despite the fact that the social gender is not an identity which one is truly aware of, it is continuously produced in environments such as the media, workplace and our homes, depending on the structures of meanings and messages around us. The media has a particular importance in this process due to the fact that the television is the main and most common means of entertainment and information for a large section of society, and people spend a substantial part of their lives watching TV and reading newspapers or magazines. The media conveys the images of men and women as far as social genders are concerned. These images reflect those cultural values and expectations which shape gender roles. They define what is noteworthy, and what the society should see and hear. The descriptions/definitions of men and women by the media can help to create social gender definitions largely shared by the society, to reinforce and maintain these definitions, or to change them (Kaypakoğlu, 2004, p 93).

The most important function of the means of mass communication, which play an influential role on our socialization, is to inform us: to convey the news. Conveying the news is an activity of the public area, and all of this activity belongs to men. The non-presence of women in the public domain has naturally caused this activity to be dominated solely by men, in terms of both the addressed mass and the subject matter. Not only the news are constructed by and about men, but they are also created from a male perspective. And this goes beyond the people or institutions producing the news, determining the overall discourse of the news (Fiske, 1989, p 284).

Rakow and Kranich claim that the news employ a male narrative style, and thus, women are not considered as the directly addressed audience of the news. According to them, the woman who is the subject/topic of the news is regarded not as a speaking subject/person, but as an
image that supports the news (Rakow and Kranich, 1991, p 12). As can be understood from these views, it is seen that the male perspective has dominance when news are evaluated in terms of social gender. While those news, carrying patriarchal traces and being conveyed to men and women from this perspective, are broadcasted as the facts themselves, social identities of men and women are reproduced.

Means of mass communication convey the news under male dominance, and within male discourse. This situation prevailing all over the world is not different in Turkey. Women do not have a say in the management of means of mass communication, and they are often employed in minor positions. Women usually take part in the news as a wife or mother, as the subject of the news pieces about violence, harassment, rape, accidents, gossips and sensations, health, nutrition, children, etc. Women are often not present as consultants or opinion-providers.

The main aim of this study is to determine the position of the women who are employed as reporters in the staff of the newspapers, and to determine in which stories women appear on news articles and what the functions of women (subject, spokesperson, expert or commentator, personal experience, eye witness, popular opinion, other) in the news stories are.

In order to realize this goal in this study, the news stories of the determined newspapers have been examined using the content analysis method; and the basis of this study is “Global Media Monitoring Project,” the research covering the news on radio stations, television channels and newspapers every five year in 1995, 2000 and 2005. The study is restricted to certain newspapers published between January 29 and February 2 2007, which are the national daily newspapers Posta, Zaman and Hürriyet, having the three highest circulations in Turkey, and Cumhuriyet published with a different viewpoint from the above-mentioned newspapers. All the news excluding articles, comments, analysis, advertisements and cartoons on the first, second and the back pages of the newspapers, which provided the sampling for the study, have been examined. 172 news stories from Hürriyet, 179 news stories from Cumhuriyet, 246 news stories from Posta, and 145 news stories from Zaman have been examined, which makes a total of 742 news.
The analysis involves the following 15 questions and items:

Page number, subject, scope of the story, role, gender, age, occupation or position, function in the news story, family relationships, victim, survivor, is this person directly quoted in the story?, is there a photograph of this person?, are women central to the news in this story?, does the story clearly highlight issues concerning equality or in equality between women and men?, does the story clearly challenge or clearly reinforce stereotypes about women and/or men?, further analysis.

Of the 638 people covered in the four sample national daily newspapers that have been studied for five days, 203 are women and 435 are men. The ratios provided in this study have not been calculated over the total number of the cases but over the ratios of women and men within their own group.

**Subject**

When the news on the sample newspapers are analyzed in terms of their subjects, it is seen that the subject of “media, including new media (computers, Internet), portrayal of women and men, and pornography” ranks first with a rate of 11.5%. The subjects following the first one are the subject of “war, civil war, terrorism, state-based violence” with a rate of 8.4%, “family relations, inter-generational conflict, single parents” with a rate of 7.1%, “domestic politics/government (local, regional, national), elections, speeches, the political process” with a rate of 5.5%, “other stories on social or legal issues” with a rate of 5.4%, “economic policies, strategies, models (national, international)” with a rate of 5.3%, and “arts, entertainment, leisure, cinema, theatre, books and dance” with a rate of 5%. The subjects that have been covered the least on the newspaper stories are the “rural economy, agriculture, farming practices, agricultural policy, land rights”, “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” with a rate of 0.3%, “poverty, housing, social welfare, aid to those in need”, “other stories on science or health”, “development issues, sustainability, community development” with a rate of 0.4%, “other stories on politics and government”, “labour issues, strikes, trade unions, negotiations, employment, unemployment” with a rate of 0.7%. When the subjects of the news on the sample newspapers are analyzed in terms of the gender, it has been found that women are covered the most on the news with the subject of “media, including new media (computers, Internet), portrayal of women and/or men and pornography” with a rate of 28.1%, “family relations, inter-generational conflict, single parents” with a rate of 13.8%, “arts, entertainment, leisure, cinema, theatre, books, dance”
with a rate of 6.4%, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation” with a rate of 5.9%, “other subject” with a rate of 5.4%, “beauty contests, models, fashion, beauty aids, cosmetic surgery” with a rate of 4.9%. It has also been found that women have not appeared on the news with the subjects of “other stories on politics and government”, “economic indicators, statistics, business, trade, stock markets”, “labour issues, strikes, trade unions, negotiations, employment, unemployment”, “rural economy, agriculture, farming practices, agricultural policy, land rights”, “consumer issues, consumer protection, regulation, prices, consumer fraud”, “science, technology, research, funding, discoveries, developments”, “other stories on science or health”, “religion, culture, tradition, controversies, teachings, celebrations, practices”. As for men, it has been found that they have appeared the most on the news with the subjects of “war, civil war, terrorism, state-based violence” with a rate of 12.4%, “economic policies, strategies, models (national, international)” with a rate of 7.8%, “domestic politics/government (local, regional, national), elections, speeches, the political process” with a rate of 7.6%, “other stories on social or legal issues” with a rate of 6.9%, “family relations, inter-generational conflict, single parents”, “media, including new media (computers, Internet), portrayal of women and/or men, pornography” with a rate of 5.7%, “non-violent crime, bribery, theft, drug-dealing, corruption, (including political corruption/malpractice)” with a rate of 5.1% where as they have been covered with a very low ratio on the news having the subjects of “poverty, housing, social welfare, aid to those in need”, “rural economy, agriculture, farming practices, agricultural policy, land rights, “development issues, sustainability, community development”, “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” with a rate of 0.2%, “other stories on science or health” with a rate of 0.5%, “labour issues, strikes, trade unions, negotiations, employment, unemployment”, “birth control, fertility, sterilisation, amniocentesis, termination of pregnancy” with a rate of 0.7%.

**Scope of story**

When the scope of stories are considered, it has been found that the stories with the highest number are “national” (have importance within my own country) stories with a rate of 54.4%, “national and other” (involve my country and other countries) stories have a rate of 19.7%, “foreign, international” (involve other countries or the world in general) stories have a rate of 14.2% while “local” (have importance within my city, community, area) stories have a rate of 11.7%. It has been found that on the analyzed stories, women have appeared on “local” stories
with a rate of 65%, “national” stories with a rate of 14.3%, “foreign and international” stories with a rate of 12.3%, and “national and other” stories with a rate of 8.4%, while men have appeared on “national” stories with a rate of 64.5%, “national and other” stories with a rate of 23.7%, “local” stories with a rate of 12% and finally “foreign and international” stories with a rate of 9.9%.

**Role**
The total of 742 stories on the newspapers that have been analyzed for five days involves reporters and journalists with a rate of 22.9% and have person in the news with a rate of 63.6%. 22.7% of the staff employed as reporters and journalists for the news on newspapers is women while 28.5% of the said staff is men.

**Gender-Age**
Out of the total of 742 stories on the sample newspapers, 58.6% of the people in the news is men while 27.4% of the said people is women and 14% of the people in question is the people whose gender is not known. When the ages of these people are analyzed, it has been revealed that the age of 50.8% of them is not mentioned; 14.6% of them has been found to be between 19 and 34; 2.2% of them has been found to be between 35 and 49, 2% of them has been found to be between 0 and 12, 1.6% of them has been found to be between 13 and 18, 1.3% of them has been found to be between 50 and 64, respectively. It has been found that 1.1% of them are 65 and above.

**Occupation or position**
When the occupation or position of the people covered on the news stories is considered, it has been discovered that “celebrities, artists, actors, writers, singers, radios or television personalities” take place the most on the news stories with a rate of 12.4%. This is followed by “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons” with a rate of 8.9%, people whose occupation are “not stated” with a rate of 6.6%, “business persons, executives, managers, entrepreneurs, economists, financial experts, stock brokers” with a rate of 5.7%, “students, pupils, schoolchildren” with a rate of 5.1%, “criminals, suspects” with a rate of 3.4%, “government employees, public servants, bureaucrats, diplomats, intelligence officers” with a rate of 3.2%. The following people have a very low coverage on news stories on newspapers; “children, young people (up to 18 years)” with a rate of 0.1%, “office or service worker, non-
management worker in office, store, restaurant, catering”, “villagers or residents engaged in unspecified occupations, retired people, pensioners” with a rate of 0.3%, “religious figures, priests, monks, rabbis, mullahs, nuns” with a rate of 0.4%, “agriculture, mining, fishing, forestry workers” with a rate of 0.5%, “homemakers, parents, either female or male and unemployed people” with a rate of 0.7%. When the occupations or positions of the people covered on newspapers are considered regarding their gender, it has been found that out of 203 women covered on newspapers 13.1% of them is “celebrities, artists, actors, writers, singers, radios or television personalities”, 5.1% of them is “students, pupils, schoolchildren”, 1.5% of them is “business people, executives, managers, entrepreneurs, economists, financial experts, stock brokers” while it has been found that women are not included among the occupation groups such as “government employees, public servants, bureaucrats, diplomats, intelligence officers”, “police, military and para-military groups, militia, prison officers, security officers, fire officers”, “science or technology professionals, engineers, technicians, computer specialists”. When their occupation was considered, it has been revealed that out of 435 men covered on newspaper stories 13.1% of them is “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons”, 7.4% of them is “business persons, executives, managers, entrepreneurs, economists, financial experts, stock brokers”, 6.1% of them is “celebrities, artists, actors, writers, singers, radio or television personalities” while it has been established that they have not been included at all in occupation groups which are “homemakers, parents, either female or male” and “children, young people (up to 18 years) ”.

**Function in the news story**

When the functions of 742 people covered in the news stories are studied, it has been found that the people have the following functions in the news stories; “subject” (the story is about this person or about something the person has done, said etc) with a rate of 41.1%, “spokesperson” (the person represents, or speaks on behalf of another person, a group or an organisation) with a rate of 13.5%, “expert or commentator” (the person provides additional information, opinion or comment, based on specialist knowledge or expertise) with a rate of 5.9%, “popular opinion” (the person's opinion is assumed to reflect that of the 'ordinary citizen' (e.g., in a street interview, vox populi etc) with a rate of 1.6%; it is implied that the person's point of view is shared by a wider group of people), “eye-witness” (the person gives testimony or comment, based on direct observation (e.g. being present at an event) with a rate of 0.5%, “do not know” (the person's function is not clear) with a rate of 0.6% and “personal
experience” (the person provides opinion or comment, based on individual personal experience; the opinion is not necessarily meant to reflect the views of a wider group) with a rate of 0.3%. When the function of people covered in the news stories is studied in terms of gender distribution, it has been revealed that out of 203 women and 435 men in total 29.9% and 33.9% of the “subjects” is women and men, respectively, 0.8% and 8.5% of the “experts or commentators” is women and men, respectively. As for “popular opinion”, there has been equality between men and women with a rate of 1.3%. 1.1% of the “spokespersons” is women while 20.1% is men. There are no women covered in news stories as a part of “personal experience” while 0.4% of it is men, there are no women covered as “eye-witnesses” whereas 0.8% of the “eye-witnesses” is men. As for the distribution of the function in the news story of the people covered in the news in terms of gender, women as the subjects have been included in the news about “media, including new media (computers, Internet), portrayal of women and/or men, pornography”, “family relations, inter-generational conflict, single parents” with a rate of 13.4%, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation” with a rate of 3.3% while men have been included in the news about “war, civil war, terrorism, state-based violence” with a rate of 9.2%, “family relations, inter-generational conflicts, single parents” with a rate of 4.9%, and “disasters, accidents, famines, earthquakes, floods, hurricanes, plane crashes and car crashes” with a rate of 4.3%. It has been found that women as “spokesperson” have taken place in the news stories about “environment, nature, pollution, global warming, ecology, tourism” with a rate of 2%, “poverty, housing, social welfare, aid to those in need”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “riots, demonstrations, public disorder” with a rate of 1%, while men have taken place in the news about “domestic politics/government (local, regional, national), elections, speeches, the political processes” with a rate of 22%, “economic policies, strategies, models (national, international)” with a rate of 19%, “other stories on social or legal issues” with a rate of 10%. Women as “experts or commentators” have taken place in the news about “environment, nature, pollution, global warming, ecology, tourism” with a rate of 6.8%, “other stories on crime and violence” with a rate of 2.3% whereas men have taken place in the news about “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping”, “war, civil war, terrorism, state-based violence”, “arts, entertainment, leisure, cinemas, theatres, books, dances” with a rate of 9.1%, “non-violent crimes, briberies, thefts, drug-dealings, corruptions, (including political corruption/malpractice) and “education, child care, nurseries, pre-school to university, adult education, literacy” with a rate of 6.8%, “labour issues, strikes, trade
unions, negotiations, employment, unemployment”, “other epidemics, viruses, contagions, BSE, SARS”, “human rights, women's rights, children's rights, gay & lesbian rights, rights of minorities” and “other stories on social or legal issues” with a rate of 4.5%  While women have not been included in news stories as “personal experiences” men have been included in the news about “war, civil war, terrorism, state-based violence” and “human rights, women's rights, children's rights, gay & lesbian rights, rights of minorities” with a rate of 50%. While women have not included in the news stories as “eye-witness”, men have been included in the stories about “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “violent crimes, murders, abductions, kidnappings, assaults, drug-related violence”, “celebrity news, births, marriages, deaths, obituaries, famous people, royalty”, “media, including new media (computers, Internet), portrayal of women and/or men, pornography” with a rate of 25%. Women as “popular opinion” have taken place in the news about “media, including new media (computers, Internet), portrayal of women and/or men, pornography” with a rate of 16.7%, “arts, entertainment, leisure, cinema, theatre, books, dance”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “family law, family codes, property law, inheritance law and rights”, and “transport, traffic and roads” with a rate of 8.3% while men have taken place in the news about “transport, traffic, roads” and “other stories on crime and violence” with a rate of 16.7%, “war, civil war, terrorism, state-based violence”, “riots, demonstrations and public disorder” with a rate of 8.3% as “popular opinion”.

Family relationship
While 57.7% of the total of 742 news stories on the sample newspapers does not include definitions referring to family relationships (women are often defined in the news in terms of their familial relationships [wife of, daughter of etc.]. Men are sometimes defined in this way too [husband of, son of etc].) 5.9% of the news includes this sort of definitions. On the news including the said definitions, they have been used for women with a rate of 7.4% while only 1.9% of them has been used for men.

Victim
While 3.1% of the people covered in 742 news stories in total in newspapers has been the “victim of an accident, natural disaster, poverty, disease, illness”, 1.2% of them has been established as the “victim of other crimes, robbery, assault and murder”, 0.2% of them has been the “victim of domestic violence (by husband/wife/partner/other family member),
psychological violence, physical assault, marital rape, murder” 05%, of them has been the “victim of unknown crimes which can not be decided”. It has been found that 0.4% of them has been the “victim of non-domestic sexual violence or abuse, sexual harassment, rape, trafficking”, “victim of violation based on religion, tradition, cultural belief, genital mutilation, bride-burning”, and “victim of war, terrorism, vigilantism, state-based violence”, 0.1% of them has been found to be the “victim of discrimination based on gender, race, ethnicity, age, religion”. 56.5% of the people included in the news has not been depicted as victims in the news stories (not a victim). When the gender distribution of the people that are found to be victims is considered, it is seen that women are the “victims of an accident, natural disaster, poverty, disease, illness” with a rate of 2.3%, “victims of domestic violence (by husband/wife/partner/other family member), psychological violence, physical assault, marital rape, murder, and other crimes, robbery, assault, murder” with a rate of 1.1%, “victims of non-domestic sexual violence or abuse, sexual harassment, rape, and trafficking” with a rate of 0.4%, and finally “victims of discrimination based on gender, race, ethnicity, age, religion” with a rate of 0.2% while men have been found to be the “victims of an accident, natural disaster, poverty, disease, illness” (2.5%), “victim of other crime, robbery, assault, murder” (0.8%), “victim of war, terrorism, vigilantism, state-based violence” (0.6%), and “victim of violation based on religion, tradition, cultural belief, genital mutilation, bride-burning” (0.2%).

**Survivor**

0.3% of the people covered in 742 news stories in newspapers has been defined as the “survivors of an accident, natural disaster, poverty, disease, illness”. 0.1% of them has been found to be the “survivors of non-domestic sexual violence or abuse, sexual harassment, rape, trafficking” and “other survivors” while 63.1% of them has not been mentioned as a survivor (not a survivor). As for the gender distribution among the people depicted as survivors on the news stories, it has emerged that women have been included in only one news story as the survivor, and men on three news stories.

**Is this person directly quoted in this story?**

On the total of 742 stories in the sample newspapers, the opinions of the people included in the stories have been “directly” quoted with a rate of 41.7% while they have been quoted “indirectly” with a rate of 58.3%. 17.4% of the subjects whose opinions have been “directly” quoted is women and 15.4% of them is men. 1.5% of the people who are included in the news
as a spokesperson and whose opinions have been “directly” quoted is women and 40% of them is men. These figures change as 1.5% and 15.4% respectively for women and men for the experts or commentators of the news. As for popular opinions, the figures become 2.1% for women and 2.6% for men. Women do not appear as the personal experience and eye witness. The men who are included in the news as eye witnesses and whose opinions are directly quoted have a percentage of 1.5%. As to the men depicted as personal experience whose opinions are directly quoted, it has been found that they show a percentage of 1%.

**Is there a photograph of this person?**

35.4% of the people covered in 742 news stories in newspapers has a photograph, and 25.5% of them don’t. 2.4% of them has a photograph on the news story, yet it has not been determined for sure if the photograph in deed belongs to that particular person.

**Are women central to the news in the story?**

It has been discovered that women are central to only 14.2% of 742 news stories in newspapers. The news stories where women have been defined central to the news includes the following in order; “media, including new media (computers, Internet), portrayal of women and/or men, pornography”, “beauty contests, models, fashion, beauty aids, cosmetic surgery”, “family relations, inter-generational conflict, single parents”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “arts, entertainment, leisure, cinema, theatre, books, dance”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “economic indicators, statistics, business, trade, stock markets”, “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, “family law, family codes, property law, inheritance law and rights”, “education, child care, nurseries, pre-school to university, adult education, literacy”, “non-violent crime, bribery, theft, drug-dealing, corruption, (including political corruption/malpractice)” and “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia”.

**Does the story clearly highlight issues concerning equality or inequality between women and men?**

It has been found that only 0.8% of 742 news stories in the newspapers the story clearly highlights issues concerning equality or inequality between women and men. The following is the ordered list of the subjects where the equality or inequality between women and men in
newspapers is clearly highlighted; “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping”, “family relations, inter-generational conflict, single parents” and “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”.

**Does the story clearly challenge or clearly reinforce stereotypes about women and/or men?**

It has been found that 42.6% of 742 news stories in newspapers the expressions that reinforce stereotypes about women and/or men are not known and cannot be decided while 3.5% of them clearly reinforces stereotypes, and 3.2% of them clearly challenges stereotypes. The stories that clearly challenge or clearly reinforce stereotypes about women and/or men are about the following, in order; “media, including new media (computers, Internet), portrayal of women and/or men, pornography”, “arts, entertainment, leisure, cinema, theatre, books, dance”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “family relations, inter-generational conflict, single parents”, “human rights, women's rights, children's rights, gay & lesbian rights, rights of minorities”, “family law, family codes, property law, inheritance law and rights”, “beauty contests, models, fashion, beauty aids, cosmetic surgery” and “sports, events, players, facilities, training, policies, funding”.

**Further analysis**

Any of 724 news stories from the four sample national newspapers does not require further analysis.

**SUMMARY AND CONCLUSION**

Women stand out in means of mass communication with their traditional roles or gender identities. Although it would be in favor of women that the means of mass communication reach a great number of people, it reinforces the stereotypes due to the unfavourable content and presentation. Today, means of mass communication are among the institutions taking place in the process of generating stereotypes; however, the women identities presented in means of mass communication have not been able to offer a new identity to women apart from their traditional roles. On means of mass communication, women generally stand out
with either their traditional roles (a wife, mother, housewife, self-sacrificing woman) or their gender identities. In order for women to be the subject of news stories, they have to be involved in tragic events such as being sexually abused, raped, (the victim), being subjected to sexual violence, others cheating on them, being the reason of ending a marriage, and committing suicide. On the news stories where women are the subject, it is presented with a discourse similar to that of glossy magazines accompanied by unrelated photographs thereby stressing the gender identity of women.

When the news stories analysed in the study titled “Women in National Newspapers in Turkey” are evaluated in terms of their topics, “media, including new media (computers, Internet), portrayal of women and/or men, pornography” ranks the first with a rate of 11.5% while the news stories about “rural economy, agriculture, farming practices, agricultural policy, land rights” rank the last with a rate of 0.3%. When the topics of the news stories are analysed in terms of gender distribution, it is seen that women are included the most in the news about “media, including new media (computers, Internet), portrayal of women and/or men, pornography” (28.1%), which is followed by the news about “family relations, inter-generational conflict, single parents” (13.8%) and “arts, entertainment, leisure, cinema, theatre, books, dance” (6.4%), and are not included in “other stories on politics and government”, “labour issues, strikes, trade unions, negotiations, employment, unemployment” and “science, technology, research, funding, discoveries, developments”. Since women are mostly used as visual materials on media and stand out with their roles of being a mother and a wife, the topics of the news stories that include women turn out to be parallel with the given data.

When the scope of story on the newspapers is considered, it has been found that the news stories covering national (has importance within my own country) issues are in the first rank with a rate of %54.4. It has been discovered that in the analysed news stories women have been included in stories covering local (65%), national (14.3%), foreign and international (12.3%), national and other (8.4%) issues.

Women constitute 22.7% of the staff working as reporters and journalists working for the total of 742 news stories in the four sample national daily newspapers that have been studied for five days. This data show that the women working in media sector are often employed in minor positions.
When the occupations or positions of the people included in the news stories are evaluated, it has been found that “celebrities, artists, actors, writers, singers, radio or television personalities” are covered the most in the news with a rate of 12.4%. When the occupations or positions of the people included in the news stories are analysed in terms of gender distribution, it is seen that while 13.1% of 203 women taking place in newspapers are “celebrities, artists, writers, singers, radio or television personalities”, 5.1% of them are “students, pupils, schoolchildren”, women are not included in the occupation groups such as “government employees, public servants, bureaucrats, diplomats, intelligence officers”, “police, military, para-military groups, militia, prison officers, security officers, fire officers”, “science or technology professionals, engineers, technicians, computer specialists”. These data show that women dominantly appear as educators, health carers —as the society think they best fit women— and as artists, singers and the like where the visual aspect is stressed.

When the functions of 742 people covered in the news stories are studied, it has been found that the people have the following functions in the news stories; “subject” (the story is about this person or about something the person has done, said etc) with a rate of 41.1%. When the functions of the people covered in the news stories are studied in terms of gender distribution, it is seen that 29.9% of 203 women appears as the subject, 0.8% of them appears as the “expert or commentator”, 1.3% of them appears as the “popular opinion” and 1.1% of them appears as the “spokesperson” and that women don’t appear as the “personal experience” and the “eye-witness”. The topic distribution of the people included in the news stories in terms of gender, women appear as the “subject” (the story is about this person, or about something the person has done, said etc) with a rate of 13.4% in the news about “media, including new media (computers, Internet), portrayal of women and/or men, pornography”, “family relations, inter-generational conflict, single parents”, as the “spokesperson” in the news about “environment, nature, pollution, global warming, ecology, tourism” with a rate of 2%, “poverty, housing, social welfare, aid to those in need” 1%, as the “expert or commentator” in the news about “environment, nature, pollution, global warming, ecology, tourism” with a rate of 6.8%, “other stories on crime and violence” with a rate of 2.3%, as the “popular opinion” in the news about “media, including new media (computers, Internet), portrayal of women and/or men, pornography” with a rate of 16.7%, “arts, entertainment, leisure, cinema, theatre, books, dance” with a rate of 8.3% while they don’t appear as the “personal experience” and the “eye-witness”. These data show that women mostly appear in the news as
the “subject” but not as the “spokesperson”, “expert or commentator”, “personal experience”, “eye-witness”, and “popular opinion”, which discloses that the opinions of women are not considered important. And this is inline with the existing perception about the women in the society.

It has been found that the definitions including the wife, husband, son, and daughter as the family relationships in the 742 news stories from the sample newspapers are used for women with a rate of 7.4%. Compared to men, women more often appear on the news stories as the wife of, sister of, mother of etc. and become the subject of the news stories.

3.1% of the people in the 742 news stories on the newspapers are the “victim of an accident, natural disaster, poverty, disease, illness”, which is the highest rate. When the gender distribution of the people found to be the victims is considered, it has been revealed that 2.3% of 203 women in total is the “victim of an accident, natural disaster, poverty, disease, illness”, 1.1% of them is the “victim of domestic violence (by husband/wife/partner/other family member), psychological violence, physical assault, marital rape, murder”, and the “victim of other crime, robbery, assault, murder”, 0.4% of them is the “victim of non-domestic sexual violence or abuse, sexual harassment, rape, trafficking”, 0.2% of them is the “victim of discrimination based on gender, race, ethnicity, age, religion”. Alongside this, it has been found that 0.3% of the people covered in the total of 742 news stories is the “survivor of an accident, natural disaster, poverty, disease, illness”. As for the gender distribution of the people defined as the survivors on the news stories, it has been discovered that only 1% of 203 women in total is included in the stories as the survivor.

The opinions of 41.7% of the people in 742 news stories from the sample newspapers have been “directly” quoted and 58.3% of the opinions have been quoted “indirectly”. 17.4% of the subjects whose opinions have been “directly” quoted is women and 1.5% of the people who are included in the news as a “spokesperson” and whose opinions have been “directly” quoted is women. 2.1% of the people who are included in the news as a popular opinion and whose opinions have been directly quoted is women. Women do not exist in the news stories as the “personal experience” and “eye-witness”.

It has been discovered that women are central to only 14.2% of 742 news stories in newspapers. When the topics of the news stories where women have been defined central are
considered, the major topics have been defined as the following; “media, including new media (computers, Internet), portrayal of women and/or men, pornography”, “beauty contests, models, fashion, beauty aids, cosmetic surgery”, “family relations, inter-generational conflict, single parents”, “arts, entertainment, leisure, cinema, theatre, books, dance”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, “family law, family codes, property law, inheritance law and rights”, “education, child care, nurseries, preschool to university, adult education, literacy”, which are about the issues that fits the position of the women in the society and their gender. The news stories in newspapers that clearly highlight issues concerning equality or inequality between women and men include “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping”, “family relations, inter-generational conflict, single parents” and “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”. It has been established that out of 742 news stories in the newspapers, the stories that clearly challenge or clearly reinforce stereotypes about women and/or men are again mainly about issues that fits the position of the women in the society and their gender; “media, including new media (computers, Internet), portrayal of women and/or men, pornography”, “arts, entertainment, leisure, cinema, theatre, books, dance”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “family relations, inter-generational conflict, single parents”, “human rights, women's rights, children's rights, gay & lesbian rights, rights of minorities”, “family law, family codes, property law, inheritance law and rights”, “beauty contests, models, fashion, beauty aids, and cosmetic surgery”.

To conclude, women employed in the media do not take place in decision taking positions and senior positions but employed in lower positions with lower payment. As the subject of the news, women are included in the topics and occupations that are parallel to the already existing positions in the society. Their opinions are not considered to be of importance and they stand out with their visuality. Besides, it has been established that the adjectives and descriptions used in the news stories are compatible with the stereotypes defined for men and women in the social system.

Abstract

According to terror management theory (TMT; Greenberg, Pyszczynski, & Solomon, 1986), the fear surrounding thoughts of one’s own death serve as a basis for much cognitive and behavioral motivation. Generally, a death reminder, or mortality salience, evokes stronger adherence to worldviews. Worldviews, within the TMT framework, are construed in part as traditional beliefs that offer protection from fear of death. Given the importance of religious belief in the face of death, the present study investigates the effects of mortality salience (MS) and religious priming on judgments of outgroups. This is follow-up study, advancing a pilot which first began to explore religion and TMT.

To accomplish this, participants will either be reminded of their own death, or be reminded of a painful experience (control condition). Then, participants will either receive a religiously prosocial prime (e.g., focusing on love and acceptance) or a passage regarding laws and commandments (e.g., defining what is wicked and despicable). Participants will then judge a member of an outgroup – an actor who is ostensibly homosexual. It is predicted that the participants who are primed with death and received the religiously prosocial prime will rate the actor in a more favorable fashion than those who are in the pain and prosocial passage condition. Through this study, the effects of varying religious passages will be explored in light of death reminders to more fully understand the nature of negative judgments of perceived outgroup members.

Abstract:
This paper describes the programming required for online homework and evaluates its use. Methods for student identification and for processing student input are presented. Evaluation is based on applications in my courses. Cost effectiveness is favored by large classes, numerous assignments, and a long horizon of intended use. Online homework was found to increase learning through increased student study-time allocations. Students felt that course website interaction was productive. They also indicated that online homework increased their perception of the value of lectures and that this approach would be welcome in other courses. All findings were highly statistically significant.
USING A DILEMMA-BASED APPROACH TO ETHICS:
LIFE LESSONS FOR COLLEGE SENIORS

Topic Area: Education - Philosophy

Presentation Format: Workshop (Paper will be submitted for proceedings)

USING A DILEMMA-BASED APPROACH TO ETHICS:
LIFE LESSONS FOR COLLEGE SENIORS

In a capstone course intended to further prepare students for their professional future, college seniors were introduced to a dilemma-based approach to articulating and evaluating their own personal and professional values as well as the values of others. Qualitative data have been collected across two years to examine how student definitions of the terms “ethics” and “morals” as well as their identification of key personal and professional values might change over the term of a semester based on their exposure to the dilemma approach. In this workshop, participants will be introduced to the philosophical underpinnings of the dilemma format and practice the structured resolution process. Small workshop groups will discuss and present dilemma resolutions. Qualitative outcomes of the author’s study, e.g. changes that might have resulted from the pedagogical format, will be presented and compared to workshop participant group outcomes. Participants will reflect on the effectiveness of the dilemma approach and implications for its future use for critical problem solving and professional preparation.
USING A DILEMMA-BASED APPROACH TO ETHICS:
LIFE LESSONS FOR COLLEGE SENIORS

The first decade of the 21st century has borne witness to a number of corporate scandals and evidence of professional misconduct. Sadly, such misconduct has not been isolated to one particular domain, but encompasses such disciplines as journalism, religion, education, law, finance, public administration, real estate, and sports, to name just a few. Many scholars agree that the gradual decline in professional moral and ethical standards in American social institutions has increased over the past three decades (Allen, Bacdayan, Kowalski, & Roy, 2005; Callahan, 2004). Worse, researchers have concluded that unethical behavior, particularly cheating, has increased in high schools and universities across the United States (Leo, 2002; Mangan, 2006; McCabe, Trevino, & Butterfield, 2001; Schneider, 1999; Vincent & Meche, 2001). Such evidence suggests a mandate for ethics as a required curriculum component in academic disciplines in order to better prepare student professionals for their future careers.

The author of this study revised the content and pedagogical approach of a senior capstone course in the department of Family & Consumer Sciences in a mid-sized university in the Southeast. Over a period of two years, the author collected data about how students defined the terms “ethics” and “morals” as well as how they identified key personal and professional values in order to determine how these definitions and values might change over the term of a semester based on exposure to the course content and to the dilemma approach to understanding ethics.

Increasing Evidence of Unethical Behaviors among Students

Callahan (2004) suggested that the cheating evidenced on college campuses is understandable, because children today are taught from a very early age to win at all
costs. Many students at the high school level, pressured to compete to gain entrance to prestigious universities, have resorted to cheating as a means to an end: “The evidence is that a willingness to cheat has become the norm” (M. Josephson, as cited in Callahan, p. 203). In an annual survey of high-achieving high school students, 80% of students with A averages admitted to some form of academic dishonesty (Who’s Who Among American High School Students, 2000). Vincent & Meche (2001) studied 729 high school students in Louisiana. While the researchers found that the majority of students recognized unethical situations and chose ethically appropriate behaviors, they also found that 26% of the students did not recognize unethical situations, and 44% of the students indicated they would participate in unethical behavior.

McCabe et al. (2001) found 70% of college undergraduates admitted to having cheated at least once during college. Mangan (2006) reported that 56% of graduate students from 32 schools of business admitted to cheating in college. In a study of 1051 undergraduate and graduate business students, Nonis & Swift (2001) found several issues of concern: 1) students who believed that cheating or dishonest acts were acceptable were more likely to engage in such behaviors; and 2) students who engaged in dishonest acts in college were more likely to engage in such acts in the workplace. They also found that male students and younger students were more dishonest in college than female students and older students. Such disturbing findings suggest that cheating may have become normative behavior for today’s student (Nonis & Swift). Therefore, it is important to increase students’ awareness and understanding of unethical behavior in order to foster academic and, ultimately, workplace integrity.
The Academic Debate over Ethics Education

There is some disagreement among scholars about the effectiveness of ethics education in and of itself (Daehlen, 2005; Leo, 2002; Nesselroade, Williams, Nam, & McBride, 2006) and about the effectiveness of varying approaches to teaching ethics (Allen et al., 2005; Carroll, 2005; Kayes, 2002). Traditionally, ethics has been taught in the undergraduate and graduate curricula of disciplines such as medicine, nursing, healthcare, and counseling (Clarkeburn, 2002; Goldie, McCommachie, Schwartz, & Morrison, 2002; Wilson, 1999; Woogara, 2005). More recently, there has been a call to integrate ethics education into the required curriculum of other disciplines, notably business schools (Carroll, 2005; Farnsworth & Kleiner, 2003) and other colleges that prepare students for various professional careers (Adams, Dollahite, Gilbert, & Keim, 2001; Humbarger & DeVaney, 2005; Paulins & Lombardy, 2005; Roubanis, Garner, & Purcell, 2006).

Wilson (1999) argued that ethics education better prepared female nursing students to resolve ethical dilemmas. In her study, females who exhibited a propensity to making moral decisions based on an ethic of care orientation were willing to incorporate the male-oriented ethic of justice reasoning into their evaluation of ethical dilemmas as a consequence of exposure to ethics training. Clarkeburn (2002) noted that ethics taught with an aim toward forcing life sciences students to accept certain values may create problems. She recommended that the focus in such courses be on the process of moral decision-making along with increasing ethical sensitivity. Further, ethics education should be tailored to students who reason at different levels, most commonly associated with students who are just beginning a program in contrast to those who are nearing
completion of their studies. For example, Clarkeburn, Downie, Gray, and Matthew (2003) found that students made a natural progression in understanding and reasoning abilities and recommended that discussions of ethical dilemmas were more effective for upper-level students who understood the basic tenets of ethics and their relative application to moral reasoning.

Woogara (2005) noted that while ethics education is important, teaching ethics in large, diverse classrooms is counterproductive because students represent numerous different cultures and beliefs. Leo (2002) cited postmodernism as the culprit, suggesting that we have arrived at an era of moral relativism in which individuals, as products of a specific culture, are encouraged to view their own cultural norms as universal standards. Truth, then, becomes “whatever the tribe or individual says it is”. College professors who ascribe to postmodernism would be inclined to communicate to students that there are no real ethical standards (Leo).

Allen et al. (2005) examined the impact of ethics training on business student values by comparing freshmen and senior students’ perceptions of Maccoby’s instrumental values. They found that the increased emphasis on ethics in the business curriculum did not have a significant impact in changing the importance of “head” (thinking aspects) and “heart” (feeling aspects) values. The authors suggested that the imbalance of head/heart values was a result of the emphasis on logic and reasoning in the business curriculum. Etzioni (2002) came to a similar conclusion in his study of 2000 business graduates, concluding that business education not only fails to improve moral character, but weakens it. Similarly, Daehlen (2005) found only minimal changes in
student ratings of intrinsic and extrinsic job values as a result of higher education. The problem, then, may not be *that* ethics is taught, rather *how* it is taught.

Farnsworth & Kleiner (2003) recommended that ethics education be required in the business curriculum because it may help breach the gap in trust and legitimacy that has been experienced by businesses on the heels of recent corporate scandals. They also noted that the development of skills to recognize and analyze issues elicits a sense of moral obligation and personal responsibility and permits tolerance of moral disagreement and ambiguity (Farnsworth & Kleiner). The researchers indicated that colleges and universities are already charged with conveying the core values of each discipline and socializing students to oversee and maintain such values.

*The Dilemma-based Approach to Teaching Ethics*

Kayes (2002) presented a concise overview of the three primary historical approaches used to teaching values and ethics. The first approach, the values clarification approach (Rokeach, 1973, as cited in Kayes) helps students understand their own values orientation, providing an increased level of self-awareness and causing them to confront inconsistencies. Kohlberg’s moral reasoning approach incorporates critical thinking and the application of values to outcomes. This approach requires students to defend their values position according to progressive developmental stages, which contrasts with the first approach because it shifts emphasis from one’s values to applying those values to a situation requiring action. The third approach, the ethics instruction approach, emphasizes application of normative models of decision-making in applied settings, including utilitarianism, the Kantian categorical imperative, and Aristotelian virtue ethics.
In the course described in this paper, the author combined all three of the above approaches to ethics instruction because each had merit. In addition, the author used a pedagogical constructivist framework, e.g. creating an environment in which students drew upon their personal experiences to build new knowledge (Paulins & Lombardy, 2005). While it may be argued that such an multi-dimensional approach might cause confusion, it seemed that the combination of the approaches helped to enhance the course emphasis on the validity of alternative opinions and courses of actions and the importance of considering multiple perspectives. Further, the introduction of several analytical approaches enhanced the new knowledge that resulted from evaluations and discussions of the ethical dilemmas.

**Course Structure and Pedagogical Approach**

The Family & Consumer Sciences (FCS) Department at the university at which this study was conducted houses several professional preparation programs, including Foods & Nutrition, Dietetics, Hospitality Management, Interior Design, Fashion & Retail Merchandising, Family Studies, and a generalist program in FCS as well as a teaching certification program. All students majoring in one of these programs are required to take a senior-level capstone course entitled Senior Seminar for Professional Development.

In 2005, the content of this course was significantly revised to include ethics education. The aim of the course revision was to expose students to the basic tenets of ethics and moral reasoning through simple, topical reading materials and structured analysis of ethical dilemmas in order to better prepare them for addressing similar issues in their professional lives. Since its revision, approximately 30 students have taken the course each semester.
Students spend the first eight weeks of each semester reading about and discussing ethics. Reading for the course includes *The Cheating Culture* by David Callahan, *How Good People Make Tough Choices* by Rushworth Kidder, a number of short news articles, as well as some brief readings from a business ethics text. On a class-by-class basis, students are broken into small groups to discuss resolutions to various ethical dilemmas. They then present the analysis of their dilemma to the class as a whole. Analysis and resolutions are structured in much the same manner as Kayes (2002), who suggested the following:

1. think critically about the problems,
2. account for the multiple competing values that arise during decision making,
3. recognize and explicate personal values and their influence on decision making,
4. and apply ethical decisions by analogy (p. 310)

Within the first couple weeks of the semester, students learn basic philosophical approaches to resolving dilemmas: utilitarianism, the Kantian categorical imperative, and Aristotelian virtue ethics, as well as the application of Kohlberg’s moral reasoning stages. Once these structured resolution processes have been explicated, students are asked to apply each of the resolution processes to the dilemmas. The purpose of such an approach is the practice of applying different types of reasoning to resolutions. In so doing, students accomplish two things: 1) alternative solutions to dilemmas are explored, and 2) acknowledgment and appreciation of different opinions are acquired. Students conduct these analyses both in groups and individually, orally and in writing.
Initially, dilemmas of a general nature are presented and discussed. Their purpose is to provoke discussion, permit students to express opinions and to begin to explore morals and values. The teacher plays the role of facilitator, encouraging debate, prompting explications, and ensuring that all students have a chance to voice their opinions. After several week of such general discussions, the content of dilemmas progresses to issues of concern in professional environments, including such topics as confidentiality, discrimination, and business tactics. Having begun to explore their values on a personal level, students are thus prompted to begin to explore them in a professional setting. Additional dilemmas that address social and moral responsibility of both companies and individuals are also discussed. Students are encouraged to think beyond what works for them and to consider aspects of moral responsibility to the group, to the profession, and to society.

Another important component of this course is the use of private weekly journal entries. Students are asked to write a brief commentary on some aspect of the class discussion, the readings, or an issue of concern to them in their own lives. The instructor reads and responds to all student journal entries. While not anonymous, the journals become a sort of private dialogue between the instructor and the student that accomplishes many things. First, journal entries give students an opportunity to further discuss classroom dilemmas. Often, students proffer their own resolution to certain dilemmas or clarify thinking on the issues raised by the dilemma – clarification that may not have been communicated in the class setting or that comes as a result of reflection after the class discussion.
Students may also use the journal entry to discuss a particular issue with which they are dealing. This may be an issue in their personal life, at their job, or on campus. In most instances, students have been prompted to present this issue because it parallels a class discussion. Many times, students will draw upon some of the dilemma resolution structures they have learned in order to work their way through the issue. While it is not the instructor’s role to offer advice, there is an opportunity to provide clarification or additional resources to the student.

It is under the guise of the journal entry that students are asked to present their thoughts in response to the following questions:

1) How would you define the term “morals”?
2) How would you define the term “ethics”?
3) What are the five personal values you think are important?
4) What are the five professional values you think are important?

Students are asked to respond to these questions as part of their first journal entry, and as part of their final journal entry at the end of the course. A content analysis of their responses has been conducted to accomplish two objectives: 1) to identify general themes, similarities and differences, and 2) to examine any changes that may have occurred during the semester as a result of exposure to course content and methods. It is understood that changes that have occurred may have also been influenced by outside events or individuals.

**Course Outcomes and Evaluation**

Qualitative data were collected from four classes taught during the 2005 and 2006 academic years. A total of 107 students completed the course during that period. For
purposes of analysis, all student responses (four classes) to each of the questions cited above were grouped together and evaluated as Beginning-of Semester (BOS) responses and End-of-Semester (EOS) responses.

In general, the greatest changes in student responses seemed to occur in their definition of the term “ethics” and, to a lesser extent, in their definition of the term “morals”. While important distinctions were evident between student identifications of personal and professional values, there seemed to be less change across the semester in values cited for either domain.

**Definition of the Term “Ethics” and Changes across the Semester**

At the beginning of the semester, the themes that were commonly identified by students in their definitions of ethics were 1) the role of society in determining right and wrong; 2) the logic or set of principles applied to determining actions; 3) the importance of morals as a reasoning premise; 4) the link, even interchangeability between morals and ethics; and 5) the link between personal and professional values.

Initially, students defined ethics as rules that are “dictated more by what society deems as correct, proper, acceptable, and appropriate”. In many instances, students suggested that ethics were a result of the group’s (society’s) decision of what was right and wrong, that ethics were culturally understood by all, and guided individual actions. Repeatedly, students referred to “guidelines”, standards”, “principles”, even “laws” when defining ethics and how such principles were used to guide both individual as well as group behavior.

One student defined ethics as “a set of reasons, or the basis behind how I make decisions”. Another wrote that ethics were “a person’s rationale about different situations
and their key to answering difficult questions”. There was definitely a sense that students saw ethics as a basis of behavior, or existential action. “I think ethics has to do with our choices based on what we would do when put in a dilemma or situation. This defines who we are”. Some students, however, did not see a difference between the terms ethics and morals. They identified them both as values, or beliefs, and suggested that one goes logically with the other, that the two terms could not be discussed separately. In a similar vein, students reported a link between personal and professional ethics, that they should be considered as related.

A review of End-of-Semester responses revealed that students were better able to articulate the difference between ethics and morals, and that they viewed ethics as more a matter of conscious personal choice. Definitions and explanations of the term evoked the following themes: 1) conscious choice of principles and actions; 2) social code of values; 3) underlying importance of morals; 4) appreciation of varying points of view; and 5) importance as a professional standard of conduct.

One student wrote that ethics were “the ability and choice to do the right thing by a set of standards that have been established”, while another stated that ethics permitted one “to know how to deal with situations in the most positive way and to try and benefit both sides in the workplace and in everyday life - being able to identify both positive and negative outcomes that arise, and knowing how to handle them in the best possible way”. In other words, students expressed a sense of control over their personal standards of conduct. While some continued to acknowledge the role of society in providing guidelines for behavior (“understood rules of social behavior”), many more indicated a
personal sense of involvement in determining the standards to which they held themselves accountable.

Morals were still included in some of the definitions of ethics, often in reference to a “code of values” that underlies the standard by which one behaves. One defined as ethics as the “system of morals and values”. Another stated, “Ethics is having morals”. But many more had teased apart the two definitions, and identified ethics as under the purview of self.

An important change that seemed to evidence itself in the review of EOS responses was the recognition of the value of differing viewpoints. Said one student, “Ethics is what comes after you know where you are standing in life on certain situations. You have to take into account that there are different ways to look at situations even though you do not feel the same way”. Not only did students recognize the importance of appreciating differences of opinion, but also an appreciation of the process of evaluating options in making choices. One student wrote that ethics had to do with “the way you rationalize situations, how you derive your answer, which is how we come up with multiple answers. There is never one way to solve things”. Such responses seem to indicate the direct effect of the dilemma approach to teaching this class. Clearly, students understood the importance of individual and varied contributions of others.

The change in understanding of the meaning of ethics has implications for understanding the role of ethical standards in a professional environment and for professionals. “Ethics are the values and standards we use in our decision making process without giving certain types of people priority over others”. One student identified ethics as “the backbone to the professional side of life”. It seems evident that students were
better prepared at the end of the semester to recognize and address ethical issues that might arise in their respective professions.

*Definition of the Term “Morals” and Changes across the Semester*

At the beginning of the semester, the themes revealed in student definitions of the term morals were fairly straightforward. Students viewed morals as personal, internalized, and derived primarily from values learned while they were young. Morals provided the basis for individual conduct, for knowing what was right and wrong, and served as the foundation of character.

“Morals are more personal” wrote one student. They are “what is inside of each individual”. “There are no rights or wrongs because morals are personal”. All of these statements indicate the general perception of students that morals are, in fact, a personal code of conduct. They are “standards of human conduct, a “set of convictions that guide me in decision making”. Importantly, many students identified morals as values-based, and even more recognized that morals were grounded in family values, instilled at a very young age. Some broadened the scope of the origin of morals to include culture and “surrounding environments”, but the general theme for many students was that morals were the foundation for personal judgments of what is right and wrong, and they provided direction for actions in the future. Finally, wrote one student, “morals are what builds good and bad character”.

End-of-semester definitions of morals followed similar themes with relation to the emphasis on family as the source of learned, internalized values. Students continued to see morals as the underlying codes by which an individual judges right and wrong.
Students seemed to understand that there was a difference between morals and ethics, but they also suggested that there might be an important connection between the two.

One student defined morals as a set of “internal laws that people want to obey”. Many still associated morals with values learned from family and close friends. In other words, they viewed morals as a set of personal beliefs that guided individuals in their choices and actions, such as “doing something good to help someone, being kind”. Morals seem to constitute, in some way, who the individual is. “Certain things don’t have a price tag, cannot be replaced or taken away. These are your morals. They hold intangible value and define a person’s personality, not the way they think, but why they feel that way. Morals are the depth of your conscience. They are the reason, concern, heart and soul of your mind.” There was new acceptance, however, of the possibility that the basis of such beliefs might be reevaluated, or at least expanded.

One student cautioned, “Remember that ethics and morals are intertwined”. Another stated, “I still do not know how to explain the difference between the two. I do know there is a difference though”. These comments, while seemingly contradictory, might suggest a better understanding of ethics and morals as a result of having participated in this class. While students seemed better able to articulate how their understanding of the term ethics had changed over this period of time, the statements cited above indicate that students had begun to view the two concepts as separate, yet complementary. It is difficult to discuss ethics without introducing the notion of morals and values and, by contrast, it is difficult to discuss morals and values without making inferences about ethical principles and belief systems. It is the contention of this author that many students could both distinguish and relate the two concepts in their minds.
Several conclusions may be drawn from the review of student responses to questions about their personal and professional values. First, there were relatively few instances in which students identified the same values for both the personal and professional domains. Second, there was very little change across the semester in the personal values articulated by students. There did, however, seem to be an orientation at the end of the semester toward increased social consciousness. Professional values identified at the beginning of the semester seemed to cluster around commonly recognized values such as open-mindedness, punctuality, ambition, and commitment. At the end of the semester, some of the same values were identified; but included in the mix were several values of broader scope such as accountability and sense of accomplishment.

With very few exceptions, students did not identify the same values as fitting both the personal and professional domain – either at the beginning of the semester or at the end. This may speak to the association that students made between morals and values, inferring that values were underlying, internalized codes of conduct that framed individual behavior. If this was the case, than the values students identified as personal would be assumed to be integral to behavior in professional situations. Another possible explanation is that students may see the domains as entirely separate, and therefore requiring emphasis of different values. Numerous discussions in the class identified the issues and conflicts that may arise when individuals bring differing sets of values to the workplace. Perhaps students felt that personal values were not likely to be a source of conflict.
Many of the personal values identified by students revolved around tenets of faith. Such a finding was not surprising given the demographics of the student population in this southeastern university. Further, additional values emphasized family and the importance of relationships, love, and honesty or trustworthiness. Many of the values identified echoed generally accepted personal codes of conduct such as those espoused by organizations such as the Boy Scouts or Girl Scouts: honor, reliability, obedience, courage. All of these values were cited again at the end of the semester.

As previously noted, it was in the area of personal values that the fewest changes occurred. This was not necessarily a bad thing. It suggests that students had strong opinions about their beliefs and values and/or that exposure to the class content reinforced those values and beliefs. One possible effect of the class, though, was the fact that many students identified more social, or global, values at the end of the semester. For example, students noted conscientiousness, selflessness, generosity, and responsibility among their EOS important personal values. It is hoped that some of the course emphasis on personal and professional responsibility helped to encourage reflection and integration of new values. Such a conclusion also speaks to the previous suggestion that one effect of the course was to cause students to reevaluate their values and to be willing to incorporate new values as a result of new experiences.

There was a fair correlation between professional values identified by students as important at the beginning of the semester and those identified as important at the end of the semester. Commonly identified professional values included leadership, drive, ability to communicate effectively, quality, and punctuality. Senior students have acquired the “language” of the professional workplace and thus seemed to be able to articulate values
generally accepted as important by organizations and professions. From the very beginning, they recognized the importance of skill, competence, efficiency, and creativity. At the end of the semester, values not previously identified included team player, sense of accomplishment, ethical conduct, and compromise. Again, it might be suggested that the identification of these new values are evidence of a broader and deeper understanding of just what values may be required in the professional work environment. Certainly, the fact that several students identified compromise as important reinforces the comments made at the end of the semester about ethics, e.g. that alternative points of view have merit and should be acknowledged and appreciated.

Summary

Although there may be disagreement about the importance of ethics education and the best approach to ethics education at the university level, there can be no disagreement about the rise in unethical behavior witnessed in various professions and corporate environments. It seems, then, imperative that some effort be made to expose college students to a reflective, analytical review of the philosophical theory behind ethics and moral reasoning and, more importantly, to guide those students through the practice and discussion of ethical dilemmas. As noted by Farnsworth and Kleiner (2003), universities provide a critical preparation for a student’s professional career. It makes sense, then, that universities accept the responsibility of preparing students to recognize and effectively address the kinds of ethical dilemmas they will encounter in their chosen professions.

Abstract

ORGANIC FOODS: IS THERE A DISCONNECT BETWEEN ATTITUDES AND BEHAVIORS?

Interest in organic foods as well as a sense of responsibility for the environment is growing among young adults in the United States. In some areas, the availability of organic foods on campus may ultimately factor into a student’s choice of university. The purpose of this study was to examine the relationship between knowledge, attitudes and behaviors of students in a mid-sized Southern university in relation to organic foods. Students (N=443) enrolled in one of two core university courses completed a survey that explored their knowledge about and attitudes toward organic foods. Results revealed that many students (49%) possessed valid factual knowledge about organic foods. Even more (64%) felt positively about having organic food options available to them both on campus and elsewhere. Taste and price were the factors that most influenced the purchase of such foods. Linear regression and path analysis was used to test whether attitudes were significantly related to the purchase of organic foods. In this case, positive attitudes toward organic foods as well as other environmentally friendly practices significantly predicted similar behaviors. Student consumers seem to act upon their beliefs.
Significance

New research and mounting interest by the public have increased global awareness of organic food products. Studies have shown that the primary consumers of organic food are women aged 30-45 who have children in the household and who are environmentally conscious (Lockie, Lyons, Lawrence, & Grice, 2004; Magnusson, Arvola, Hursti, Aberg, & Sjoden, 2003). However, the interest in both organic foods as well as a sense of responsibility for the environment is growing among younger people, specifically college students. During young adulthood, individuals are likely to identify issues of importance that will influence their attitudes and activities in the future. Support of eco-friendly causes such as the production and consumption of organic foods is an example of positive socially conscious behavior (Bissonnette & Contento, 2001).

Several universities, particularly in the western United States, have responded to students’ increased interest in environmentalism by adding organic foods to their menus. In fact, some media have reported that the practice of integrating organic foods to the campus food options may ultimately factor into a student’s decision about where to attend school (Horovitz, 2006a). Therefore, the purpose of this study was to further examine the awareness (knowledge), attitudes, and behaviors of university students towards organic foods, and to determine whether students who expressed positive attitudes about organic foods and other environmental issues actual act upon those beliefs.

Review of Literature

Federal Standards for Organic Foods

The terms natural and organic are not interchangeable. The term natural refers to products that do not contain any artificial flavorings, colorings, or chemical preservatives and...
which are only minimally processed (The National Organic Program, 2007). Organic food differs from conventionally produced food in the way it is grown, handled, and processed. The United States Department of Agriculture (USDA) defines organic foods as products grown without the use of pesticides, synthetic fertilizers, sewage sludge, genetically modified organisms, or ionizing radiation (The National Organic Program). The agency also requires that organic meat, poultry, eggs, and dairy products be produced from animals that are not given antibiotics or growth hormones (Organic.org). There is an increased recognition of the term organic as a trusted symbol of eco-friendly products (Loureiro, McCluskey & Mittelhammer, 2002).

Before a product can be labeled organic, a government-approved certifier must inspect the farm where the food is grown to ensure USDA organic guidelines are followed (The National Organic Program, 2006). For example, no pesticides can be used to grow or process organic products. Companies that handle or process organic foods for public consumption must be certified by the USDA (The National Organic Program). Many of the foods exhibit the USDA Organic Seal (Figure 1) as evidence of this certification.

Consumers who want to buy organic products must be able to correctly identify them. Label standards for organic products, as put forth by the USDA, are: 100% Organic (made with 100% organic ingredients); the word organic or the organic seal (95% organic); made with Organic Ingredients (a minimum of 70% organic ingredients); organic ingredients listed on the
side panel (less than 70% organic ingredients) (The National Organic Program, 2007; Organic.org, 2006).

Other certification programs, such as the eco-labeling program for products in Oregon and the system of integrated management (SIM) in Greece, have been developed to promote eco-friendly products to consumers (Botonaki, Polymeros, Tsakindou & Mattas, 2006; Loureiro et al., 2002). Loureiro et al. (2002) studied consumers’ level of awareness of certified products using eco-labeled apples. However, while the general level of awareness about organic products was high (86%), the awareness of the label meaning was limited.

**Consumer Attitudes and Behaviors**

Many consumers have developed trust in organic products. According to a Swedish study, the attitudes towards and the purchase of organic foods were strongly related to the perceived human health benefits of those foods (Magnusson et al., 2003). Researchers in the United Kingdom found the term organic had emotional resonance for consumers in terms of personal well-being, health, benefits to the environment, and a healthy diet (Padel & Foster, 2005; Tregear, Dent & McGregor, 1994).

As attitudes towards organic products evolve, values play an important but mixed role in how organic products are perceived (Dreezens, Martijn, Tenbult, Kok & de Vries, 2005; Chryssohoidis & Krystallis, 2005). Dreezens et al. indicated that modified foods (foods that have been manipulated at a genetic level) were viewed negatively and associated with the values of power, dominance and submission. In contrast, organic foods were associated with the values of welfare for all people and protection of nature. By contrast, Chryssohoidis and Krystallis found that external values such as belonging to society were less important to consumers who
purchased organic foods than internal values such as self-respect and enjoyment of life, which were strongly associated with the consumption of organic fruits and vegetables.

Consumer perception of the appearance, taste and texture of organic foods varies. In Northern Ireland, a focus group found organic products bland and lacking in color. However, the same group stated that some organic foods, especially mixed vegetables, had a better texture and flavor (Connor & Douglas, 2001). Researchers in the United Kingdom and Australia concluded that the taste of organic food was better than conventionally grown products (Tregear et al., 1994) and that organic food had sensual qualities (Lockie et al., 2004).

As consumers develop more positive attitudes toward organic food, they are faced with purchase decisions. Studies have examined different decision-making factors. Padel and Foster (2005) concluded that the process is complex, and that motives and barriers may vary with product categories. Researchers have found a widespread perception of organic foods as expensive (Tregear et al., 1994) and that the primary barrier to purchasing organic food was the consumer’s level of personal disposable income (Davies, Titterington & Chochrane, 2005). Lockie et al. (2004) suggested that increased education and household income is positively associated with the likelihood that an individual has consumed organic foods. However, Chryssohoidis and Krystallis (2005) and Fotopoulos (2000) found that the main factor that hinders the purchase of organic food is limited availability of such foods.

Nevertheless, consumer purchases of organic foods have increased. In 1994, Tregear et al. found that 29% of the general public occasionally bought organic foods. A later study (Connor & Douglas, 2001) found that almost half of the respondents purchased organic food on a regular basis. Fruits and vegetable tend to be the first organic products that consumers buy and
are often the only organic products consumers buy (Padel & Foster, 2005). In spite of increased purchases, however, few consumers follow a diet that is mainly organic (Lockie et al., 2004).

There is some disagreement about whether there is an association between other environmentally friendly behaviors and the consumption of organic foods. Davies et al. (1995) found that consumers of organic foods were not necessarily concerned about the environment. However, two more recent studies found a significant relationship between environmentally friendly behaviors and organic consumption (Lockie, et al., 2004; Magnusson et al., 2003).

Consumers who are likely to buy organic products have several common characteristics. In Oregon, the likelihood that a consumer will pay a premium for eco-labeled apples was positively associated with being female, having children in the household, and to being environmentally conscious (Loureiro et al., 2002). In Greece, willingness to pay for organic products was higher among consumers who placed importance on health (Botonaki et al., 2006).

In summary, while current research seems to corroborate an increasing awareness of and interest in organic foods, there seems to be a gap that continues to exist to explain why consumers fail to consistently purchase and support the production of such products.

Attitudes and Behaviors of Young People

In a study of 651 high school students in a major metropolitan area, Bissonnette and Contento (2001) found that adolescents had positive attitudes about organic foods. The students believed organic foods were healthier, tasted better, and were better for the environment. Yet their beliefs were not strong enough to urge them to act upon those beliefs (Bissonnette & Contento). Perhaps as adolescents mature and increasingly make their own food choices and purchases, the positive attitudes about organic foods may align more directly with corresponding behaviors.
Interest in organic foods or alternative food sources is especially evident in college age individuals who show an increasing enthusiasm for a healthy lifestyle and a sense of responsibility for the environment (Horovitz, 2006a). Universities across the United States have begun to introduce organic food options in response to increasing demands from their student clientele. For example, the University of Wisconsin at Madison became the first major American public university to commit to putting foods grown on local farms on the regular menu (Organic Consumers Association, 2006b).

The University of California – Berkeley boasts the nation’s first organic certification on a college campus (University of California-Berkeley, 2006). Menlo College has introduced nearly 100% organic foods and beverages on campus (Horovitz, 2006b). Colorado State University and the University of Pennsylvania have student food venues that sell locally grown food. Oral Roberts University introduced its Green Cuisine brand, which includes organic salads, sandwiches and packaged goods make from local food (Organic Consumers Association, 2006a; Horovitz, 2006b). Thus, universities have responded to increasing demands for healthy foods from their students. Further, such a response supports and encourages socially responsible behaviors.

As American universities introduce more organic options on campuses, it is important to determine exactly what students think about organic foods. If research has established that consumer purchases may or may not necessarily follow upon knowledge and attitudes, it makes sense to explore the gap between attitudes and behaviors with regard to organic foods in order to better understand and respond to consumer needs on college campuses.
Method

Population and Sample

The population for this study was students at a mid-size four-year university in the Southeast United States. The sample included 443 students who were enrolled in one of two entry-level political science classes in Spring 2007. All students are required to take both of the political science courses as part of the mandated core curriculum; therefore, the sampling method provided an ideal means of gaining a representative of the student body. No student could be enrolled in both classes at the same time.

Instrumentation

The instrument used for this study was a survey designed by the researchers. The instrument was four pages in length and consisted of 28 items. The consent information was included on the first page of the instrument followed by 24 multiple choice questions, three Likert-style rating questions, and one ranking question.

The first six questions requested demographic information: gender, race, age, student classification, place of residence and income level. The following four questions evaluated the subjects’ awareness of organic foods; the next four questions addressed the subjects’ attitudes toward organic foods; and the final section of thirteen questions sought information about student eating behaviors in relation to organic foods.

Protocol

The chair of the Political Science department at the university granted permission for the students in entry-level political science classes to be involved in the study. Researchers then contacted individual professors to make arrangements to administer the survey in each class. The average class size was 50 students. Students in some course sections did not participate because
professors could not coordinate an administration date, and students who were not present during survey administration did not participate. The survey was administered over a period of two weeks.

At the beginning of each class, a research assistant read procedures from a script before the surveys were distributed. Students were informed that the survey was voluntary and anonymous. Because the informed consent was part of the questionnaire, subjects indicated their consent to participate by completing the questionnaire. Once the surveys were completed, the research assistant placed them in sealed envelopes where they were kept until data analysis.

Statistical Analysis

Data analysis was conducted using SPSS Version 14.0 and Jump Version 5.0. Descriptive statistics were used to describe the sample and to display the frequencies of responses to survey items. Chi-square analysis was conducted to determine associations between categorical variables of interest. Further, a correlation matrix was constructed to examine relations between student attitudes about eco-friendly practices and their related behaviors. Finally, a path analysis model was tested in which attitudes toward organic foods were evaluated relative to similar environmentally positive behaviors.

Results

The sample for this study consisted of 443 students ($N = 443$). Of the sample, 44.2% were male and 55.8% were female. The mean age of the group was 21.6 years. The racial/ethnic background of students was 54.6% White/Non-Hispanic, 30.6% African American, 7.0% Hispanic, 3.9% Asian, and 3.7% Other. The majority (59.5%) of the students were classified as sophomores, and approximately one-third (27.4%) of the students lived on campus. Respondents indicated the income level of the household in which they resided. The income level for 32.6%
of the respondents was less than $20,000 annually. Twenty-seven percent reported an annual household income level between $20,001 and $50,000. The remainder (40.2%) reported an income level above $50,001 annually.

When asked to identify the definition of the term “organic”, 214 respondents (49.0%) selected the correct definition. Meanwhile, 138 (31.7%) indicated that they recognized the USDA-approved organic seal. Knowledge of the correct definition of organic and recognition of the seal were significantly associated ($r_s = .161, p<.001$). Students under the mean age of 21.6 years and at the lowest and highest household income levels were more likely to know the definition of organic and recognize the organic seal.

A majority of students indicated they knew that organic foods were available for purchase in grocery stores and in health food stores (72.2% and 79.0%, respectively). Some (9.7%) believed organic foods were available in restaurant environments. When asked to indicate in what form organic foods could be purchased (subjects could indicate all that applied), responses were as follows: produce (87.1%), grains (72.2%), dairy (53.5%), snacks (31.4%), meat (29.3%), beverage (28.2%), and candy (7.7%).

Most students (56.4%) were neutral when asked their opinion about organic foods, but 41.3% of the respondents noted that they either “accept organic foods” or “only eat organic foods”. Students ranked taste as the factor that influenced them most when selecting organic foods, followed by price, appearance, availability, and package information (Table 1). Approximately one-third (31.1%) of the respondents believed organic foods to taste the same as conventionally grown products while 15.8% felt organic foods tasted better, and 12.3% felt organic foods tasted worse.
Only 20.7% of the respondents reported that they could purchase organic foods on campus, and few indicated that they consumed more than 50% organic diets, no matter where they purchased foods. However, between 33.2% and 45.5% reported they purchased and consumed some organic foods on campus, in restaurants, or at home. The highest number (45.5%) purchased for consumption at home. When asked where they purchased organic foods, 47.4% indicated the grocery store and 13.5% indicated a health food store. The frequencies of types of organic foods purchased were as follows: produce (40.4%), grains (28.2%), dairy (22.8%), drinks/beverages (20.8%), snacks (16.3%), and meat (13.8%).

Interestingly, slightly more than half (50.5%) of the students indicated they would support the use of organic foods on campus, and 64.0% reported they would buy organic foods if offered on campus.

There were significant positive relationships between knowledge of the definition of the term organic and opinion about organic foods (attitude) \( r_s = .103, p < .05 \) and between recognition of the organic seal (knowledge) and opinion about organic foods (attitude) \( r_s = .197, p < .01 \). Thus, awareness and attitude about organic foods were found to be associated. A linear regression was conducted to test whether the two knowledge variables to predict attitude. Results

were significant \( R^2 = .04, F(2, 422) = 9.73, p < .000 \). Recognition of the seal was the strongest of the two predictors.

There was also a significant positive relationship between recognition of the organic seal and opinion about the taste of organic foods as compared to conventionally grown products \( r_s = .298, p < .01 \). The relationship between the other knowledge variable (definition of organic) and attitude was not significant. Linear regression tested recognition of the organic seal as a predictor of attitude and was found to be significant \( R^2 = .08, F(2, 418) = 20.09, p < .000 \). When knowledge of the definition of organic was added as a predictor and tested in a second linear regression, model fit did not change significantly, corroborating the previous conclusion that the stronger predictor was recognition of the seal.

A multiple correlation was conducted to examine the relationship between attitudes about organic foods and subject responses that indicated the support and purchase of organic foods (behavior) in different contexts (Table 2). Attitude towards organic foods was found to be

significantly related to three different behaviors: 1) purchase and consumption of organic foods on campus, 2) purchase and consumption of organic foods (usually in restaurants), and 3) purchase for consumption of foods at home.

Given the significant findings of the correlational analysis, a path analysis (Figure 2) was conducted to determine whether attitudes toward organic foods would predict the three sets of purchase and consumption behaviors. Attitude was found to be a significant predictor ($p < .01$) of all three behaviors (Table 3).

Attitude towards organic foods was found to be significantly related to students’ perception of whether or not they lead a healthy lifestyle ($r_s = .160$, $p<.01$). A second path analysis was conducted to determine the direct effect of attitude towards organic foods on other healthy lifestyle practices (Table 4). Significant path coefficients were calculated for relationships between positive attitudes towards organic foods and healthy diet, regular exercise, and consumption of organic foods only.

A final analysis examined the relationship between attitudes about environmentally friendly behaviors and the actual behaviors themselves. A multiple correlation determined that most of the attitudes expressed about such behaviors were related to the practice of the behaviors (Table 5). Further, in many instances, the attitudes of respondents about an eco-friendly behavior such as recycling and energy conservation were significantly correlated to other eco-friendly behaviors. For example, a positive attitude towards water conservation was significantly related to supportive behaviors such as recycling, energy conservation, ozone protection, and donating money to environmental causes.

Discussion

We found that many students are relatively knowledgeable about organic food products and tend to feel strongly that organic foods are beneficial and necessary. Many expressed an interest in having more organic foods available on campus, and even more indicated they would be willing to purchase organic foods if made available on campus. Contrary to some of the outcomes reported in the literature, we found that students were more likely to act upon the beliefs they expressed about both organic foods and environmentally friendly behaviors.

In this study, there were more female than male respondents. In general, we found that almost as many males as females (relative to sample size) knew the correct definition of the term organic, recognized the federal organic seal, and expressed a positive attitude towards organic foods. This finding varies from the literature that identifies females as being more aware and having stronger attitudes about organic foods. Such a finding may be a consequence of the source of the sample, e.g. students as opposed to the general public (Lockie et al., 2004). Students on a college campus are more frequently exposed to state-of-the-art research and information.

When examining the relationship between awareness (knowledge) and attitude, we concluded that even though a large number of students (44.7%) selected one of two alternative (incorrect) definitions of the term organic, those students may have, in fact, also had strong opinions in support of organic foods and other eco-friendly practices. Such findings were confirmed when we examined the association between the selection of one of the two other options and attitude questions. Even though students might not have known the correct definition, they still expressed positive attitudes towards organic foods and other practices.
Most of the students in this study clustered in household income levels of under $20,000 or $50,000 and above. We would have expected students to report lower household income levels because many live on their own. It is possible that those who reported higher household incomes were students who either lived with their parent(s) or a spouse, e.g. many students are commuters and/or more are married or live with a significant other. More than 30% of study respondents from the upper household income levels reported that they “accept organic foods”. This agrees with similar findings in the literature that indicate higher levels of awareness and support for organic foods among individuals with higher incomes. More than 20% of the students in the lowest household income level also expressed a positive attitude towards organic foods. It is possible that many of these students, while living on their own for school, come from households that fall into a similar upper income range.

Another interesting finding in this study was that significantly more students under the mean age of 21.6 years knew the correct definition of the term organic and recognized the organic seal than those over the mean age. Further, twice as many respondents under the mean age of 21.6 years expressed positive attitudes toward organic foods as those over the mean age. Such a finding agrees with Bissonnette and Contento (2001) who examined the attitudes of high school students. Similarly, the finding suggests that younger people may be more inclined to seek out organic foods in various food environments or at least to feel strongly about having them available. If such a conclusion is drawn, it makes sense that university food services should be integrating more organic food options into their on-campus menus.

Many students indicated that they knew organic foods were available in grocery stores and health food stores, but very few thought that such foods were available in commercial restaurants. While more than half of the respondents indicated they had no opinion about organic
foods, more than half of the subjects responded to a question that asked them to rank factors that influenced their buying decision when purchasing organic foods. It was expected that price, particularly among students, would be the most important factor; however, taste was reported to be the most important factor, followed in order by price, appearance, availability, and package information. Bissonnette and Contento (2001) also reported that high school students thought organic foods tasted better. The literature has shown that consumers associate health benefits with organic foods. Perhaps a younger, more health-minded generation of educated consumers may place more emphasis on quality (taste) and value (price) than has been the case in the past. Such a conclusion might also support the fact that students knew of the availability of many forms of organic foods.

It is important to note that many students in this study expressed “no opinion” when asked about their attitudes towards organic foods. Thus, some of the significant findings are based as much on associations between lack of knowledge or opinions about organic foods as they are on those who expressed positive opinions about organic foods. Interestingly, more students ranked the factors that influenced them when purchasing organic foods than responded positively about their opinions towards organic foods.

When asked whether they purchased and consumed organic foods in varying contexts – on campus, off campus (restaurants), or at home - more students indicated that they purchased organic foods for consumption at home than on- or off-campus. Since they also indicated that these foods were primarily purchased at grocery stores and health food stores, it seems logical that a greater number consumed these foods at home. Produce, grains, and dairy were the most commonly identified forms in which organic foods could be purchased and they were, also the most common types of purchases for those who said they purchased organic foods.
Very few students reported they consumed an all-organic diet. Most indicated that they purchased and consumed “50% or less” organic foods. This, combined with the larger number of students who said they had no opinion about organic foods, might lead to the conclusion that this group was generally not interested in information about or exposure to organic foods. However, more than half reported they would support the integration of organic foods into campus menus, and even more said they would buy organic foods if offered on campus. Such findings seem to reinforce the current move on university campuses to provide more organic food options.

One of the primary purposes of this study was to examine the link between knowledge and attitudes about organic foods, and then to determine if there was a significant link between attitudes and behaviors supporting those opinions. Study outcomes led us to the conclusion that students were relatively knowledgeable about organic foods, that they held strong opinions about such foods, and that their opinions served to predict their behaviors. It is important to reiterate that the study findings about the relationship between knowledge, attitudes and behaviors were not only reflective of students who knew about and supported the purchase and consumption of organic foods. These findings were also reflective of respondents who were not knowledgeable about organic foods and had no strong opinions about such foods; therefore, they were not necessarily inclined to purchase and consumer organic foods.

Nevertheless, the regression analyses conducted did support the finding that students who were able to identify the correct definition of the term organic and who recognized the USDA organic seal were more likely to have positive opinions supporting organic foods. Recognition of the organic seal was a significant predictor of taste perceptions. In other words, students who recognized the organic seal were more likely to think that organic foods tasted as good as or better than their conventionally grown counterparts.
Our statistical analysis revealed that students who had strong opinions about organic foods actually acted upon those beliefs and purchased and consumed such foods in different venues. They were most likely to purchase for home consumption. Importantly, attitude towards organic foods predicted purchase and consumption of such foods. Lockie et al. (2004) noted that income and education levels may be associated with the consumption of an organic diet. The subjects in this study reported higher household incomes and were university students. Connor and Douglas (2001) slightly less than half of their study respondents consumed organic foods. Our results paralleled those of Connor and Douglas. In addition, while others have attributed the failure to purchase organic foods to availability (Davies et al., 2005; Tregear et al., 1994) and price (Chryssohoidis & Krystallis, 2005; Fotopoulos, 2000), we found students to be most influenced by taste.

A final set of analyses examined student attitudes about other healthy lifestyle practices as related to their attitudes about organic foods, and the relationship between other environmentally conscious attitudes and similar behaviors. Botonaki et al. (2006) suggested that consumers of organic foods are likely to engage in other healthy lifestyle practices. Students in this study who reported a positive attitude towards organic foods also reported that they led a healthy lifestyle. In fact, significant associations were found between positive attitudes toward organic foods and consuming a healthy diet and exercising regularly. However, such an attitude did not necessarily affect student practices related to consumption of alcohol and smoking. It is possible that behaviors such as drinking and smoking that have a long-term effects on health do not resonate with younger individuals in the same ways as diet and exercise.

Several studies have found an association between various types of eco-friendly behaviors. For example, Lockie et al. (2004) and Magnusson et al. (2003) found the consumption
of organic foods and other environmentally conscious behaviors to be significantly related. Our findings concurred, for the most part, with Davies et al. (2002) who did not find such attitudes and behaviors to be related. When students were asked their opinion about such behaviors as recycling, various forms of energy conservation, and ozone protection, they tended to express strong support. Importantly, in many instances, there was a significant relationship between a positive attitude about these factors and the corresponding behavior. In other words, there did not seem to be a disconnect between the belief and the action. Padel & Foster (2005) suggested that the decision-making process about such issues was complex. Individuals who agree in theory with eco-friendly practices may take more factors into account in making the choices to actually follow through on their beliefs. Clearly, students in this study not only felt strongly about environmental issues but they also felt compelled to practice such behaviors.

Summary

One of the principle findings of this study was that students seem to be knowledgeable about organic foods and that they support the integration of organic foods into their menu choices and diets. While approximately one-third to one-half of the students indicated that they purchased and consumed organic products in various environments, more than half the study respondents reported that they would support the use of organic products on campus and would actually purchase organic foods on campus.

This sentiment is an important indicator for college and universities that have not evaluated the opinions and behaviors of their campus constituents. Certainly, there is already a demand for healthy food options on university campuses (Horovitz, 2006a, 2006b). It seems that campus foodservices should begin to evaluate not only their menu offerings, but even what they term healthy choices, in terms of organic food standards. Our study focused on students as
primary consumers; however, campuses also accommodate significant numbers of faculty and staff, many of whom may have opinions similar to those expressed by the students in this study. A future study might examine the opinions of other groups on campuses and implications for university food services.

This study found that students who felt positively about organic foods were also inclined to behave accordingly. In other words, they were more likely to act on their opinions and choose to purchase and consume organic foods. Such a finding may have implications for market food producers in general, in that college students are important consumers today but also primary consumers in the future. It will be important to address this growing demand in more venues than college campuses.

FINANCE AND POVERTY: EVIDENCE FROM PANEL STUDY

Abstract

This paper presents empirical evidence of direct relationship between financial development and poverty. A poverty determination model is considered which integrates financial development and financial instability. Using panel data for 68 developing countries over the period 1980-2004, the study finds that on average financial development is conducive for poverty reduction but the instability accompanying financial development is detrimental to the poor. This outcome only holds when financial development is measured by the ratio of money to GDP (M3-GDP) and not by the credit-GDP ratio.

I. INTRODUCTION

There is little doubt in the literature (e.g. Levine et al 2000, Levine 1997, Easterly 1993) that financial development boosts economic growth and sustainable growth is a necessary condition for poverty alleviation (Beck et. al 2004, Honohan 2004, and Julilian and Kirkpatrick 2002, and Dollar and Kraay 2002). The implication from the above studies is that financial development plays an indirect role in the battle against poverty. The more fundamental question is however, can financial development exert a direct impact on poverty? The primary objective of this paper is to empirically investigate this question. To make the study more comprehensive and in order to comprehend the overall impacts on poverty, we consider both the level of development and instability that the process of development is likely to cause. Financial development may bring benign outcomes for the poor as long as that development is sustainable over time. If the process of development experiences unanticipated ups and downs, then it is very likely that the so-called benign effects turn out to be harmful because financial instability may worsen poverty by affecting the poor disproportionately. Therefore, a study of the linkage between financial development and poverty alleviation is incomplete if the level of development is not factored into the study.
The number of studies investigating the finance-poverty linkage using macroeconomic data is not very rich. One reason for the lack of studies in this area relates to the difficulty in deciding on a uniform measure of poverty across different countries. Although the World Bank suggests certain indices that may be used to compare poverty across countries, consistent time series data on such measures is not available. The available data is usually taken from irregular surveys, despite these limitations some researchers have made attempts and documented fairly acceptable results. Among the renowned studies are those by Honohan (2004), Beck et al (2004) and more recently Jeanneney and Kpodar (2005).

Honohan (2004) considers the relationship between financial development and absolute poverty while Beck et al (2004) examines whether financial development boosts the income growth of the poor at a faster rate than that of the rich. Using a cross country sample, Honohan (2004) shows that financial development reduces the share of the population below one dollar a day while controlling for GDP per capita. Beck et al (2004), on the other hand finds that financial development reduces poverty by boosting the income growth of the poor. Jeanneney and Kpodar (2005) considered a number of measures of financial development in relation to their impacts on poverty. They find that financial depth (measured by the ratio of M3 to GDP) is beneficial to poverty reduction but the ratio of bank credit to GDP fails to alleviate poverty. They interpret their results as an evidence of the relevance to McKinnon’s (1973) conduit effect which implies that financial intermediaries do not exert a direct impact on poverty but stimulate growth by enhancing economic activities. Poor people participate in these activities, and hence, eventually benefit from financial development. But if the rich get richer as a result of financial intermediation, that is, if financial development merely supports a trickle down process, there is every likelihood that the poor will suffer disproportionately. Jeanneney and Kpodar (2005) consider the impact of financial instability upon poverty and find that financial instability significantly impedes poverty reduction. This study largely draws on Jeanneney and Kpodar and considers the impact of both the level and instability of financial development on absolute poverty, that is, the population under income of one dollar a day.
In this paper we consider a poverty determination model which integrates financial development and financial instability. The model is estimated on a set of panel data for 68 developing countries having three or more observations of the poverty index over the period 1980-2004. Panel estimation techniques have been applied in order to control for cross country heterogeneity. Our results cannot reject the null hypothesis that on average financial development is conducive for poverty reduction but the instability accompanying financial development is detrimental to the poor. This outcome only holds when financial development is measured by the ratio of money to GDP and not by the credit-GDP ratio.

In a preliminary investigation into the effects of financial development on poverty alleviation we did take account of a number of microeconomic studies (e.g. Hashemi et al 1996, Hossain 1998, and Khandker and Pitt 2002) concerning the presence of specific institutions for the poor, such as microfinance institutions. However, we did not apply a micro-economic approach because such analysis cannot explain differences across countries in the presence/absence of specific policy measures. A policy prescription may appear to be helpful for one country but may be detrimental to some others due to the presence of some country specific issues. The primary reason why we adopt a macroeconomic approach is that this methodology allows us to analyze the impact of alternative financial development programs after controlling for country specific heterogeneity. The paper is organized as follows. Section two presents a brief review of literature. Section three considers the model, data and estimation techniques. Section four presents the results with interpretations, and section five concludes the paper.

II.BACKGROUND OF THE RESEARCH ISSUE AND REVIEW OF LITERATURE

It is well documented in the literature that financial development boosts economic growth and growth helps alleviate poverty. Although this indirect link between finance and poverty has attained strong empirical support, there are doubts about the direct role of financial development in reducing poverty and income inequality. The evidence on the above links does not have universal support particularly from academia, which sees the availability of financial services as simply inappropriate to the poor who consequently do
not avail of them. This idea is systematically presented by Greenwood and Jovanovic (1990) who argue that getting involved in the financial sector or subscribing to such financial services as screening and risk pooling requires an initial set-up cost. Poor people are not in a position to incur this cost. Moreover, the low to medium income groups may not find financial intermediaries a beneficial place to park their savings.

However, this regressive prediction of Greenwood and Jovanovic (1990) does not have much empirical support. Li et al (1997) for instance, find that financial depth enters strongly and significantly as a contributor of lower inequality (Gini index) and raises the average income of the lower 80% of the population. They conclude that financial development removes credit constraints for poor households and thereby feeds their desire to spend money on activities such schooling and healthcare for children. The same reasoning is echoed by many other observers such as Rajan and Zingales (2003) and Beck et al (2004).

Rajan and Zingales (2003) observe that as the financial system becomes healthier, powerful and more competitive, it is likely that a grater amount of capacity and a desire by owner’s to bear the high cost of credit. Moreover, the development of informal credit, which is often the only source of borrowing for poor people, is made easier by the growth of a formal financial system which offers opportunities for profitable investments. An identical conclusion is drawn by Beck et al (2004). They observe that in an environment of competitive markets for factors of production, credit may improve the well being of the poor, even if they do not directly receive the loans. This is the essence of so-called conduit effect, which was formally proposed by McKinnon (1973). He professes the idea that even if financial institutions do not provide credit to poor people confined to self-financed investment, they are useful to them in so far as they offer some profitable financial opportunities for their savings. By this proposition, when economic units are involved in self-finance investment activities, the distinction between savers (households) and investors (firms) disappears. This makes money and capital complementary. Hence, if the real return on holding money increases, so does self-financed investment over a significant range of investment opportunities. McKinnon argues that the increased demand of the poor for holding cash balance reduces the opportunity cost of saving internally for the eventual purchase of capital goods from outside the firm/household.
The financial conduit for capital accumulation is thereby enlarged. McKinnon’s complementary hypothesis and the conduit effect have relevance in developing countries where financial markets are not yet very deep. For developing countries money and capital are complementary because, in the absence of deep financial markets and extensive intermediation, money balances have to be accumulated before indivisible investment can be undertaken.

An assessment of the impacts of financial development on poverty alleviation will not be complete if the impact of financial instability is not taken into account. There are many reasons to believe that financial instability hurts the poor more than the rich. For example, as Jeanneney and Kpodar (2006) have put forward, low income people are particularly hurt by disruption of the payment system, unwarranted bank closure and freezing of deposits since they have limited scope for diversifying their assets. In countries where some banks are periodically unable to ensure the liquidity of their deposits, the so-called conduit effect suggested by McKinnon is likely to be diminished by the uncertainty surrounding the health of the banking system. Moreover, when banks are in difficulty, they begin to ration small loans as these loans are less profitable for the banks and because poor people have little power of negotiation. In addition to these direct impacts, there are indirect consequences of financial instability.

Ramey and Ramey (1995) present empirical evidence of a negative relationship between the average rate of growth and the volatility of annual rates. This evidence points to the indirect linkage between financial instability and poverty. Instability induces volatility in growth and volatility impedes the rate of growth which eventually hurts the poor. More specifically, financial instability induces instability in the rate of investment which eventually induces instability in economic growth while the poor suffer from that instability because growth is a necessary condition for sustainable poverty reduction.

A distinguishable feature of our study is that while previous studies have focused only on credit (e.g. Dollar and Kraay 2002, Honohan 2004, and Beck et al 2004), we use both liquidity and credit indicators as measures of financial development and estimate their direct impact on poverty measured in terms of the percentage of the population under a dollar income per day. We do not focus on the indirect effect of these indicators of financial development which comes through growth. Another aspect that set’s this
study apart from many others is that we introduce a measure of financial instability in an attempt to see its direct impact on poverty. The model and estimation techniques are described in the following section.

III. THE MODEL AND ESTIMATION TECHNIQUES

As mentioned at the outset, financial development enhances growth and growth is good for the poor. This is the indirect effect of financial development. We are not interested in this indirect effect because it is already well documented in the literature. We are interested in investigating the direct impact of financial development and financial instability on poverty. Having been influenced by the conduit effect proposed by McKinnon (1973), we hypothesize that financial development directly helps reduce poverty, and that part of the poverty-reduction effect of financial development is reduced when financial instability accompanies financial development.

As a measure of poverty, we use head count index (hci) which is defined as the percentage of population under a dollar daily income. On the explanatory side, financial development is represented by two measures namely the ratio of currencies and deposits (M3) to GDP and the ratio of credit (by bank and non-bank financial institutions to the private sector) to GDP. Impact of each measure of financial development on poverty is studied independently. The other variable of interest-financial instability is measured in terms of the absolute value of the residual of a trend line estimated for each measure of financial development from a time series over the period 1960 through 2004. We estimate the effect of financial development and financial instability on poverty after controlling for the effects of such variables as per capita income and inflation.

Initially we estimate a naïve model that disregards the time and space dimensions of our data. In other words, we simply stake time series observations of one country upon another and then run linear regressions. Three different specifications are attempted. First, the head count index (hci) is regressed on log of the per capita income, the ratio of M3-GDP and the rate of inflation. Then in a second regression, the variable measuring financial development and financial instability on poverty after controlling for the effects of such variables as per capita income and inflation.

Studies such as Dollar and Kraay (2002), Jeanneaney and Kpodar (2006), have used real per capita GDP. But we use per capita household income which is available at the same source from where we collect the poverty data. The reason for using this measure of per capita income is keep uniformity in measurement of poverty and income across country. Both the poverty line and income are measured at 1993 PPP. See Ravallion (2001) and http://iresearch.worldbank.org/PovcalNet/jsp/index.jsp for more details.
financial instability is added in order to see if there is any difference in the parameters estimated between the two specifications. We expect financial development to exert a larger impact after financial instability is added to the model. Accordingly, we also expect the standard error of the estimate to fall and R-squared to increase as the new variable, financial instability, is added to the model. Then, in the third regression, we add a complement namely standard deviation of per capita GDP. The reason for adding this is to see whether the detrimental impact of financial instability is channelled through the instability of economic growth as the cost of economic crises might be borne disproportionately by the poor.

We cannot rely on the results from pooled data regression above because they omit cross-country heterogeneity. Popular estimators that allow for such heterogeneity are fixed effect (FE), and random effect (RE) models. This set of estimators allows for heterogeneity across panel units but confines that heterogeneity to the intercept terms only. So the slope coefficients are considered fixed across units in FE and RE models. We consider both these estimators to estimate our poverty model which is specified as:

\[ P_{\text{v},i,t} = \beta_i + \beta_1 \log(Y_{i,t}) + \beta_2 FD_{i,t} + \beta_3 FI_{i,t} + \beta_4 \log(1 + Inf)_{i,t} + u_i + e_{i,t} \]  

where \( \beta_i \) is the intercept term for country \( i \). \( PV_{i,t} \) is Poverty indicator of country \( i \) defined as percentage of population living under the $1 poverty line at time \( t \). \( Y_{i,t} \) is level of income per capita of country \( i \) at time \( t \). \( FD_{i,t} \) is the level of financial development of country \( i \) at time \( t \). We use two measures of \( FD \) namely the Credit-GDP ratio and the M3-GDP ratio. Credits include those extended to the private sector by the bank and non-bank financial institutions while M3 includes currencies and deposits. We cannot expect financial development to have immediate impact on poverty. It may take couple of years to exert an influence on peoples’ living condition. Moreover, poverty index is observed at irregular intervals. For these reasons, we take an average of five years. Thus, each observation of \( FD \) at time \( t \) is an average taken over the year of poverty index and preceding four years. We could have used lag \( FD_s \), but the panel data model we use here, e.g. fixed effect model, does not allow lags. \( FL_{i,t} \) is the indicator of financial instability. This has been measured by the average (again over the period of poverty index and

---

2 The model partially draws Jeanneney and Kpodar (2006).
preceding four years) of the absolute value of the residual of the equation: \( FD_t = a + bFD_{t-1} + ct + \varepsilon_t \). Thus \( FI_{i,t} = \frac{1}{n} \sum_{t=1}^{n} |\varepsilon_{i,t}| \) where \( n = 5 \). \( Inf \) is the rate of inflation measured by the annual rate of change in CPI. \( u_i \) is unobserved effect which vary across countries but fixed over time. \( u_i \) may or may not be correlated with the regressors. Models that assume \( u_i \) to be uncorrelated with regressors are known as fixed effect (FE) models and those consider \( u_i \) to be correlated with regressors are called random effect (RE) models. We consider both assumptions, \( e_{i,t} \) is the error term which varies across both time and space, \( e_{i,t} \) is often referred to as idiosyncratic error (Wooldridge 2006) because it represents unobserved factors that change over time and affect the dependent variable. The classical assumptions e.g. no-correlation with explanatory variables (including \( u_i \)) applies to \( e_{i,t} \). Equation (1) implies that even if we assume that \( e_{i,t} \) is uncorrelated with regressors, estimates based on pooled OLS will be biased and inconsistent if \( u_i \) and the regressors are correlated. However, OLS can give consistent and unbiased results if we can remove \( u_i \) from the model (provided \( u_i \) and \( e_{i,t} \) are uncorrelated). Two popular methods to remove \( u_i \) are first differencing and time-demeaning\(^3\). An alternative way to handle the unobserved country specific effect is to consider a dummy variable for each panel unit. But if the size the panel units is large, using dummies for each unit means estimating a large number of parameters which might cause a lot of problems e.g. loss of degrees of freedom and multicolinearity.

We apply the time-demeaning technique. This technique involves a simple transformation\(^4\) of data: the mean calculated over the number of time periods for each unit (country) is taken away from each observation. The model obtained is called fixed effect model. Thus a simple panel data model such as:

\[
y_{i,t} = \beta_1 + \beta_2 x_{i,t} + u_i + e_{i,t} \tag{2}
\]

which is subsequently transformed into a time-demeaned or fixed effect model as

\(^3\)For description see Wooldridge (2006) and Baum (2006).

\(^4\)The demeaning transformation is also known as fixed effect transformation.
\[ y_{it} - \bar{y}_i = (\beta_1 - \bar{\beta}_1) + (x_{it} - \bar{x}_i)\beta_2 + (u_i - \bar{u}_i) + (e_{it} - \bar{e}_i) \]

or \[ y_{it} - \bar{y}_i = (x_{it} - \bar{x}_i)\beta_2 + (e_{it} - \bar{e}_i) \]

or \[ \gamma_{it} = \gamma_{i0}\beta_2 + \gamma_{i1} \] where \((x_{it} - \bar{x}_i) = \gamma_{i0}\) and \((e_{it} - \bar{e}_i) = \gamma_{i1}\)

Thus we can see that the constant term \(\beta_1\) and the variable \(u_i\) (which vary across panel units but fixed over time) do not appear in the transformed model (because \(\beta_1 = \bar{\beta}_1\) and \(u_i = \bar{u}_i\)). Given that the classic assumptions hold for it i i it i i it i it it i it i it

\[ \gamma_{i0} \]

Because each observation in the model represents a deviation from the panel level mean, the fixed effect model will have explanatory power only if the deviation above or below the mean in the response variable for a given panel unit is significantly correlated with the deviation above or below the mean in the regressors for that panel unit. In other words, the explanatory power depends on the variation within the panel unit. Moreover, FE models produce best linear unbiased and efficient (BLUE) estimates of parameters if the unobservable unit specific effect \(u_i\) is correlated with the regressors.

Another estimator for panel data is the ‘between’ effect (BE) estimator in which the panel level means of the response variables are regressed on the panel level means of the regressors. BE models are not widely used because they disregard the unit-specific variation in the response variable and as a result produce biased estimates. However, they are often applied when the time series of various panel units have inaccuracies in measurement. The idea is that if the inaccuracy has a zero mean (random) over time, a solution to this problem can be found by averaging the data over time and retaining only one observation per unit. BE estimators are biased when the individual effect \(u_i\) and the regressors are correlated. If they are uncorrelated, we prefer the random effects models.

If \(u_i\) is uncorrelated with regressors or everything else in the model, then it may simply be parameterized as a random effect in addition to random disturbance \(e_{i,t}\). Models that assume \(u_i\) as a random effect are called random effect models. Thus, in the RE models, the error term becomes the sum of \(u_i\) and \(e_{i,t}\). A simple panel data model such as:

\[ y_{it} = \beta_1 + \beta_2 x_{it} + (u_i + e_{i,t}) \] (3)

\[ \text{That is why fixed effect estimators are also known as within estimators.} \]
may be transformed into an RE model as:
\[(y_i - \theta \bar{y}) = \beta_1 (1 - \theta) + \beta_2 (x_{it} - \theta \bar{x}_i) + u_i (1 - \theta) + (e_{it} - \theta \bar{e}_i)\]
where \(\theta = 1 - \sqrt{\frac{\sigma^2}{\sigma^2 + \sigma^2_u}}\)

Thus, RE models are estimated essentially by a GLS regression method. We apply optimal weight based on \((1 - \theta)^2\). We test if \(\sigma^2_u = 0\) (no random effect, hence pooled OLS estimator is appropriate) using Breusch and Pagan (1980) LM test. Moreover, Hausman (1978) test is applied to see which specification, RE or FE, is more appropriate to our data.

IV. RESULTS

In all pooled data OLS models, the level of financial development measured in terms of the ratio of M3 to GDP appears as a significant explanatory variable of poverty. The expected minus sign of M3-GDP implies that poverty falls as the level of financial development enhances. For instance, as revealed in model 1, a 10 percentage point increase in the level of financial development reduces poverty by approximately 0.8 percentage points. The impact of financial development becomes more prominent as we introduce financial instability. The coefficient of M3-GDP changes from 0.0849 to 0.1336 in absolute values when financial instability is introduced in the model. Moreover, as tables A1 and A2 in the appendix reveal, t-values (in absolute terms) and R-squared increase while the standard error of the estimate decreases when financial instability is considered together with the level of financial development. This implies a strong correlation between the level of financial development and financial instability, suggesting financial development helps the poor to a larger extent in countries with stable financial system. The Wald test results with regard to model that considers both financial

---

6 Table A3 in the appendix presents the beta coefficients of the regressors in the model which are defined as \(\frac{\partial y^*}{\partial x^*}\), where \(x\) and \(y\) are the explanatory and the response variables respectively. The starred quantities are z-transformed or standardized values of these variables. For instance, \(y^* = \frac{(y_i - \bar{y})}{s_y}\), where \(\bar{y}\) is the sample mean and \(s_y\) is the sample standard deviation of the response variable (Baum 2006). Thus the beta coefficient for M3-GDP tells us that the poverty index would decrease by 0.1762 standard deviations given a 1-standard deviation increase in M3-GDP.
development and instability (shown in the appendix) suggest that we can strongly reject the null hypothesis that population coefficients for these variables are zero.

Financial development measured in terms of the ratio of private credit to GDP appears to be a weak variable to explain poverty. Its coefficients are significant only at a low level of confidence. But as we will see later, its impact on poverty disappears in estimation considering country specific effects. As we mentioned earlier, the OLS estimation by pooling data across countries has omitted variable problem caused by heterogeneity across countries. The weaknesses of these estimations are clearly revealed by the scatter plot shown in figure 1 below. The figure plots the actual and the predicted values of the response variable in pooled data model 2. The scatter plot shows considerable difference in actual and predicted values especially where the level of poverty is relatively high.

Figure 2 presents the plot of residual against M3-GDP in the pooled OLS model 2. The pattern in the graph indicates a problem with the model. More specifically, the figure casts doubts over the classic assumption of homoskedasticity in OLS estimates as it clearly reveals the fact that the residuals are much more variable for low levels versus high levels of M3-GDP.
Figure 1
Actual Versus Predicted Values from the Pooled Data OLS 2

Predicted poverty index

Figure 2
Residual versus Predictor Plot from Pooled Data OLS 2

Actual poverty index (hci)
The fact that the results obtained from pooled data regression suffer from specification problem becomes clear if we introduce lags of the poverty index in the model. We can see in table A5 in the appendix that as lags of the dependent variable is added to the model, all the other regressors in the model lose their explanatory power. Results from this regression indicate why we cannot make the assumption that our observations are independently distributed. This is a core assumption for the OLS to provide consistent and unbiased estimates. But because of the panel nature of the data, we cannot make such assumption. We are dealing with multi-period observations so it is very likely that observation of one period is affected by the observation(s) of other period(s). This is true especially for a variable like poverty which is caused by many factors and consequences of which is likely to expand over generations. More precisely, poverty is likely to be affected by a number of factors; some of which we may observe and some we may not. Moreover, some of the unobserved effect may vary over both time periods and countries while the others may remain constant over time but vary only across countries. What all these suggest is the fact that OLS estimates presented in table 1 suffer from omitted variable problem. Because heterogeneity across countries is not taken into account, the OLS estimates are not consistent and unbiased. We therefore need to consider some special type of models. Some of the possible alternatives are considered here.

**Results from Panel Data Models**

Before results are presented, we need to have a look at our data. Table B1 in appendix B presents the overall, between and within statistics of variables considered in our basic model. Because the explanatory power of FE models depends on variation within a given panel unit, any variable with a within standard deviation of zero will be dropped and the coefficients on variable with small within standard deviation are not well identified in FE

---

7 In the appendix, we provide Ramsey’s Reset test result with regard to pooled data model 2. The result strongly suggests that we can reject the null hypothesis of no omitted variables for the model.

8 Stata 9 provides an F test to check if individual-specific heterogeneity is necessary. This F test results are presented underneath the regression results from FE models. For instance, F test result in table B2 in appendix B indicates that there are significant individual (country level) effects, implying pooled OLS is not appropriate for the data we considered.
models. The log of per capita income and the rate of inflation have small standard deviations compared to other variables. So they may not be as well identified as the other variables.

| rho      | .7338   | .7355   | .7345   | .73     | .7291   | .7281   |

Results presented in this and the following tables should be read in conjunction with the results presented in appendix B.

There are two versions of FE models namely one-way and two way FE models. In the one-way models the heterogeneity across panel units are confined within the intercept term which are time invariant but varies across panel units. While under the two-way version of FE models, the intercept term is allowed to vary over time within each panel unit. Table 2 presents estimated coefficients from one way FE models. As we can see in the table, the ratio of credit to GDP does not appear in any specification as a significant explanatory variable of poverty but M3-GDP does appear in all specifications with statistical significance and desired sign (negative). It should be mentioned here that the intercept term appeared in table 2 (labeled _cons) is not the constant term that would result had we used the original data. It is the intercept of the time-demeaned model where each observation within a country is taken as a deviation from the country level mean.

The FE models implemented here take $u_i$ as deviation from this constant term (_cons). Sigma_u reported in the table is the estimated variance of $u_i$, while $\sigma_i^2$ is displayed as sigma_e. The table displays another statistics labeled rho which represents the fraction of variation due to $u_i$. The estimate of rho suggests that around 73 percent of the variation in poverty estimate is attributable to cross country differences in poverty rates. Table B2 in...
appendix B presents some other results e.g. the correlation between $u_i$ and the fitted values of the regressors (labeled corr $u_i$, $X_b$), which is 20 percent for the FE model 2. Presence of this correlation suggests that the RE models are not appropriate for the data we considered. But because the correlation is not very strong, we applied RE models too and find that the results from the RE models do not have much variation from the results from FE model.

However, the Hausman (1978) test result with respect to RE model 2 (see table B9, appendix B) suggest that the country level individual effects do appear to be correlated with the regressors so we cannot accept the null hypothesis that the RE estimator is consistent for the type of data we considered. But this does not mean that $\sigma_u^2 = 0$. The Breusch and Pagan (1980) LM test in context of the RE model 2 strongly rejects the null hypothesis that $\sigma_u^2 = 0$. If $\sigma_u^2$ were zero, then the results obtained from pooled OLS could be considered optimal.

We can see that both FE and RE models fail to predict the impact of financial instability on poverty. Financial instability in these models appears with negative sign which contradicts the reality. Moreover, its impact on the measure of poverty is statistically insignificant in both FE and RE models. However, in the BE models (table 3) financial instability appears not only as a significant explanatory variables but also with the desired positive sign. Thus, the BE model suggests that financial instability impedes poverty alleviation through financial development. The more the instability, the more the incidence of poverty. However, the results from BE models need to be interpreted with cautions because these models assume no correlation between the unobserved country
specific effect \((u_i)\) and the regressors. Validity of this assumption may be questioned because \(u_i\) and the explanatory variables do have correlation as revealed in results from FE models. As we see in table B2 in appendix B, the correlation between \(u_i\) and the fitted values of the regressors (labeled corr \(u_i, X_b\)) is 20 percent for the FE model 2.

The difference in the results obtained from FE and RE and BE models points to the likelihood of measurement error in the time series of various panel units. We will address this issue in our next attempt.

V. CONCLUSION

Empirical evidence suggests that financial development is pro-poor. We employed various specifications of fixed effect and random effect models and found financial development measured in terms of the ratio of M3 to GDP to have significant impact on poverty reduction in almost all specification. But the impact of financial development is good to the extent the development is not accompanied by instability. Our results suggest financial instability considerably hurt poor compared to the rich segment of the population. However, these results do not hold when financial development is measured in terms of the ratio of credit to GDP. In literature, this outcome is be interpreted as evidence of the relevance of the conduit effect.

A major limitation of this study is that it applies only the one-way FE and RE models. We do run a FE model considering time dummies but found the regressors to
lose explanatory power once the time dummies are considered. This may be due to the unbalanced panel and high autocorrelation in data. However, we considered a FE linear model with AR (1) disturbance and found the same results as obtained from the other versions of the FE models. But this time the F test result (see under the regression output in table B10, appendix B) suggests that pooled OLS would be appropriate. Another limitation of the study is that we consider strict exogeneity of the regressors including $u_t$.\n

Description of the Variables and Sources of Data

cgdp: The ratio of credit by the banks (to the private sector) to GDP. Source: World Development Indicator (WDI) 2006.

m3gdp: The Ratio of M3 to GDP. Source: WDI 2006.

instbm3gdp: Financial instability measured in terms of M3-GDP ratio.

inflation: Log (1+ rate of inflation expressed in decimal). Source: (rate of inflation measured from CPI) WDI 2006

stdgdppc: Standard deviation of GDP per capita. Source (GDP Per Capita): WDI 2006

Title: WOMAN IN NATIONAL WEEKLY NEWS MAGAZINES IN TURKEY

Field of the Study: Communication and Woman Studies
Format of the Presentation: Written Text- Powerpoint
Name of the Author: Asistant Prof. Emine DEMİRAY
Department: Anadolu University Open Education Faculty Film Making Center
Mailing Address: Anadolu University Open Education Faculty Film Making Center
Eskisehir/TURKEY
E-mail Address: edemiray@anadolu.edu.tr
Phone No: 0 90 222 3350580-2436

ABSTRACT
Means of mass communication convey the news under the male dominance and within the male discourse. This situation prevailing all around the world is not different in Turkey. Women cannot have a say in the management of the mass media and mostly work in lower positions. Women take part in the news either as a mother or as a wife and these news are only about violence, harassment, rape, accident, illustrated magazine, health, nutrition, child etc. They are not the ones who are being consulted or whose ideas are requested.

This study is restricted with only one issue of each news magazines titled as AKSİYON, AKTÜEL, HAFTALIK, TEMPO and NOKTA. These magazines are published nationally and they are among the ones which have the highest circulation rate in Turkey. The news, which compose the sampling in the study and which were published in the weekly news magazines, are going to be examined by content analysis method.

The aim of the study is to determine the position of the women who are employed in the staff, which prepares the news magazines, and to determine how the women are dealt with in the news.
In the light of this aim

- The sex distribution of the people (reporter, journalist) who took part in the news production process
- The topic distribution of the news in the news magazines
- Under which topics men and women are mentioned in the news magazines
- The sex, age and social position of the people mentioned in the news in the magazines
- Whether the people mentioned in the news are victim or survivor in respect to their sexes,
- The sex, age and social position of the individuals who were consulted will be examined.
WOMEN IN NATIONAL WEEKLY NEWS MAGAZINES IN TURKEY

The concept of “social gender” is one of the most important concepts used in women’s studies. Two different gender concepts are found in the literature of social sciences. One is biological sex, and the other is the concept of social gender. Biological sex means the classification of people as “men” and “women” depending on their physical differences. Social gender, on the other hand, defines the different roles and behaviours of men and women within the society (Suğur, 2006, p 3).

The patriarchal understanding prefers to perceive being a woman and being a man as opposite ends, and tries to differentiate gender roles with a clear-cut separation. As a rule, there is a list of expectations for men consisting of “do”s and “be”s while the same list of expectations consists of “don’t”s for women. Similarly, what women are expected to do/be, men are forbidden to do/be. Men are expected to be tough, dominant, powerful, judging, determined, successful, independent, ambitious, active and effective solution finders, while women are expected to be benign, accommodating, weak, obedient, irresolute, unsuccessful, dependent, helpless and passive. This system has, for the sake of predetermined gender roles, divided into two those characteristics which make all of us a whole in terms of being human beings, assigning one half to men and the other to women, and thus, making us limited individuals lacking the other half of themselves (Navaro, 1996, p 29).

Every individual experiences the process of socialization to become a member of the society (s)he lives in, to fit in that society and to earn himself/herself a position in it. The individual gains/forms an identity through this process of socialization, in which the family, friends, the social environment, the school and means of mass communication all play a role. The socialization process assigns different identities to men and women in terms of their gender roles. One of the most basic elements of socialization is communication. The means of mass communication, which we all are involved with during our daily lives, play an important role in the socialization process as well.

Means of mass communication encompass various codes and indications related with the process of communication. These codes and indications, which are related with the value judgements establishing the cultural content of society, are held together thanks to tradition, and meanings are built through traditions as well. Means of mass communication provide
examples for the society, offer alternative perspectives, socialize people according to these perspectives, and reflect the society which they live in. Each of these means (newspapers, the radio, the television, the cinema, magazines and the Internet) has different features of their own; yet, what they have in common is that they are all available for mass access/utilization (Burton, 1995, p 39).

We all have a social gender, which is influential on every aspect of our lives. Those processes which produce and reproduce social genders never come to an end. Despite the fact that the social gender is not an identity which one is truly aware of, it is continuously produced in environments such as the media, work place and our homes, depending on the structures of meanings and messages around us. The media has a particular importance in this process due to the fact that the television is the main and most common means of entertainment and information for a large section of society, and people spend a substantial part of their lives watching TV, and reading newspapers or magazines. The media conveys the images of men and women as far as social genders are concerned. These images reflect those cultural values and expectations which shape gender roles. They define what is noteworthy, and what the society should see and hear. The descriptions/definitions of men and women by the media can help to create social gender definitions largely shared by the society, to reinforce and maintain these definitions, or to change them (Kaypakoğlu, 2004, p 93).

The most important function of the means of mass communication, which play an influential role on our socialization, is to inform us: to convey the news. Conveying the news is an activity of the public area, and all of this activity belongs to men. The non-presence of women in the public domain has naturally caused this activity to be dominated solely by men, in terms of both the addressed mass and the subject matter. Not only the news are constructed by and about men, but they are also created from a male perspective. And this goes beyond the people or institutions producing the news, determining the overall discourse of the news (Fiske, 1989, p 284).

Rakow and Kranich claim that the news employ a male narrative style, and thus, women are not considered as the directly addressed audience of the news. According to them, the woman who is the subject/topic of the news is regarded not as a speaking subject/person, but as an image that supports the news (Rakow and Kranich, 1991, p 12). As can be understood from these views, it is seen that the male perspective has dominance when news are evaluated in
terms of social gender. While those news, carrying patriarchal traces and being conveyed to men and women from this perspective, are broadcasted as the facts themselves, social identities of men and women are reproduced.

Means of mass communication convey the news under male dominance, and within male discourse. This situation prevailing all over the world is not different in Turkey. Women do not have a say in the management of means of mass communication, and they are often employed in minor positions. Women usually take part in the news as a wife or mother, as the subject of the news pieces about violence, harassment, rape, accidents, gossips and sensations, health, nutrition, children, etc. Women are often not present as consultants or opinion-providers.

The main aim of this study is to determine the positions of women working as reporters for weekly news magazines, to understand under what subjects women are handled in these magazines, and what their functions are in these news stories (subject, spokesperson, expert or commentator, conveyor of personal experience, eye witness, conveyor of popular opinion, other).

To achieve this aim, all the news of the selected news magazines have been examined with the content analysis method, and the evaluation has been based on the “Global Media Monitoring Project,” which was realized on the radio, the television and the newspaper news in 1995, 2000 and 2005, respectively. The study is limited to one issue each for 5 news magazines published in Turkey, which have the highest circulation rate in Turkey: AKSİYON, dated 29 January 2007; AKTÜEL, dated 01 February 2007; HAFTALIK, dated 28 January 2007; TEMPO, dated 01 February 2007; and NOKTA (a political news magazine), dated 01 February 2007. All the news pieces in the news magazines constituting the sampling in this study, except for the commentaries, letters to the editors, advertisements, cartoons and introductions, have been examined. A total of 410 pieces of news have been evaluated, and their breakdown among the magazines is as the following: 114 from Aksiyon; 83 from Aktüel; 80 from Nokta; 74 from Tempo; and 59 from Haftalik.
The evaluation encompasses the following 15 headings concerning the news examined:

Item number, subject, scope of the story, role, gender, age, occupation or position, function in the news story, family relationships, victim, survivor, is this person directly quoted in the story?, is there a photograph of this person?, are women central to the news in this story?, does the story clearly highlight issues concerning equality or in equality between women and men? does the story clearly challenge or clearly reinforce stereotypes about women and/or men?, further analysis.

Of the 385 people from the five weekly news magazines constituting the sampling of this study, 109 are women, and 276 are men. The percentages provided in the text for men and women have not been calculated over the total number of cases, but over the numbers of men and women separately.

**Subject**

When the news pieces in the weekly news magazines are examined in terms of their subjects, the subjects “arts, entertainment, leisure, cinema, theatre, books, dance” come in the first rank with a rate of 18.8%. This is followed, respectively, by “other stories on social or legal issues” and “celebrity, arts and media-other subject” (7.6%), “sports, events, players, facilities, training, policies, funding” (7.3%), “domestic politics/government (local, regional, national), elections, speeches, the political process” (6.6%), “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” (5.4%), and “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” and “war, civil war, terrorism, state-based violence” (5.1%). The subjects least covered in the news magazines are, respectively, “riots, demonstrations, public disorder” and “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash” with a rate of 0.2%, “labour issues, strikes, trade unions, negotiations, employment, unemployment” and “religion, culture, tradition, controversies, teachings, celebrations, practises” with a rate of 0.5%, “other stories on the economy” and “other stories on celebrities, arts, media” with a rate of 0.7%, and “family relations, inter-generational conflict, single parents” with a rate of 1%. When the news pieces in the weekly news magazines are evaluated in terms of gender distribution, it is seen that women are covered most for the following subjects: “arts, entertainment, leisure, cinema, theatre, books, dance” (24.8%), “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” (12.8%), “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” and “sports, events, players, facilities,
training, policies, funding” (7.3%), “education, child care, nurseries, pre-school to university, adult education, literacy” (6.4%), and “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping” and “other stories on social or legal issues” (5.5%). Yet, women are not covered for the following subjects; “economic policies, strategies, models (national, international),” “labour issues, strikes, trade unions, negotiations, employment, unemployment,” “science, technology, research, funding, discoveries, developments,” “human rights, women's rights, children's rights, gay & lesbian rights, rights of minorities ..,” “religion, culture, tradition, controversies, teachings, celebrations, practices,” “other stories on celebrities, arts, media” and “domestic politics/government (local, regional, national), elections, speeches, the political process”. As for men, they are covered most for the following subjects: “arts, entertainment, leisure, cinema, theatre, books, dance” (13%), “other subject” and “domestic politics/government (local, regional, national), elections, speeches, the political process” (9.4%), “other stories on social or legal issues” (8.7%), “sports, events, players, facilities, training, policies, funding” (8%), “war, civil war, terrorism, state-based violence” (6.9%), and “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” (4.7%). Men have never been covered for the subjects of “disasters, accidents, famines, earthquakes, floods, hurricanes, plane crashes, car crashes”. The subjects for which men are least covered are as follows; “beauty contests, models, fashion, beauty aids, cosmetic surgery” (0.4%), and “labour issues, strikes, trade unions, negotiations, employment, unemployment,” “other stories on the economy,” “development issues, sustainability, community development,” “family relations, inter-generational conflicts, single parents,” and “religion, culture, tradition, controversies, teachings, celebrations, practises” (0.7%).

Scope of story
The evaluation of the weekly news magazines in terms of the scopes of news stories reveals the following rates: Most of the news pieces (62.2%) are on a “national” level (having importance within my own country); 19.5% of the news pieces can be classified as “national and other” (involving my country and other countries); 10.2% are on a “local” level (having importance within my city, community, area); and 7.6% comprise of news on a foreign/international level (involving other countries or the world in general). The gender distribution in terms of scope of story for the news pieces evaluated is as follows: For the news pieces covering women; 60% are on a local level, 21.3% can be classified as “national and other,” 12% are on a national level, and 6.5% are on a foreign/international level. As for
the news pieces covering men; 66.9% are on a national level, 18.2% can be classified as “national and other,” 8.4% are on a local level, and 6.5% are on a foreign/international level.

Role
Of the people coded in a total of 410 news pieces from five weekly news magazines, 24.9% are reporters/journalists; 68.8% are “persons in the news.” Of those people employed as reporters/journalists in the weekly news magazines, 43.1% are women, and 21% are men.

Gender-Age
Of the people coded in a total of 410 news pieces from the news magazines constituting the sampling, 67.3% are men, 26.6% are women, and the gender of 0.7% is not known. When these people are evaluated in terms of their ages, it is seen that: the age of 61% is not mentioned, 3.7% are 19-34 years old, 2.4% are 65 or older, 1.5% are 50-64, and 1% are 13-18 years old.

Occupation or position
When the occupations/positions of the people covered in the weekly news magazines are evaluated, the following rates are revealed: the majority (10.2%) are in the group of “media professionals, journalists, video or film-makers, theatre directors,” 8% are in the group of “celebrities, artists, actors, writers, singers, radio or television personalities,” the occupation of 7.6% is not known, 7.1% are in the group of “academic experts, education professionals, teachers or university lecturers (all disciplines), nursery or kindergarten teachers, child-care workers,” 6.6% are in the group of “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons,” and 5.1% are in the groups of “business people, executives, managers, entrepreneurs, economists, financial experts, stock brokers” and “sportspeople, athletes, players, coaches, referees”. The occupations/positions least seen among the people covered in weekly news magazines are as follows; “criminals, suspects” (1.2%), “science or technology professionals, engineers, technicians, computer specialists” and “homemakers, parents, either female or male” (1%), “retired people, pensioners” (0.7%), and “religious figures, priests, monks, rabbis, mullahs, nuns,” “activists or workers in civil society organizations, non-governmental organizations, trade unions, human rights, consumer issues, environment, aid agency, peasant leaders, United Nations,” and “villagers or residents engaged in unspecified occupations” (0.2%). When the occupations/positions of the people covered in these news pieces are evaluated in terms of
gender distribution, the rates obtained are as follows: Of a total of 109 women, 4.5% are in the occupational group of “celebrities, artists, actors, writers, singers, radio or television personalities,” 2.8% are in the group of “academic experts, education professionals, teachers or university lecturers (all disciplines), nursery or kindergarten teachers, child-care workers,” and 1.7% are in the group of “health or social service professionals, doctors, nurses, laboratory technicians, social workers, psychologists,” while women are not found in occupational groups such as “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons,” “police, military, paramilitary group, militia, prison officers, security officers, fire officers,” and “science or technology professionals, engineers, technicians, computer specialists”. As for men, of a total of 276 men covered in the news pieces, 12.8% are in the group of “media professionals, journalists, video or film-makers, theatre directors,” 9.3% are in the group of “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons,” and 7.3% are in the group of “academic experts, education professionals, teachers or university lecturers (all disciplines), nursery or kindergarten teachers, child-care workers” while 0.3% are in groups of “activists or workers in civil society organizations, nongovernmental organizations, trade unions, human rights, consumer issues, environment, aid agency, peasant leaders, United Nations,” “retired people, pensioners,” “villagers or residents engaged in unspecified occupations,” and “religious figures, priests, monks, rabbis, mullahs, nuns,” and men are not found in the occupational group of “homemakers, parents, either female or male.”

**Function in the news story**

When the functions (functions in the news story) of the people covered in a total of 410 news pieces from weekly news magazines are evaluated, the following rates are revealed: 28.3% of these people are the “subject” of the news piece (the story is about this person, or about something the person has done, said etc.); 17.6% are “experts or commentators” (the person provides additional information, opinion or comment, based on specialist knowledge or expertise); 11.5% serve to convey the “popular opinion” (the person's opinion is assumed to reflect that of the 'ordinary citizen' (e.g., in a street interview, vox populi etc); it is implied that the person's point of view is shared by a wider group of people); 8.3% are “spokespersons” (the person represents, or speaks on behalf of another person, a group or an organization); 2.9% convey their “personal experience” (the person provides opinion or comment, based on individual personal experience; the opinion is not necessarily meant to
reflect the views of a wider group); 1.2% are “eye-witnesses” (the person gives testimony or comment, based on direct observation (e.g. being present at an event)); and the functions of 0.5% in the story are not known. When these people are evaluated in terms of both their functions in the story and their gender, the following rates are obtained for a total of 109 women and 276 men: 12.8% of women and 27.6% of men are “subjects” in the news pieces; 4.8% of women and 20.1% of men are “experts or commentators;” 1.7% of women and 13.8% of men convey the “popular opinion;” 0.7% of women and 11.1% of men are “spokespersons;” 0.7% of women and 3.5% of men convey their “personal experience;” and 0.7% of women and 1% of men function as “eye-witnesses.” When these people are evaluated in terms of both their gender and the subject of the news piece they are covered in, the following rates are found: Of the women, 6.9% are covered in the news about “arts, entertainment, leisure, cinema, theatre, books, dance;” 4.3% are covered under the subject of “migration, refugees, asylum seekers, ethnic conflicts, integration, racism, xenophobia,” and 3.4% under “medicine, health, hygiene, safety, disability, medical researches, funding (apart from HIV-AIDS),” while of the men, 16.4% are covered under the subject of “arts, entertainment, leisure, cinema, theatre, books, dance,” 6.9% under “sports, events, players, facilities, training, policies, funding,” and 6% are covered under “war, civil war, terrorism, state-based violence”. Only 5.9% of women function as “spokespersons” for the subject “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS),” and they don’t act as spokespersons for any other subject. As for men, 20.6% are found to act as “spokespersons” for the subject of “other stories on social or legal issues,” 14.7% function as “spokespersons” for the subjects of “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping,” and 14.7% act as “spokespersons” for “other subjects”. Among the women acting as “experts or commentators,” 4.2% cover the subjects of “medicine, health, hygiene, safety, disability, medical researches, funding (apart from HIV-AIDS)” and “arts, entertainment, leisure, cinema, theatre, books, dance,” 2.8% cover the subject of “education, child care, nurseries, pre-school to university, adult education, literacy,” while among the men functioning as “experts or commentators,” 9.7% cover the subjects of “war, civil war, terrorism, state-based violence” and “other stories on science or health,” and 8.3% cover “other stories on social or legal issues.” 16.7% of the women convey their personal experience on “sports, events, players, facilities, training, policies, funding” and for no other subject. As for men, 41.7% of them convey their personal experience on “sports, events, players, facilities, training, policies, funding,” 25% on “other stories on social or legal issues,” and 8.3% on “other stories on
science or health.” 20% of the women function as eye-witnesses for the subjects of “war, civil war, terrorism, state-based violence,” and “celebrity news, births, marriages, deaths, obituaries, famous people, royalty,” and for no other subject. As for men, 20% of them act as eye-witnesses for the subjects of “migration, refugees, asylum seekers, ethnic conflicts, integration, racism, xenophobia,” “media, including new media (computers, internet), portrayal of women and/or men, pornography,” and “other subjects.” Of the women, 6.4% function to convey the popular opinion on “other subjects,” 2.1% on “migration, refugees, asylum seekers, ethnic conflicts, integration, racism, xenophobia” and “changing gender relations, roles and relationships of women and men inside and outside the home”. As for men, 34% function to convey the popular opinion on “domestic politics/government (local, regional, national), elections, speeches, the political process,” 17% on “economy-transport, traffic, roads” and 6.4% on “science, technology, researches, funding, discoveries, developments”.

**Family relationships**

In a total of 410 news pieces published in the weekly news magazines constituting the sampling, 67.6% of the news pieces do not include definitions in terms of family relationships, such as one’s wife/husband/son/daughter etc., while 2.7% include such definitions. In those news pieces encompassing such definitions, 3.1% of them are used for women, and only 0.7% are used for men.

**Victim**

Among those people covered as “victims” in a total of 410 news pieces from weekly news magazines, 1% are defined as “victims of accidents, natural disasters, poverty, diseases, illnesses,” 0.7% as “victims of other crimes, robberies, assaults, murders,” 0.5% as victims of “victim of war, terrorism, vigilantism, state-based violence,” while it is not known or can not be decided whether these people are victims or not in 0.2% of the cases. 67.8% of the people covered in the news pieces are not defined as victims. Of the women defined as victims in the news pieces, 0.3% are found to be victims of “victim of an accident, natural disaster, poverty, disease, illness” and “other victims,” while 1% of the men defined as victims are found to be victims of “victim of an accident, natural disaster, poverty, disease, illness,” and 0.7% victims of “victim of other crime, robbery, assault, murder” and “victim of war, terrorism, vigilantism, state-based violence”.

---

2007 HICSS Proceedings
Page 640
Survivor

Among those people covered as “survivors” in a total of 410 news pieces from weekly news magazines, 0.1% are covered as “other survivor” while in 0.2% of the cases, it is not known or can not be decided whether these people are survivors or not, and 69.3% are found not to be survivors. Of those defined as survivors in the news pieces, 1% of the women and 0.3% of the men are found to be “other survivors”.

Is this person directly quoted in this story?

In a total of 410 news pieces from the weekly news magazines constituting the sampling of this study, 54.6% of those people stating their opinions are quoted directly, and 15.6% are quoted indirectly. Of those people who act as the subject of the news piece and are directly quoted, 8.5% are women and 22.3% are men; of those who act as the spokesperson in the news piece and are directly quoted, 0.9% are women and 11.6% are men; of those experts or commentators directly quoted, 6.3% are women and 23.2% are men; of those people who convey their personal experience and are directly quoted, 0.9% are women and 4.5% are men; of those who function as eye-witnesses in the news pieces and are directly quoted, 0.8% are women and 0.9% are men; and finally, of those who act to convey the popular opinion and are directly quoted, 1.8% are women, and 17% are men.

Is there a photograph of this person?

In a total of 410 news pieces from the weekly news magazines, there are photos for 32% of the people covered in the news pieces, and there are no photos for 35.9%. In 2.7% of the news pieces, while there is a photo, it is not clear whether the person who is the subject of the news piece appears in it.

Are women central to the news in the story?

Women have been found to be in a central position only in 14.6% of a total of 410 news pieces from the weekly news magazines. The subjects of those news pieces in which women hold a central position are as follows respectively: “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping,” “other stories on the economy,” “medicine, health, hygiene, safety, disability, medical researches, funding (apart from HIV-AIDS),” “development issues, sustainability, community development,” “education, child-care, nurseries, pre-school to university, adult education, literacy,” “family relations, inter-generational conflicts, single parents,” “other stories on social or legal issues,”
“arts, entertainment, leisure, cinema, theatre, books, dance,” “media, including new media (computers, internet), portrayal of women and/or men, pornography,” and “beauty contests, models, fashion, beauty aids, cosmetic surgery”.

**Does the story clearly highlight issues concerning equality or inequality between women and men?**

In only 1.2% of a total of 410 news pieces from the weekly news magazines, the story clearly highlights issues concerning equality or inequality between women and men. The subjects handled in those news pieces in which the story clearly highlights issues concerning equality or inequality between women and men are as follows respectively; “other stories on the economy,” “family relations, inter-generational conflicts, single parents,” and “beauty contests, models, fashion, beauty aids, cosmetic surgery”.

**Does the story clearly challenge or clearly reinforce stereotypes about women and/or men?**

In 35.1% of a total of 410 news pieces from the weekly news magazines, it is not known or it cannot be decided whether the news story challenges or reinforces stereotypes about women and/or men. In 2% of the news pieces, the story clearly reinforces stereotypes, and in 1.5% of the news pieces, the story clearly challenges stereotypes about women and/or men. The subjects of the news pieces in which the story clearly challenges/reinforces stereotypes about women and/or men are as follows respectively; “other stories on the economy,” “education, child-care, nurseries, pre-school to university, adult education, literacy”, “arts, entertainment, leisure, cinema, theatre, books, dance,” “media, including new media (computers, internet), portrayal of women and/or men, pornography” and “beauty contests, models, fashion, beauty aids, cosmetic surgery”.

**Further analysis**

In of a total of 410 news pieces from the weekly news magazines, none requires further analysis.

**SUMMARY AND CONCLUSION**

Women attract attention in means of mass communication for their traditional roles or their gender identities. Despite the fact that a very high number of people have access to means of mass communication and this could result in positive changes for women, the negative
aspects of the content and the presentation serve to reinforce their existing social roles. Today, means of mass communication are one of the institutions which contribute to the production of social gender roles; yet, the presentation of women in means of mass communication can only reinforce their traditional roles, and can not offer new identities for women. In the means of mass communication, women are basically seen either with their traditional roles (a mother, a wife, a housewife, a self-sacrificing woman) or with their sexual identities. In order for a woman to be covered in a news piece, she is usually required to be involved in a tragic event, such as rapes, harassments or tortures (a victimized woman), or she has to be deceived by her husband, or cause a man to break up with his family due to a love affair, or commit suicide. In those news where women are covered with a focus on celebrities or entertainment, non-relevant pictures are presented, and attention is drawn to the sexual identity of women.

When the news pieces evaluated in the study titled “Women in National Weekly News Magazines in Turkey” are examined in terms of their subjects, it is seen that the subjects most covered are “arts, entertainment, leisure, cinema, theatre, books, dance” with a rate of 18.8%, and the least covered subjects are “riots, demonstrations, and public disorder” with a rate of 0.2%. When these news pieces are evaluated in terms of subject and gender, it is found out that women are most covered in news about “arts, entertainment, leisure, cinema, theatre, books, and dance” with a rate of 24.8%, “medicine, health, hygiene, safety, disability, medical researches, funding (apart from HIV-AIDS)” (12.8%), and “migration, refugees, asylum seekers, ethnic conflicts, integration, racism, and xenophobia” (7.3%), while women are not covered in news about “economic policies, strategies, models (national, international), “labour issues, strikes, trade unions, negotiations, employment, unemployment,” and “science, technology, researches, funding, discoveries, and developments”. These data are in accordance with the fact that women are basically used as visual materials in the media, and take part in the news for their roles as mothers and wives.

When the news pieces from the weekly news magazines are evaluated in terms of the scope of the story, it is seen that it is the national news pieces (which have importance within my own country) which are covered most with a rate of 62.2%. In the news pieces evaluated, women are covered in those news on a local level with a rate of 60%, in news covering subjects which can be classified as “national and other” with a rate of 21.3%, in news on national subjects with a rate of 12%, and in news on foreign/international subjects with a rate of 6.5%.
In a total of 410 news pieces from five weekly news magazines, 43.1% of those people acting as reporters/journalists are women. This data indicates that women employed in the media mainly hold lower positions such as journalists/reporters.

When the people covered in the weekly news magazines are evaluated in terms of their occupations/positions, it is seen that most (10.2%) are employed in the media sector as “media professionals, journalists, video or film-makers, theatre directors”. When the gender distribution is evaluated among occupations, it is revealed that, among a total of 109 women covered in the news, 4.5% are “celebrities, artists, actors, writers, singers, radio or television personalities,” 2.8% are “academic experts, education professionals, teachers or university lecturers (all disciplines), nursery or kindergarten teachers, child-care workers,” and 1.7% are “health or social service professionals, doctors, nurses, laboratory technicians, social workers, or psychologists,” while none of the women covered in the news pieces holds any of the following professions; “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons,” “police, military, para-military group, militia, prison officers, security officers, fire officers,” “science or technology professionals, engineers, technicians, computer specialists”. These data indicate that women mainly hold professions in fields of education and healthcare, which are considered by the society as “suitable” for women in terms of social gender, besides professions where visuality becomes important, such as artistic occupations.

When the people covered in a total of 410 news pieces from the weekly news magazines are evaluated in terms of their functions in the news story, it is found out that the majority (28.3%) functions as the subject of the news story (the the story is about this person or about something the person has done, said etc). When we look at the gender distribution and function in the story at the same time, among a total of 109 women covered in the news pieces, 12.8% have been covered as the subject, 4.8% have been covered as an expert/commentator, 1.7% have been covered to convey the popular opinion on a certain subject, 0.7% have been covered as spokespersons, and another 0.7% have been covered to convey their personal experience on a certain subject or as an eye-witness. When the news pieces are evaluated in terms of subjects and gender distribution at the same time, the following rates are obtained: women have been the subject of news pieces about “arts, entertainment, leisure, cinema, theatre, books, dance” at a rate of 6.9%, and about “migration, refugees, asylum seekers, ethnic conflicts, integration, racism, xenophobia” at a rate of 4.3%;
they have acted as spokespersons (5.9%) in the news pieces about “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”; as experts or commentators (4.2%) on the subjects of “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” and “arts, entertainment, leisure, cinema, theatre, books, dance”; women have conveyed their personal experience (only 16.7%) on subjects of “sports, events, players, facilities, training, policies, funding”; they have acted as eye-witnesses (20%) on subjects of “war, civil war, terrorism, state-based violence” and “celebrity news, births, marriages, deaths, obituaries, famous people, royalty”; they have been covered to convey the popular opinion on “other subjects” (6.4%), and on “migration, refugees, asylum seekers, ethnic conflicts, integration, racism, xenophobia” (2.1%). These data indicate that women are mainly covered as subjects in the news, not as spokespersons, experts, commentators or eye-witnesses, and they are not covered to convey their personal experience or the popular opinion on a particular subject, which demonstrates that women’s opinions are not highly valued. This, in turn, is in accordance with the general understanding of the society concerning women.

In a total of 410 news pieces from the weekly news magazines constituting the sampling, definitions such as one’s wife/husband/son/daughter etc. have been used for women at a rate of 3.1%. In the news pieces, women are defined in such terms (as one’s wife, mother, daughter etc.) much more commonly when compared to men, and covered within the limits of these definitions.

Among the people covered in a total of 410 news pieces from the weekly news magazines, 1% are “victims of accidents, natural disasters, poverty, diseases, illnesses”. When the gender distribution of those people defined as victims is evaluated, it is seen that 0.3% of a total of 109 women have been covered as victims of an accident, natural disaster, poverty, disease, or illness. Besides, only 0.1% of the people covered in a total of 410 news pieces are defined as “other survivors”, and among a total of 109 women, only 1% are described as survivors.

In a total of 410 news pieces from the weekly news magazines constituting the sampling, 54.6% of those people covered in the news pieces are directly quoted, while 15.6% are indirectly quoted. Women constitute 8.5% of those people who function as subjects and are directly quoted, 0.9% of those who function as spokespersons and are directly quoted, 6.3% of those who function as experts or commentators and are directly quoted, 0.9% of those
people who convey their personal experience and are directly quoted, 0.8% of those who function as eye-witnesses and are directly quoted, and 1.8% of those who are covered to convey the popular opinion and are directly quoted.

It has been found out that, of a total of 410 news pieces from weekly news magazines, only 14.6% cover the women as central to the news story. The subjects of these news pieces covering women as central to the news story are basically as follows; “medicine, health, hygiene, safety, disability, medical researches, funding (apart from HIV-AIDS),” “education, child-care, nurseries, pre-school to university, adult education, literacy,” “family relations, inter-generational conflicts, single parents,” “arts, entertainment, leisure, cinema, theatre, books, dance,” “media, including new media (computers, internet), portrayal of women and/or men, pornography” and “beauty contests, models, fashion, beauty aids, cosmetic surgery”. This data indicates that women are central only to those news covering subjects considered as fit for the social position and social gender of women. In the weekly news magazines, the news story clearly highlights issues concerning equality or inequality between women and men when the subject is “other stories on the economy,” “family relations, inter-generational conflicts, single parents” or “beauty contests, models, fashion, beauty aids, cosmetic surgery”. In a total of 410 news pieces covered in the weekly news magazines, the story clearly challenges stereotypes about women and/or men when the subject is “other stories on the economy,” “education, child care, nurseries, pre-school to university, adult education, literacy,” “arts, entertainment, leisure, cinema, theatre, books, dance,” “media, including new media (computers, internet), portrayal of women and/or men, pornography,” or “beauty contests, models, fashion, beauty aids, cosmetic surgery”. These subjects are also considered as more “fit/suitable” for the social position and social gender of women.

Finally, women employed in the media sector do not hold higher positions and are not decision makers; they are employed in lower positions and paid lower wages. If a woman is covered in a news piece, subjects and occupations in line with her social position are covered in the news piece; the opinions of women are not highly valued, and women are brought to the forefront for purposes of visuality. The definitions and adjectives used in the news pieces are found to be in line with the rigid value judgements of the society used for men and women in the social system.

6. Abstract

This paper will examine Iranian diaspora media produced primarily in the United States. The proliferation of media by Iranian expatriates - in particular, satellite television channels and radio stations - raises four interesting research questions I will address: (1) What goals do these U.S.-based media outlets seek to achieve? What is their self-declared raison d’etre? (2) Which audiences are these outlets targeting and why? (3) How do media consumers in Iran perceive these outlets? (4) What role do these outlets play vis-à-vis consumers in the original homeland - in this case, Iran - and among expatriates in the new host society? I shall place my discussion of these issues in the context of a literature review focusing on immigrant media and cultural production. Looking at specific expatriate outlets, their content and objectives, I will use qualitative and survey research conducted among Iranians in and outside Iran since 2002 to illuminate consumers’ perceptions of these media. The popularity of these outlets does not necessarily correlate positively to opinions of their credibility or ability to influence public attitudes. My analysis of consumers’ perceptions is significant in light of ongoing debates about how diaspora media may
shape political discourse inside Iran and whether the United States should assist or even coopt particular outlets as agents in public diplomacy.

California Polytechnic State University, San Luis Obispo

The adverse effects of status quo housing development and (sub)urban planning strategies in California result in over-parked endless sprawl, heat island effect, long commutes, and wide right-of-ways crafted for the vehicle, while ignoring the human scale and experience. The dubious qualities of the suburban tract are well documented; yet, despite the fact that these negative impacts are so obvious and plentiful, we continue to build and plan in this fashion as our primary means for providing new housing. This paper will endeavor to set in motion a paradigm shift in (sub)urban planning that reverses the negative impacts, while creating a more intuitive land mapping process that listens to the land for inspiration.

The models are the M:OME Bridge Street Neighborhood (BSN), a 27 unit mixed-use development in the City of San Luis Obispo, and the M:OME Pine Street Lofts (PSL), a 9 unit mixed-use live:work loft project in El Paso de Robles. Both are in California and both bring
environmentally friendly housing and work/live lofts, as well as diverse living options that appeal to a wide range of personalities and income levels. All of these housing options create an inherent diversity ensuring a rich, varied community.

Both PSL and BSN embrace the ideals of higher density, in-fill development bringing offices, manufacturing, and housing into closer proximity with each other. In-fill development encourages a sense of community because the residents are naturally inclined to interact with each other by means of proximity. Feeling part of a community is important for people. In the increasingly popular user-generated “Sims” games by Maxis and Will Wright, if your character has less than three friends you suffer from loneliness and your character suffers the consequences. The same is true in neighborhoods. Architectural decisions such as common gardens, piazzas, shared parking, and mailboxes increase serendipity, spontaneous meetings, and planned interactions, all of which increase connectivity and the feelings of being part of a larger whole. The whole of the community becomes greater than the sum of its parts, creating a sense of family. Lifestyle shifts allow one to save money on gas for the vehicle and utilities for the home. Entertainment is not bought and sold but lived daily. Walking and biking increase the health and well-being of the occupants.

Another important benefit is the mitigation of peripheral sprawl and the preservation of open space and Ag lands from conversion into suburban growth, mitigating also the force that requires residents to drive further to access work and services. Housing people closer to work, retail and services means more of them are walking and biking around town, reducing green house gases that are purported to cause “global climate change”. The Pine Street Lofts are specifically located across the street from the main train station in town, so the residents can not only access the City of El Paso de Robles without a vehicle, they may also access the state of California as well.

b) view of the Pine Street Lofts looking across Pine Street toward the east elevation, emphasizing public outdoor space.
Many projects embrace these ideals; however, the key move in this project's development is to suspend concern for the creation of property lines, usually the first planning move in a subdivision's life.

The standard modus operandi in a planned urban development or suburban tract community is to first layout roads, utilities and the various lots. Usually, the lots are split into simple rectangles, with trapezoids happening around the cul-de-sac. There is little or no regard for the lay of the land, view corridors, wind roses, optimal solar orientation, hills, creeks, existing mature trees, and site forces or unique features.

In the Bridge Street Development and the Pine Street Lofts, the design process begins with an evaluation of the entire site to understand the forces that fashion the most beneficial urban plan, as well as the most environmentally sensitive endeavor. At the same time, we design the site like we design a house, trying to find the “outdoor living room” of the community. Areas are evaluated to determine optimal locations for open space, commercial work/live space, dense urban residential space, medium density and the lowest density residential spaces, as well as community garden spaces. At the same time, the residences are designed to take advantage of views and primary solar exposure for direct gain in the cold months. Solar shadows are determined such that no residence misses the opportunity for heat gain until three in the afternoon on the 21st of December. Visual congruity between the architecture (with its exclusive-use outdoor spaces) and the community gardens and the community open space is optimized. Topography and site features such as mature trees, rock outcroppings, creeks, steep slopes, and the narrow width of the panhandle in BSN are all considered.
A desire for social sustainability also filters into the design, driving the decision to provide a variety of housing and commercial spaces.
In BSN, the housing diversity creates units ranging from 450 square foot studios with garages and workshops beneath up to 2,700 square foot four bedroom detached houses with guesthouse over detached garage, twenty-seven units in all. In PSL, the units range from 1,000 square foot two bedrooms with 450 square foot commercial/retails space up to 2,100 square foot three bedrooms with 900 square feet of commercial/retail.

The guest unit in BSN is designed to be used by extended family members, nannies, nurses, guests, or as an office or rental to help defray the mortgage expenses. The BSN commercial spaces were designed along the 60-foot wide panhandle, which also acts as the entry onto the site. Inspired by Dutch canal housing, the Gatehouse lofts are designed to benefit artists, artisans, craftsmen, and manufacturers, professionals, or any individual requiring a work/live environment.

**Only after the project has been completely planned and designed architecturally and with special attention paid to all of the aforementioned considerations, such that the design is seemingly inalterable, only then do we begin to subdivide the property.**

d) Intuitive Mapping Urban Design Strategy, showing Bridge Street Neighborhood (dotted) adjacent to old paradigm development: Woodbridge on the right (east).

**This Intuitive Mapping allows the site to broadcast where and how development should occur.** It allows the most sustainable and effectual urban plan to emerge with the arbitrary and invisible property lines taking a back seat as a design consideration. It is a most intuitive approach to urban planning, and yet remains the least common mode of operation for developers and planners because it requires the land plotter to actually think about the multiple layers of a property development ahead of the map creation.

California land speculators and developers have come by their counter-intuitive land plotting process honestly. Marwan Ghandour⁴, in his paper “Representation and Spatial Incorporation of
Iowa, 19th-20th c.,” writes extensively about the strategies incorporated by the U.S. surveyor general from 1785 until the present. These strategies originated from the township system of 1620 New England. In other words, this abstractly conceived and overly quantified land mapping process has been with us throughout our entire existence here in the United States.

The American system of creating the township (6x6 square miles), the 36 sections (1x1 square mile), and the sixteen sub-sections (40 acres each) filters all the way down to the creation of home lots made with a blind eye toward the way space is lived and experienced, as Ghandour writes, “Establishing control of the land without having to set foot in it...” and “...the map enabled the dissociation between the space as lived and the space from which land managers, or the eye of power operates.”

e) sustainable site plan of the Bridge Street Neighborhood.

Opportunities for winter heat gain were ignored while western summer heat and glare were allowed to penetrate directly into the most livable spaces of the house. The large street right-of-way created an enormous separation between the homes and the hills. Some homes back up to the view, ignoring it directly. Others are oriented properly, but the basic floor plan gives the garage door the best views of the hills. If the windows are placed properly for good passive cooling potential from the prevalent site winds, it is purely by coincidence. The landscaping of the

One need look no further than the 1980's Woodbridge development, immediately adjacent to the Bridge Street Neighborhood, to experience the old paradigm of counter-intuitive land planning. By dint of close proximity, it provides an interesting comparison to the Bridge Street Neighborhood. Woodbridge borders the same hills, has a similar topography with similar site drainage issues. It enjoys the same views, has the same creek running through it, and of course, has the same latitude, solar orientation and wind patterns as the Bridge Street Neighborhood. In this project, the lots were drawn first. Each standard "Modified-Ranch" then was plopped onto the site with its large picture window addressing the street regardless of view or solar orientation.
community is, in essence, the standard lawn, requiring an inordinate amount of scarce water supply. There is no coherence with the surrounding hills and the prevalent natural grasses, drought and serpentine soil tolerant native plants. The site drainage was designed to get the water off site as quickly as possible. The water was directed to concrete swales and street gutters, and even parts of the creek were cast in concrete. If there is a clog in the system, they experience flooding from time-to-time. The system was designed in complete contrast to the way Nature handles water by slowing it down, absorbing it into the soil, irrigating as it moves on to the larger creeks and tributaries.

In every one of these instances, the Bridge Street Neighborhood contrasts by listening to the site forces, adapting the plan and architecture to cohere to the site, and to benefit from all it has to offer.

“It's developers who are willing to push new concepts like Bridge Street that ultimately move those ideas into the mainstream.”

Jennifer Seal, Rocky Mountain Institute

II. Site Design Philosophy

"Permaculture is the art and science that applies patterns found in nature to the design and construction of human and natural environments. Only by applying such patterns and principles to the built environment can we truly achieve a sustainable living system. Permaculture principles
are now being adapted to all systems and disciplines that human settlement requires. Architects, planners, farmers, economists, social scientists, as well as students, homeowners and backyard gardeners can utilize principles of Permaculture Design."

Larry Santoyo

The goal is to create a neighborhood based on the principles of permanent culture or 'permaculture', adopting an attitude of sensitivity to the site. The goal of the architecture is to place it lightly on the land by respecting the existing vegetation and habitats. The M:OME definition of a successful design is a self-managed system, regarding both site and architecture. The Bridge Street community of housing and commerce would be harmoniously integrated into the natural setting in a way that supports a healthy micro-community. The neighborhood is a size in which people are able to know and be known by others and where each member feels they are able to influence the community's direction. For example, food can be grown in common in the edible orchards, and the neighborhood decides how the community garden is appropriated to most benefit the residents (as garden, natural open space, play areas or similar).

The houses will rest on landscaping resembling the original site and the surrounding hills. The housing placement forms a common area for a community orchard, gardens, mailboxes, and bike benches that allows residents to interact. In addition, turf pavers and decomposed granite will be used on the vehicular surfaces to allow greater percolation into the water table, and greater sensitivity to the original feel of the site. A nice side-effect of the permeable paving, in lieu of AC paving, is a reduction in the heat build up that black-top streets and parking lots create. In
addition, the permeable paving is coupled with a narrower road width to create our own “woonerf” concept. The Dutch developed the idea of “woonerfs” (loosely translated as “living yard”) to take back their streets for pedestrians, children, and cyclists by decreasing the vehicular right-of-way, and modifying it to something more permeable and tactile. The vehicles naturally slow down, without a sign telling them to do so. We also adopt permeable parking areas in case the spots do not get used for cars; furthermore, we limit the number of parking to the minimum required by the City, because, as Andy Wiley-Schwartz was quoted in DWELL magazine this month, “People just don’t get that if you build faster roads and you build more parking, there will be faster roads and more parking”.

One of the most important issues for the site design of this parcel is the natural flow of water from the surrounding hills through the site. Our proposal is to plant an orchard in the southern catchment ravine to control erosion and capture some of the rainfall for irrigation as it comes down the hill. This addresses the permaculture principle of water catchment and soil fertility as high (in elevation) on the landscape as possible.

h) View of the Pine Street Loft barrel vaults and clerestories for passive heating and stack ventilation cooling.

Because of the serpentine rock at a shallow level on the site, the water sheet flows through the site rather than percolating down. Vegetated contour swales address this problem by acting to harvest seasonal sheet flow of rainfall, which slowly infiltrates and recharges groundwater down slope, thus retaining moisture in the landscape much longer. This is called ‘pattern application’ in permaculture. More than an aesthetic caprice, these contours now direct water flow and nutrient dispersal with maximum efficiency via gravity.
Permaculture principles of ‘edge effect’ are used in retaining the existing vegetation of brambles in the wildlife corridor (a dense blackberry thicket forming a wildlife corridor, and a physical and visual boundary to the northern edge of the site). An edge is an interface between two mediums; in our case this would be the edge between the housing and the neighboring property to the north.

Plant Guilds are made up of a close association of species clustered around a central plant. This assembly acts in relation to the central plant to assist its health, aid in management, or buffer adverse environmental effects. An example would be apple trees with edible mint and nasturtium planted below to naturally prevent apple maggots, adopted in our edible orchards.

III. Building Design Philosophy

“I sometimes dream of... a house whose inside is an open and manifest as a bird’s nest... where to be a guest is to be presented with the freedom of the house, and not carefully excluded from seven-eights of it, shut up in a particular cell…”

Henry David Thoreau\(^9\)

The Bridge Street Neighborhood responds to the need for a house that is warm, friendly, and economical to operate; an efficient machine with integrated environmentally-friendly technologies. A new Victorian, Craftsman or Mission style home with photovoltaic panels, water catchment systems, solar water heaters, and sunshade devices, appears incongruent and anachronistic.

h) View of the Pine Street Loft barrel vaults and clerestories for passive heating and stack ventilation cooling.

i) View of the Pine Street Lofts from the entrance to the El Paso de Robles Railroad Station. This is the first view of Paso from the point of view of train visitors exiting the station.
The inverted gable roof provides the water catchment system, an optimal photovoltaic roof angle, and a unique aesthetic while obscuring from vision the roof equipment. It maximizes natural daylight to minimize reliance on power. In addition, the roof-form extending up and out opens to views of surrounding ridgelines so prevalent on this site. It accentuates the notion of the indoor/outdoor relationship desirable in our climate, and it phenomenologically invites one to enter into the core of its interior, not to mention inviting the welcome winter sun. The project will be built using “Healthy House” materials that incorporate non-toxic materials with little or no outgassing and that are not destructive to the environment in their manufacturing process.

IV.

In conclusion, M:OME intends to demonstrate that it is possible to build a community of houses and workspaces that set a higher standard than the convention. We can live in technologically and socially progressive houses, which take advantage of scientific advances ready and available on the market.

The M:OME team would like to set a precedent and inspire the establishment of other communities such as this throughout our region and beyond. A group of people can come together, buy a piece land, hire an architect to guide them through the design, permits, codes and variances, and create their own version of a micro neighborhood using “intuitive mapping” urban strategies. This then obviates the need for a developer and the additional cost to each of their residences. The Bridge Street Neighborhood and Pine Street Lofts provide a model for this type of community.

Abstract:

Previous research with bilingual Hong Kong university students found higher independent self-construal scores when questionnaires were administered in English than when administered in Chinese. Interdependent self-construal scores were not so affected. The present study explored the language priming effect among mainland Chinese students who were currently studying English and who presumably were less strongly bicultural and less fluent in English. Among freshmen, but not among juniors, independent self-construal scores were lower when the task was presented in English. As before, interdependent self-construal scores were not affected. The discussion focuses on the presence and accessibility of cultural frames, cue strength and foreign language anxiety as moderators of language priming effects.
“Confronting the ‘Others’: Paranormal Popular Culture and Symbolic Representations of the Outsider.”

bdonovan@spc.edu

ABSTRACT

This study in progress is a content analysis of several supernatural and comic-book-themed TV shows and films presenting symbolic narratives about a dominant culture’s inevitable alteration by empowered subcultures, outsiders and alternate-lifestyleed minorities. According to genre theory, such hyperbolic entertainment as science fiction and superhero fiction has always functioned on a metaphorical level, representing the most pressing concerns of the day. When examined on these metaphorical terms, several of the most popular of these films and TV shows – namely the TV programs “Heroes” and “The 4400” and the films “Superman Returns” and “The X-Men” series – all seem to be foregrounding the interaction between hegemonic power structures and challenges posed by previously subordinate cultures. These shows and films, in turn, explicitly endorse these challenges and empowerment of the outsider.
Marbles Lost and Found: Children and the Material Culture of Marbles

Marbles Lost and Found: Children and the Material Culture of Marbles

In this study the often invisible role of children in the past is brought to the forefront through the material culture of marbles. The project specifically looks at collections of marbles from two historic homes in Charleston, South Carolina in order to understand social hierarchies and play patterns among children, and the relationship among children, adults, and the wider society through the medium of marbles.

Marbles offer an especially good window from which to access the daily activities of children’s vibrant living in the past, because they form an epiphenomenal subculture of toys due to the accumulation of personal property. This aspect shows marbles to be unique among toys and games and provides the needed fuel to create an economic system not found in other children’s activities. This project is the first to consider and synthesize marbles data collected from diffuse sources to examine lifeways of the residents of the sites through the lens of children’s social practices and material culture.
Mystic Laterite: The Role of Gender and Fit in Prehistoric Stone Selection

Mystic Laterite: The Role of Gender and Fit in Prehistoric Stone Selection

The use of laterite, or red ochre, transcends time and culture; it is the universal material used for human expression and ritual. In this study 78 modified laterite artifacts from the prehistoric Birimi site in sub-Saharan Africa were examined to help answer the question as to how attributes such as thickness and naturally occurring shape contributed to pigment-making stone selection.

Three aspects of stone selection were focused on: (1) analysis of striation patterns was conducted to determine whether there was a correlation between a modified stone’s striation pattern and the degree of grip comfort; (2) the correlation between an artifact’s thickness and degree of fit was analyzed in response to the hypothesis that the thicker the specimen, the less important an ergomatic grip would be; and (3) the role of gender in the selection process was considered to test the hypothesis that there would be variation in the categorization of artifacts by males and females.

Only nine artifacts rendered unanimous ratings: two stones were found to have an intentional ergomatic fit (IEF), two unanimously earned a somewhat intentional ergomatic fit (SIEF), and five were found to have poor ergomatic fit (PEF). SIEF was the most selected category by females (40%), followed by PEF (35%), and IEF (25%). The males’ evaluations differed slightly from the females. Males most often selected (IEF) (36%) by a very small margin over PEF (35%); SIEF was the least selected among the male participants (29%). The results indicate a correlation between striation patterns and ergomatic fit; however, the thickness/grip hypothesis was not supported by the findings, as only 20% of the unanimously evaluated modified stones thicker than 12mm had a poor ergomatic fit. Variation between male and female categorization was supported.
Mystic Laterite: The Role of Gender and Fit in Prehistoric Stone Selection

There is an intrinsic mystical energy in red ochre that transcends not only time, but also culture. It is the universal material used for human expression and ritual; indeed, our ancestors’ red-ochre-painted handprints, large and small, still serve as signatures from the distant past. One might think that an entity with such awesome power would be as rare as a December downpour in the sub-Saharan African town of Gambaga, but this is not the case. This “magical” dust is produced from the earth’s plentiful iron oxides, such as laterite.

My research addresses the question as to which attributes, found in naturally occurring laterite, were desirable in prehistory for the preparation of red ochre paint. I seek to shed light on what prehistoric peoples may have been looking for when selecting stones to grind into their precious pigment powder and the role of gender in the selection process. Three aspects of stone selection were focused on: (1) analysis of striation patterns was conducted to determine whether there was a correlation between a modified stone’s striation pattern and the degree of grip comfort; (2) the correlation between an artifact’s thickness and degree of fit was analyzed in response to the hypothesis that the thicker the specimen, the less important an ergomatic grip would be; and (3) the role of gender in the selection process was considered to test the hypothesis that there would be variation in the categorization of artifacts by males and females.

An assemblage of laterite collected at the Kintampo-Complex, Late-Stone-Age Birimi Site which lies approximately 7 km NE of Gambaga (D’Andrea and Casey 2002), in sub-Saharan Africa was used in my research. The site’s impressive distinction of
containing the earliest occurrence to date of Birimi-pearl-millet finds acts to make investigation into other aspects of the site more significant; indeed, the presence of this sub-Saharan domesticate indicates not only early agriculture, but also implies accompanying early cultural activities. The distinctive material culture consisting of ground stone tools, grooved stones, and bored stones found at Kintampo sites (D’Andrea and Casey 2002) supports this argument.

**Laterite Formation**

Distinct seasonality in the form of a pronounced dry (November-April) and a wet (May-October) season are present in the Gambaga region. These seasonal changes, coupled with tropical temperatures over thousands of years, are ideal climatic conditions for laterite formation (Inco 2004) and the most significant factor in the mineral’s creation.

Laterization is a chemical weathering process whereby groundwater, atmospheric and biologic processes interact through exposed rock faces and fractures in the bedrock to decompose primary minerals and form more stable mineral phases (Inco 2004). An important aspect in the formation of laterite is the leaching of more mobile elements such as silica and magnesium, which are deposited at the foundation of the laterite profile (Inco 2004). Less soluble elements remain, forming an iron cap rich in haematite below which lies a hydrated haematite layer (Figure 1). The further dehydration and concentration of elements forms hard concretionary nodules. Laterite, commonly referred to as red ochre, is a form of this haematite.

**Symbolic and Artistic Use of Laterite**
The artistic use of red ochre can be found in the intricate illuminations of the Middle Ages, works of world-renowned artists, and amongst an amateur’s most humble paintings. It is, however, in its universal use as a paint medium in prehistoric pictographs, jewelry, and body art that its symbolic use is most compelling.

Pictographs created with red pigment are found worldwide. In the United States a barely visible elk (Walker 2002) graces a secluded rock wall in Snake River Canyon, Idaho suggesting its beneficial role to humans. Similarly, culturally specific referents from Ojibwe legends, including an anthropomorphic figure with outstretched arms, bull moose, quadrupedal mammal with long tail, dashes and a large “X,” are seen in one of the North Hegman Lake pictographs of Minnesota. These images insinuate cosmological or religious significance (Callahan 2006). On a cave ceiling in Altamira, Spain (Cave Art 2004) testimony to the landscape in which the artist lived is manifest in the rendering of a powerful bison, with muscles painted in conjunction with the contours of the rock, standing majestically in a 20-50K B.P. pictograph. While these pictographs are of great significance, the hand stencil found in Chauvet Cave, France 30K B.P. (Sabbeth 1999), is perhaps most indicative of the important message of pictographs, for it declares human self-awareness.

The use of red ochre in adornments is evinced as much as 75,000 years ago at the Blombos Cave site, in South Africa, where approximately 40 perforated tick shells (Nassarius kraussianus) believed to be organic beads were unearthed (Henshilwood et al. 2004). The assemblage was found inside the cave, 20 km east of the tick shells’ source, indicating deliberate transport of the shells as articles of worth. More compelling to the value argument is the human modification to the shells, which suggests that they were
used as jewelry. This use was substantiated from the thread-friction patterns present on the inside of the drilled holes and microscopic red-ochre residue detected on and in the beads (Henshilwood et al. 2004). It is significant that these conditions are not found on natural tick shells.

Importantly, red ochre was not only used for decoration of jewelry or the creation of pictographs—it was also used as a deeply human symbolic medium, as exhibited by body treatment of the dead. A telling example of the use of red ochre in symbolic death-rite treatment is found at the Mesolithic site of Vlasac, located in Eastern Europe along the banks of the Danube River. Here, the skeletal remains of Burial 67 compared with those of Burial 6 and 6A well illustrate the virtually certain use of red ochre as a ritual medium (Boric and Stefanovic 2004).

The skeletal remains of Burial 67, an adult female with her fetus still within her, had been covered with red ochre over the groin area. In addition, the deceased’s right hand had been placed on her lower torso (Boric and Stefanovic 2004). To better demonstrate that the red ochre and hand placement were intentional and symbolic one need only compare the grave to the context of Burial 6 and 6A, a mother and her neonate child. In this case, the neonate was placed on its mother’s chest, and, as expected if ochre is a symbolic medium, red ochre was found on the chest area where the child was placed (Boric and Stefanovic 2004) rather than the groin.

Over 65,000 years have passed since the burial of these mothers and their children and still the message remains clear because of the use of red ochre. Indeed, had Burial 67 been found sans ochre, there would most certainly be debate as to the placement of her right hand. Did it happen to fall over her child and groin while she was being buried?
Did it shift due to taphonomic forces? Again, it is the use of red ochre that answers these questions, I believe, definitively. The painting of red ochre in disparate areas in Burials 67 and 6 can best be interpreted by the singular commonality of placement in the area of the child. This phenomenon makes a strong statement: our ancient ancestors used the mineral ritualistically and, I would suggest, had empathy. It is indeed amazing that an inorganic mineral can act as the portal to the past.

The above artifacts illustrate the use of red ochre over time, be it artistic, ritualistic, or both. This prompts the question of why; why was red ochre selected for such uses? By tracing the origin of laterite to its parent mineral, haematite, one may find a clue to its selection. Webster’s Students Dictionary (1962) gives [fr. L., fr. Gr. *haimatites* bloodlike, fr. *haima*, *haimatos*, blood.] as the etymology of ‘haematite.’ Although speculation, one may imagine that prehistoric peoples substituted red ochre for blood in ritual ceremonies, not unlike the use of red wine in many contemporary religions. The importance of blood as a source of life and a means of death, cannot be overstated; considering this, one may posit that red ochre came into prominent use myriad years ago due to its resemblance to blood when ground and liquefied.

**The Birimi Assemblage and Methodology**

The laterite assemblage from the Birimi site has a total of 301 (+-5) specimens. Within the assemblage 98 pieces (33%) have been modified by grinding; the other 203 pieces (67%) have remained unmodified. Within the unmodified pieces 154 (76%) were laterite; 42 pieces (21%) are iron concretions; and 7 pieces (3%) were of an unidentified material. Unidentified material was not utilized in my research beyond counting and
division by color and/or material. Red laterite, 82 pieces (53%) made up a small majority of the unmodified laterite; there were 72 pieces (47%) of yellow laterite.

Raw data made up of color, weight, maximum length, maximum width, maximum thickness, and number of modified faces was gathered, with comments added when needed. I also experimented with grinding techniques, discovering that it was easier to move the large sandstone rather than the smaller pieces of laterite, and that deer antler was not effective as a grinding tool. I had initially planned to focus my research around the symbolic nature of laterite, but after handling so many pieces I began to see the rocks as individual entities—especially in their “feel.” This prompted the question as to how prehistoric people selected stones to grind into their precious pigment powder.

After experimenting with pigment making—in which I combined vegetable oil and urine with the ground laterite—I set aside my arduous task of grinding laterite into powder and targeted my attention on the investigation of ascertaining the desirable attributes present in rocks selected for modification. In addition to the obvious selection of rocks that ground more readily—I found the iron concretion specimen to be among the easiest to grind, the dark red laterite the toughest—I hypothesized that the thicker the specimen, the less important an ergomatic grip would be.

In order to test my hypothesis I enlisted the aid of six participants, three females and three males. Participants ranked the modified laterite pieces by natural, comfortable feel or the degree of “intentional” ergomatic grip. A ranking of 3 was given to the artifacts with the most intentional ergomatic fit; a ranking of 2 indicated that the grip felt somewhat intentionally comfortable; and a ranking of 1 indicated that there was no
discernable intentional ergomatic grip. Although this ranking was completely subjective, I theorized that the results would be pertinent to my hypothesis.

As I continued to handle the specimens more questions surfaced. I felt that hand size and gender might also be factors in rock selection; therefore I compared the results between female and male volunteers. Due to time constraints, only 78 modified artifacts were used in the experiment and the results from one of the volunteers was rendered useless for the study because the evaluation had been done with her left hand. In order to continue the research as planned, I substituted my personal evaluation to maintain the female to male ratio.

Further evaluation was conducted to establish whether there was a correlation between the types of grip unanimously selected by the participants and the striations present on the ground face of the rocks. Each artifact was examined under magnification to ascertain whether (1) striations were present, and, if present (2) if the striations’ direction correlated to the artifacts ranking (Table 1). The criterion used was the pattern(s) of the striations: (a) predictable based on comfortable hold, one direction; (b) more than one direction, but less than three directions; (c) haphazard (Table 2). Finally, I compared these results to the maximum thickness of each artifact.

Results

After analyzing the results I found that only nine artifacts rendered unanimous rating evaluations from the participants. Two stones were found to have an intentional ergomatic fit (IEF), two unanimously earned a somewhat intentional ergomatic fit (SIEF), and five were found to have poor ergomatic fit (PEF). These findings indicate
that both females and males in the past may have used these artifacts, since both groups experienced similar grip comfort.

Females most often selected SIEF (Table 3) when determining grip (40%), PEF was a close second (35%); and IEF elicited 25% of the females’ choice. As hypothesized, the males’ evaluations differed from the females (Table 3). Males most often selected IEF (36%) by a very small margin over PEF (35%); SIEF was the least selected among the male participants (29%). These findings are evidence for the support of the variation between male and female categorization hypothesis.

My hypothesis that an ergomatic grip would be less important in thicker specimens was not supported by the findings, as only 20% of the unanimously evaluated modified stones thicker than 12mm had a poor ergomatic fit. In addition, 100% of the unanimously rated artifacts in the IEF and SIEF categories were thicker than 12mm, suggesting that grip is important in thicker modified stones used for pigment making.

The results from striation analysis indicated a correlation between striation patterns and ergonomic fit. All unanimously selected IEF modified stones were in the striations predictable one direction based on grip category (100%), indicating repeated use in a common manner (Table 2). Unanimously selected SIEF pieces had an equal number of pieces in the predictable one direction striations category (50%) and the greater than one, but less than three directions category (50%). This usage patterning correlates to readjustment of the pieces for comfort. Only unanimously selected PEF artifacts were found in the had no striations category (60%), which suggests the stones were cracked and discarded, or haphazard striations category (20%) which may indicate
that the grinder kept turning the stone in an unsuccessful effort to achieve a comfortable grip.

While my research could have been improved by more stringent controls and evaluation of the entire assemblage, I still believe much was gained. A better understanding of why some laterite pieces appear to have been split, but never ground may now have a limited answer as indicated by such pieces being placed in the PEF category. Using ethnographic analogy, one can imagine breaking a nodule, finding it uncomfortable to hold, and tossing it aside.

Perhaps the most intriguing finding is the discrepancy between female and male assessment (Table 3) of the SIEF category. While SIEF had the highest percentage among females, it ranked lowest among males. This disparity may suggest that in general the females were more willing to compromise or were less decisive than the males. It is also possible that the males were more single-minded or more reluctant to admit that they did not know the answer. Further research is needed to help clarify what this difference between the genders may indicate; indeed, it may simply be caused by the difference in hand size when handling a piece of mystic laterite.
Acknowledgments. Special thanks to Dr. Joanna Casey of the University of South Carolina for the loan of her laterite assemblage for my research, and especially for her continued support and guidance.

Table 3
INTRODUCTION

Athletic shoes have been a part of the apparel industry for decades, evolving to the point of being a billion dollar industry (Prubit and Richie, 2004). For a class project a survey was administered to fifty college aged men to investigate what men look for when purchasing athletic shoes and to investigate factors that influence men’s footwear. This group was chosen for study because they are considered style conscience and are more physically active in today’s society (Hall, 2006b). Throughout this paper you will find the review of literature, methodology and findings with discussion.

REVIEW OF LITERATURE

The earliest sport shoes were first seen being worn by cavemen in cave drawings. According to Brooke (1971) cavemen developed an athletic shoe in order to protect their feet from the rocky surfaces on which they ran. The Egyptians, dating back to 4,500 B.C., wore athletic shoes made of plaited papyrus. Archeologists even found royal calf
leather sandals in the tomb of Tutankhamen (Brooke, 1971). According to Cheskin (1987) Greeks and Romans wore sandals, and even had a spiked shoe for combat. As for cold climate shoes, the first recorded athletic shoes were worn by the Chinese, and were made of cloth, wood, and animal furs. In Ireland archeologists found shoes that were made of animal hides and braided grass (Cheskin, 1987).

A review of literature was performed revealing characteristics identified as being of importance to men in selecting athletic shoes: comfort, style, price and size (Hall, 2006a; Hall, 2006b; Pribut and Richie, 2004). Comfort is one of the main characteristics that are most preferred by men. It is vital to locate the shoe that fits to your individual needs. Style, another characteristic, is one of the leading factors in purchasing athletic shoes. Sometimes a man can overlook comfort for style and fashion. A great deal of what people purchase can depend on what the celebrities are wearing or what is considered “in” in the recent magazines. They do not think about the shoe being good for them or what will be an ideal purchase to best fit their needs. Shoe designers are trying to make comfort and style in a single shoe, which will lead to consumer satisfaction (Hall, 2006a).

Although price is a factor, it is not the underlying reason for young men purchasing a particular shoe. Athletic shoes are an item on which most men splurge. One should focus on a shoe that can support their feet when they are involved in sporting activities. Sometimes people go to the sales rack when purchasing an athletic shoe, however those shoes in particular may have hard soles from being placed on display too long. Soles are one of the most vital parts of an athletic shoe and it is not good for one’s feet to wear shoes with a dried out sole. According to Hall (2006a), high-quality athletic
shoes could cost someone $100 or more and it all depends on the style, comfort level, and the brand name of that particular shoe.

Another characteristic to consider when purchasing the right shoe is size. The size of a shoe is different from the size of a person’s foot. Athletic shoe stores are supposed to carry a Brannock device. This device measures the length and width of the feet. It is important to measure the customer’s foot on this device because it measures both the foot size and shoe size. Feet need room within the athletic shoe for comfort and performance. It is always good to try on shoes with socks to see how it feels since most people wear socks when wearing their athletic shoes. If the shoe is tight or uncomfortable while one is trying it on, then it will likely be uncomfortable after the purchase.

Hall (2006b) identified five general types of shoes men need to consider when making a purchase decision: motion control, stability, cushioned, lightweight training, and trail shoes. Motion control shoes are those that are the most inflexible and strong. The motion control shoe clings tight to the foot so that the foot is not moving around and is less likely to cause an injury. Stability shoes are supportive, firm, and durable. Average weight men that do not do a great deal of activities find that this shoe offers just the right support.

Cushioned shoes are best for individuals who need additional support in their shoe and do not use their foot in a great deal of movement. Lightweight training shoes are extremely light and are intended for many types of high-speed training or racing. Runners who do not have motion control troubles will find that this type of shoe is ideal for them. Trail shoes are the final category and are great for bad weather because they
have an added stability and are very durable. It is good to own trail shoes to give your sport shoes a break, so they will last longer. (Hall, 2006)

**METHODOLOGY**

The purpose of this paper was to survey college aged men to identify the factors influencing athletic shoe purchases. Based on topics of importance in the literature review the following questions, along with demographic questions were included in the survey:

- When one purchases an athletic shoe, what is the brand are you most likely to chose?
- What style do you prefer?
- What qualities do you look for in athletic shoes?
- How much do you typically spend on athletic shoes?
- What color do you prefer for athletic shoes?
- Is comfort of importance? If so, how important?

Surveys were administered at the library of a mid-sized university and in restaurants frequented by college students. Time of day and day of week were varied. Responses were analyzed for frequency percentages.

**FINDINGS**

The sample stated that brand name was a major factor in their athletic shoe choices and they expressed being brand loyal. According to the men surveyed, fashionable brands include Adidas, Nike, New Balance and Asics. Through this research Nike was shown to be by far the most popular shoe on the market today.
the fifty men that took the survey 40% of the men preferred Nike. The Nike is the leading
footwear among men. They strive to provide a competitive edge among the athletic shoe
industry. Nike footwear was worn more in the daytime with casual clothing and can be
seen at night or for fitness purposes. Asics made up 22% of men’s athletic footwear.
Asics was most used for running or walking then for casual wearing. Asics has been
around since the 1940s and is known for being a great sport shoe. Reebok was preferred
by 24% of the men’s athletic footwear. Adidas makes up 14% of the findings; it is the
least worn athletic shoe by men in the sample.

The athletic shoes studied were seen in various colors. Colors preferred by the
sample were white, silver, black and grey. The most consistent colors for this age group
seem to be grey, consuming 36% of the sample. White (34%) was the next most popular
color followed by black (14%). Black may have been selected least often because it is
hard to match with a great deal of clothing.

Most athletic shoes are worn three different heights: high top, medium tops, and
low tops. The most popular style worn by men in the sample was the low tops. Low tops
were worn by 48% of the sample. This type of shoe was worn during the day and at
night. It serves many purposes such as running, walking, casual, and even fitness.
Medium top shoes were the next, with 34% of the sample choosing this height. High tops
went out of fashion for a while but are proving themselves and are coming back into
style. They were not worn much by the sample (18%).

The sample was asked what kind of quality they look for before purchasing a
certain athletic shoe. Most men wanted their shoes to be durable, long-lasting, and they
wanted to be able to wear them in any weather condition.
Men look at comfort and style as the most important feature that they want the shoe to possess. Style is a major factor depending on what their friends or celebrities are wearing. Style is always changing and is important to men that want to stay up on the latest trends. Even though men are becoming more stylish and like to have a good looking shoe, comfort still was a big concern for the men being surveyed.

Thirty percent of the sample purchased athletic shoes for wear day to day. The remaining 70% purchased athletic shoes for a certain athletic activity. This contradicts Pribut and Richie (2004) who state that fashion is as big a trend as function and the shoes are rarely purchased for the sport intended.

Price range was also a question asked to the men surveyed because price is sometimes a major factor to men (Hall 2006b). Price was not really a factor for these men. Most said that they would purchase a shoe they liked or felt would meet their needs regardless of the price. They would rather spend a lot of money on a shoe that will lower the risk on getting hurt.

**CONCLUSION**

Designers and product developers who create men’s shoes must be well informed to keep their target market pleased. They must study their market’s behavior to learn what best suits them. Using information such as discovered in this exploratory study, in conjunction with other consumer and market behavior can assist designers and product developers to better understand their customers. In conclusion, men’s athletic shoes have evolved into an item of function and fashion and are the shoe type most wanted and worn
by men. They are used to express personality, show style and provide comfort when walking, running or playing any number of sports.
REFERENCES

ABSTRACT

Means of mass communication convey the news under the male dominance and within the male discourse. This situation prevailing all around the world is not different in Turkey. Women cannot have a say in the management of the mass media and mostly work in lower positions. Women take part in the news either as a mother or as a wife and these news are only about violence, harassment, rape, accident, illustrated magazine, health, nutrition, child etc. They are not the ones who are being consulted or whose ideas are requested.

This study is restricted with the chief news bulletins of the state TV channel TRT 1, the first news channel NTV, the first private TV station Star TV and Channel 7 which has a different broadcasting attitude (that is showing respect to religious, spiritual and moral issues). By recording the chief news bulletins of the channels for a week, the news about women are going to be examined by content analysis method.

The aim of the study is to determine the position of the women who are employed in the staff, which prepares the chief news bulletins, and to determine how the women are dealt with in news bulletins.
In the light of this examination, in the sample chief news bulletins of national TV channels:

- The sex distribution of the people (anchor, announcer or presenter, reporter, off voice) who took part in the news production process
- The topics of TV news bulletins and the topic distribution of the news about women
- Under which topics men and women are mentioned in the TV news bulletins
- The sex, age and social position of the people mentioned in the TV news bulletins
- Whether the people mentioned in the TV news bulletins are victims or survivor in respect to their sexes,
- The sex, age and social position of the individuals who were consulted on the news topics will be examined.
WOMEN IN TELEVISION NEWS IN TURKEY

The concept of “social gender” is one of the most important concepts used in women’s studies. Two different gender concepts are found in the literature of social sciences. One is biological sex, and the other is the concept of social gender. Biological sex means the classification of people as “men” and “women” depending on their physical differences. Social gender, on the other hand, defines the different roles and behaviours of men and women within the society (Suğur, 2006, p 3).

The patriarchal understanding prefers to perceive being a woman and being a man as opposite ends, and tries to differentiate gender roles with a clear-cut separation. As a rule, there is a list of expectations for men consisting of “do”s and “be”s while the same list of expectations consists of “don’t”s for women. Similarly, what women are expected to do/be, men are forbidden to do/be. Men are expected to be tough, dominant, powerful, judging, determined, successful, independent, ambitious, active and effective solution finders, while women are expected to be benign, accommodating, weak, obedient, irresolute, unsuccessful, dependent, helpless and passive. This system has, for the sake of predetermined gender roles, divided into two those characteristics which make all of us a whole in terms of being human beings, assigning one half to men and the other to women, and thus, making us limited individuals lacking the other half of themselves (Navaro, 1996, p 29).

Every individual experiences the process of socialization to become a member of the society (s)he lives in, to fit in that society and to earn himself/herself a position in it. The individual gains/forms an identity through this process of socialization, in which the family, friends, the social environment, the school and means of mass communication all play a role. The socialization process assigns different identities to men and women in terms of their gender roles. One of the most basic elements of socialization is communication. The means of mass communication, which we all are involved with during our daily lives, play an important role in the socialization process as well.

Means of mass communication encompass various codes and indications related with the process of communication. These codes and indications, which are related with the value
judgements establishing the cultural content of society, are held together thanks to tradition, and meanings are built through traditions as well. Means of mass communication provide examples for the society, offer alternative perspectives, socialize people according to these perspectives, and reflect the society which they live in. Each of these means (newspapers, the radio, the television, the cinema, magazines and the Internet) has different features of their own; yet, what they have in common is that they are all available for mass access/utilization (Burton, 1995, p 39).

We all have a social gender, which is influential on every aspect of our lives. Those processes which produce and reproduce social genders never come to an end. Despite the fact that the social gender is not an identity which one is truly aware of, it is continuously produced in environments such as the media, workplace and our homes, depending on the structures of meanings and messages around us. The media has a particular importance in this process due to the fact that the television is the main and most common means of entertainment and information for a large section of society, and people spend a substantial part of their lives watching TV, and reading newspapers or magazines. The media conveys the images of men and women as far as social genders are concerned. These images reflect those cultural values and expectations which shape gender roles. They define what is noteworthy, and what the society should see and hear. The descriptions/definitions of men and women by the media can help to create social gender definitions largely shared by the society, to reinforce and maintain these definitions, or to change them (Kaypakoğlu, 2004, p 93).

The most important function of the means of mass communication, which play an influential role on our socialization, is to inform us: to convey the news. Conveying the news is an activity of the public area, and all of this activity belongs to men. The non-presence of women in the public domain has naturally caused this activity to be dominated solely by men, in terms of both the addressed mass and the subject matter. Not only the news are constructed by and about men, but they are also created from a male perspective. And this goes beyond the people or institutions producing the news, determining the overall discourse of the news (Fiske, 1989, p 284).

Rakow and Kranich claim that the news employ a male narrative style, and thus, women are not considered as the directly addressed audience of the news. According to them, the woman who is the subject/topic of the news is regarded not as a speaking subject/person, but as an
image that supports the news (Rakow and Kranich, 1991, p 12). As can be understood from these views, it is seen that the male perspective has dominance when news are evaluated in terms of social gender. While those news, carrying patriarchal traces and being conveyed to men and women from this perspective, are broadcasted as the facts themselves, social identities of men and women are reproduced.

Means of mass communication convey the news under male dominance, and within male discourse. This situation prevailing all over the world is not different in Turkey. Women do not have a say in the management of means of mass communication, and they are often employed in minor positions. Women usually take part in the news as a wife or mother, as the subject of the news pieces about violence, harassment, rape, accidents, gossips and sensations, health, nutrition, children, etc. Women are often not present as consultants or opinion-providers.

The main aim of this study is to determine the position of the women who work as an announcer, reporter or an off voice in chief news bulletins and to identify the function of these women in the news story (subject, spokesperson, expert or commentator, personal experience, eyewitness, popular opinion and other).

To achieve this aim, the chief news bulletins of the chosen television channels have been examined by content analysis method and the study entitled as “Global Media Monitoring Project” which was conducted in the year 1995, 2000, 2005 on radio, television, and newspaper news was taken as a base in this study. The study is restricted with the chief news bulletins of the Turkish state TV channel TRT 1, the first news channel NTV, the first private TV station Star TV and Channel 7 which has a different broadcasting attitude (that is showing respect to religious, spiritual and moral values). The news bulletins, which were examined, were broadcasted between 29 January and 2 February 2007 in Turkey. The chief news bulletins of the television channels, which make up the sampling, were recorded during five days and all of the news except for sports news, weather forecast and the advertisements were included in the analysis. The number of the news analyzed is 317 in Channel 7, 364 in NTV, 284 in Star TV, 229 in TRT 1, which makes up a total number of 1194.
This analysis includes the following 15 questions and items:

Item number, subject, scope of the story, role, gender, age, occupation or position, function in the news story, family relationships, victim, survivor, Are women central to the news in this story?, Does the story clearly highlight issues concerning equality or inequality between women and men?, Does the story clearly challenge or clearly reinforce stereotypes about women and/or men? and further analysis.

482 of 1188 people who take part in the chief news bulletins broadcasted for five days in the television channels constituting the sampling are women while 706 of them are men. The rates given in the study were not calculated by using the total number of the people. The percentages for women and men were calculated within each group.

**Subject**

According to subject analysis of the television news, it has been seen that the subjects of “war, civil war, terrorism, state-based violence” are in the first place with the rate of 15.7%. Following subjects are respectively “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash” with the rate of 10.7%, “non-violent crime, bribery, theft, drug-dealing, corruption (including political corruption/ malpractice)” and “other stories on social or legal issues” with the rate of 7.8%, “other subjects” with the rate of 6.3%, “medicine, health, hygiene, safety, disability, medical research, funding, (apart from HIV-AIDS)” with the rate of 5.3%, “economic policies, strategies, models (national, international)” with the rate of 4.9%, “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping” with the rate of 3.9%. The subjects which are less included in the television news are respectively the news on “science, technology, research, funding, discoveries, developments”, “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” with the rate of 0.2%, “national defense, military spending, military training, military parades”, “consumer issues, consumer protection, regulation, prices, consumer fraud and other stories on the economy”, “development issues, sustainability, community development” with the rate of 0.3%, “human rights, women’s rights, children’s rights, gay-lesbian rights, rights of minorities” with the rate of 0.5%. When the news were analyzed in terms of gender it has been seen that the women were mostly included in the news subjects on “war, civil war, terrorism, state-based violence” with the rate of 12.4%, “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash” with the rate of 12.2%, “non-violent crime, bribery, theft, drug-dealing, corruption, (including political
corruption/malpractice)” with the rate of 7.7%, “other subjects” with the rate of 6.8%, “other stories on social or legal issues” with the rate of 6.6%, “medicine, health, hygiene, safety, disability, medical research, funding, (apart from HIV-AIDS)” with the rate of 6.4%, “economic policies, strategies, models (national, international)” with the rate of 3.9%. It has been also seen that the women were not included in the news subjects on consumer issues, consumer protection, regulation, prices, and consumer fraud. The news subjects in which the women were less included are “other stories on crime and violence” with the rate of 0.2%, “national defense, military spending, military training, military parades”, “science, technology, research, funding, discoveries, developments”, “other stories on science and health”, “development issues, sustainability, community development”, “migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia” with the rate of 0.4%. However, while the men were mostly included in the news subjects on “war, civil war, terrorism, state-based violence” with a rate of 18.1%, “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash” with the rate of 9.6%, “other stories on social or legal issues” with the rate of 8.4%, “non-violent crime, bribery, theft, drug-dealing, corruption, (including political corruption/malpractice)” with the rate of 7.9%, “other subjects” with the rate of 5.9%, “economic policies, strategies, models (national, international)” with the rate of 5.5%, “riots, demonstrations, public disorder” with the rate of 5%, they were not included in the subjects on “science, technology, research, funding, discoveries, developments, migration, refugees, asylum seekers, ethnic conflict, integration, racism, xenophobia”. The news subjects in which the men were less included are “poverty, housing, social welfare, aid to those in need and other stories on the economy” with the rate of 0.1%, “national defense, military spending, military training”, “military parades, development issues, sustainability, community development” with the rate of 0.3%, “education, child care, nurseries, pre-school to university, adult education, literacy”, “human rights, women's rights, children's rights, gay & lesbian rights, rights of minorities” with the rate of 0.4%.

Scope of story
According to the scope of the news stories broadcasted on the television channels, it has been seen that they were mostly “national” with a rate of 49.9% and respectively “local” with a rate of 23.8%, “national and other” with a rate of 16.4%, “foreign and international” with a rate of 9.9%. The women were mostly included in “local” news with a rate of 46.5%, and respectively in “national” news with the rate of 28.4%, in “national and other” news with the rate of 15.4%, in “foreign, international” news with the rate of 9.8% while the men were
included mostly in “national” news with a rate of 52.1%, in “local” news with the rate of 20.7%, in “national and other” news with a rate of 17.1%, in “foreign, international” news with the rate of 10.1%.

**Role**

When it comes to anchors, announcers or presenters who announce the chief news bulletins which were recorded during five days, it has been seen that one man in Channel 7, one man and one woman in NTV, one woman in Star TV and TRT 1 were employed as anchor, announcer or presenter. While in the 31.3% of the news, there was a reporter beside the anchor, in the 39.6% of the news there was a person in the news (interviewee, commentator, analyst or spokesperson whom the story is about). 32.1% of those reporters were women while 30.9% were men and 15.8% of the people in the news were women while 55.8% were men.

**Gender-Age**

Of the people who were included in a total of 1194 news broadcasted for five days on the television channels constituting the sampling 59.1% were males whereas 40.4% were females and 0.5% of them were not classified (not known). As for the ages of those people, it has been revealed that 29.4% of them were unidentified, 27.9 were between 19-34, 24.5% were between 35-49, 14.5% were between 50-64, 1.8% were 65 and older, 1.1% were between 13-18 and 0.6% were between 0-12.

**Occupation or Position**

When the occupation or position of the people in the television news was analyzed, it has been revealed that “government officials, politicians, presidents, government ministers, political leaders, political party staff, spokespersons” were mostly included in the television news with a rate of 8.5%. The other people included in the news were respectively those whose occupations were not stated with a rate of 7.7%, “criminals or suspects” with a rate of 3.4%, “government employees, public servants, bureaucrats, diplomats, intelligence officers” with the rate of 3.3%, “celebrities, artists, actors, writers, singers, radio or television personalities” with a rate of 1.9%, “health or social service professionals, doctors, nurses, laboratory technicians, social workers, psychologists” with a rate of 1.8%, “media professionals, journalists, video or film-makers, theatre directors” with a rate 1.7%. “Unemployed” people with a rate of 0.1%, “sex workers and prostitutes” with a rate of 0.2%,
“retired people, pensioners” and “agriculture, mining, fishing, forestry workers” and “science or technology professionals, engineers, technicians, computer specialists” with a rate of 0.3%, “sportspeople, athletes, players, coaches, referees” with a rate of 0.6%, “academic experts, education professionals, teachers or university lecturers (all disciplines), nursery or kindergarten teachers, child care workers” with a rate of 0.7% were less included in the news. As for the gender distribution of the people in the television news, out of 482 females appeared in the news, the occupations of 4.9% were not stated, 2.3% were “celebrities, artists, actresses, writers, singers, radio or television personalities”, 2.1% were “home-makers and parents”, 1.7% were “health or social service professionals, doctors, nurses, laboratory technicians, social workers and psychologists”, 1.5% were “office or service workers, non-management workers in office, store, restaurant and catering”. None of the females appeared on the news was a “government employee, public servant, bureaucrat, diplomat, intelligence officer”, “police, military, para-military group, militia, prison officer, security officer, fire officer”, “science or technology professional, engineer, technician, computer specialist”. However, out of 706 men appeared on the news, 21.6% were “government officials, politicians, presidents, government ministers, political leaders, political party staff or spokespeople”. 8.3% were “criminals or suspects”, 3.8% were “media professionals, journalists, video-filmmakers, or theatre directors”, 3% were “trades people, artisans, laborers, truck drivers or construction, factory, domestic worker”, 2.5% were “celebrities, artists, actors, writers and radio or television personalities”, 2.1% were “business person, executives, managers, entrepreneurs, economists, financial experts or stockbrokers”.

**Function in the news story**

When the functions of the people covered in a total of 1194 news were analyzed, it has been revealed that 13.8% of them appeared as spokesperson, 11.7% appeared as subject, 7.4% appeared as popular opinion, 3.4% appeared as expert or commentator, 2.8% appeared as eyewitness, 0.5% appeared as personal experience. The function of 0.1% is unknown. When the functions of the people appeared in the news were analyzed according to their gender, it has been noted that out of 109 women, 7.6% were subject, 3.2% were popular opinion, 2.3% were eyewitness, 1.5% were expert or commentator, 1.1% were spokesperson, 0.4% were personal experience. However, out of 706 men, 33.3% were appeared as spokesperson, 21.7% appeared as subject, 15.4% appeared as popular opinion, 7.2% appeared as expert or commentator, 4.6% appeared as eyewitness and 0.8% appeared as personal experience. When the topic distribution in each function was examined according to the gender, it has been seen
that women appeared as subject were included in the news topics related to “medicine, health, hygiene, safety, disability, medical research or funding (apart from HIV-AIDS)” with a rate of 5.7%, 5% of them were included in the news topics related to “disaster, accident, famine, earthquake, flood, hurricane, plane crash or car crash” and 2.9% of them included in the news topics related to “non-violent crime, bribery, theft, drug-dealing or corruption, (including political corruption/malpractice)”. As for the men appeared as subjects; it has been found out that 17.9% of them were included in the news topics related to “non-violent crime, bribery, theft, drug-dealing or corruption, (including political corruption/malpractice)”, 16.4% of them were included in topics related to “war, civil war, terrorism or state-based violence” and 5.7% of them were included in topics related to “violent crime, murder, abduction, kidnapping, assault or drug-related violence”. While 1.8% of the women who were appeared as a spokesperson on TV news were took part in the news topics that are not classified (other subjects) and 1.2% of them took part in the topics related to “arts, entertainment, leisure, cinema, theatre, books or dance”, 18.2% of men took part in topics related to “other stories on social or legal issues”, 14.5% of them took part in the topics related to “war, civil war, terrorism or state-based violence” and 13.3% of them took part in the topics related to “economic policies, strategies or models (national, international)”. 4.9% of the women appeared as expert or commentator were included in the news topics related to “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “other epidemics, viruses, contagions, BSE, SARS and other stories on science or health”. However, 17.1% of the men appeared as expert or commentator were included in the news topics related to “war, civil war, terrorism, state-based violence”, 9.8% of them were included in the topics related to “other stories on social or legal issues”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” and 4.9% of them were included in the topics related to “other epidemics, viruses, contagions, BSE, SARS”. While the women appeared on the television news as personal experience were mostly included in the topics related to “other stories on celebrities, arts, media” with a rate of 33.3%, 33.3% of men appeared as personal experience were included in the topics related to “economic indicators, statistics, business, trade, stock markets” and 16.7 of them were included in the topics related to “riots, demonstrations, public disorder” and “other stories on celebrities, arts and media”. Women appeared as eye-witness were mostly included in the topics related to “education, child care, nurseries, pre-school to university, adult education, literacy”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “beauty contests, models, fashion, beauty aids, cosmetic surgery” with a rate of 6.1%
whereas 18.2% of men were included in the news topics related to “disaster, accident, famine, earthquake, flood, hurricane, plane crash and car crash”, 15.2% of them were included in the topics related to “other stories on crime and violence”, 12.1% of them were included in the topics related to “non-violent crime, bribery, theft, drug-dealing, corruption, (including political corruption/malpractice)”. While 4.5% of the women appeared as the popular opinion in the news were included in the news topics related to “war, civil war, terrorism, state-based violence”, “disaster, accident, famine, earthquake, flood, hurricane, plane crash and car crash”, 1.1% of them were included in the topics related to “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “arts, entertainment, leisure, cinema, theatre, books and dance”; 20.5% of men were included in the topics related to “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, 14.8% of them were included in the topics related to “war, civil war, terrorism and state-based violence”, 9.1% of them were included in the news topics related to “economic indicators, statistics, business, trade, stock markets”.

Family Relationships

In the 1194 recorded news chunks, the phrases such as wife, husband, his/her daughter, his/her son etc. related to family relationships were not observed in the rate of 38.3%, whereas these phrases were observed in the rate of 0.6%. The identifications were only used for the women with a rate of 1.5% in the television news where such phrases were used. The identifications were not used for men.

Victim

1.6% of the people appeared on 1194 television news broadcasted on the TV channels were “victims of an accident, natural disaster, poverty, disease, illness”, 1.1% of them were “victims of other crime, robbery, assault, murder etc.”, 0.2% were “victims of non-domestic sexual violence or abuse, sexual harassment, rape, trafficking” and “victims of discrimination based on gender, race, ethnicity, age, religion”, 0.1% were “victims of war, terrorism, vigilantism, state-based violence” and “unidentified victims”. 35.7% of the people appeared on the news were not appeared as victim. As for the gender distribution of the people who were appeared as victims on the television, it has been revealed that while the women were “victims of an accident, natural disaster, poverty, disease, illness” with a rate of 3.4%, “victims of other crime, robbery, assault, murder” with a rate of 1.1% and “victims of non-
domestic sexual violence or abuse, sexual harassment, rape and trafficking” with a rate of 0.4%; the men were “victims of other crime, robbery, assault, murder” with a rate of 1.7%, “victims of an accident, natural disaster, poverty, disease, illness” with a rate of 0.6% and “victims of war, terrorism, vigilantism, state-based violence” with a rate of 0.23%.

Survivor

0.1% of the people appeared on 1194 television news were “survivor of an accident, natural disaster, poverty, disease or illness”, 38.5% of them were not a survivor, 0.3% were “unidentified survivors”. As for the gender of the survivors; 0.6% of women were “unidentified survivors”, 0.2% of men were “survivor of an accident, natural disaster, poverty, disease or illness”.

Are women central to the news in this story?

Out of 1194 TV news, only 1.9% were defined as woman centric. The news which were defined as women centric were respectively about “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)”, “violent crime, murder, abduction, kidnapping, assault, drug-related violence”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “media, including new media (computers, internet), portrayal of women and/or men, pornography”, “other stories on celebrities, arts, media”, “riots, demonstrations, public disorder”, “non-violent crime, bribery, theft, drug-dealing, corruption, (including political corruption/malpractice)”.

Does the story clearly highlight issues concerning equality or inequality between women and men?

Out of 1194 television news, only 0.1% has clearly focused on the issues of equality or inequality. The issues, in which equality or inequality were clearly focused, were only about “disaster, accident, famine, earthquake, flood, hurricane, plane crash and car crash”.

Does the story clearly challenge or clearly reinforce stereotypes about women and/or men?

It has been found out that while in 27.7% of 1194 TV news broadcasted on the TV channels, the statements reinforcing stereotypes about women and/or men cannot be decided; in 0.5% of them the statements clearly reinforce stereotypes and in 0.5% of the news, the statements
clearly challenge stereotypes. The stories that clearly challenge or clearly reinforce stereotypes about women and/or men respectively are about “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “violent crime, murder, abduction, kidnapping, assault, drug-related violence”, “other subjects”, “poverty, housing, social welfare, aid to those in need”, “medicine, health, hygiene, safety, disability, medical research and funding (apart from HIV-AIDS)

Further Analysis
None of the 1194 TV news broadcasted for five days in the TV channels constituting the sampling needs further analysis.

SUMMARY AND CONCLUSION
It is possible to state that means of mass communication and especially television have an important place in both gender’s (women and men) lives. Television is significant in terms of affecting people’s opinion and attitude. However, the things which are reflected via television are not the reality itself, rather they are the reality which is presented after a kind of selection process. This process involves certain and primary ideology and produces theories about gender.

Feminity and masculinity have been cultural identities which are formed separately in each social system. Woman has been defined as dependent on man in terms of capacity and authorization and inferior to him. This definition shows the center of the authority. Television is important in terms of circulating the information, news and entertainment in this process. Means of mass communication do not reflect the world as it is, they reproduce and duplicate it. On the other hand, this duplication and reproduction are closely associated with limits of the social formations and institutional ideologies. The production of means of mass communication is fulfilled within the framework of certain ethical rules. Therefore, what information is to be revealed and which subjects are to be highlighted are an outcome of social rules. The inequality in the representation of woman and man depend on the social definitions about sexes rather than the person or the institution that produces the message. In other words, gender is a phenomenon formed culturally and changes according to time and the society in which it occurs. Briefly, gender exists in where we live, namely in our social address. In terms of acquiring the consciousness of decoding the patriarchal ideology which produces the gender ideology in favor of men, determining the amount of time women appear
on chief news bulletins on television, in which subjects they are included and their function in the news story gains importance.

When the news analyzed in the study “Women in Television News in Turkey” were examined in terms of their subjects, it has been revealed that the mostly appeared subjects were “war, civil war, terrorism, state-based violence” with a rate of 15.7% and the least appeared subjects were “foreign/international politics, relations with other countries, negotiations, treaties, UN peacekeeping” with the rate of 3.9%. As for the distribution of the subjects in terms of gender women appeared mostly in the subjects about were “war, civil war, terrorism, state-based violence” with a rate of 12.4%, “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash” with the rate of 12.2% and “non-violent crime, bribery, theft, drug-dealing, corruption (including political corruption/ malpractice)” with a rate of 7.7%. They did not appear in the subjects about “consumer issues, consumer protection, regulation, prices and consumer fraud”. It can be stated that women are mostly used as visual material in media and they appeared most in the subjects of media and art.

When the scope of the news stories was examined, it has been revealed that the stories are mostly national with a rate of 49.9%. Among the news examined women appeared on local news with a rate on 46.5%, on national news with a rate of 28.4%, on national and other news with a rate of 15.4% and on foreign and international news with a rate of 9.8%.

32.1% of the reporters on 1194 news broadcasted on the channels examined were women. This data shows that women working in the media works mostly in lower positions as reporters. When the occupation and the positions of the people on the news broadcasted on the television were analyzed, it has been revealed that out of 482 women 4.9% have an unknown job, 2.3% were “celebrities, artists, actors, writers, singers, radio or television personalities”, 2.1% were “housewives and parents”, 1.7% were “health or social service professionals, doctors, nurses, laboratory technicians, social workers, psychologists” and 1.5% were “office or service workers, non-management workers in office, store, restaurant and catering”. However, none of them were “police, military, para-military group, militia, prison officer, security officer, fire officer”. Due to the fact that women appear less on the television news and those who appear on the news took part in limited positions, this data proves that men are dominant in the social power areas such as politics, business life and education and gender discrimination in social power areas are still in favor of man and also it
makes it evident that men have higher positions in chief news bulletins just as they have in social system.

When it comes to the functions of the people appeared on 1194 television news, it has been revealed that 7.6% of women appeared as subject and women were included in the news topics related to “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” with a rate of 5.7% and “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash” with the rate of 5%. The function of men and women on the news supports the discrimination between genders. As a result, it has been determined that women appear less on television as subject, expert or commentator, eye-witness, popular view and spokesperson compared to men.

On the 1194 news broadcasted on television, the definitions about family relationships were used for women with a rate of 1.5% whereas they were not used for men.

In 1194 television news, women were seen as victims on the issues of “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “violent crime, murder, abduction, kidnapping, assault, drug-related violence”, whereas men were the “victims of violent crime, murder, abduction, kidnapping, assault, drug-related violence”, “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, “war, civil war, terrorism, state-based violence”. None of the women in the news were defined as survivor. In the category of whether the news stories are women centric or not, 1.9% of the news were woman centric and their subjects were “disaster, accident, famine, earthquake, flood, hurricane, plane crash, car crash”, “violent crime, murder, abduction, kidnapping, assault, drug-related violence”, “gender-based violence, harassment, domestic violence, rape, trafficking, genital mutilation”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” and “media, including new media (computers, internet), portrayal of women and/or men, pornography”.

Finally, in this study, it has been revealed that the news topics mostly consist of politics and celebrity, arts and media; that the people who were subjects of the news and appeared as popular view were mostly men; that the women centric subjects were not included enough in the chief news bulletins; that the woman centric news topics consist of “disaster, accident,
famine, earthquake, flood, hurricane, plane crash, car crash”, “medicine, health, hygiene, safety, disability, medical research, funding (apart from HIV-AIDS)” which can be proofs of weakness and that the definitions and adjectives used in the news are in line with the common judgments for women and men in the social system.

Abstract

Popular discourse suggests that family meals are becoming increasingly rare and that their disappearance is contributing to the rising level of childhood obesity and to diminished family functioning, with negative psychosocial outcomes for children and adolescents. Evidence from research studies on the function of family mealtimes has failed to support such strong claims. What little is known about the social, cultural, nutritional and psychosocial impact of family meals is based on the mealtime practices of American families. This paper presents data from a survey of 625 adolescents drawn from schools in the metropolitan region of Perth, Western Australia. Using an online questionnaire, adolescents were asked about their current family meal practices and their ideas about family meals, as well as about their own activities, their health and well-being, and their sense of family connectedness. Relationships between various demographic factors, family and individual level variables, health indicators and eating practices are presented and issues regarding the methodology are described.
The image of the ideal family meal pervades our everyday life from television advertising and programming to literature and beyond. This image presents a ‘family’ sitting down at a table being served food by a mother wreathed in smiles. It is a traditional, nostalgic image of a cocooned family, safe from the disorder and uncertainty of the outside world. This image is continually validated by a media focus that gives credence to the importance of family meals as a cornerstone of society, connecting individual/s with community and effecting socialization.

Nevertheless, despite these enduring images, there is growing national and international concern regarding the apparent demise of the family meal. Moral panic and fear has set in as eating moves from being a social to a more individual practice (Fischler 1980: 947). The loss of the family meal has been linked to psychological, social and physical effects resulting in, for example, low self esteem, family dysfunction, social unrest and obesity. However, little research exists on the continuing significance, or otherwise, of the family meal as a site where ‘community’ and communication occur.

This paper presents findings from research aiming to address the significant lack of knowledge regarding the family meal and its role in the current Australian context. This research indicates that concerns about the demise of the family meal are premature, although the form it takes may not necessarily conform to the nostalgic image to which we are exposed.

The literature on meals is divided into three main categories: socio-cultural, psychological and nutritional. The cultural encompasses aspects such as gender and
labour divisions, the influence of class, the constitution of a ‘proper meal’ in terms of food and preparation as well as types of activity, and the impact of the meal on belonging (Beardsworth & Keil 1997; Grieshaber 1997; Hupkens et al. 1998; Lupton 2000; Murcott 1982, 1997, 2000).

The psychological literature has some overlaps, in particular with the meal as a key facilitator of socialisation. Psychological treatises on the meal tend to focus on socialization, health and mental health of adolescents and the development of self-esteem, processes of family communication, and issues of intimacy and trust (Compañ et al. 2002; Coveney 1999; Eisenberg et al. 2004; Erwin et al. 2002; Neumark-Sztainer et al. 2004; Soliah et al. 2003).

The nutritional literature focuses on the influence of the family meal on food intake and its nutrition quality, childhood obesity and child-parent interactions around food (Burke et al. 2001; Campbell & Crawford 2001; Gibson et al. 1998; Oliveria et al. 1992).

Just as definitions of ‘family’ have become more fluid and inclusive, so too has the definition of ‘meal’ (Mäkäla 2000). What it is, how it varies with different life phases and what impact this has on the social fabric of our communities is unknown. Most of the above studies are based on white, American, middle-class families and the few Australian studies which exist have produced contradictory findings (Skatssoon 2003). Campbell and Crawford (2001: 23) suggest that ‘in the Australian context we have few insights regarding the family food environment in which our children learn their food habits, or
how this might differ across social groups’. There has been no attempt to bring together findings on food and family research from a range of disciplines, despite the fact that ‘such an integration has the potential to throw light on a number of issues from different methodological angles’ (Coveney 2002: 114).

Part of the definitional problem in identifying the ‘family meal’ involves the conflation of actual practice with ideal representation. Murcott (1997) argues that representations of the family meal reflect an ideal to which people aspire, rather than a reality, and suggests we need ‘to separate reports of frequency from articulations of an idealised image’ or ‘actual activities’ from ‘images of family living to which people aspire’ (Murcott 1982:693). 

The current research was undertaken by a multidisciplinary team consisting of a psychologist, two sociologists and a nutritionist to try to begin answering some of these questions: What, where and how are people eating their evening meals? How is this related to age, class, ethnicity, gender, family composition, and employment status? What is considered to be a ‘family meal’? Who prepares and cooks food in the household? Does food intake differ between those who do and don’t engage in ‘family meals’? Is eating ‘family meals’ related to psychosocial well-being?

Research Plan, Methods and Technique

After considerable deliberation about the most appropriate methodology, a compromise position was arrived at which saw Year 10 students from eight secondary schools in the
Perth metropolitan area invited to participate. Being at a critical stage of development in terms of their own nutritional choices, eating habits and health/obesity concerns, the adolescents constitute a relevant sample. Schools were selected to provide a range of socio-economic backgrounds. For convenience of application and to ensure all students (regardless of access to computer and internet access at home) were able to participate, schools were asked to include the survey as part of the Year 10 Health or Science program. Participants were encouraged to complete an online questionnaire. Measures of family connectedness, health and well-being were also included.

**Sample**

The sample consisted of 314 males (50.2%) and 311 females (49.8%), making a total of 625 Year 10s, 90.4% of whom completed the web-based version and 9.6% the paper-based. We estimated the socioeconomic status of the participants generally through SES bands based on median weekly household income by suburb (2001 ABS data). 40.2% of participants were from schools in suburbs in the high band, 13.4% in the medium and 46.4% in the low.

**Household Characteristics**

The average number of people living in respondents’ houses was 4.5; 92.6% were living with mothers and 1.8% with stepmother, 71.8% with fathers and 9.3% with stepfathers. 9.0% had relatives other than siblings living in the house. Father/stepfather was employed in 92.0% of households, and mother/stepmother employed in 68.7%. Of respondents, 42% were the eldest child in the family, and 35% the youngest.
The cultural diversity of the sample broadly reflects that of the population in general. The vast majority of the sample was born in Australia (78.6%), with 3.7% of the sample being from Aboriginal and Torres Strait Islander background. The top six other countries of birth were England (14.9% of other countries), Singapore (9%), New Zealand (8.2%), and Malaysia, Scotland and South Africa (all 5.2%). A large proportion of the sample (73.1%) spoke English at home. The top six other languages spoken at home were Vietnamese (11.4% of other languages), Cantonese and Chinese (7.8%), Serbian (7.2%), Macedonian (6%) and Italian (5.4%).

Family meals: experiences and expectations

In terms of general eating habits, a majority of respondents reported that they ate and drank whatever they wanted, although almost as many were a little careful about eating habits. Few reported that they were ‘sometimes’ or ‘always’ on a diet.

Table 1: Distribution of responses regarding usual eating habits (N=625)

<table>
<thead>
<tr>
<th>Response</th>
<th>Count (Percentage)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I eat and drink what I want, whenever I want</td>
<td>274 (43.8%)</td>
</tr>
<tr>
<td>I am a little careful about what I eat and drink</td>
<td>284 (45.4%)</td>
</tr>
<tr>
<td>I am sometimes on a diet</td>
<td>53 (85%)</td>
</tr>
<tr>
<td>I am almost always on a diet</td>
<td>14 (2.2%)</td>
</tr>
</tbody>
</table>

Just over half (52.7%, N=329) reported that they always ate breakfast on weekdays with just over 80% (81.6%, N=510) eating breakfast on the weekends.
We asked participants to provide as much detail as they could about the meal they ate the previous night. When coded for the type of food eaten, 72% ate "home-made" meals, 10% instant meals at home (such as instant noodles or frozen complete meals) and 22% fast food such as McDonald’s, Hungry Jacks, fish and chips, Chicken Treat etc.

Interestingly, over a quarter (27%) of the adolescents reported that they had decided what they were going to eat that night. 15% prepared their own evening meal, but for the majority it was the mother (50%) or father (14%) who had prepared the meal.

Participants were asked to provide more detail about the meal they ate the previous night – what it consisted of, where it was eaten, and whether all household members ate it in the same place.

Meals consisted of a wide variety of foods eaten – from the well balanced to the less nutritional (e.g. ‘ice-cream’ as a meal). The art of ‘home cooking’ does not seem to have disappeared, with meals including ‘veggie bake and lamb chops’; ‘freshly baked pasta with cheese sauce, fried pork schnitels [sic] with a cream sauce, freshly baked capsicum [sic] with a bit of garlic and oil’; ‘crumbed fish, mashed potato, fresh peas, fresh corn, fresh carrot, salad’; the ubiquitous ‘spaghetti with meat sauce’; and more exotic options such as ‘stir fry (noodles, chicken)’; ‘satay chicken (sauce from packet) and rice with onions capsicum and carrots’; ‘lamb curry with potatoes in it and rice with safron [sic] in it’; and the eclectic ‘chiken [sic] curry with rice salad n fries’ or ‘rice, scrambled eggs with pepperoni, bok choy with potato’. There were also the more traditional ‘chops, chips, salad and 2 rolls’ and ‘sausages mashed potatoes and peas’.
Of the 579 responses to the question, ‘Where did you eat your meal last night?’ almost half ate at a dining room table, with another quarter eating in the lounge and family rooms. A small group (6%) ate in their bedrooms.

Table 2: Distribution of responses regarding eating site for last night’s meal (N=579)

<table>

<td>Other</td>
<td>50 (8.6%)</td>
</tr>
</tbody>
</table>

76.7% reported this was at the same place as everyone else, and 78.6% that the meal was eaten at the same time as everyone else.

We were also interested in activities undertaken during mealtme (or while eating). As Table 3 indicates, talking was engaged in by almost eight out of ten participants, and while the TV was on in 61.3% of households, only about three quarters of these respondents were actually watching it.\(^i\)
Table 3: Activities while eating (total numbers and percentages)

<td>253 (72.9%)</td>
<td>94 (27.1%)</td>
</tr>
</tbody>
</table>

70% of the sample perceived their meal the previous night as a ‘family’ meal. Their reasons were mainly based around the sociality of the event – that everyone was collected for the meal event (48.7%). However, almost 40% used a nutritional definition of the family meal, suggesting it was a family meal because it was home cooked or included meat and vegetables.

Table 4: Previous night’s meal was a family meal because (respondents could tick more than one option; N=645 responses)

</tr>
</tbody>
</table>

Of the 30% who felt it was not a family meal, again the focus was on the social aspect of not everyone being together (see Table 5), with the meal not being cooked at home not a
major factor (although a number of the ‘other’ answers indicated that since different family members were eating different foods, this was what precluded it from being a ‘family meal’).

Table 5: *Previous night’s meal was not a family meal because* (respondents could tick more than one option; *N*=164 responses)

Of course our aim had been to identify not only current eating patterns, but the degree to which these reflect ideals of the family meal and whether having family meals was important to adolescents. In response to the question, ‘Is having family meals important to you?’ 55.2% of the 625 gave affirmative answers, and 44.8% negative. This almost equal split is fascinating, and we suspected that it reflected a gender difference, but of those who said that family meals were important 49% were male and 51% were female – almost equal proportions.

Of the 215 who said yes (see Table 6), the most common theme in their explanations in the qualitative section of the question, was framed around the opportunity provided by
the meal for communication with other family members. This was related to the second most frequent theme, that of spending time together.

The following few examples of written responses indicate the overwhelming similarity of the discourse.

Yes, because it’s the only time everyone gets to sit down and catch up especially [sic] during the week.

Yes because you can discuss problems to [sic] your parents.

Because we can spend quality time together and talk about what is on our mind.

Because we all sit down and talk.

It gives us a chance to converse and communicate as a family.

Because you can [sic] talk about the events that took place in that day and have some family time together.
It’s comfy and nice to have the family all together. Having a family meal in the evening is very important to me because I get to talk to my family all together at the same time. We also try and solve problems we may be having. We have a good time and we can all relax while enjoying a good meal.

Those who did not feel the family meal was important gave answers which clustered around the general theme of not caring, or not seeing the point, although one in ten found mealtime an opportunity to take a break from the family or to enjoy their own solitude.

One in ten found they had other opportunities for family time or to talk, and that the family meal itself was less important for this aspect of family life.

Table 7: Those who felt it was not important (N =266; participants could give more than one response)

The qualitative responses for the negative were far less forthcoming with many providing single or a few words in answer. Some examples follow:

No it doesent [sic] matter.
Because.
No.
Why is it important.
Because its [sic] nothing just eating dinner.
Because I see my family members during the day and I need some space which is at dinner time.
Not really because you get annoyed [sic] with your family. They ask to [sic] many questions.
Because I dislike my sister.
BECAUSE IT IS JUST EATING.

Health and Well-Being

In general, the adolescents reported that their health was good or very good with only about 16% indicating that it was ‘fair’ or ‘poor’, although there was moderately high medicine and alcohol use for this age group. Reported use of other drugs was low.

When asked to report on their feelings of stress, anxiety or depression during the past week, less than 10% of the sample reported frequent occurrence of such feelings, but another 25% had experienced these feelings ‘a few times’. Physical activity levels were very good for about 90% of the group, averaging between one and two hours for the
reporting days. However, there was also a reasonably high level of television viewing throughout the day, with between two and three hours of viewing for the majority of the adolescents. Just over 40% of the adolescents also had part-time jobs, averaging just over 12 hours per week.

The adolescents also had reasonably positive views of themselves, especially in terms of their achievement at school, with more than 93% of those responding describing themselves as ‘average’ to ‘above average’ in this area. More than half (54.8%) thought that looks were ‘important’ and just under half (44.5%) thought that they were at least ‘good looking’, with about a quarter of the group (27.6%) indicating that they were below average in this regard.

*Family Connectedness*

A strong finding of the study was the degree to which the adolescents felt that they were connected to their families. More than 70% indicated that family members were ‘supportive of each other during difficult times’ and more than 65% felt that their family members were ‘very close and get along very well’. However, this did not necessarily translate into enjoying ‘doing things together’, with a slightly reduced proportion of the sample (57.8%) endorsing this type of connectedness and just over a quarter of the sample (26.1%) indicating that their families didn’t really enjoy doing things together. However, when adolescents were having problems, parents and other family members were consulted ‘quite a bit’ or ‘very much’ by 51.4% and 47.5% of the sample,
respectively. Friends were consulted only slightly more (57.2%). By contrast, teachers were avoided by 57% of the sample.

Conclusion

These results indicate that the moral panic about the demise of the family meal is premature. Our findings fall in between a recent poll by a pasta sauce manufacturer which indicated, ‘meal times have become a recipe for food rejection, stress, stand-offs and bribery’ with 95% of children rejecting home-cooked meals (Skatssoon 2003), and a Meat and Livestock Australia commissioned study (2003) which indicated that 86% of families sit down to an evening meal and the television is switched off 60% of the time. Similar to Neumark-Sztainer and co-workers’ (2000) focus group based research on family meal patterns of adolescents attending seventh and tenth grade in the US, we found a great diversity in family meal patterns, including both the ‘sit down regular meal’ and the ‘eat and run’ scenario. We were surprised that almost half of the respondents reported eating around a dining room table, a more traditional image of family interaction than many might expect. Likewise it appears the gendered division of labour is still common, although significant proportions of fathers and of adolescents themselves were preparing meals (one in three of our sample). Home made meals were common, with almost three quarters of our sample reporting eating a meal cooked at home the previous night.

Our findings also support Neumark-Sztainer and colleagues’ conclusion that watching television is a relatively common, though by no means universal, activity while eating a
meal. Concerns about the impact of television watching suggest that if everyone’s eating is done in front of the television set without the scrutiny of adults, ‘children might never learn to cut and chew neatly, how to notice what it is that other people need or are saying, or any of the other marks of being “well brought up”’ (Visser 1991: 55). Our study indicates that while the television may be on, not everyone is watching it, and for those who are, this does not preclude communication – 80% reported talking during the meal. It is this communication aspect which seems to define it as a ‘family meal’ for the majority of adolescents. While Neumark-Sztainer and co-workers (2000) found that key reasons for not eating a family meal were busy schedules, dissatisfaction with family relations and a dislike of the food being served at family meals, many of our respondents challenged the value of the ‘family meal’ itself.

Our findings appear to support Ottes’ (1991: 105) argument that meals potentially assemble groups and ‘may signify unity and sharing’, with almost 75% of our sample indicating that they ate in the same place as other family members on the night in question, and over 70% reporting they ate together 4 or more times a week. Certainly many valued the family meal as an opportunity to come together and share with other members of their families. However, for almost equal numbers, the ideal of the family meal meant little, and was seen as unimportant to them.

The family meal has long been considered a strong marker of, and a vehicle for, promoting family connectedness, being an opportunity to develop a sense of family belonging and a site for transferring not only a food heritage (Soliah et al 2003), but other
aspects of socialisation. The findings of the current study go some way to dispelling the myth that traditional notions of the family meal no longer exist. It also suggests that socialisation can still occur in non-traditional meal practices.

i We also asked about daily TV watching, and found that respondents reported watching on average close to 4 hours of television a day. But students also overwhelmingly (89.1%) reported undertaking some physical activity such as Phys Ed classes, walking, running, football/soccer/hockey, netball/basketball over the past week, averaging an hour on week days and two hours on weekends. This indicates that students are not simply sedentary television and video game viewers.

ii This answer indicates the methodological difficulties of inviting adolescents to participate in a school setting where the question of their consent is perhaps a moot point, since teachers agreed that their classes would participate. Since this was one of the compulsory questions, past which students could not move on the WEB based survey until they had entered something, this student simply hit random keys on the keyboard in order to move through the questionnaire. The various methodological issues arising from the research design will be taken up in a separate paper.

CORRESPONDING AUTHOR: Guy Smith
Sustainability—it’s a new word for an old concept, a more pleasant and innocuous word that elicits no conspicuous and tolerable counterpart against which to be pitted. Last year it was “green”: green power, the green party, the green movement. The opposite of green is…purple. The opposite of sustainability is…the inability to remain. Now that should sound a few alarms. Recent interviews conducted on a West coast college campus found that three out of four students would consider joining an extracurricular club named “The Sustainability Club,” while one out of four would consider joining “The Green Club” (Interview, Eddy, 2006). It looks like two can play at the game of reification, and “climate change” may have met its match.

Sustainability also has a philosophical opposite: hegemony—“control or dominating influence by one person or group over others, especially by one political group over society or one nation over others” (Encarta Dictionary, 2007). In order to fully comprehend hegemony, one must fully comprehend its necessary opposite, subjugation; they are but two sides of the same coin. A note on logic: the absence of hegemony does not equal the opposite of hegemony (The Fallacy of the Alternative Syllogism: p or q, p, therefore not -q), although that is how “real” freedom is typically portrayed by the hegemonic power (Hurley 2000).

Contrary to one’s initial estimation, freedom and hegemony have everything to do with sustainability. Millions of Americans have seen “An Inconvenient Truth,” the Environmental Protection Agency (EPA) has publicly released myriad studies verifying rapid deterioration of local and global resources as well as the disquieting recent reduction in biodiversity; and “Greenhouse gasses” is a household term. The alarm has sounded, and markedly little has changed. The factories continue polluting, developers
continue clear cutting, and miners continue mining. This is because the decisions that must be made in order to preserve our planet and our species are not up to the people; they are up to the CEOs and/or Boards of Directors of a few massive corporations whose only moral is profit above all else, and they have more influence over the lawmakers than any group of citizens (McChesney, 2004). “History is the long and tragic story of the fact that privileged groups seldom give up their privileges voluntarily” (King, 1963, p. 3).

Freedom is “a state in which somebody is able to act and live as he or she chooses, without being subject to any, or to any undue, restraints and restrictions” (Encarta Dictionary, 2007). Yet these profit machines keep us consuming our future; we shop at Wal-Mart out of economic necessity for low priced goods. Now that the king of part-time minimum-wage jobs (Wal-Mart) is the nation’s largest employer (Ehrenreich, 2001), each time they hire an employee they create another citizen dependent on the rock bottom prices that only unregulated overseas manufacturing can create: a customer. At minimum wage, conventional methods of green living and eating organic are an unobtainable philosophical pipe dream (Ehrenreich, 2005). Research is now indicating that choosing to eat organic can save more than just the planet, “Organic milk, produced without synthetic chemicals, hormones or antibiotics, is the best choice for kids and families, according to Dr. Alan Greene, one of the nation’s leading pediatrician” (Temple, 2006, p. 1). Regrettably the ability of most families to eat healthfully is crippled by low wages and high prices:

A recent study by researchers at the University of California-Davis reported that U.S. shoppers who consistently choose healthy foods spend nearly 20 percent
more on groceries. The study also said the higher price of these healthier choices can consume 35 to 40 percent of a low-income family's grocery budget. That's bad news for public health. (Harrison, 2005, p. 1)

Living restrained by your inability to afford safe and healthy foods for your family is not freedom. The economic subjugation of the populace is a tool of hegemonic powers.

Hegemony is a theory of social control developed by, among others, Italian Marxist philosopher Antonio Gramsci. Gramsci asserted that capitalist systems are not unlike socialist systems, rather like Marx's oft-maligned concept of false consciousness, they offer the illusion of personal freedom thereby allowing the system to maintain discrete control over citizens. This control is exerted via the enforcement of social norms defined by the power elite (see, for example, Bodley, 2003). Using what boils down to a massive public relations campaign, the powers that be appease a nation's citizens by dangling the dream of a perfect "free" life just out of their reach, never permitting such a dream to come to fruition. "Social control, in other words, takes two basic forms: besides influencing behavior and choice externally, through rewards and punishments, it also affects them internally, by molding personal convictions into a replica of prevailing norms," noted Joseph Femia (1987) in his book Gramsci's Political Thought (p. 24). The creation of the illusion of freedom gives the masses little reason to question it, thereby simplifying the task of persuading them of who they should be, and where they will fit into society.

Michele Foucault was a French philosopher, sociologist, and intellectual who popularized many progressive ideas about why civilizations act toward their citizens as they do. Among other things, Foucault's early work focused on the "mentally ill,"
specifically how they are separated from society to be relieved of their “issues” (Fillingham, 1993). Foucault observed that most mental patients were never cured of their ailment, and often no one could identify their malady. Foucault determined that many of the “insane” were only social deviants; a collection of people whose ideas didn’t conform to the rest of society. The community separated the social deviants from the general public to prevent a sort of contamination of ideas.

Utilitarian philosopher Jeremy Bentham recognized the handiness of social self-censorship, inspiring his architectural concept the panopticon; it is a simple prison structure which facilitates the exertion of extreme control over its occupants with minimal effort and involvement by the authority. According to Lydia Fillingham (1993) in her book *Foucault for Beginners*, the panopticon consists of a circular structure that contains many small rooms for occupants that are visible from a large central watch tower which has darkened windows, thereby yielding it impossible for the occupants to know whether they are being watched (p. 126). Aware that they could be being observed at any time, Bentham hypothesized that the occupants would begin to self censor and self control. Welcome to an early version of George Orwell's "Big Brother". According to Bentham, the conceptual representation of the panopticon as a prison of simple self-enforcement could be implemented in "factories, schools, barracks, hospitals and madhouses," according to (Fillingham, 1993, p. 126). According to Parenti (2003), panopticism is already an enforcement tool in most American workplaces, be it in the form of closed-circuit television (CCTV) “security” cameras, mystery shoppers, or point of sale (POS) data surveillance.

It is a chilling prospect that an 18th century philosopher was proposing that in
order for society to function smoothly, it required constant self-censoring and control. It is even more disturbing however, when one realizes that the modern "free" United States is operated in much the same way. Citizens now aware that various three letter agencies can listen to their phone calls, read their emails, and review their internet searches in the name of "security," but for whom? According to Christian Parent (2003), author of *The Soft Cage: Surveillance in America from Slavery to the War on Terror*:

9/11 was only fuel to a fire already raging out of control. The state’s drive to tag, monitor, and criminalize, and the media’s compulsion to summon fear at every turn, are matched or surpassed only by the aggressive proliferation of commercially based identification, registration, and tracking. (p. 3)

The tool of terrorism shaped by a massive public relations campaign and fostered by the Department of Homeland Security has eased the American grip on civil liberties. Welcome to American Hegemony.

Prolific author on the subject of American hegemony, Noam Chomsky (2003), wrote:

Those at the center of power relentlessly pursue their own agendas, understanding that they can exploit the fears and anguish of the moment. They may even institute measures that deepen the abyss and may march resolutely toward it, if that advances the goals of power and privilege. They declare that it is unpatriotic and disruptive to question the workings of authority—but patriotic to institute harsh and regressive policies that benefit the wealthy, and subordinate a frightened population to increased state control. (p. 217)
Chomsky described America as an imperialistic giant that will stop at nothing to gain more power. "The goal of the imperial grand strategy is to prevent any challenge to the 'power, position, and prestige of the United States,'" wrote Chomsky, quoting Dean Acheson (Chomsky, 2003, p. 14). He offers the United States' war in Iraq as an example. When the United States was attempting to rally worldwide support for its new war, there was little enthusiasm for such a conflict. As a result, the U.S. chose to go against the will of the United Nations, veto their resolutions, and attack Iraq nonetheless.

Washington 'made it clear that it intends to do all it can to maintain its preeminence, “then announced that it would ignore” the UN Security Council over Iraq and declared more broadly that “it would no longer be bound by the [UN] Charter's rules governing the use of force” (Chomsky, 2003, p. 13).

Chomsky contends that the United States is actually controlled by the very rich elite of the nation, a clique with goals that are somewhat unclear other than their inherent need for power and prestige. "Controlling the general population has always been a dominant concern of power and privilege, particularly since the first modern democratic revolution in seventeenth-century England...it is necessary to safeguard a system of elite decision-making and public ratification—'polyarchy,' in the terminology of political science—not democracy" (Chomsky, 2003, p. 5). Chomsky's belief is that America's capitalist economy is a hegemonic system, designed to keep the citizens in their place and out of the way producing more consumers who in turn continue to purchase from corporate America, empowering the elite to control and manipulate the world as if it were their personal play-thing. In Walter Adamson's book (1980) *Hegemony and*
Revolution, Gramsci is quoted,

Socialists must not replace order with order. They must bring about order itself.

The Juridical norm that they want to establish is the possibility of the complete realization of one's human personality for every citizen. With the realization of this norm, all established privileges collapse. (p. 19)

We have lost our way as a result of hegemony, and its progeny, globalization. An alarming side effect of globalization is the hefty collateral damage that resource extraction has upon the environment. Vast quantities of resources are required to fuel the first world's ever expanding "need" for new possessions. Jared Diamond (2006) discusses this in his book Collapse: How Societies Choose to Fail or Succeed,

Environmental practices of big businesses are shaped by a fundamental fact that for many of us offends our sense of justice. Depending on the circumstances, a business really may maximize its profits, at least in the short term, by damaging the environment and hurting people (p. 483).

The environment isn't the only victim, humans are just beginning to feel the squeeze of the rapid depletion of our natural resources, notably crude oil reserves. While it is outside of the scope of this paper to delve far into the oil industry as a subject, it is critical to note that oil as a commodity is currently driving the entire western economy. Diamond (2006) writes:

The world's major energy sources, especially for industrial societies, are fossil fuels: oil, natural gas, and coal. While there has been much discussion about how many big oil and gas fields remain to be discovered, and while coal reserves are believed to be large, the prevalent view is that known and likely reserves of
readily accessible oil and natural gas will last for a few more decades (p. 490). Revolution is a tricky business. So long as the whole of American society believes that they are “free” and that life is all about attaining more and more, it is will prove onerous to compel them to demand extreme change simply to be able to breathe in 30 years. Unfortunately, hegemony begets hegemony. No sooner does a revolution of thought take place than a new hegemony is created and new systems of societal control are put in place. However, revolution itself is a necessary part of human existence, and periodic revolution allows humankind to institute positive change. Creating a society that is empowered is a feat that would require much effort on the part of everyone involved. While there is no easy solution to the problem of hegemony and sustainability there is an alternative way of living that holds hope for the future. This alternative is Permaculture.

Permaculture is a holistic approach to everything, particularly food production. Old problems are evaluated from new angles, and no possible solution is dismissed due to its privatives. Permaculture is a vehicle to freedom, and an alternative to hegemony. The concept converges on freeing the individual from their dependence on the hegemonic cycle of subjugation and destruction. Small self-contained communities that can sustain themselves are the name of the Permaculture game. Permaculture erects a new small society which liberates the individual from the shackles of slavery to one’s essential needs, and the subtle prison of Hegemony.

Modern agricultural methods in industrialized nations, while successful in producing food in large volume, have significant flaws that render them unfeasible for sustained use. The vast amount of chemical fertilizers applied in an attempt to combat
soil depletion, the immense amount of land assigned to single crops for ease of harvest, and the typically great distances between farm and market are factors which conspire to result in enormous ecological damage in the wake of our unending quest for “more”. Consequently, alternate models of food production are entering the world stage; one of the most promising models emerging recently is Permaculture.

*Permaculture* was coined by Bill Mollison in 1959, when observing the forests of Tasmania. He explored the concept of this man-made system along with one of his students, David Holmgren, together developing “a set of techniques for holistic landscape designs that are modeled after nature yet include humans” (Hemenway, 2000). Permaculture studies the mechanics of forests and utilizes the “underlying principle which makes them work,” specifically, “a web of beneficial relationships between the different plants and animals, and between them and the rock, soil, water, and climate of their habitat” (Whitefield, 2002).

Permaculture takes into consideration both biological and social science, with a primary focus on the ability of human systems to sustain themselves without damaging the environment surrounding them. Another discussion of the subject states:

It recognizes, first, that all living systems are organized around energy flows. It teaches people to analyze existing energy flows (sun, rain, money, human energy) through such a system (a garden, a household, a business). Then it teaches them to position and interconnect all the elements in the system (whether existing or desired) in beneficial relationship to each other and to those energy flows. When correctly designed such a system will, like a natural ecosystem, become increasingly diverse and self-sustaining. (Wasser, 1994)
This precept of energy flow also applies to the planning of a Permaculture site, which is typically laid out into five (in some systems, six) zones, placed in proximity to a centralized location (like a house) based on the needs for attention; Zone 1 includes those systems requiring the most attention, Zone 2 less so (vegetable gardens, compost bins, beehives, and other relatively independent parts of the plot), and so on, with Zone 5 being wilderness outside of the plot, which is interfered with as little as possible. In this way, the layout of the plot is designed to make it require minimal investment of time for a maximum production.

Permaculture focuses primarily on food production, with other beneficial aspects and tenets of society emerging from the core concepts. The design concepts are taken from nature’s blueprint and the beneficial interaction of life in a given ecosystem, such as a forest; this has led to the term “forest garden” being commonly applied, “the careful design of relationships among them – interconnections – that will create a healthy, sustainable whole. Interconnections are what turn a collection of unrelated parts into a functioning system, whether it’s a community, a family, or an ecosystem” (Hemenway, 2000). A typical permaculture site possesses a wide variety of food plants with varying production times, to ensure as close to a year-long food supply as possible between stored nuts and dried fruit for the winter, with fresh food for most of the rest of the year.

The creation of sustainable behaviors in humans is a major tenet of Permaculture which is summed up by Mollison, “one should only carry out necessitous acts, that non-necessitous behavior tends to be very destructive” (1981). This summarizes the principles of cultural reform enmeshed in permaculture; focusing on energy efficiency and seeking less harmful solutions than those currently used (e.g. petroleum).
significant element of Permaculture considers the desirable qualities that can be achieved by community planning; using the same regard for energy flow found in the zones listed above. This is found in both building design (taking advantage of sunlight for extra heating, minimizing waste water and energy, and otherwise improving the efficiency of a given building) and community layout (designing a town to prevent suburban mentality and reduce or eliminate the need for a commute, as well as to create food production within the city rather than requiring imports). The core concepts of utilizing energy to the fullest and reducing or eliminating dependence upon imports through cooperative relationships between elements of a system are the heart of what makes permaculture a highly sustainable social philosophy.

Sustainability has a number of definitions, the most applicable to Permaculture being “the ability to meet the needs of the present without compromising the needs of the future.” This is what sets Permaculture apart from the typical “anti-growth” image of green activism, as it acknowledges the need for development of new technologies and new suitable areas for habitation; however, the concept of sustainability seeks to focus on technologies that do not carry the heavy costs associated with our dependence on fossil fuels, but focuses centrally on necessities, to pare back the use of luxuries and reduce the consumption of the populace. A sustainable system is one that can support itself without relying on external scarce commodities; scarce, in the economic sense, being anything that is not available in sufficient quantity for all needs for it to be met. In short, the core concept of Permaculture is ensuring that a system does not have dwindling returns; it refuses to compromise the long-term life of a system in exchange for short-term affluence.
There are intricacies associated with Permaculture that proponents of the established agricultural systems will argue. A Permaculture plot would be exceptionally difficult if not impossible to automate with today’s technologies, requiring hands-on attention to grow and harvest; however, this is offset by the vast difference in energy input between the two, as explained by Bill Morrison:

[my friend] told me that the older Chinese agriculture (weeding by hand) produced, under very intensive conditions, using natural manures, about three times as much energy as it consumed. Then they modernized…I think he said that they put 800% more energy in and got a 15% increase in yield. And then as they continued to pour in more energy, the yield decreased. By now they are into the same kick that we have. They only get 4% to 6% of that energy out again (1981).

This is why current forms of agriculture are considered unsustainable. The immense quantity of energy required by a modern farm, which is often supplied by fossil fuels and other limited and dangerous sources, far outweighs that of the mild manual labor required for a Permaculture site in both sheer quantity and in regards to efficiency of output. The math in Morrison’s example is staggering; if prices on some necessity without substitute (standing in for the food being made) were to change from three dollars per unit of some substance to twenty dollars for an equal amount, there would be an incredible protest. And yet because of the exclusion of that energy cost, so that all that is heard is “crop yields are up by 15%,” it is silently accepted as being the best system we have.

Unfortunately, this waste of energy and dependence upon an artificial inflation of
production carries a heavy cost. The soil is depleted of nutrients, the runoff accumulates, and the damage to the environment ramps up with every passing day. As the fields become less productive, more are hacked out of the landscape. In South America and Africa, this is done by burning and clear-cutting jungle and forest, eliminating biodiversity and causing erosion in the tropical climates. Rather than consider that perhaps the method of choice is not the best, farms “stay the course” towards ecological destruction.

A success story from New Mexico is that of Roxanne Swentzell. Under the guidance of permaculture designer Joel Glanzberg, over the course of four years she changed her barren land north of Santa Fe—described by herself as “no trees, no plants, no animals, just pounded-down dirt and lots of ants” (Hemenway, 2000)—to a permaculture garden,

[bringing] immense biodiversity to a once-impoverished place. Here in the high desert was almost too much water and shade. Food was dropping from the trees faster than they could harvest, and birds that no one had seen for years were making a home in the yard. (Hemenway, 2000)

Permaculture is a promising solution to a danger posed to the modern world, that of over-consumption and ecological failure. Depleting oil supplies, nonsustainable agricultural practices, and greenhouse gas-induced climate change threaten human societies, if not human life as a whole, with collapse and possible extinction. The danger may not be within this decade, or even several decades, but the evidence suggests that a solution must be sought, and as traditional wisdom holds, an ounce of prevention is worth a pound of cure. Permaculture has been shown to work, with
Freedom through Sustainability

minimal labor on the part of the garden’s owners; it is an efficient way to produce food as well as a potential means to restore some of the damage wrought upon this planet.

Hegemony has presently locked society into the cycle of environmental destruction, and continues to thwart attempts to create a sustainable future. The only prospect of a sustainable future requires freedom from the hegemonic power. This freedom can be germinated through Permaculture.

*Introduction to permaculture* (1981)

APPENDIX

To address the issue of supplying sustainable organic produce on campus we will be creating our own Permaculture site proposed to be placed between two buildings on campus, Kulshan Hall and Cascade Hall. This site was chosen because of the proximity to the science building, Kulshan Hall. The site also currently has a seasonal pond which could be easily extended and converted to a pond more suitable for the long-term permaculture site we envision. The pond is essential because it will supply water in a sustainable manner by using grey water—water from showers, sinks, and washing machines obtained from the college buildings—as well as natural rainwater collected from buildings across campus. (Hemenway, 2000)

The plants in Zone 1 of the plan will consist of blueberry bushes, blackberry bushes, and raspberry bushes. These were all chosen for their fruit producing qualities as well as their ability to flourish in rainy Northwest Washington. Also in Zone 1 roses will be grown to produce rose hips. (Hemenway, 2000) In the center of the garden, seasonal vegetables would be grown, including, but not limited to, rhubarb, spinach, chard, kale, chives, and wild strawberries, all to be used for food production. (Whitefield, 2002)

The plants in Zone 3 would be fruit and nut trees such as apples, to be the majority of our trees because of their heartiness and the storage life of their fruit. Also grown will be plums and pears, though making up a lesser part of the garden because of the reduced yield and difficulty to develop in extremely rainy weather. Also crab apples, for preserves. (Whitefield, 2002)
Planted throughout the garden on the ground among these plants will be herbs, like fennel and lavender, as well as vegetables, like broccoli and cauliflower, grown to attract insects that feed on pests. (Wetherbee, 2004) The majority of the plants, however, would be in Zone 2 as well as the center of the permaculture site. Legumes would also be used because,

The fixation of nitrogen by some plants is critical to maintaining the health of soil as it converts the inert atmospheric form of nitrogen into compounds usable by plants. Legumes, as used in this study, are an important group of plants as they have the ability to fix nitrogen. (Nature, 2006)

Abstract

I began an exploratory study of spiritual development as it relates to college major. The specific majors that I will be looking at are Social Work, Religious Studies, and various non-declared majors (specific students in English 291 Advanced Writing). The way this study came about was that I decided to teach a course on Spirituality in Social Work. At the time I didn’t think I would get enough students (15) in order for the class to have the necessary enrollment for it to be taught as an experimental course. So I decided to cross-list my social work course with a Religious Studies course (Rel. 304). Much to my great surprise forty-three (43) students signed up for the course and we had to close the enrollment to prevent more students from enrolling.

At this point I decided to split the course into two sections: (1) social work; and (2) religious studies and advanced English. So I ended up with twenty-one (21) students in my social work course and twenty-three (23) students in my combined religious studies/English course. It was at this point that I realized that I could conduct a study in spiritual development, which the course content would cover, and I could examine if there were any differences related to major, in terms of spiritual development. I also plan to use one of my other social work courses (SWK 307 Human Behavior and the Social Environment) as a control group. At this point I have conducted the pretest on all three groups and will conduct the posttest at the end of the semester. I will then be in a position to report my findings at the Hawaii International Conference on Social Sciences. I am also in the process of conducting a review of the literature in conjunction with my co-author.
Uganda and Brazil’s success in combating the HIV/AIDS epidemic indicates that a sustained political commitment to providing basic HIV/AIDS prevention and treatment services is a crucial element in making progress toward reducing transmission rates. Initiatives promoting free universal access to antiretroviral (ARV) therapy, the “abstain, be faithful, and always use condoms” (ABC) method, increased nongovernmental organization (NGO) participation in policy making and implementation, and the scaling-up of pharmaceutical production in the public and private sectors have dramatically reduced infection rates; Uganda has reduced its HIV/AIDS prevalence rate from approximately 18.3% in 1992 to 6.7% today, while Brazil’s 2006 prevalence rate is only 0.5%. Identifying the context within which such political commitments and achievements occur is imperative in targeting and reversing negative trends in China, India and the vast majority of sub-Saharan Africa, and thus in preventing an escalation of the pandemic that already has claimed over 22 million lives.
Factors Influencing Frequency of Visits Between Incarcerated Mothers and their Children*

Factors Influencing Frequency of Visits Between Incarcerated Mothers and their Children

The number of individuals incarcerated in America’s prisons, jails and other facilities has increased dramatically in recent years. Harrison and Beck (2003) reported that the US prison population increased at an average rate of 45,000 incarcerations per year since 1995. By 2005, According to the Bureau of Justice Statistics (BJS), over two million men and women were incarcerated in Federal or State prisons or in local jails.

Increasing numbers of incarcerated individuals have implications for families and children as well as for individual prisoners and society. According to Mumola (2000), an estimated 55-63% of incarcerated individuals are parents of minor children. Similarly, it appears that one in 40 children in the U.S. has a parent in prison (Adalist-Estrin & Mustin, 2003). While exact counts do not exist, the estimated number of children separated from parents by incarceration in America increased from 500,000 in 1991 (Mumola, 2000), to over 1.8 million by 2004 (based on extrapolation from U. S. Census Bureau data, 2004).

Separation of children from incarcerated parents can be seen to have social and psychological as well as physical dimensions. Despite the physical separation of incarceration, it is sometimes still possible for incarcerated parents and their children to maintain a relationship via visits, phone calls, letters and other contacts. Indeed, research (Mumola, 2000) on a national sample of incarcerated parents found that 40% of fathers and 60% of mothers reported contact of some kind (i.e., visits, phone calls, letters) once a week, while somewhat more, 62% of fathers and 78% of mothers, had contact of some kind once a month. Most striking, however, was the finding that the majority, 57% of fathers and 54% of mothers, reported having had NO visits with their children while incarcerated in state prison. Anecdotal reports from parents, educators and childcare workers tend to suggest that incarceration of parents has negative consequences for children, and that harm to children can be reduced by contacts between children and their incarcerated parents. Indeed, research on incarcerated mothers and their children (Hu, Engel, & Yuen, 2006) found that children who have more visits with their incarcerated parents have less reported school difficulties and fewer behavioral/emotional problems.

Little is known about, and thus research is needed, to identify the factors that determine how often an incarcerated parent has contact with his/her child(ren). Such information might have practical implications for prison programs and policies, as well as community and social service programs.

Women who engage in illegal activities that lead to imprisonment have been found to have had numerous and severe negative life experiences that might be interpreted as risk factors for incarceration, experiences such as running away or becoming pregnant as a teen, domestic/family violence, alcohol/drug abuse, and homelessness (Yuen, Hu & Engel, 2005).
The present study is designed to identify and clarify factors that determine the frequency of contacts between incarcerated mothers and their children. We hypothesize that various life experiences, risky behaviors, “risk factors”, substance use/abuse history and treatment, and family and community resources influence the frequency of contacts between incarcerated mothers and their children. Thus, incarcerated mothers who report less contact with their children are expected to report more negative experiences (i.e., “risk factors,” etc.) over their lifetime than mothers who report more contact with their children.

METHOD

To obtain information about the life experiences of incarcerated mothers and their contacts with their children while in prison, 51 women incarcerated in a community residential transition program in the State of Hawaii were interviewed extensively. As a result, qualitative and quantitative data were obtained on a sample of incarcerated mothers, related to life histories and development, needs and well-being, family/community resources, and the frequency and types of contacts with children they had while in prison. For the purposes of this research, contact was operationally defined as in-person visitation between mother and child, as opposed to other kinds of contacts such as mail and/or telephone. Of 51 incarcerated women interviewed, 40 were mothers. Incarcerated mother – child pairs were divided into two groups based on reported frequency of visits with/from a particular child: (1) mothers who were visited infrequently (rarely or never, less than once per month) and (2) mothers who were visited frequently (once per week or more often). Data were analyzed via Chi-square and t-tests to test for differences between groups and identify variables that might influence later frequency of contacts with children when mother is incarcerated.

RESULTS

Demographic Characteristics

Of the 40 mothers in the study, thirty were found to have infrequent (rarely or never, less than once per month) visits, while 10 were found to have frequent (once per week or more often) visits.

Thirty-three percent of infrequent visit mothers reported being born out-of-state, compared with 50 percent of frequent visit mothers. Twenty-three percent of infrequent visit mothers reported having less education than a high school degree, compared with 30 percent of frequent visit mothers. Fifty-three percent of infrequent visit mothers reported never having married, compared with 40 percent of frequent visit mothers. (See Table 1).

Incarcerated Mothers and Risky Behaviors

An incarcerated mother’s history of “risky behaviors” may relate or be predictive of later frequency of contact with children when incarcerated. As hypothesized, higher percentages of infrequent-visitation mothers compared with frequent-visitation mothers reported having run away from home (77% vs 60%), dropping out of school (53% vs 40%), using drugs (100% vs 90%), and experiencing teen pregnancy (80% vs 70%). Contrary to the hypothesis, a higher percentage (100%) of frequent-visitation mothers reported using alcohol than (93%) infrequent-visitation mothers. While differences were not found to be significant at the p < .05 level, such findings could be interpreted to support the conclusion that an incarcerated mother’s history of risky behaviors may affect her later frequency of contact with her child. (See Table 2).

Risk Factors of Incarcerated Mothers

Various factors (“risk factors”) often associated in the literature with incarceration, such as experiencing home/family violence, sexual abuse, homelessness, or foster care, may relate to or in some way be precursors of frequency of visitation for incarcerated mothers and their children. Consistent with our hypothesis, higher proportions of infrequent-visitation mothers, compared with frequent-visitation mothers, reported experiencing home violence (50% vs 40%), domestic violence (83% vs 80%), sexual abuse (53% vs 23%), and homelessness (43% vs 30%). In contrast, a higher proportion (30%) of frequent-visitation mothers experienced living in a foster home than did (10%) of infrequent-visitation mothers. While differences were not found to be significant at the p < .05 level, such findings could be interpreted to support the conclusion that an incarcerated mother’s history of risk factors may affect her later frequency of contact with her child. (See Table 3).

Substance Use/Abuse History and Treatment of Incarcerated Mothers

Results describing incarcerated mothers’ substance abuse history and treatment are presented in Table 4. Compared with frequent-visitation mothers, higher proportions of infrequent-visitation mothers reported that their parents’ use of alcohol affected their life, that their own use of alcohol affected their life, that their own use of drugs affected their life, and that they participated in various alcohol and drug treatment, counseling, education and related programs. In eight cases, differences were found to be significant at the p < .05 level. Such findings add support to the conclusion that substance use/abuse has an impact on subsequent frequency of visitation with children.

Family and Community Resources of Incarcerated Mothers

Table 5 reports the results of comparing infrequent-visitation mothers with frequent-visitation mothers on various family and community resource variables. Approximately the same proportion (97% vs 100%) of both groups reported having their mother as a primary caregiver when they were children. However, only 67% of infrequent-visitation mothers reported that their father was a primary caregiver when they were a child, compared to 80% of frequent-visitation mothers. It may be that incarceration “runs in families” and that incarceration of a parent, sibling, or spouse/significant other may be a risk factor for incarceration, and secondarily a factor influencing frequency of visitation during incarceration. In each case, a higher proportion of infrequent-visitation mothers, compared to frequent-visitation mothers, reported having had their own father incarcerated (13% vs 0%), having a sibling incarcerated (37% vs 10%), and having a spouse or significant other incarcerated (37% vs 10%). It also appears that a higher proportion of infrequent-visitation mothers, compared with frequent-visitation mothers, get mental health treatment in the community, i.e., get counseling or therapy (67% vs 40%), medication (33% vs 20%), or are treated in a mental hospital (20% vs 0%). Although differences were not found to be significant at the p < .05 level, the data suggest that family background and community resources may also have an impact on subsequent frequency of visitation with children.

DISCUSSION AND CONCLUSION

Interpretations and generalizations from this study should take into account several limitations in data and analysis. In this study, incarcerated mothers and their children were sampled in mother-child pairs, to control for child related visitation variability. This resulted in a total sample of 40 mother-child pairs, reflecting 40 different children. Because 12 of the mothers reported on visitation with two children, on some variables they could be double-counted. Further analysis and/or additional research is needed to insure that this has not biased the data and/or conclusions. Similarly, this study could be considered to suffer from small sample sizes. While the direction of differences in percentages of the two groups can be interpreted to support the hypothesis that various life experiences, risky behaviors, substance use/abuse history and treatment, and family and community resources influence the frequency of visitation between incarcerated mother and her child, the degree of differences between groups may not be significant, statistically or practically. Additional research with larger sample sizes might avoid this problem.

In conclusion, risky behaviors such as running away from home, dropping out of school, using drugs and teen pregnancy, risk factors such as experiencing home violence, domestic violence, sexual abuse, and living in a foster home, substance use/abuse history and treatment, and various family and community resource variables appear to influence the frequency of visits between incarcerated mothers and their children.

REFERENCES

Imagine it’s the first day of school. You’re a sixth grade student. You walk into a new classroom in a new school, meeting the teacher, greeting old friends, and getting into a new routine, perhaps very different from what you did during summer break. As students settle into their seats, the teacher writes a question on the board and asks you to write in your journal, “How did you spend your summer vacation?”

Many Americans have an idyllic image of summer as a carefree, happy time when “kids can be kids” and enjoy such experiences as summer camp; time with family; vacations; and trips to museums, parks, and libraries. While this picture holds true for wealthier kids, summer break looks very different for poorer children. Wealthier children and youth typically access a wide variety of resources that help them grow both academically and developmentally over the summer, but poorer children often struggle to access basic needs such as healthy meals and medical care. Summer is thus a time when the rich get richer, and the poor get poorer.

Some of this difference is due to public policy. Although policies guarantee that all children and youth have access to public education and school-based resources from September to June, guaranteed access to summer resources is rare. This paper analyzes the current landscape of public policies that directly or indirectly support summer
learning opportunities for young people in kindergarten through twelfth grade. Based on this review, we draw several conclusions.

First, policies supporting summer learning opportunities are scarce. Despite a clear need for summer programs, particularly for disadvantaged children and youth, surprisingly few policies target summer specifically as a time to advance learning, support healthy development, and keep kids safe while the school doors are closed.

Second, current policies tend to conceive of summer programs narrowly as falling into one of six domains, from education or child care to delinquency prevention. Policies do not necessarily encourage coordination or collaboration among programs across these domains, and they do not match programmatic realities. Many summer programs have broad goals that do not neatly fit into any one of the six policy domains. A summer program provider that wants to sustain itself must be savvy enough to navigate across the policy domains and combine funding streams to support its activities.

Third, private philanthropy plays a larger role in summer programming than in afterschool programming. For nearly every policy area we examined, public funds are more likely to support afterschool than summer programming. One solution many local communities have devised to help programs navigate the policy and funding arena is to create an intermediary organization. Such organizations help drive the policy agenda, streamline funding opportunities, facilitate networking among providers, and provide training and technical assistance. Public policy that effectively supports the growing field of summer programming has yet to be developed.

Finally, while this paper examines only public policies supporting summer learning opportunities, it appears, on the surface, that families are paying for the majority of summer experiences available to children and youth. Our review suggests that middle- and upper-income youth participate more in enrichment opportunities and camps paid for by family contributions, while lower-income youth tend to participate in summer school or summer programming that is focused on academic remediation rather than on enrichment.

In order for summer program providers to meet the full scope of youth and family needs, we argue for:

- A more coordinated approach to public funding and policy development and implementation at the local, state, and national levels
- Explicit language drawing attention to summer as a critical time for young people’s learning and development
- Greater emphasis on programming for disadvantaged children that mirrors the types of experiences available to middle- and upper-income youth

The findings of our review offer insight into new policy directions that would result in sustainable and equitable expansion of summer learning opportunities for all young people.

The Summer Learning Gap

Why should we care about what kids do during summer break? Since 1906, numerous studies have analyzed the impact of summer break on student learning. A meta-analysis of 29 such studies found that all students, regardless of income level or race, generally score lower on standardized math tests at the end of the summer than they do on the same
tests at the beginning of the summer (Cooper, Nye, Charlton, Lindsay, & Greathouse, 1996). Students generally suffer the greatest losses in factual and procedural knowledge, including an average setback of more than two months of grade-level equivalency in computation skills (Cooper, et al., 1996).

Summer learning loss in reading, however, is more acute among low-income students. While middle- and upper- income children tend to stagnate or make slight advances in reading performance during the summer, low-income children experience an average loss in reading achievement of over two months (Cooper, et all, 1996). The differences in summer learning losses are often rooted in family and community influences and access to resources. Summer learning losses in reading are a main cause of the widening achievement gap in reading between lower- and higher-income youth; in fact, recent research shows that summer learning differences at an early age substantially account for achievement-related differences later in students’ lives, such as whether they complete high school and attend a four-year college (Entwisle, Alexander, & Olson, 1997; Heyns, 1978; Alexander, Entwisle, & Olson, 2006).

In addition to these academic setbacks, many young people face a broader set of risks due to lack of adequate adult supervision during the summer. Young people who are unsupervised during out-of-school time are more likely than those who benefit from constructive activities supervised by responsible adults to use alcohol, drugs, or tobacco; to engage in criminal or other high-risk behaviors; to receive poor grades; and to drop out of school (Carnegie Council on Adolescent Development, 1994; Newman, Fox, Flynn, & Christeson, 2000). Researchers examining childhood obesity among kindergarten and first-grade children found that growth in body mass index is faster during summer vacation than during the school year, especially among children who are African-American, Hispanic, and already overweight (von Hippel, Powell, Downey, & Rowland, 2006). This finding suggests that summer experiences that provide children with nutritional meals and opportunities for physical activity could help reduce unhealthy weight gain.

Another concern is access to quality programs and childcare. In a public opinion survey conducted by Public Agenda, parents, particularly low-income parents, consistently cite summer as the most difficult time to find quality programming and care for their children. Fifty-eight percent of parents say summer is the hardest time to make sure their child has things to do, followed by 14 percent for afterschool hours and 13 percent for the weekend (Duffett, Ellenbogen & Falk, 2004).

**How Summer Programs Help**

The positive impact of summer learning programs is as well documented as the need for such programs. A meta-analysis of 93 summer school program evaluations provided convincing evidence that summer programs have a positive impact on the knowledge and skills of participants (Cooper, Valentine, Charlton, & Nelson, 2003). Studies have also shown that the most beneficial programs are comprehensive ones that holistically address children’s needs (Halpern, 2005). Such programs not only boost student achievement but also positively affect student behaviors, self-esteem, and confidence. Some afterschool research found that programs that promote increased self-esteem and confidence for students had positive effects on standardized test scores in math and reading, while those focusing primarily on homework completion did not result in increased academic
achievement. Evaluations have also shown that well-designed summer programs keep children safe and healthy, increase connections to the workforce and community service, and develop and nurture new skills and talents.

When examining academic achievement over the summer in particular, two randomized studies of summer programs are worth mentioning. A 2006 study by the Urban Institute and Mathematica found that elementary students attending the BELL (Building Educated Leaders for Life) summer learning program showed improved reading performance and increased interest in reading. Participating students improved their reading skills by approximately one month of grade equivalency; they also took part in more academic activities, read more books, and were more encouraged by their parents to read (Chaplin & Capizzano, 2006). Similarly, findings from a randomized three-year longitudinal study of the Teach Baltimore Summer Academy Program suggested that students returned to school having gained close to one-half year in reading comprehension and vocabulary after at least two summers of regular attendance (Borman & Dowling, 2006).

**Time to Address Summer Program Policies**

If the need for and impact of high-quality summer learning opportunities is so unequivocal, we would expect public policy to address summer programming in a fairly comprehensive way. What are the strengths and limitations of current local, state, and national policies that respond to the research on summer learning loss and the significant needs of children and families during the summer?

In the past decade, there has been tremendous growth in federal support for out-of-school-time programming. In fiscal year 2006, Congress appropriated over $981 million for the 21st Century Community Learning Centers program, up from $453 million in 2001 (U.S. Department of Education, 2006). The No Child Left Behind Act of 2001 also includes a major emphasis on closing the achievement gap through in-school and out-of-school interventions.

There is also evidence that the field of summer programming is growing. Estimates suggest that the number of public schools offering summer programs has doubled over the past 25 years (Borman, 2001). The total number of children attending public schools during the summer is estimated to be 5 million, or close to 10 percent of public school children (Gold, 2002). Evidence about participation of children in summer programs run by other public agencies such as recreation departments is difficult to find, as are statistics about the growth of nonprofit and for-profit summer programs. However, the American Camp Association estimates that the number of day camps has increased by 90 percent over the last twenty years and that more than 11 million children currently attend day and resident camps each summer (Sundius, 2006).

**Framework for Analysis**

Our analysis focused primarily on federal policies that are used to support summer programming for children and youth from kindergarten through twelfth grades. In some cases, as information was available, we went deeper into investigating how federal policies were communicated and implemented at the state and local levels.

We defined a *summer program* as any academic, enrichment, early childhood, recreational, youth development, or workforce development program operated during the
summer by schools, camps, community- and faith-based programs, and government agencies. This definition guided our policy search by providing parameters. For example, what types of policies provide young people with workforce development experiences, or with enrichment experiences?

We defined public policy as the laws, regulatory measures, courses of action, and funding priorities concerning out-of-school time in general and summer opportunities in particular (Kilpatrick, 2000). We examined the research literature, actual pieces of legislation, and testimonials provided by programs to better understand the purposes of each policy and how each policy was implemented in practice. In all, we examined over 80 sources and analyzed nearly 40 policies. We also reviewed nearly 50 summer learning program models and interviewed staff from four organizations that received Excellence in Summer Learning Awards in 2006 from our organization, the Center for Summer Learning at Johns Hopkins University. While we certainly did not examine every policy that could be used to support a summer program, we selected policies based on the following criteria:

- Is the policy or funding source cited frequently in the literature or in interviews with program providers as a major source of funding for summer programming?
- Are the words summer, summer learning loss, or summer program explicitly used in the legislation?
- Does the policy support a major emphasis of summer programming, such as enrichment, academic achievement, childcare, or crime prevention?

If the policy met one of these three criteria, we included it in this analysis.

At the beginning of the study, we anticipated encountering difficulties in identifying federal policies that focused on summer programming or summer learning loss in particular. With a few notable exceptions, our hypothesis was correct. We found few examples of public policies that explicitly supported summer programs, and fewer yet that recognized summer learning loss or the summer resources gap. In some cases, summer learning loss was mentioned in relationship to some other issue, such as the need for extended time for learning. Surprisingly few of the education policies we examined actually addressed key findings of the research literature on summer learning loss. We also found little emphasis on the need to provide learning opportunities in the summer-related policies, with the exception of those that were specifically focused on education.

**Surveying the Summer Policy Landscape**

Based on our review, we grouped the policies we examined into six general categories or domains according to their primary purpose:

- Education
- Childcare and development
- Health and nutrition
- Employment development and service learning
- Delinquency prevention
- Informal and cultural learning

We chose these categories because they seemed to represent the full spectrum of types of programs available to youth over the summer. The policies typically fit very easily into one category without crossing purposes with another. Even though many summer
program providers address several or all of the six categories, our review revealed a lack of coordination and comprehensiveness in the design and implementation of policies supporting summer programs. The following sections provide details of the results of our analysis of the six domains. Each section ends with our recommendations of ways that domain’s policies could be revised to better meet the needs of the children most in need—though finally our conclusion is that the very existence of these rigid categories is part of the problem with current policies affecting summer programming.

**Education**

Summer program providers tend to conceive of education broadly as any activity that supports and advances young people’s learning and development. In contrast, public policies often narrowly define *education* as advancement in reading and math. Notably, all of the education policies we examined targeted low-income or low-performing students. Few seem to approximate the types of experiences available to middle- and upper-income youth during the summer. In some cases, the only option available to low-income youth is remedial summer school—whether or not the children require remediation.

In this section, we examine the following policies:

- The No Child Left Behind Act (NCLB), with a particular emphasis on the 21st Century Community Learning Centers Program and the Supplemental Educational Services Provision
- State and local policies on summer school
- State and local efforts to modify school calendar
- The proposed STEP UP Act, one of the few policies we found whose primary purpose is to stem summer learning loss in order to help close the achievement gap.

The NCLB policies discussed in the section were the most frequently cited policies in our literature review; they were generally the first public policies mentioned when we asked programs how they were funded.

**No Child Left Behind**

The No Child Left Behind Act (NCLB) has two provisions that specifically support out-of-school-time interventions: the 21st Century Community Learning Centers program and the Supplemental Educational Services provision. Minor enhancements to both of these provisions could dramatically catalyze growth in summer learning programs that would mirror the growth in afterschool programming in the past decade. Additionally, many state and local education agencies use NCLB resources to support summer school or extended-year programs.

**21st Century Community Learning Centers.** A rare exception to the compartmentalized nature of most funding streams that support summer programs, the 21st Century Community Learning Centers program (21st CCLC) is designed to support a wide array of youth development and academic enrichment activities for low-income youth in low-performing schools. Both afterschool and summer programs are eligible for funding through 21st CCLC. Enrichment activities during non-school hours must be designed to complement a child’s regular academic programs (White House Office of
Management & Budget, 2006). For fiscal year 2007, the program was authorized to receive $2.5 billion, but only $981 million was actually appropriated by Congress (Afterschool Alliance, 2006). Approximately two-thirds of the grantees operate programs during the summer; somewhere between 40 and 65 percent of Title I schools report that they use 21st CCLC to support all or a portion of their summer programming. (as cited in Winship, Hollister, Horwich, Sharkey, & Wimer, 2005)

Although two-thirds is a relatively high percentage of grantees operating summer programs, interviews with grantees and state administrators suggest that summer programs are the first to be eliminated when programs are forced to make substantial cuts, which typically coincides with the end of the 3–5 year funding cycle (Szekely & Padgette, 2006). As funding “sunsets,” programs are forced to decide between maintaining services during the school year or continuing summer programming.

**Supplemental Educational Services Program.** The Supplemental Educational Services program (SES), a more recently developed federal policy, can be used to support tutoring for struggling students during non-school hours. Under NCLB, a Title I elementary or secondary school that has not made “adequate yearly progress” for three years is required to provide supplemental educational services to help eligible students increase their academic achievement, especially in reading, language arts, and mathematics. Opportunities must be provided in out-of-school settings, including before or after the regular school day, on weekends, or during the summer. Low-income students who are determined by the local education agency to require Title I support are eligible; within this group, the lowest-achieving students have priority. Parents can choose a supplemental service opportunity for their child from a list of providers approved by the state education agency.

Though SES appropriately targets the neediest children and youth, several features limit its effectiveness in addressing summer learning. Most importantly, the non-regulatory guidance for SES clearly states that the intent of the program is to provide tutoring services during the school year rather than the summer (U.S. Department of Education, 2005). In addition, parents must choose a provider in the fall of each school year, making it unlikely that they would reserve the voucher for summer tutoring. Third, a typical SES voucher ranges from approximately $800 to $1,400 per year, which is not sufficient to provide both afterschool and summer support (Sunderman & Kim, 2004).

A report by Public/Private Ventures reveals additional challenges in the implementation of SES. Large numbers of eligible students are not being served, often because parents are not getting timely or adequate information about SES and thus have limited opportunity to make informed decisions about the program or providers (Public/Private Ventures, 2005). The U.S. Department of Education estimates that in the 2003–04 school year, only 18 percent of eligible students received the free services. Though locally operated afterschool and summer programs could serve as known and trusted institutions for service delivery, they face hurdles that have prevented many from becoming providers. Administrative requirements, difficult recruiting environments, and the financial reimbursement mechanism SES employs keep such smaller organizations scarce among SES providers (Public/Private Ventures, 2005).

Our interviews with qualified SES providers reveal that few programs currently use SES funds to support their summer programs. However, several providers expressed
interest in using SES dollars more flexibly to promote comprehensive year-round programming. A variety of reforms listed under Recommendations below would help more providers use SES funding, though the cumbersome reimbursement mechanism could remain an obstacle.

**State and Local Summer School Policies**

Although 21st CCLC and SES stand out as the most prominent NCLB funding sources for out-of-school-time programs, many state and local agencies tap other NCLB resources and Title I funds to support summer school programs. To date, summer education policies at the local and state levels have concentrated nearly exclusively on providing remedial summer school for students who fail to meet promotion requirements (Zinth, 2006). Many elected officials and education policymakers view summer as a logical and convenient time for remediation only. A 2006 survey by the Education Commission of the States revealed the following findings:

- Thirty-five states and the District of Columbia have *summer remediation policies* in either statute or administrative code; 18 states have multiple remediation policies, which are frequently targeted at different age groups or subject areas.
- Twelve states operate summer remediation programs designed exclusively to ensure their students are *reading* at proficient levels. These policies are typically found at the elementary level and are especially common for students between kindergarten and third grade.
- Thirteen states explicitly include both *mathematics and science* as subjects in their remediation policies. An additional seven states and the District of Columbia include mathematics but not science.
- Ten states have policies that *target specific districts, schools, or students in specific schools* for remediation. These districts or schools are identified for various reasons: not making adequate yearly progress under NCLB, the size of the district’s population, or measures of poverty in the population.
- Nine states operate summer remediation programs explicitly designed to *help high school students meet graduation requirements*. In addition, two states have policies relating to remediation of future or current high school graduates who intend to attend or are currently enrolled in a college or university. (Zinth, 2006)

Summer school is widely viewed as an alternative to social promotion or in-grade retention. Nearly all of the 100 largest school systems in the country offered remedial summer instruction for failing students (Borman, 2001). Some districts also offer summer enrichment courses, but these programs are smaller and typically fee-based, so that participation can be limited. While some evidence suggests that summer remediation leads to short-term achievement gains, research shows a number of shortcomings in such an approach, including:

- **Limited opportunities for enrichment.** Remedial programs do not typically provide opportunities for enrichment, despite evidence that the gap in reading achievement between low-income and middle- or upper-income students is primarily due to the fact that more affluent children have access to enrichment opportunities during the summer (Allington & McGill-Franzen, 2003; Rothstein, 2004).
• **Limited “dosage” and duration.** Policies typically limit summer remedial programs to three or four hours a day for up to four weeks. The research literature suggests that most high-quality summer programs run for six hours or more for six to eight weeks, combining academic instruction with enrichment opportunities (Borman & Dowling, 2006; Chaplin & Capizzano, 2006).

• **Inability to meet the needs of children and families.** Despite the fact that parents consistently cite summer as the most difficult time to find adequate activities for their children, many families are unable to take advantage of summer school programs because limited hours of operation don’t meet their need for full-day childcare.

One example of a local summer policy initiative that seeks to foster more comprehensive programming in conjunction with its formal summer school policy is Chicago’s Keep Kids Learning effort. Developed as a partnership between the mayor’s office and the Chicago Public Schools, the pilot initiative involved 11 schools in the Englewood community in 2006. The initiative extended Chicago’s three-hour mandatory summer school program to address both academics and enrichment for six weeks, six hours a day. The program included students in mandatory summer school who wanted an extra three hours of enrichment, as well as students who weren’t required to attend any summer school at all but wanted to participate. Preliminary data from the pilot suggests positive benefits for students, teachers, and parents (Carran, Brady & Bell, 2006). Keep Kids Learning, along with other citywide models such as those operated by LA’s BEST in Los Angeles and TASC (The After-School Corporation) in New York City, offer insights into how local and state policy makers can connect formal summer school initiatives to more comprehensive models of summer programming.

### School Calendar Modifications

An alternative to summer school involves modifying the school calendar. In recent years, many local school districts have pursued year-round schooling as an effort to redistribute the standard 180 days of school into various calendar formats. Such efforts often result in shorter, more frequent breaks from school rather than a prolonged summer vacation. One reason for calendar modification is economic: More students can use existing school buildings. Another is an increasing desire on the part of educators to provide more instructional time prior to standardized tests, which are typically administered in February or March. Many states and school districts have sought to begin the school year in late July or early August, a process sometimes referred to as “calendar creep.”

Calendar modification faces serious opposition from the tourism industry and some parent groups. In general, parent groups cite valuable family time and a needed break from school as their primary reasons for opposition. Parent groups are currently comprised mainly of families who are fortunate enough to take advantage of summer as an ideal time for such enrichment opportunities as family vacations; summer camps; and trips to museums, parks, and libraries. Opposition efforts have been successful enough to inspire several states to enact or consider laws prohibiting schools from beginning prior to Labor Day.

However, the most critical flaw in many calendar-modification policies is that they do not result in more time spent learning. Research on the benefits of vacation redistribution suggests that such a strategy may have far less potential impact on student
achievement and development than actually expanding the number of days and hours that students are involved in constructive learning activities (Cooper et al., 2003).

The Proposed STEP UP Act

Despite the growth in summer school at the state and local levels, there are no current federal policies that focus exclusively on summer as a time to improve children’s academic or developmental outcomes. In response, Senators Barack Obama (D-Illinois) and Barbara Mikulski (D-Maryland) proposed the Summer Term Education Programs for Upward Performance (STEP UP) Act in 2006. STEP UP would provide grants for “summer opportunity scholarships” to local educational agencies, for-profit educational providers, nonprofit organizations, or summer enrichment camps. The scholarships, available for students in grades K–3, would entitle each student to the equivalent of 30 full days of instruction.

The criteria in the proposed legislation would mandate that summer opportunity programs:

- Employ research-based educational programs, curricula, and practices
- Provide a curriculum that emphasizes reading and mathematics
- Be aligned with the standards and goals of the school year curriculum
- Measure student progress in the skills taught, disaggregating the results of student assessments by race and ethnicity, economic status, English proficiency, and disability category

The proposed legislation addresses several of the shortcomings of traditional remedial summer school policies by providing programs of longer duration that can be administered by a greater variety of providers. However, the implementation would need to be carefully structured so that the targeted young people would receive services that mirror the enrichment experiences available to middle- and upper-class youth.

Recommendations

Our analysis revealed many opportunities to build on existing summer-related education policies to more fully support high-quality summer learning programs for children and youth. At the state and local levels, policymakers should develop more proactive and collaborative approaches to summer school policies that focus on enrichment in addition to remediation. Policymakers should consider how best to leverage smaller investments in remedial services and create incentives for delivering comprehensive, full-day programs.

On the federal side, full funding at the authorized level for the 21st Century Community Learning Centers and structural changes to the Supplemental Educational Services provision of No Child Left Behind should be priorities for policymakers who seek to facilitate sustainable and equitable expansion of summer learning opportunities. Fully funding 21st CCLC, as well as including incentives to encourage providers to pursue year-round programming, would allow communities to build comprehensive, multi-year efforts. Year-round service delivery would also enhance the effectiveness of SES in building and sustaining comprehensive summer learning programs that include math and literacy learning. SES language could be changed to refer to summer as a preferred time for service delivery. SES should also require state and local education agencies to notify parents of SES opportunities at least twice a year, with the second
notification happening as the end of the school year approaches. In addition, making the reimbursement mechanism more flexible would allow smaller community-based providers to access SES funding.

**Child Care and Development**

Many families in high-poverty communities face an urgent need for childcare during the summer. Mezey, Greenberg, and Schumacher (2002) estimate that 15 million U.S. families are eligible for state childcare assistance, yet only 14 percent actually receive it. More than one in ten children regularly spend time in self-care, either alone or with a sibling younger than 13, during the summer months (Capizzano, Adelman, & Stagner, 2002). While this percentage is consistent with self-care during the school year, the number of hours per week increases from 4.8 during the school year to more than 10 hours during the summer.

The quality and type of childcare also varies widely based on parent income. Higher-income families more frequently enroll their children in organized activities, such as camps; they also pay far more for summer care than they do for care during the school year (Capizzano, Adelman, & Stagner, 2002). Lower-income families, by contrast, devote a larger percentage of their income to childcare generally (Matthews & Ewen, 2006) but pay less for summer care than they do for care during the school year. Since higher-income and lower-income families are equally likely to pay for care over the summer, these findings suggest that economically disadvantaged children receive lower-quality summer childcare and engage in fewer enrichment activities (Capizzano, Adelman, & Stagner, 2002).

The two primary federal policies that address the need for childcare for low-income families during the summer are Temporary Assistance for Needy Families (TANF) and the Child Care and Development Fund (CCDF).

**Temporary Assistance to Needy Families**

TANF, which was funded at $17.278 billion in fiscal year 2005, has four primary purposes, one of which is to end the dependence of needy parents by promoting job preparation, work, and marriage. (White House Office of Management and Budget [OMB], 2006b). Since preparing for or holding down a job can leave children home alone, states often use TANF funds to provide subsidies to parents for out-of-school-time care for their children. States can also choose to transfer up to 30 percent of their TANF funds into the Child Care and Development fund to increase the overall amount of funding directed toward childcare (White House OMB, 2006a).

**Child Care and Development Fund**

CCDF is the largest federal childcare subsidy program, funded at $4.8 billion in fiscal year 2005. Eligible recipients of CCDF subsidies are children under the age of 13 residing with a family whose income does not exceed 85 percent of the state’s median income and whose parents work or attend a job training or educational program. One goal of the subsidies is to expand parental access to a range of childcare options, including arrangements that promote development and learning (Finance Project, 2001). The policy does not make specific recommendations, however, about the structure of learning and developmental activities in the childcare setting.
Approximately 1.78 million children per month received CCDF childcare services in 2005. This number has remained relatively consistent since 2000 (Center for Law and Social Policy, 2006). State agencies often use a portion of CCDF funds to operate summer programs in cooperation with local departments of social services. County and city social service departments often contract with community-based organizations that run camp programs, such as YM/YWCAs and Boys and Girls Clubs, to provide summer care. Contracts are awarded to providers in low-income neighborhoods that otherwise lack summer program options, typically providing enough funding to subsidize the cost of participation. These summer programs are open to all children, not just those who qualify for subsidies. By awarding contracts in this fashion, states are able to increase the supply and quality of care while extending the benefits of CCDF to a wide range of children and families.

**Recommendations**

Although neither TANF nor CCDF are specifically designed to advance young people’s learning and development during the summer, these policies do provide critical resources for summer programming. Our interviews with summer program providers suggested that only a few were able to use childcare subsidies to enhance their programming. A primary reason is that providers must be licensed to access subsidized childcare program dollars. Many summer day camp providers are exempt from licensing requirements because they operate as recreational programs for fewer than four consecutive months. Though some public and private agencies, such as 4-H, YMCAs, and Boys and Girls Clubs, become licensed in order to receive subsidies, many enrichment camps that cater to upper-income families are not licensed and are therefore inaccessible to lower-income kids.

Several strategies could improve the quality of investments in summer care. The Center for Law and Social Policy recommends that policies prioritize full-year care and early learning opportunities for disadvantaged children. Integrating childcare and pre-kindergarten programs has the potential to provide opportunities in the face of cuts to state childcare programs. While state policies do encourage programs to offer full-day, full-year opportunities, they do not require, coordinate, or fund such activities (Schumacher, Ewen, Hart, & Lombardi, 2005). Most state programs are part-day, part-year programs intended to benefit a limited number of four-year-olds based on family income.

Policymakers should consider strategies to generate greater awareness among summer program providers about the uses of CCDF and TANF. Incentives for summer day camps to become licensed and widen their recruitment efforts to include children from disadvantaged and diverse backgrounds should be included in the legislation. Policies should explicitly discuss the need for continued learning and enrichment over the summer months; they should prioritize funding for organizations that collaborate effectively to increase the opportunities available to children and youth. For example, a partnership among the public school, community-based organizations, and the public library could result in a well-rounded experience that incorporates a wide variety of learning experiences, while maximizing and combining funding streams, such as those that fund library summer reading programs.
Health and Nutrition

The third category of summer-related policies we considered relates to the health and well-being of young people, specifically with regard to food and nutrition. In the face of alarming statistics about the rise of childhood obesity across the country, summer programs should provide children with good nutrition and physical activity. Numerous studies show that good nutrition is a vital component of a child’s education: It stimulates a student’s learning, improves school attendance and behavior, and contributes to cognitive development (cited in Finance Project, 2000). Good food is also a meaningful incentive for children and youth to attend out-of-school time programs.

We focus specifically on nutrition in this section to the exclusion of physical fitness programs simply because we found no large funding stream specifically dedicated to sports and recreation during the summer. Even local parks and recreation departments, according to our research, use most of their summer funding for upkeep of facilities, providing only limited programming in the form of sports leagues that function only a few hours a week. More comprehensive programs usually result from partnerships with local community-based organizations. Several of the policies we discuss elsewhere in this paper, including 21st Century Community Learning Centers (under Education) and Byrne Grants (under Delinquency Prevention), have physical fitness or recreation as an “allowable use” of funds in summer programs. Such programs, however, were not frequently cited in the literature as a major source of summer funding and are not explicitly dedicated to summer programming. In contrast, the nutrition policies we explore below are focused on summer and are frequently discussed as a source of guaranteed funding for summer programs that choose to enroll. All of the providers we interviewed accessed summer nutrition programs relatively easily.

The nutrition policies we explore below are all administered by the United States Department of Agriculture (USDA). The unique feature of the USDA policies is that they were created to address the gap in nutritional resources that students experience when school is out—a rare example of a policy that targets summer specifically as a time when young people experience a loss in access to needed services.

School Lunch and Summer Food Programs

The National School Lunch Program (NSLP) and the Summer Food Service Program (SFSP) provide funding for state agencies to reimburse providers for meals and snacks served to children during the summer. Eligible providers include public and private schools, nonprofit school authorities, residential childcare institutions, local governments, national youth sports programs, and private nonprofit organizations. For children with family incomes below 130 percent of the federal poverty line, meals are free. Children whose family income is between 130 and 185 percent of the poverty line receive meals at a substantially reduced price. These are entitlement programs, meaning that all eligible children are entitled to receive meals. An advantage of entitlement programs is that providers do not have to compete for funding, since the amount of funding available to them is not capped.

SFSP is the single largest source of funds for local providers that want to serve meals as a part of their summer program. The program is designed to ensure that low-income children and youth remain healthy, engaged, and mentally and physically fit during the summer months. In order to be considered as an SFSP site, programs must either serve a student population of whom at least 50 percent are eligible for free or
reduced-price meals or operate in a geographic area where at least half of the children are eligible (Food Research and Action Center [FRAC], 2006).

Unfortunately, the abundance of reporting and paperwork required by both the SFSP and the NSLP has deterred many summer programs from applying. Only 18 of every 100 children who participate in the free and reduced-price meals program during the school year receive meals over the summer. Participation rates in these programs have been on a steady decline for the past seven years. If states could increase participation so that just two-fifths of eligible children received meals over the summer, an additional $188.8 millions dollars would be directed to states for summer nutrition (FRAC, 2006).

**Newer Options for Summer Nutrition**

USDA has adopted two policy changes that have made progress in addressing the underutilization of its summer nutrition funding. One solution has been to offer a Seamless Summer Food Option, under which schools offer summer meals as a continuation of NSLP without having to fill out additional paperwork.

A second policy change has been the implementation and growth of the Simplified Summer Food Program (SSFP), formerly known as the “Lugar Pilot.” Congress created this pilot program to reduce paperwork and maximize reimbursement. The SSFP eliminates time-consuming accounting procedures and allows sites to earn the maximum reimbursement as a standard for all meals. As a result, sponsors complete less paperwork and gain potentially higher reimbursements (FRAC, 2006). Since the program’s inception in 2001, the thirteen original “Lugar states” increased summer nutrition participation by 41.3 percent, while non-participating states fell 11.9 percent (FRAC, 2006). In Ohio, the *Cincinnati Enquirer* reported that the Cincinnati Public Schools partnered with the Children’s Hunger Alliance and the city’s Recreation Commission to serve 163,000 free meals to children in the summer of 2006, up from 19,500 the summer before (“163,000 free meals,” 2006).

**Recommendations**

Summer nutrition programs strengthen existing summer programs and make them more attractive to children from low-income families who need the extra meals. Young people who receive free meals typically do so through a summer program that addresses more than simply their nutritional needs, so that they receive additional educational or health benefits by participating. A rare exception to the rule, these federal nutrition programs are designed and implemented to benefit children and young people specifically during the summer. The documented success of the Simplified Summer Food Program, or Lugar Pilot, suggests that the program should be expanded to include providers currently enrolled in other summer nutrition programs. Expanding this program would streamline administrative burdens while maximizing reimbursement and participation rates.

**Employment Development and Service Learning**

The summer months offer many of the nation’s teens 16 and older an opportunity to gain valuable first-time experience in the labor market as well as connections to community businesses. In summer 2006, an average of 8.5 million young people aged 16–19 were either working or actively looking for work (Sum, McLaughlin, & Khatiwada, 2006).

To respond to the summer influx of young job seekers, the nation’s employers have typically expanded their hiring of teens. Local governments often provide funds to
help government agencies and nonprofit organizations hire additional teens during the summer. In addition, workforce development and service learning opportunities expose youth to experiences that prepare them for productive adulthood. Summer programs provide these opportunities in a variety of ways, including service learning that combines community service with classroom instruction; school-to-career activities such as career fairs, interviewing opportunities, and job shadowing; and work-based learning.

In the past, summer was explicitly recognized as an optimal time for youth employment, and public policies directed funding to summer jobs. In recent years, however, the focus on summer jobs has been diluted, at least at the federal level. Though some state and particularly local governments have attempted to make up the difference, they have not been able to compensate for the decline in federal funding. One promising initiative is such service-learning opportunities as AmeriCorps, offered by the Corporation for National and Community Service.

Federal Youth Employment Programs
Subsidizing summer youth employment for youth ages 14–21 was a major youth investment strategy of the federal government from the 1970s through the 1990s. One of the primary reasons for this investment was the research that revealed the impact of summer learning loss. Policies encouraged local areas to combine “learning and earning” by offering an academic component within their summer youth employment programs (M. Pines, personal communication, November 11, 2006). Several major national youth programs, including YouthBuild and the Youth Conservation and Service Corps, redesigned their programs to incorporate an academic component, particularly GED preparation for students who had dropped out of high school.

In 1998, the passage of the Workforce Investment Act (WIA) represented a change in youth service delivery that resulted in less federal emphasis on summer employment programs. Rather than providing a direct funding stream specifically for summer jobs, WIA funds summer employment as one of ten possible services: tutoring, alternative secondary school services, work experience and internships, occupational skills training, leadership development and community service opportunities, transportation and childcare support, adult mentoring, follow-up services, and guidance and counseling (Finance Project, 2003). This focus on integrated services was an attempt to more closely connect education and employment. Although program providers are not required to provide all ten services, local Workforce Investment Boards must ensure that all ten are available to eligible youth.

Federal funding for youth education and training has been on the decline: from $996 million in fiscal year 2005 to $951 million in fiscal year 2006 and a proposed $851 million for fiscal year 2007 (White House OMB, 2006c). Teen summer employment rates have shown a corresponding decline, falling from 45.2 percent in 2000 to 37.1 percent in 2006 (Sum, McLaughlin, & Khatiwada, 2006).

State and Local Jobs Programs
Many state and local governments have responded to federal cuts by increasing their investment in summer jobs. New York City, for example, operates one of the largest summer youth employment programs in the nation. During the summer of 2005, the city spent approximately $48.4 million on summer youth employment programs, using $24.6 million from city taxes and only $6 million in WIA funds (New York City Department of Youth and Community Development, 2005). Since 1999, New York City has nearly
tripled its own investment in summer youth employment programs to compensate for the loss in federal support. Cities across the country, where mayors and communities value summer jobs programs because they keep older youth productively engaged and out of trouble, have followed suit.

Other localities recognize the value of summer youth employment programs but are not as well positioned to provide summer jobs without federal support. In fiscal year 2006, the Maryland Summer Youth Connection program authorized use of a mere $150,000 in Cigarette Restitution Funds, an amount that met only a small proportion of the need in Baltimore City, a primary recipient of such funding given its high concentration of young people in poverty. Baltimore contributed $7 million, raised mostly through private donations, to provide summer work experiences to 7,000 young people between the ages of 14 and 21. The city anticipates the need to secure additional funding, as participant numbers are expected to increase (Baltimore Workforce Investment Board, n.d.).

**Summer Service Learning**

Service learning can be defined as providing “thoughtfully organized experiences that integrate students’ academic learning with service that meets actual community needs” (RMC Research Corporation, n.d.). Several agencies and policies support summer service learning opportunities, including WIA, as a part of the leadership development and community service elements, and NCLB. Title I of NCLB, for example, recommends that service learning can be part of a school reform strategy offered before and after school, as well as during the summer, to provide an enriched and accelerated curriculum (RMC Research Corporation, n.d.).

The primary agency responsible for administering service learning programs, however, is the Corporation for National and Community Service (CNCS), a public-private partnership. The AmeriCorps and Learn and Serve America programs funded by CNCS provide opportunities for youth, college students, and educators to engage in rich service-learning experiences over an extended period of time during summer break as well as other times during the year. Two primary goals of CNCS are to engage more college students in service and to encourage more K–12 schools to incorporate service-learning curricula. Roughly half of the Corporation’s annual program budget, which was $828 million in 2006, supports the AmeriCorps and Learn and Serve America programs (http://www.nationalservice.org).

The Summer of Service Act, introduced by Senators Dodd (D-Connecticut) and Cochran (R-Mississippi) and Representative DeLauro (D-Connecticut) in both Houses of Congress on November 15, 2006, would add to CNCS’s program offerings by providing an additional $100 million in federal funding in the first year to engage middle school students in intensive and structured community service during the summer. Participating youth would have the opportunity to earn $500 in educational awards after completing 100 hours of service, offering an additional earning incentive for participation (Innovations in Civic Participation, 2006). This legislation would help bridge the gap in programming available to middle school students over the summer, engaging youth in work-like experiences before they are eligible to participation in a summer jobs experience under WIA.

**Recommendations**
Though WIA is designed to provide disadvantaged youth with educational and work opportunities, and despite the efforts of state and local governments to supplement federal funding for summer jobs, low-income and minority youth are not keeping pace with their higher-income peers. While young people residing in families with annual incomes above $75,000 are employed at a rate of 51.9 percent, low-income Asian- and African-American youth are employed at rates of 16.8 percent and 17.4 percent, respectively (Sum, McLaughlin, & Khatiwada, 2006). The higher the family income, the more likely that a teen in that family is to have paid employment. Thus, young people who are already at a disadvantage have less work experience and fewer connections to employers than more privileged, higher-income peers. This disparity has grave implications for the future employment prospects of lower-income and minority youth. If federal policies continue to minimize the importance of summer youth employment, many youth may finish school with little or no connection to the workforce.

One strategy to increase investment is greater coordination among policies that emphasize both summer employment and service learning. Coordinating NCLB, WIA, and CNCS resources, directing them to agencies that are able to offer service-oriented work experiences, could make the best use of existing funds and better connect education and workforce efforts. Some summer jobs programs already involve young people in academics, service learning, and workforce development simultaneously. For example, the Met program in Providence, Rhode Island, connects its students at six small high schools with mentors and service-oriented internship opportunities in the community (The Big Picture, n.d.). Such models merit additional attention and support.

**Delinquency Prevention**

Another frequently cited reason for investing in summer programs, particularly in programs for older youth, is the increase in crimes committed by or against young people during non-school hours. In the area of delinquency prevention, we examined both local and federal programs.

**Local Initiatives**

Several local governments cite crime statistics as one of the primary reasons they invest in summer jobs programs. Our policy review identified several communities, including Chicago, Washington, Denver, and San Francisco, where well-publicized events involving youth violence over the summer months contributed to the development of summer programs and policies focused on positive youth development.

One example is the Summer Scholars Program in Denver, Colorado. In 1993, Denver experienced a period of escalating youth violence, dubbed the “Summer of Violence” by the local media, characterized by a series of gang-related shootings that took the lives of several innocent victims. Legal remedies included expanding prosecutors’ powers to deal with juvenile offenders, but “home-grown” violence prevention programs such as Summer Scholars focused on giving younger youth opportunities to interact with caring adults in a supportive, enriching environment as an alternative to engaging in risky behaviors. Over its 11-year history, Summer Scholars has provided over 11,000 low-income children, ages 5 to 11, with high-quality reading and writing instruction as well as enrichment and athletic activities such as swimming lessons. Strong partnerships with the Denver Public School System and the Denver Department of Parks and Recreation support Summer Scholars in its mission to offer
literacy and youth development to low-income children. Financial support comes from both public and private funds, including more than 1,500 individual donations (Summer Scholars, n.d).

**Department of Justice Initiatives**

The largest source of funds to support summer delinquency prevention resides with the Office of Justice Programs (OJP) in the Department of Justice (DOJ). In 2004, OJP provided approximately $2 billion to states and localities in support of efforts to prevent and control crime, improve the criminal and juvenile justice systems, increase knowledge about crime and related issues, and assist crime victims. Afterschool programs, which broadly defined can include summer programs, are eligible to receive funding under several of OJP’s grant programs.

The Bureau of Justice Assistance (BJA) also supports out-of-school-time programs by providing funding, training, technical assistance, and information to state and community criminal justice programs and by emphasizing the coordination of federal, state, and local efforts. The BJA’s Byrne Memorial Justice Assistance Grants program funds state and local efforts to reduce illegal drug activity, crime, and violence and to support the work of local police departments. While community-based and statewide prevention programs, which may include afterschool and summer efforts, are two of the specific activities that can be supported by the grant, such programs must compete for scarce resources with other priorities, including adjudication, corrections, and treatment programs, as well as efforts to improve programs and systems.

Additionally, the Office of Juvenile Justice and Delinquency Prevention provides some funding to support programs engaged in preventing and reducing delinquency, including afterschool and summer programs. Allowable program activities include mentoring, gang prevention, substance abuse prevention, and youth development. For example, the Ella J. Baker House, a faith-based youth services agency in the Dorchester area of Boston, operates summer and afterschool programs as part of its larger mission to reduce youth violence and help at-risk youth achieve literacy and access jobs. The Baker House relies in part on the Juvenile Accountability Block Grant through a partnership with the Boston Police Department.

**Recommendations**

The delinquency prevention policies we examined direct relatively small amounts of funding to summer and afterschool programs. The grants are highly competitive and often include restrictions on allowable activities that make it difficult for afterschool and summer programs to compete. In its guide to federal funding sources for out-of-school-time programming, the Finance Project (2003) identified only three DOJ programs that permitted “academic enrichment” as an allowable activity. This restriction flies in the face of research suggesting that one of the most fundamental strategies for preventing delinquency is to re-engage young people in learning and help them understand the critical role that education plays in achieving their life goals (Noguera, 1996, 1997, 2001). Since summer programs have demonstrated results in using academic enrichment to motivate young people to pursue higher levels of academic achievement (McLaughlin, 2000), our findings suggest that summer programs should be more fully used as part of a delinquency prevention strategy during a time of year when other educational resources are scarce.
**Informal and Cultural Learning**

A rich array of policies at the federal, state, and local levels recognize the critical role that the arts, libraries, museums, and other informal learning institutions play over the summer months. These disciplines and institutions are an important part of the fabric of summer learning opportunities for young people and their families, consonant with the belief that summer is a unique time when children can explore their interests, talents, and skills. They also reflect the types of learning experiences available to middle- and upper-class youth during the summer. Interestingly, these policies do not appear to target disadvantaged youth, but rather seem designed to reach young people from families of all income ranges.

While the arts is a learning discipline in and of itself, we include it in this section because our analysis revealed that arts learning is often connected to and delivered through museums and cultural institutions in the context of summer programming. Though policies and funding streams that support the arts, libraries, museums, and other informal learning institutions are too numerous and varied to list, our research revealed several agencies that lead the way in providing arts and informal learning experiences over the summer, particularly the National Endowment for the Arts, the Institute for Museum and Library Sciences, and the National Science Foundation. We chose the three initiatives we discuss in this section because of their focus on summer specifically, or on summer and afterschool programming in particular.

Despite the funding available from these federal agencies, our interviews with program providers indicated that they used other sources for programming centered around the arts and informal learning. Nearly every provider regarded arts and informal learning as essential ingredients for summer programming, particularly for engaging and retaining youth. However, most providers funded those opportunities either through another grant with a different primary purpose—for example, through a 21st Century Community Learning Center grant, whose primary purpose is education—or through private philanthropy. In fact, though we did not emphasize private philanthropy in other sections of this report, philanthropy seemingly plays a large role not only for arts programs but for all summer programming—much larger, in fact, than it does in afterschool programming. The role of philanthropy in summer arts and informal cultural learning provides an example of a larger issue on which we will elaborate in the conclusions section of the report.

**Summer Library Reading Programs**

For over a century, public libraries have played a critical role in providing summer learning opportunities to young people in the United States. At a time of year when many public institutions close their doors to children and families, more than 122,000 public libraries provide summer reading programs and a variety of educational activities to enrich communities. Today, 95 percent of all public libraries in the United States operate summer reading programs (Fiore, 2005). Youth participation rates vary by community but generally range from 10 to 20 percent of the eligible youth population. Multiple studies explain the positive benefits of library summer reading programs (Heyns, 1978; Allington & McGill-Franzen, 2003). In fact, a recent study found that volume of summer book reading was positively related to fall reading achievement independent of prior reading and writing skills and student background characteristics (Kim, 2004).
Summer reading programs offered by libraries are supported by several funding sources at the federal, state, and local levels. Federal grant dollars are available through the Institute for Museum and Library Sciences under the provisions of the Library Services and Technology Act, which is administered by each state. In addition to general library funds, most public library systems raise significant private philanthropic support annually for their summer reading programs. In fact, we found that many public library systems relied nearly exclusively on private funds—from local foundations, corporate sponsors, local chambers of commerce, and friends of the library foundations—to support summer reading programs.

While such broad-based support is generally viewed as positive, it also presents a number of challenges in terms of the prospects for expanding access to library summer reading programs. The reliance on private grant dollars creates significant planning challenges for libraries, as they often have to prepare to operate programs prior to receiving all of the necessary funding. This uncertainty potentially limits young people’s access to reading programs. Given the research on the potential benefits of such programs and the relatively low cost of additional outreach activities, policymakers should consider strategies for increasing public investment in these programs.

One such strategy is the development of partnerships. We identified several promising models that integrated school district and public library summer reading programs in order to increase participation and coordination. In many cases, such integration reduced duplication of effort and ensured that librarians knew what books the schools required for summer reading and were able to promote the summer reading programs in the schools.

Informal Science Education Initiatives
Informal science education initiatives are currently being championed as one strategy to help increase the nation’s global competitiveness in science, technology, engineering, and mathematics (STEM). One of the most important sources of funding for informal science institutions at the federal level is the National Science Foundation (NSF). For fiscal year 2006, NSF provided $25 million in competitive grants for informal science education designed to increase interest, engagement, and understanding of STEM subject matter on the part of individuals of all ages and backgrounds. NSF also funds projects that advance knowledge and practice of informal science education.

NSF defines informal learning as learning that happens throughout people’s lives in a highly personalized manner based on their particular needs, interests, and past experiences. This type of multi-faceted learning is voluntary, self-directed, and often mediated in a social context (Falk, 2001; Dierking, Ellenbogen, & Falk, 2004); it provides an experiential base and motivation for further activity and subsequent learning. The NSF’s Informal Science Education (ISE) program invests in the development of experiences that encourage informal learning in science, technology, engineering, and mathematics (STEM). It promotes public engagement with and understanding of STEM content through such means as exhibitions, media projects, and educational programs. ISE projects reach audiences of all ages and backgrounds across the nation in museums,
theaters, community centers, and many other settings, including outdoor environments and people’s homes.

Much of the funding granted by NSF for youth ISE focused on afterschool and summer programs. Funding for the program is connected to revenue derived from H1-B visas issued to workers from foreign countries to fill U.S.-based jobs in technical fields. The rationale for the program is to invest in programs that prepare young people in the U.S. to eventually fill those positions, thereby reducing the need for H1-B visas in the future. We found this approach to using summer programs as a means for fostering greater career and educational development in STEM very compelling. One limitation of the program is that it provides only about $25 million in total funding for approximately 50 grants each year across the country. Another is that the funds aren’t necessarily reaching the neediest youth.

**Summer and the Arts**

The National Endowment for the Arts (NEA), according to its 2005 annual report, offers several grants that either directly or indirectly support summer opportunities:

- **Access to Artistic Excellence** funds projects that encourage and support artistic creativity, preserve our diverse cultural heritage, and make the arts more widely available in communities throughout the country.
- **Learning in the Arts for Children and Youth** funds projects that help children and youth acquire appreciation, knowledge, and understanding of and skills in the arts. The focus is on children and youth in the general age range of 5 to 18. Included in this area is the Summer School in the Arts program.
- **Challenge America—Reaching Every Community** funds simple, straightforward local projects that involve experienced professional artists and arts professionals in small or mid-sized communities where opportunities to experience the arts are limited by geography, ethnicity, economics, or disability. (National Endowment for the Arts, 2005)

The Summer Schools in the Arts program, included in Learning in the Arts for Children and Youth, provides up to 50 grants per year, ranging from $15,000 to $35,000, to nonprofit organizations and agencies. The intent of the grant program is to offer “rigorous, challenging summer arts education programs that enable children and youth to acquire knowledge and skills in the arts as well as gain lifelong interests in the arts and culture” (NEA, 2006). While this program explicitly focuses on summer, the amount of funding is small, and the number of organizations, and therefore youth, affected is very low. In 2005, only 24 organizations received funding through this grant program.

**Recommendations**

The most striking distinction about informal and cultural learning policies, compared to the other policy areas we researched, is that they reach a broad cross-section of youth, rather than a subset of youth who have been targeted as low-income or low-achieving. However, public funding streams for informal and cultural learning tend to be very small,
albeit numerous, so that few young people can benefit. Families have increasingly used their own income to provide cultural learning experiences for their children during the summer, but public funding has yet to do the same for disadvantaged youth.

More coordinated policymaking and funding could, in this case as in many others, lead to better use of scarce dollars. Partnerships between public libraries and public schools to coordinate summer reading programs, for example, leverage scarce resources at the local level. State departments of education, school districts, and public library systems need to encourage more such collaboration between public libraries and schools. States should provide incentives for collaboration and discourage competing or parallel programs that operate in isolation from one another in local communities. Federal and state funds should be dedicated to fostering stronger partnerships that promote free voluntary reading programs in schools and public libraries.

**Increasing Summer Opportunities for All Youth**

Summer is a unique time of year in our culture. Despite occasional perceptions that the typical school-year calendar is outdated, many Americans feel strongly that summer is a time for rest, relaxation, and rejuvenation. Kids expect summer to look and feel different from the school year; parents look for summer opportunities that ensure their children are well cared for while having fun; and working parents need access to programs that allow them to continue working with minimal interruption.

So how do we honor our cultural beliefs and simultaneously respond to the research on summer learning loss? What can we do to ensure that summer programs are able to meet the expectations of children and families while offering learning experiences that help close the achievement gap? How can policies be redesigned to support high-quality programming?

The very existence of public policies to support children and families during out-of-school time is encouraging. Funding for summer programs cuts across many federal departments and programs, serving many purposes. We applaud the intent of and support for the public policies in each of the six areas we discussed; however, a more coordinated approach to public policy and funding would better leverage scarce dollars. In order for summer program providers to meet the full scope of youth and family needs during the summer months, policies should more explicitly focus on summer as a critical window of time for young people’s learning and development—and as a time when families have particular need for safe and enriching childcare options. A comprehensive approach to summer programming should place particular emphasis on providing programming for disadvantaged children that mirrors the types of summer experiences available to middle- and upper-income youth.

**Coordinated Opportunities**

Each of the six policy areas examined in this report meets a critical need over the summer, but resources could be leveraged much more effectively if the policy areas were better coordinated. Without such coordination, we will continue to see the development of “niche” programs that provide specific interventions to special populations at the expense of programming for the broader population of youth and families in need of services.

However, it may be unrealistic to expect the interagency collaboration necessary to identify and streamline funding priorities and to develop shared agendas at the federal level. An alternative is to support the development of local, state, and national intermediary organizations that focus on coordinating summer learning policies and funding streams and on supporting the work of summer providers.

An intermediary organization “operates in a position between the youth-serving organizations they assist and a body of knowledge, skills, contacts, and other resources. They take
a deliberate position as brokers and facilitators, functioning both as representatives and as agents of change” (Wynn, 2000, p. XX). Some intermediary organizations focusing on out-of-school-time or summer learning already exist. At the national level, they include the Afterschool Alliance, the Center for Summer Learning, the National Institute on Out-of-School Time, and the National Afterschool Association. A few of the state intermediary organizations are the Minnesota Commission on Out-of-School Time and the New Jersey School Age Care Coalition. Some of the many local organizations are The After-School Corporation in New York City, the After-School Institute in Baltimore, the DC Youth Investment Trust Corporation, and LA’s BEST.

Whether their focus is local, state, or national, intermediaries typically meet a variety of needs: They help to shape the vision and define the field; build consensus; aggregate demand; convene stakeholders and provide a forum for networking and professional exchange; collect and disseminate relevant research, information, best practices, and resources; facilitate communication among providers, researchers, and policymakers; locate funding sources and raise funds to support programs; track and advocate for policy change; define quality standards for how programs should operate; develop competencies for program staff; assess program quality; work directly with summer program providers to deliver training and technical assistance; and develop and pilot new program approaches. In short, intermediaries offer “expertise, outside support, legitimation, and clout” (Schorr, 1997, quoted in Wynn, 2000).

Intermediary organizations can often act more nimbly than government agencies in responding to the needs of the field. As a given public agency shifts priorities and program resources wane, an intermediary can assess opportunities to “fill the gap” and redirect programs to alternate sources. Another advantage is that intermediary organizations are mission-driven around a particular issue, so that they can bring together seemingly disparate stakeholders and resources—for example, museums, schools, and libraries—to align them toward a common purpose. Finally, because summer learning is so closely connected to private philanthropy, many intermediaries have the distinct advantage of being networked to private philanthropists, foundations, and other community resources, so that they can leverage investments in ways that public agencies are often unable to do. Though the level and quality of support intermediary organizations provide varies and is somewhat dependent on the amount of their funding, providers generally have a favorable view of intermediaries as needed resources. Providers often must neglect the functions listed above in favor of meeting the immediate needs of young people; thus, intermediary organizations fill an important need.

Though the functions intermediary organizations fulfill are important for developing and sustaining the field over time, few intermediaries currently focus on summer as a priority, and fewer yet take summer programming as their primary focus. If intermediaries are part of the solution to coordinating funding for summer programs, policymakers need to recognize their immense value to the field, include these entities in legislative language, and make them eligible to receive technical assistance and training grants (Blank et. al, XXXX). Policymakers and private funders can work together to increase the amount of funding set aside for the functions provided by intermediaries. Simultaneously, intermediaries, the research community, and practitioners should work together to define appropriate measures for gauging the success of an intermediary’s efforts. At present, few resources suggest ways to measure the success of, for example, advocacy or training efforts. Such measures would provide much needed guidance and benchmarks for organizations serving in this capacity, thus improving their effectiveness.

Comprehensive Opportunities

Another challenge for policymakers is addressing the needs of working families by supporting full-day, year-round programming for kids. From a public funding perspective, summer has traditionally been an afterthought—secondary to afterschool, with little recognition of the
difficulties parents face in finding adequate, affordable, engaging summer care. Summer and afterschool need to be considered equally in public policy; quality programs must be made available and accessible to families year-round. The difference between summer and afterschool programming goes beyond the fact that they operate at different times. Summer programs operate for more hours per day; they also get kids when they’re fresh rather than after a seven-hour school day. Thus, the structure of summer programs is often very different from that of afterschool programs; those differences should be taken into consideration when designing public policy.

While some communities look to year-round school as the answer to the need for year-round childcare and education, there’s merit in exploring what summer programs, specifically, can do to “round out” a child’s education. Summer programs can offer experiences that children can’t get in school. Summer programming often involves the community and local institutions in deep and authentic ways. Particularly for young people who attend low-performing schools, summer programs can make a powerful difference when compared to a year-round school that may be offering more of the same, only on a different schedule.

Opportunities for All

Policymakers must take a stronger role in supporting enriching summer learning experiences for low-income children. Nearly all parents want safe, fun, engaging experiences for their children over the summer, but access to these experiences is not equally distributed among poorer and wealthier children and communities. The research-based rationale for funding summer programming for all children that provides the kind of enrichment activities now available primarily to middle- and upper-income children is clear:

- All kids experience some learning loss if they don’t have opportunities to practice skills over the summer months.
- Summer losses in reading are more pronounced for low-income kids because they have less access to enriching literacy activities.
- Middle- and upper-income families are increasingly relying on enrichment camps and programs to provide much-needed childcare while offering the types of experiences they deem appropriate for their children during summer break.
- Low-income children tend to receive remedial summer programming, whether they need it or not.
- Learning embedded in enrichment experiences is often more beneficial and more easily committed to long-term memory than learning delivered in the context of punitive remedial programs.

All these findings add up to a vision of summer programming that supports all youth in achieving not only academic outcomes, but also developmental milestones. For example, a program could focus on reading comprehension and self-esteem through teaching performing arts. Another program might build math skills, foster teamwork, and teach conflict resolution in the context of playing basketball. Middle- and upper income families are already investing in such experiences and programs for their children, yet policies for low-income youth tend to narrowly target remedial reading and math or a particular developmental need, such as childcare or nutrition, without taking into consideration children’s individual needs, their potential to excel in a different type of learning environment, or their unique interests and hobbies.

One policy exception is the 21st Century Community Learning Centers program, which has fostered many unique summer learning programs that combine academic, developmental, and workforce development efforts while keeping children safe and healthy. We believe these programs should be applauded and expanded. Four programs we studied—Harlem RBI, BELL (Building Educated Leaders for Life), Trail Blazers, and Higher Achievement—used 21st CCLC
funding to advance learning, support positive youth development, and meet youth and family needs. Two of these programs illustrate the ways in which public funding can support a broad range of learning opportunities for disadvantaged children that mirror the summer opportunities available to more privileged kids.

Harlem RBIs REAL Kids Summer Program prevents summer learning loss in reading, teaches sportsmanship, and exposes children to new experiences, using baseball as the “hook” to get kids in the door. In morning literacy workshops, certified teachers and two college coaches lead kids through balanced literacy activities that are linked to the afternoon baseball game. REAL Kids prioritizes youth choice and collaborative learning to keep kids engaged and motivated to succeed. Kids score runs both on the field and in the classroom. To measure participants’ success, Harlem RBI tracks their literacy, social, and emotional growth, as well as their physical health. As was true of many of the high-quality summer programs we studied, Harlem RBI is funded primarily by private philanthropy, with only about 10 percent of its funding coming from public sources.

Trail Blazers provides youth from low-income urban areas the opportunity to grow in academic knowledge and social experience by participating in a 20-day residential camp in rural New Jersey. Trail Blazers seeks to instill in youth the values of caring, cooperating, and learning to settle differences peacefully while developing literacy skills. Throughout the camp experience, young people read independently and together, record their experiences in a journal, deliver presentations, perform plays, and write articles for the camp magazine. These activities are paired with more traditional camp activities, such as swimming, hiking, and sleeping under the stars. Trail Blazers, too, is funded largely through private philanthropy, in this case individual contributions. The program has also creatively combined various public funding streams, including the Summer Food Service program, Supplemental Educational Services, TANF, and some local funding.

Summer learning should be different from school-year learning; it should offer young people new experiences and give them opportunities to develop talents and skills. In other words, the research on summer learning loss and our cultural beliefs about the meaning of summer are not in conflict. Kids can continue to learn during the summer while having fun in a safe, nurturing environment. Private philanthropy has often led the way in funding the development and implementation of high-quality summer experiences for low-income children. It is time for public policymakers to follow the lead of foundations and individual contributors by adopting a coordinated and comprehensive approach to summer learning that can benefit all children and their families.

Use of Traditional Media and Internet among Adolescents in Guang Zhou

Abstract

With the fast development of media, especially the Internet, the information seeking and retrieval environment has changed greatly. The relationship between consumer and their media use needs to be updated accordingly. What’s more, as the youth market expands and consuming power increases, advertisers need to capture the latest trends in order to reach the young generation. This study tries to examine the media use among the young generation in Guang Zhou. Our study focuses on how the adolescents utilize various media, especially the Internet. Three hundred and eighty-six Chinese respondents aged 11 to 18 completed a structured questionnaire in December 2006 in Guang Zhou. The questionnaire was based on a previous study of teens conducted in the U.S. (La Ferle, Edwards, and Lee, 2000) Results show that over 73 percent of the respondents own personal computers with Internet connection at home. The study provides information about what they are using Internet for, and how they surf on the web. This paper will also discuss the traditional media and Internet use by gender and by educational level.
Extended Abstract

Introduction

The media have been shown to be powerful socializing agents of the young people (Arnett, 1995; Atkin, 1982; Moschis and Moore, 1979; O’Guinn and Shrum, 1997). They define the world with the help of media (Arnett, 1995). So when we explore how media choices may influence the adolescents’ development and subsequent consumption practices, we should consider examining how they allocate their time among media.

Teen’s behaviour could influence the market. Research showed that teenagers built their social identities through consumption behaviour and their material possessions (Montemayor and Eisen, 1977; Solomon, 1983; Chan, 2005). Thus knowing how they consume media could be of great help of understanding their lifestyles, consumption orientations and behaviours.

Literature review

Adolescents make active choices of the media they use according to their personalities, socialization needs, and personal identification needs (Arnett, 1995). The adolescents are active media users and they prefer to find things themselves. The nature of Internet seems making it a viable way of marketing to teens (La Ferle, Edwards and Lee, 2000). Now with the increasing penetration of Internet in Hong
Kong, it’s time to update the knowledge about how this new media may affect adolescent allocation of time spent with other media, as well as how the Internet can be used to fulfil existing adolescent needs. This study contributes to the understanding of the latest relationship between the young generation and the media. The current study attempts to answer the following questions: (1) How do young people in Guang Zhou allocate their time across various media? (2) What are the young people’s attitudes towards advertising? (3) Do media choices vary by gratification sought? (4) What do they use Internet for? (5) How do they find out the website they want?

**Method**

A questionnaire was developed based on La Ferle, Edwards and Lee’s (2000) work. The questionnaire consisted of mainly close-ended questions were distributed to people aged 12 to 24 through personal sources. Three hundred and eighty-six Chinese respondents aged 11 to 18 self-administrated a structured questionnaire in December 2006 in Guang Zhou. We chose Guang Zhou because it is one of the most developed cities in China with a relatively rich traditional and new media environment for all ages. This study would provide a further understand to the current situation in urban China.

**Findings**

Findings show that over 73 percent of the respondents own personal computers at home, while only 36.8 percent of them possess their own television sets. Sixty percent
of the students used Internet at schools and nearly 88 percent of them used Internet at homes.

About 89 percent reported that they used Internet to search information for homework. Forty percent of them find shopping information through reading magazines. Over 50 percent of respondents used online shopping. About 45 percent of the respondents said that they used Internet at home for more than one hour. They used internet for playing games, doing homework and listening to the music. On the other hand, they still relied on friends for sensitive information. The Internet was reported as the easiest and the most convenient way of getting sensitive information.

Abstract

Nationwide, kindergarten teachers estimate that nearly one in three children enters school unprepared to meet the challenges of the classroom. Often the gap widens as children move through the grades. Parents, schools and communities all play significant roles in helping develop “ready children” for “ready schools.”

This presentation will report on the efforts and progress of a medium size urban community to improve children’s school readiness by creating a seamless system of universally available education, care, and support services for families with pre-school children. In particular, we will focus on the effectiveness of a community-wide planning group in moving from networking among themselves to collaboration. Factors supporting and inhibiting movement will be explored and suggestions for promoting community-wide change efforts will be given.
Title: ‘Cultural Relativism in the 21st century: A Sociological discourse on the debates about rights and justice in a globalized world’

Abstract:

The key essence of cultural relativism stems from its acknowledgement of two sentiments: that of “equal respect” for all individuals and the need to respect a person’s culture in order to “respect his identity”. Coupled with its pronouncement that “moral judgments and standards” are evaluated in accordance to an individual’s personal culture, it can thus be argued that any debates on the “universal and unequivocal” rights required for humanity is not required as it would be “wrong to judge moral beliefs and practices in other cultures according to one’s own standards”.

In this paper, there would be an evaluation of the propagators of cultural relativism and their approaches in advocating the desire for cultural relativism as a response to the notion of the “western-based” concept of human rights. The articulation on why Sociological debates on human rights must and will continue to persist are critically assessed in view of the several problematic resultant consequences if a non-confrontational approach is adopted in unequivocally accepting the fundamentals of cultural relativism in reviewing discourses on rights and justice.

The quintessentially assumed ‘western’ precepts of rights and justice would be reviewed in terms of their ‘adherence’ or ‘detachment’ to the basis of rights governance in non-western societies with a concomitant examination of the veracity of these
‘universalistic’ hallmarks which the United Nations has persistently pronounced. The analysis on the institutional definition of culture as a detriment to the contemporary evolution of genuine cultural features in non-western societies would be elucidated through the current debate on rights and justice in East Asia.

The validity of utilizing cultural elements in the articulation of rights’ particularism in regional settings would subsequently be assessed through a discussion on the seemingly blurring of cultural boundaries in a globalized world and its impact on the situatedness of identity and citizenship stipulations.

Paper:

The key essence of cultural relativism stems from its acknowledgement of two sentiments: that of “equal respect” for all individuals and the need to respect a person’s culture in order to “respect his identity” (Freeman, 2002: 108). Coupled with its pronouncement that “moral judgments and standards” are evaluated in accordance to an individual’s personal culture (Li, 2006: 55), it can thus be argued that any debates on the “universal and unequivocal” rights required for humanity is not required as it would be “wrong to judge moral beliefs and practices in other cultures according to one’s own standards” (Li, 2006: 65).

In this paper, I would like to recognize the propagators of cultural relativism and understand their approach in advocating the desire for cultural relativism as a response to the notion of the “western-based” concept of universal human rights. More critically, I would attempt to illuminate why Sociological debates on human rights must and will continue to persist in view of the several problematic resultant consequences if we were
to adopt a non-confrontational approach in unequivocally accepting the fundamentals of
cultural relativism in reviewing discourses on rights and justice.

The issue of rights and the “problem” of cultural relativism

The issue of “rights” has been discussed intermittently by the international
community in modern history with various campaigns against slavery, for humanitarian
laws of war and for the emancipation of women and minorities taking place
concomitantly with the proclamation of the Universal Declaration of Human Rights by
the United Nations in 1948 (Robertson and Merrills, 1996: 32). The key articles of the
declaration vaguely pronounced the need to “re-affirm the faith in fundamental human
rights and the universal respect for all without distinction as to sex, language and
religion” (Freeman, 2002: 33). The United Nations’ notion of human rights thus
suggested the possibility of “universal” rights of “exceptional importance” that includes
the crucial and primary need to “protect morally valid human interests against the abuse
of political power” (Dworkin, 1978:61).

The fundamentals of the United Nations’ declaration of rights thus possessed two
significant points of contention. The first involved the defense of universal civil and
political rights and the view that all human rights are “indivisible” and “interdependent”
(Freeman, 2002: 148) which contradicts the vital assertion of cultural relativists that
certain rights are solely “relative and relevant” to certain cultures (Talbott, 2002:88).
However, the United Nations’ declaration of rights did provide an opportunity for states
to violate these “universal” rights under “especially strong reasons” (Dworkin, 1978: 61).
The lack of a concrete definition of what will actually be constituted as “strong reasons”
would provide the impetus for certain states to violate certain rights in accordance to the
cultural relativists’ pronouncement that certain principles and rules are peculiar cultural norms of certain states.

The key critique of the cultural relativists’ prescription for human rights generates from its own standards of stipulating the “judgment of others solely through their own cultural standards” (Williams, 1972: 66). Primarily, by stipulating the guidelines for the communal contemplation of human rights, cultural relativists are thus guilty of demanding other individuals to act according to their relativistic prescription, the very action which they are advocating against (Li, 2006: 61). There is also the argument that any “moral claims” made have to be “universally binding” not only in the propagator’s own culture but also beyond (Teson, 1985: 137-138). Thus, the moral agent can never be “relativist” as he is essentially making “normative claims” which are intended to be applied internationally as these moral judgments formed the crucial mores which are universally recognized (Teson, 1985: 138). Cultural relativism has also failed to envisage an outlet for the general objection of certain cultures which defy human rights. The paradox stemmed from its recognition of these “cultures” in respect of their “cultural attributes” when these “cultures” are themselves not respectful to other cultures in their incessant violation of human rights (Freeman, 2002: 109).

The argument for cultural relativism and the cessation of debates on human rights

The concept of cultural relativism has been utilized by several communities as an important “defense of their idealized way of life” against the “individualism and alienation” that liberal human rights are thought to imply (Howard, 1948: 51). There is an assumption that the precepts of human rights both encourage and support the individual’s needs over the desires of the communitarian society (Howard, 1948: 51). The practice of
a particular “indigenous” society, under the eyes of the proponents of cultural relativism, is regarded as “sacred” in its “spirited and nostalgic” attempts to fend off “unwarranted ideological interference” (Donnelly, 1989: 52). The recognition and the respect in leaving each society to its own “cultural devices” are emphasized in the attempt to negate discussion on a uniform and generic code on the elemental precepts of human rights.

Cultural relativists have also astutely challenged the interpretation and the particular definition of “human rights” in relation to its conception by each individual community. For instance, the caste system of stratification in India could be utilized as an example in arguing against the notion of the parallel linkages between egalitarianism and the chief characteristics of human rights. Cultural relativists have illustrated the emphasis on “hierarchical positioning” and the exemplification of “social spirituality” in Hinduism of “centering the hierarchies of kinship and caste” as an institutional conception of human rights (Stachhouse, 1984: 54). Thus, in an Indian or Hindu society, the basis of human rights is recognized in the acknowledgement of “human nature” differentiation from caste to caste, with each caste being regarded as a particular “species of mankind” (Donnelly, 2003: 83).

The notion of human rights and the quest for social justice have been regarded by certain supporters of the cultural relativist school as a potential source of “social fragmentation” instead of integration if they were to be actively debated and introduced to cultures where such norms are not intrinsic or native to the customs of these societies (Berger, 1969: 6). The articulation of this argument alludes to the symbolic interactionist’s precept of individuals being symbolically attuned and disciplined to envisioning their particular cultural concept of living as the only “desirable” one
Thus, any critical debate on alternative versions of rights would only succeed in breaking down the “relationship binds” which integrates an individual in his society. In light of this argument, international human rights institutions have also accepted that human rights standards ought to be interpreted differently in different cultural contexts. For instance, the International Covenant on Civil and Political Rights has allowed for consideration to the representation of different forms of civilization and different legal systems (Arai, 1998: 104).

Instead of arguing for a universal concept of human rights, there’s also an alternative school of thought which reveres and acknowledges the “aesthetical” value of the “truth” pertaining to rights and justice for a specific cultural environment (Munevar, 1998: 54). Instead of side-stepping them in the quest for a universal truth, proponents of this particular concept of justice creation illuminates the potentiality of the utilization of the “past and present” variation of rights as a unique experience of a particular culture (Munevar, 1998: 65). This particular brand of outlook draws from its functional purpose in allowing the individuals of each society to draw particular sources of inspiration, criticism, identification and affirmation from the evolution of their rights’ movement. It can be articulated that the self-actualization and consciousness of an emblematic version of rights could be achieved if a community is given the autonomy for self classification and elucidation of these rights.

The on-going debate on rights and justice has also been criticized as unnecessary or even futile and short-sighted if these definitions of rights are conceived as “western-centric” or “European-centric” and thus are deemed as overtly universal but latently “relativist”. The key question one needs to ask is the definition of a particular concept or
phrase in the official article of the United Nations’ declaration of human rights. The uproar over the practice of genital mutilation and infanticide and its collective condemnation by the majority of the members in the United Nations (UN) only stands to illuminate the “relativist” interpretation of “cruelty” by these members in their inability to acknowledge the alternative interpretation of such practices by its propagators and practitioners (Robinson, 2006:14).

Debates on the concept of a universal truth or norms could also be obviated if none of these norms could be found in all cultures and societies (Munevar, 1998: 46). The variation from one culture to another in terms of its approach towards human rights could be envisioned as being “so different and large that the universalist thesis seems to be completely in error” (Munevar, 1998: 46). In order to illustrate this quintessential difference, scholars have articulated that the idea of human rights is centered on the western knowledge structure which positions the individual as the “unit of norm fulfillment” as opposed to the oriental’s conception of positioning the group as a unit of norm regulation (Galtung, 1994:14). The western actualization of “cultural dynamics” could be gleaned from the dictates of human rights which pronounced the “sacredness of the individual and the spirit of the individual” which supercedes the governance and influence of the collective (Galtung, 1994: 15).

American influence on human rights has aided the augmentation of the debate against the notion of an effective deliberation on the quest for a universal precept of rights and justice. This is largely due to the argument that the United States has been used as a proto-typical benchmark when the UN reviews a nation’s adherence to the fundamental goals of its construct of universal rights and justice while the United States
has been relatively left to its own devices in the sphere of human rights (Passavant, 2004: 7). In general, the UN’s declaration has been criticized for its perceived utilization of “western bias” in its emphasis on rights rather than duties and it’s pre-occupation with civil and political rather than social and cultural rights (Cassese, 1992: 36). The accusation of these concepts as a hallmark of western liberal individualism has potentially alienated it from the “roots of non-western cultures and societies” (Chun, 2001:103).

Response to cultural relativism: the notion of a “universal” brand of human rights

The primary response to the cultural relativist’s vision of human rights came with the recognition of moral discourse which argued that rights are indeed “universalizable” (Teson, 1985: 57). Arguments on rights and justice could still take place if the chief premise of cultural relativism- that of these rights being relativist is contradicted. This is activated through the enunciation of the possibility of categorizing certain rights as possessing “supreme universal value” in that most people, if deprived of these protections, would want to have them regardless of their culture of origin (Teson, 1985: 58). These rights may include the “protection of people’s lives, safety and individual freedom” (Teson, 1985:58). There is also the collective debunking of the “relativistic” categorization of sentimentality as universal proponents of human rights have asserted that the non-rational and sentimental “revulsion and indignation” against human atrocities have provided the justification of human rights as a universal depiction and representation of “humane sentimentality” (Li, 2006: 70).

Alternatively, there have been calls for the enactment of human rights laws even in the event when it has been regarded as a “relativist pursuit”. This stemmed from the
argument that although certain aspects of human rights are not “feasible” in particular traditional societies, some characteristics of it are paramount in ensuring the universal acknowledgement of cultural rights (Li, 2006: 89). The verbalization of the universal need for an individual to participate in the creativity and development of one’s culture regardless of his background would require the enforcement of certain universal libertarian rights in assuring the practitioner’s autonomy in his cultural pursuits which maintained the essence of his cultural identity (Okin, 1989:91).

The substance of the UN declaration of human rights stems from its pronouncement of certain rights which have been categorized by certain scholars as “inalienable rights” and which served as the basic requirement of human dignity (Donnelly, 2003: 94). Any conception of human nature which denounced the rights of “life, legal personality, equality before the law and protection against inhuman treatment” must then be indefensible in contemporary international society (Donnelly, 2003: 94). Concomitantly, this list could be representative of Nussbaum’s concept of the “first threshold of humanity” which stipulates that an individual would be deemed “impoverished to a level of non-humanity” if his basic quest for mobility and his cognitive quest for perception is denied (Gould, 2004: 55). These concepts of human rights could be regarded as elemental in binding a “growing diversity of culture” and advocating a non-relativist but universal need for collective protection (Morris, 2006: 1-2).

Problematizing the “culture” in Cultural Relativism

Cultural relativism drew its assumption on the interpretation of culture from its depiction of culture as a “unitary and unique whole” that one is born into and will always
be a relatively unchanging feature of an individual’s personality (Howard, 1948: 58-59). However, critics of this form of definition have argued that an individual may not necessarily derives his identity from place of birth but highlights the “adaptive-ness” of culture in that an individual cultural identity may be “permeable and changeable” as culture is always constantly “reproduced” and its structures are “predestined to change” (Howard, 1948: 59). The cultural relativist’s notion of the individual adapting solely to a particular cultural prescription is thus inconceivable in modern society where individuals readily moved away from the mechanistic gemeinschaft society to urban districts where they are inundated with a multiplicity of cultural presentation (Donnelly and Howard, 1987: 60).

It is also difficult to conceive of a particular culture as being spatially bounded. The notion that a culture is “relativist” to a particular region or district is flawed in that each district may house individuals of varied religious beliefs (An-Na’im, 1992: 113). For instance, in a particular district in the Malaysian state of Kelantan, the Muslims in the area would be governed by the Islamic (Shari’a) laws which advocate punishments such as limb amputation for Muslim thieves, a punishment actively rejected by the non-Muslims in the state (An-Na’im, 1992: 113). The cultural relativist’s conception of individuals within a particular society as being unable to connect with “outsiders” has also proven to be flawed in the context of possible rights violation. For instance, in the case of honour killing as a local cultural practice in Pakistan, certain Pakistani’s advocacy women groups have rejected such a practice as being “relativist” in their nation and have worked with “outsiders” such as foreign non-governmental organizations in a collective campaign to lobby against these practices (Crocker, 1991: 66).
The universal concepts of human rights may in a sense be envisioned as a list with clauses which may be “overlapping” consensus among cultures and that a “large common core” of values may be recognized by the majority of cultures (Donnelly and Howard, 1987: 99). Therefore, the principles of cultural relativism may be critiqued in view of the particularly “negligible” differences in the acknowledgement of rights. Thus, all forms of cultural relativism has failed to recognize that “cultural practices routinely outlive their usefulness” and that internal dialogues and cross-cultural discussion on human rights can both equally construct a relatively “universal” idealization of human rights and social justice analogous across all cultures (Donnelly and Howard, 1987: 102).

Cultural relativism and the Asian response to human rights

Asian societies have often utilized the relativistic conception of “communitarian” values in their detachment with the avocation of individualism in most human rights’ discourses (Bauer and Bell, 1999: 5). The quest for most Asian states to “rise up from their penury status” through the sole focus on development for communal benefit has been linked to the demotion of individualistic conception of civil rights to secondary status in certain Asian societies (Bauer and Bell, 1999: 2). This preoccupation in maintaining stability and ensuring economic growth has been articulated by the Malaysian government, for instance, in the detention of rioters under the internal security acts in 1980 and the Chinese government in the 1989 Tiananmen massacre of pro-democracy demonstrators as “crucial” in maintaining continuous “development and subsistence” (Ozay, 1999: 176).

However, the Asian government’s denouncement of anti-western conception of human rights could be faulted on several accounts. Fundamentally, these states’
invocation of state’s sovereignty in rejecting the pressing calls to acknowledge certain
eright is essentially a western concept while it is a fallacy to also labeled “communitarian
elements” as a non-western as these practices could be found in “western social practices
and political theories” (Ozay, 1999: 1).

Besides these misinterpretations with regards to western values, the concept of
human rights recognition as a non-eastern or non-oriental fundamental is also
problematic. For instance, scholars have reiterated that women’s rights concepts are not
wholly western construct but are also present in the “Quaranic concept of human dignity
found in Islam” (An-Na’im, 1992: 180). Moreover, there is also a rising consciousness
among Asian nations in acknowledging the non-exclusivity of development and human
rights recognition as there has been no concrete evidence linking the recognition of
human rights as hampering economic development (An-Na’im, 1992: 185). In short, the
perception that the individualistic conception of human rights is not relevant in Asian
societies has been constantly placed under threat through the changing cultural outlook in
Asia.

The articulation of “weak cultural relativism” has been largely used as a response
to Asian society’s usage of the “cultural relativist shield” to defend their lack of
implementation of certain human rights (Bauer and Bell, 1992: 83). Essentially, these
rights are still treated as being universal in their core concepts but they could be
considered for “subjective implementation” by Asian states in accordance to their cultural
dictates (Bauer and Bell, 1992: 83). For instance, Asian states must adhere to the
universal precept of punishing any individuals who threatened the security of another
individual but the choice of punishment could be left to the choice of each nation.
Accordingly, the primary pre-occupation of “weak” cultural relativist is the guarantee of “free-choice” to citizens by the state and the protection of these individual choices provided that they do not violate “conventional universal norms” (Bauer and Bell, 1992: 85). Thus, the cultural relativist’s role in averting the debate on rights by Asian states could be negated through the introduction and promotion of “weak” cultural relativism in these states.

**Debating institutional definition of “culture”**

It must be enunciated that the interpretation and delineation of a specific brand of tradition or cultural traits of a nation or a particular community is often controlled by the authorities or the state machinery which governed the society. The manipulation and aggrandizement of “pseudo” cultural qualities have been known to aid the authorities to retain and exercise their power with the insistence of the recognition of their “relativistic cultural practices” as a shelter from external inquiry of their potential violation of human rights (Conquest, 1986:14). One example of this was gleaned from the expulsion of an environmental group by the Kenyan president in 1989, the reason being that under “African patriarchal tradition”, the male president would have the unequivocal right to dismiss any suggestions made by the female president of the environmental group (Perlez, 1989). The key significance here is that there has been no concrete evidence from interviews with the Kenyan populace and opinion leaders that such a “tradition” actually presides in Kenya either in the past or in the contemporary state (Perlez, 1989).

There is a pertinent need to examine the phenomenon of “cultural indoctrination” by the political elites in the twentieth century, especially through the mass media and educational system (Howard, 1948:72). The central state apparatus has been capable of
promoting their particular brand of cultural and political ideology often with their power to transmit a version of “relativistic cultural traits” such as sacrificial obedience to their leader (used by General Amin in Ghana in the 1970s) which is solely beneficial to them in maintaining their control over the populace (Howard, 1948:72). This utilization of cultural relativism thus served both to protect these governments from “imperialistic” invasion of their “traditional” practices but also allow them to act as “gatekeepers” with the ability to present an “official” version of their people’s culture to the outside world (Taylor, 1987: 110). This would then potentially thwart western liberals or even human-rights supporters from questioning the “cultural traits” expressed by these leaders for fear of being “racist” (Taylor, 1987: 110).

There have also been affirmation that the small elites controlling the state’s machinery has actually not only side-stepped and ignored on traditional practices but has actually trampled on them in their quest to marginalized the minority or subgroup in their nation. For instance, the former president of Indonesia, Suharto, has concentrated power in the hands of himself and his cronies by shielding the reality of state repression under the aura of “traditional culture” (Killen and Smentana, 2006:122). The side-lining of minorities’ rights has also often been attributed to their culture being eclipsed as a result of the practices of the ruling elites who often cull the cultural fundamentals of the dominant group in the society in presenting their version of the “official culture” to external parties (Killen and Smentana, 2006: 211).

The lack of conception of cultural minorities has meant that the state government in oppressive states would not need to cater to the needs of their minorities in terms of preserving their tradition but would instead subject them to “unwanted assimilation” in an
attempt at “nation-building” which subverts all the citizens to identify with a uniform cultural script (Lyons and Mayall, 2003: 55). Besides the acts of “unwanted assimilation” witnessed for instance in Spain with the absorption of the Catalans and Basques, state expulsion has also been frequently used by states to eliminate “troublesome” minorities who don’t fit into their version of a “pure and authentic” culture (the expulsion of ethnic Germans from Eastern and Central Europe in the 1940s is one example) (Lyons and Mayall, 2003: 55). Thus, there is a need to actively debate the UN’s declaration of human rights which exceedingly respect the “sovereignty” of each state in enforcing their “relativistic cultural principles” without acknowledging that these “cultural principles” may not be inclusive of minority groups’ rights.

Cultural relativism and the selective interpretation of citizenship

The generic concept of citizenship stipulates the relational idea that entails “co-operation between the state and citizens in the running of the latter’s life” (Faulks, 2000: 1). Hence, the universal ideal of citizenship involves the bestowment of rights on the individual citizen by the state with a concomitant return of duties and obligations by the latter (Faulks, 2000: 1). With the enactment of cultural relativism in the international discourse on rights and citizenship, states can now generate their own version of “citizenship” that is “relativistic” to their mode of culture as long as they can justify that their administration and governance of citizenship is based on the reciprocal exchange of rights and duties between the state and the citizen. The allocation for the recognition of cultural relativism has enabled states to categorize discrimination and slavery of certain minority groups (in Sudan before the mid 1990s) as the “duties” of these ethnic group, to enforce conscription as a requisite duty for citizens and arbitrary “looking into the needs”
of citizens and taking care of their “rights” and “concerns” without actually taking any concrete action (Slawner and Denham, 1998: 14). Thus, the dramaturgical presentation of the state’s ascription to the regulation of citizenry has often been left unquestioned through the recognition of cultural relativism.

However, the precept of cultural relativism has imperturbably ignore the key fundamentals of citizenship, which acknowledges individuals’ ability to make “judgments about their own lives which is not pre-determined by their race, religion or any other individual cultural attributes” (Faulks, 2000: 4). Thus, the key defining characteristic of citizenship is the “ethic of participation” by the individual and is therefore “incompatible” with their “stipulated cultural domination by the state or ruling elites” in ascribing them their designated rights “relativistic” to their supposed traditions (Faulks, 2000: 4). Citizenship must also be regarded as a “dynamic identity” with the acknowledgement of each citizen as “creative agents” in constantly reviewing their rights and duties that caters to their contemporary aspirations for them and their community (Faulks, 2000: 6). The state’s utilization of cultural relativism in assigning the rights and duties to each cultural community may be regarded as being neglectful of this aspect as it is merely dictating and selectively interpreting the cultural traits of these communities without enacting their participation (Brenner et.al, 1995:142).

Citizenship laws have also been gradually debated with regards to its continual influence by state apparatus which defined for itself the “relativistic” structure of their notion of citizenry in accordance to their cultural tapestry. Although the state still possessed the rights to form the “primary context” for the individual citizen, the impact of globalization and the rise of the international order such as the emergence of multi-
national corporations and international actors have influenced and thus complicated the state’s potential unilateral domination and pronouncement of the cultural rights of its citizens. Citizenship has now been “enhanced” through the rapid democratization of states such that pertinent “global” qualities such as egalitarianism are extended within state boundaries and not just confined to specific cultures (Gulalp, 2006: 146). Contemporary scholars have also questioned the very essence of cultural relativism in citizenship discourse. This can be illustrated through the illumination of the Korean wars and the Gulf wars which depicts the conflict between different states with relatively the same cultural norms and with the same batch of “cultural citizens” (Gulalp, 2006: 147). Hence, there is a backlash against the attribution of citizenry and other human rights’ conception to essentially “cultural” influences and dictates.

The blurring of cultural boundaries in a globalized world

The elemental precept of cultural relativism which pronounced the identification by individuals with their cultural community has gradually came under siege from critiques who espoused the reality of contemporary citizens extending their sense of obligation and identity by actively participating in societies not native to one’s own (Howard, 1948: 121). The communitarian viewpoint has also interprets society as a “grouping of unrelated individuals torn from their sense of collective identity” with the non-adherence to traditional elements giving rise to the quest for material gratification (Howard, 1948: 114). The lack of identity with a particular culture has been alluded to the lack of “ethnic” identification by each citizen in a given region due to the “mix-match” grouping of individuals with varied identity inhabiting a district with a “globalized identity” (Howard, 1948: 117).
Coupled with the “loss” of identification with any specific culture, contemporary citizens have also started to question the paradoxical assemblage of the terms “cultural relativism” with that of “human rights and justice”. With the assertion that community needs should necessarily be superceded by individual rights, the individualistic ownership of human rights and justice have been dynamically detached from its guidance by “cultural relativism” which pronounced group allegiance and ascription (Becker, 1963: 129).

The discussion on international rights and justice has to be enduring in spite of the influence of cultural relativism in contemporary society as it is imperative to be conscious of external regimes in weakening any steadfast allegiance to definite cultural precepts in modern discourse. The concept of “global governance” has meant that the dual concepts of state sovereignty and human rights have been drawn into a “complex global system” which effectively juxtaposed the traditional “statist” model of international law (Held, et. al: 1999: 155). Therefore, states and their traditional legal systems are invariably involved in a global “extra-legal” system with the resultant outcome of states being gradually deprived of their rational utilization of the precepts of “cultural relativism” to halt the international community from debating their internal policies. Consequently, the “international community” can now hold states accountable for “crimes against humanity regardless of the state’s cultural principles” as exemplified through the Nuremberg trials of Nazi war criminals not long after the inauguration of the UN’s declaration of human rights (Held, et. al, 1999: 155).

Besides international governance by the UN, multi-national corporations (MNCs) have also made use of their rising influence in international commerce by enforcing their
version of “human rights codes” on certain states (Rodman, 1998: 159). For instance, some MNCs have pulled out of “rights-violating” countries such as Myanmar and China while a collation of 800 international firms have also formed an organization known as “business for social responsibility” with a quest to promote a programme which deals with human rights issues (Rodman, 1998: 159). It would also be harder for states to exercise their specific “brand” of cultural approach towards issues on rights and justice as more states are increasingly pressured, primarily for economic and regional solidarity impetus, to enter into a supranational level grouping such as the European Union. With the supranational organization being the central power, individual states would then be faced with immense difficulties in activating their respective “cultural guidelines” in managing the provision of rights and justice within their own state’s boundaries.

The notion of “care” and the “expression of love” of contemporary citizens for individuals in different social groups have stemmed from the “feeling of solidarity” these citizens possessed upon being made aware of the plight of other global inhabitants (Faulks, 2000: 62-63) through the enactment of “ecological citizenship” (Gulalp, 2006: 152). The primary indicators of ecological citizenship extrapolated the shift away from contemporary citizens’ pre-occupation with material wants to being concerned with the non-tangible and emotive concerns with the global “environment” as a whole and being conscious of the need to preserve “welfare and other social rights and justice” for all global citizens (Gulalp, 2006: 152). This seemingly collective international approach in restoring justice and the fundamental acuity of human rights have been presented as an active response to the cultural relativist’s notion of reserving debate and management of these issues for the specific “cultural autocrat” or ruling elites in each nation (Li,
Moreover, contemporary societies such as the People’s Republic of China has themselves radically departed away from their traditional cultural manners of settling disputes over rights and duties through classical philosophies such as Confucianism and has adopted the international litigious approach in administrating these issues (Li, 2006:99).

Conclusion

The impact of cultural relativism in the debates on contemporary discourse on rights and justice has often stemmed from its emphasis that it is “wrong to judge other culture according to one’s own”. Cultural relativism has therefore encouraged the cessation of deliberations over each culture’s inherent practices on rights and justice as active debates could essentially “disrespect” and “destabilize” the normative cultural “codes” of each society according to the proponent’s relativistic vision. The illumination of the Indian caste system as pronouncing hierarchical structuring and not egalitarianism in its cultural relativistic vision of “humane rights” and the notion of active introduction of non-native prescription of rights being detrimental to the “stability” of a civilization’s symbolic ascription to the interpretation of rights have both seemingly “justified” the cultural relativist’s elucidation of a “non-bias” justice analysis in society.

However, I believe that discussions and debates on rights and justice should not ceased principally as the attribution of cultural relativistic rationalization on the potentiality of abandoning arguments on rights seems to be highly questionable. The fundamental precept of cultural relativism could already be regarded as problematic as its pronouncement of the disinclination to judge other’s culture according to the values of one’s own is already a personalized conceptual promulgation in itself. Moreover, it
neglects the potentiality that a particular element of culture could be continuously “permeable and changeable” and not so static as to be readily bestowed with an identifiable set of cultural principles of rights management. Fundamentally, it would also be extremely arduous to define a specific “cultural realm” for a given region as individuals in each cultural dominion may harbour constructs of rights and justice in respect to their identification with their state or religious’ outlook instead of their “cultural guidelines”.

A cultural relativistic approach to human rights and justice will also obviate the crucial need to illustrate the potentiality of certain rights (such as the right for the guarantee of an individual’s safety and freedom) as being “non-relativistic” but essentially “universalizable” and “inalienable” as they can be regarded as forming the elementary concept of humanity. Moreover, the definition and interpretation of “cultural principles” could be manipulated or distorted by states’ apparatus in utilizing the justification of “cultural relativism” to consolidate their supremacy and to potentially stymie the delivery of justice to minority formations. An alternative approach, often regarded as “weak cultural relativism”, could also reinvigorate the debate on rights and justice if states are pressured to adopt elemental precepts of human rights but are given some leeway to exercise them in accordance to their cultural prescribes.

The impact of globalization has also significantly contributed to the blurring of any definable “cultural boundary” for a viable account of cultural relativism while the influence of international extra-legal agents and institutions, inclusive of pro-rights non-governmental organizations and UN’s machinery such as the world bank, have increasingly contradicted individual state’s attempt to install and upkeep their
particularistic “cultural” interpretation of rights by active lobbying and sanctioning any state which “goes against” their version of human rights activation. Active debate and participation for rights and justice must then continue despite the consideration of the cultural relativist’s judgment on international rights to facilitate the global quest for “reciprocal action” for international justice and for the creation of “universal laws” among nations to regulate the “intercourse they have with each other” (Passavant, 2004: 12).
Bibliography

---

1. The approval of the Universal Declaration of Human Rights by the United Nations in 1948 spawned two international convenants, one on civil and political rights and the other on economic, social and cultural rights. The significance of these rights stemmed from their ratification by the majority of states in making human rights a matter of international concern and governments being made liable to the international community for their implementation.

2. Concomitantly, the Chinese government has maintained their “cultural right” to maintain their “traditional” interpretation of human rights which emphasized the collective over the individual, with an allusion to Confucian’s principles. However, this allusion has been criticized by several Confucian scholars who have asserted that the state has “selectively focus” on particular aspects and not the holistic fundamentals of the Confucian discipline.

3. Minority claims for special rights in the arena of education, religion and culture have been “noticeably absent” from human-rights treaties that were signed after 1945. Human rights treaties signed under the UN and other multi-national umbrella have been exceedingly pre-occupied with each state’s sovereignty by
giving them the lee-way to recognize minority rights only when they are not “incompatible with national legislation”.
Postal Code Profiling:  
Prop 103 and the Ghetto Tax since the 1970s

How does where one lives affect one’s chances in life? Should a zip code matter more than individual merit in deciding the prices paid for goods and services? Why, over the last four decades or so, have auto insurers charged inner-city drivers, insuring identical cars and with the same driving records as those from middle class neighborhoods, higher premiums? What does all this tell us about the impact of place in modern America? In a broader sense, have market forces eroded the American ethos of individual meritocracy?

With these particular questions in mind, this case study will examine the impact of the “ghetto tax” in California, America’s so-called bellwether state, where history is often said to happen first. Specifically, the case study focuses on Proposition 103, a near thirty-year struggle between California voters and corporate insurance interests to end zip code-based rate pricing. By ghetto tax I mean the extra fees and charges (e.g., high-cost mortgage and equity-loans, payday loans, zip code-based insurance premiums, etc) paid by poor urban residents who are cordoned off, socially and geographically, by such factors as age, race, gender, and even zip code. These quarantine communities typically pay more, often totaling hundreds if not thousands more each year per household, than the public at large for basic goods, services, and everyday necessities.

There are foreseen material consequences for eliminating the ghetto tax. In California, for example, a rate adjustment means ending the current subsidy, approximately $204 million a year, that many urban consumers now pay to auto insurers, like the state’s largest, State Farm for living outside lower income neighborhoods. That subsidy, in turn, often allowed State Farm and other insurers to pass these savings, in the form of lower premiums, on to non-inner city drivers. (Conversely, killing the ghetto tax on auto insurance potentially could result in hiking rates of suburban and rural drivers nearly as much as sixty percent.) California merely reflects national trends. Similar subsidies in the form of equally dramatic rate differentials—exist in the more populous northeast, where drivers with inner-city zip codes typically pay as much as $400 more each year than fellow suburban drivers. Cutting the ghetto-tax for these families by just one percent translates into as much as $6.5 billion each year in new spending power—additional monies these families could use to save or invest in incoming-growing assets.

While significant research is located in California, the issues have broader implications. First, for a society predicated on individual meritocracy, what does it mean when the state, from the voting citizens’ perspective, privileges industry over individual merit? Second, given the global fluidity of post-industrial capital, there is little surprise that predatory lending practices is an emerging international policy concern, particularly in comparable liberal democratic free-market economies, as international high-risk lenders and insurers have patterned themselves after U.S. markets. Third is the potential class implications—as Japanese specialists contend is the case in Japan, arguably the most ethnically homogeneous society of the industrialized world. There, the recent onset of ghetto taxes is, as one scholar put it, eroding Japan’s post-1945 egalitarian ethos into a post-cold war zero-sum society divided between winners and losers.

In these ways, a case study of Prop 103 may offer us insights into, as well as the costs of, the emerging crisis in modern democratic capitalism.
Branding Tibet

Abstract: Tibetan identities are informed by often contrasting narratives. A metanarrative of Tibetan-ness focused on religiosity and suffering acts to shape Tibetan lives as billboards for enunciating the atrocities of Chinese repression and the enduring non-violent nature of the ‘Tibetan spirit.’ On the other hand, personal Tibetan narratives often lack the vigorous religiosity and/or the occasions of violent repression. The result has been the ‘branding’ of Tibetans to match up with the highly politicized metanarrative. This occurs in two main ways. Tibetans with physical markers (scars) and emotional experiences of repression and religious fervor are raised up and proclaimed as ideal or model Tibetans. Therefore, those without the proper scars or experiences are appropriating others stories, they are replacing their personal narratives with the politicized metanarrative. This results in the branding and marketing of Tibetan lives for international consumption. ‘Tibet’ has become a brand, both physically marked and fully recognizable to the intended audience. This paper therefore deals with the implications of branding Tibet, especially relating to the ‘packaging’ of individuals.
Branding Tibet

Introduction

Globalization continues to be a hot topic in the humanities, with particular focus recently on the possibilities of imagination on narratives and identities brought about through globalization. Arjun Appadurai (1996) has argued that through globalization, identities, and by proximity, narratives and memories are increasingly constructed in relation to one’s imagination of distant places and the ideas related to those places. Identities and their narratives are formed from an amalgamation of ideas, values, experiences and memories, and can vary from day to day and depending on the environment. Identities and narratives are never formed in a vacuum; they are always constructed in relation to the various groups to which the individual belongs. Remembering is a social practice; narratives are the story of the individual as well of the group. This paper will discuss the construction of a metanarrative, or “a totalizing cultural narrative schema which orders and explains knowledge and experience,” and the mediation of personal narratives within a campaign to manage the reputation of Tibet internationally (Stephens 1998).

Due to the nature of the Tibetan diaspora the interplay of the metanarrative and personal and local narratives is extremely important in forming individual identities. Prior to 1959, when the Chinese took control of Tibet, Tibetans primarily self-identified according to regional membership or according to local leaders or monasteries. The Dalai Lama was the official secular and religious leader in Tibet, but his de facto power was limited in scope throughout Tibet. However, once in diaspora the Dalai Lama came to exercise more control of Tibetans. This is not to say that every Tibetan fully agrees with his central leadership, but he is perceived to be the face and voice of all of Tibet by the world. As a result the Dalai Lama and his leaders have sought to eradicate sectarianism within the Tibetan diaspora. This was not done to accumulate power, but instead was focused on gaining a voice in the global political arena. Tibet, as a displaced nation who was unrecognized by any major power, sought to begin a campaign against the Chinese in order to work towards self-determination in their homeland. Being a religious leader, the Dalai Lama and the Tibetan government-in-exile focused on religiosity and suffering, both of which were already religious values and historically entrenched ideals about Tibet in western imaginations.

Due to the Dalai Lama’s religious position he is in a powerful place to suggest to Tibetans what is appropriate and good for them. For the last decade or so, the rhetoric of the Dalai Lama and associated leaders and organizations has centered on religiosity and suffering. Over time this rhetoric has amassed into a metanarrative for all Tibetans, which has standardized the experience of Tibetans for the international community. Tibetan subjects have become the locus for enunciating the atrocities of Chinese repression and the enduring non-violent nature of the ‘Tibetan spirit.’

Tibetan identities are informed by a multitude of narratives, each with inherent goals. At the national level a metanarrative of Tibetan-ness focusing on religiosity and suffering seeks to mold Tibetans into billboards for the Tibetan freedom movement. There are also personal and local narratives that shape Tibetan lives. Personally, many Tibetans have experienced the level of suffering that is found in the metanarrative, but many more have not. Personal narratives are full of daily minutiae, such as education, shopping and travel to see family back in home villages. Regionally anchored narratives can also be replaced, as non-national identities are deemed divisive and thus castigated by Tibetan leadership (McGranahan 2005).
This paper will deal broadly with the branding of Tibet. First, Tibetans are branded as a nation in the international political arena in order to gain soft power to resist the Chinese (see Nye 2004; Magnusson 2002). Secondly, due to the nation branding campaign, Tibetan bodies have become the locus of confirmation and advertisement of Tibetan religiosity and suffering. This has resulted in the elevation of scars, both emotional and physical, to emblematic or symbolic status. In other words, the physical and emotional scars of Tibetans signify that they are true Tibetans, ones who have suffered at the hands of the Chinese. Tibetans as a whole are branded as a product for international consumption and as individuals through physical and emotional trials. Just as the cursive Coca-Cola and the circular crest of Starbucks signify all that is involved in their brands, so do the scars of Tibetans act as the logo of Tibet.

**Nation Branding Theory**

Nation branding has been a hot topic in the advertising and marketing world for several years, but it has much to teach us in the humanities about the processes and actions of nations in the global political economy. In a very general way, nation branding is not too much different than creating and maintaining an image for a brand such as Colgate or Pepsi. In short, it is reputation management, specifically the images surrounding the nation. It requires marketing in order to get information to the consumer. In the case of nation branding, the consumer is typically international investors, tourists, and foreign governments looking for political and economic allies (Hahn 2006).

In the social sciences the concept does not change very much, but instead of focusing on investment, tourism, and political relations we should examine the implications of branding the people within a nation. Dzenovska (2004) has taken a hold of nation branding and examined it according to an anthropological perspective. What she finds is that nation branding makes use of intentionally essentialized and exoticized images and ideals about the nation in order to market it to the world. Wally Olins (2001), a well-known advertising executive, argues that essentializing or making use of romantic notions of a nation is a significant means of branding a nation. Olins (2001) and others have also argued that nation branding includes the creation of national myths or narratives that unify the people living within the nation, thus forming a collective identity. These myths are often based on historical tales, rediscovered traditions and invented traditions (see Hobsbawm 1983). Nation branding is artistry, where existing and newly created elements are reshaped and melded together in a way that portrays the nation as desired.

In order to examine these processes we must view the nation as a discursive terrain, where competing imaginations jockey for position and prevalence (Dzenovska 2004). Raymond Williams refers to the nation as a key word, which triggers a catalogue of related ideals and images in the minds of the consumer/citizen (see Shore 2000). Thus, like individuals, nations can reinvent themselves, albeit in a much slower fashion. Branding a nation is much like pulling colors off of a painters pallet; it is the mediation and combination of a repertoire of characteristics, which can vary with the social/political environment and need.

Gudjonsson (2005) points out that people are perhaps the most important element of a successful nation branding campaign. His point is that a brand can not be successful unless the product matches the information and description that is present in the media (see also Olins 2001). Therefore, people must live according to the brand that is produced for international consumption, making a united collective identity paramount for the success of a nation branding
campaign. This can have a massive impact on identities within a nation, easily resulting in the subversion of individual experience and narratives if the metanarrative of the nation branding campaign is successful. Bruner (1986) has described dominant narratives such as a national narrative as a guiding metaphor that shapes personal memory. Cole (2005) adds to this, arguing that memory is inherently a habit that occurs only within a collective; it connects the individual to the collective. Such a narrative provides individuals with the ability to reconstruct their personal narrative to match the national narrative. Wang (2005) adds to this argument by emphasizing the importance of sub-national actors in constructing national brands and in complying with the brand’s image. In essence, individuals serve as living billboards for the dissemination of national brand advertising. They also serve as the location of validation for the consumer, either confirming the product or cancelling out the marketed images. Overall, it is easy to see that the branding of a nation is not only an economic or political activity; the construction and maintenance of national identity and the marketing of the nation to the world has far reaching effects on the citizens of that nation, shaping and reshaping personal memory and identity.

Tibetan Billboards

Since 1959 the Tibetan government-in-exile has fought a political battle against the Chinese for control of Tibet. Being politically and economically weak, the Tibetan government-in-exile has had to turn to a campaign of meekness in order to accomplish its goal. The Tibetan government-in-exile has no overt international power; therefore it uses what Nye (2004) has termed soft power, or non-direct and non-militaristic power in order to coerce more powerful nations into supporting them. This soft power campaign has never had a strong framework, but there has been considerable consistency in making use of existing imaginations of Tibetans as pious and natural as compared to the warmongering Chinese. Through the actions and materials produced by the Tibetan government-in-exile and non-governmental advocacy groups, a metanarrative of Tibetan-ness focusing on religiosity and suffering has been produced. This metanarrative is produced and maintained by pro-Tibetan websites, biographies of Tibetan refugees, and most notably in the worldwide speaking tours of the Dalai Lama. This metanarrative has gained considerable acceptance throughout the world as the official narrative of Tibet.

In essence, the metanarrative has become the marketing campaign the Tibetan brand, which has been constructed and managed by harking back to romanticized and exoticized imaginations of Tibet from the early 20th century and by melding them with modern Tibetan values and needs. Through the production of films such as Kundun and Seven Years in Tibet, and the increasing proliferation of images of pious and suffering Tibetans in print media Tibet has become a brand of religiosity and suffering. The message is consistent regardless of the source—so long as it is pro-Tibetan. Tibetans are peaceful, pious and overall good people.

The metanarrative of Tibetan-ness has become the narrative of true Tibetan-ness even for diasporic Tibetans. Therefore, Tibetans whose personal memories and experiences match up with the metanarrative become model citizens, and those with physical scars are raised up as symbolic citizens. The problem with this is that the metanarrative, in focusing on religiosity, peacefulness, and suffering, does not represent all Tibetans accurately. Many Tibetans live without consistent episodes of suffering, are not pious, or have even increased their social and economic standing under the Chinese. Also, many Tibetans continue to resist Chinese
occupation violently, forming resistance. This is true for Tibetans living in diaspora as well as in China. This creates anxiety for Tibetans with narratives without suffering and religiosity; they can feel and be perceived as less Tibetan than those with physical and emotional scars.

Therefore the branding of Tibet as a nation of peaceful, pious and suffering individuals inherently results in the reconstitution of Tibetan identities and memories. Those without narratives and memories that do not match up to the metanarrative have begun to appropriate the narratives of others. The story of Tibetan nationalism and their resistance to Chinese control has always been the preservation of a unique and valuable culture, but by valorizing these elements of Tibetan life they are building new Tibetans with new memories and narratives. However, this is not to say that the process of branding Tibet is producing carbon-copied citizens. It is simply arguing that individuals are under pressure to conform to the metanarrative, which in turn is pushing out region, religious, and social variability within the worldwide Tibetan community. Prior to the Chinese entry into Tibet in 1949, Tibet was a population fragmented along religious, regional and socio-economic lines with a long history of internal warfare. Through fostering a national identity for political purposes, much of the unique tradition and heritage is replaced with imported memories and experiences. Tibetans are in a way packaged for observation and consumption by foreign governments and empathetic onlookers in order to gain soft power in resisting Chinese occupation.

Finally, as increasing numbers of Tibetans have rejected the metanarrative’s definition of Tibetan-ness the case for Tibetan freedom is weakened. Tibetans are caught between their desire for freedom and conformation to the message of the Tibetan brand, and their own experiences and memories. This is a very unique situation, as Tibetans are acutely aware that they are constructing their identities on a daily basis. In the end Tibetans are left to sift through their own and other’s narratives to construct their identities, with dramatic implications for their choices.

Conclusions

The question of this paper is: What happens when a nation and its people are branded and identified under a new collective identity? And what happens when national narratives come to replace personal ones? The answer is not a clear one, but certainly it is evident that lives are drastically impacted. Personal memories and narratives can be replaced and altered, traditional identities can be overtaken, and personal identities can be infused with a political discourse that is foreign to the experiences of the individual.

This paper sought to being discussing some of the implications of branding Tibet. While there is no program or overt intention to ‘brand’ Tibet, there is however a clear campaign intended to shape the imaginations of foreign governments and international onlookers. Nation branding has primarily been used to understand the overt actions of a government to attract tourists and investment capital, but as this paper makes clear, it can do much more. Nation branding is a way to understand the policies and actions of a government in the political economy as well as in the social lives of its citizens. Not only are nations and places branded, but by proxy so are individuals; in a way they are constructed and packaged for international consumption. This paper deals only briefly with all the issues involved in nation branding, but it suggests the immense possibilities of examining the impact of nation branding on people and their identities.

Abstract

Resiliency: Lessons from diverse fields to inform marital research

Introduction

Researchers have long known that early marital adjustment is a challenging process. For example, Huston, Houts, Caughlin, Smith, and George (2001) reported that most newlyweds experience some struggles, and features of their interactions (e.g., responsiveness, antagonism) predict marital stability over a 13-year period. Extensive research has been dedicated to marital problems (e.g., conflict) and interventions, but less empirical attention has been given to couples’ own efforts to maintain and/or repair their relationships (Fincham, Hall, & Beach, 2006; Lambert & Dollahite, 2006). Thus, resiliency is an understudied phenomenon in marital studies.

Given its understudied status in relationship research, perhaps much can be learned from resiliency studies in other fields. Resiliency has been examined at the community, group and individual level. The purpose of this paper is to discuss the key points identified in resiliency research and the ways in which such research informs a “work-in-progress” study of resiliency among couples who have been married less than six years.

Community Resiliency

One form of research has focused on community engagement in survival and/or growth. For example, Varghese, Krogman, Beckley & Nadeau (2006) examined mill ownership and community resiliency. They described resiliency as the processes by which communities maintain their social functions and respond to changes. Resilience can be either reactive (adapting to extant events) or proactive (responding to anticipated events) in nature. Community resiliency has also been examined in educational settings. For example, Dass-Brailsford (2005) examined the ways in which environmental factors (e.g., transportation) created challenges that were buffered by social factors (e.g., teacher/family support) to promote academic achievement among students in South Africa. In both types of studies, community members are mindful of the logistical factors that might be beyond their control, but they focus on the aspects of community life that they can impact.

Group/Family Resiliency

Some studies have focused the role of groups/group members in resiliency. Some groups are self-constructed (e.g., families), whereas other groups are organizationally constructed (e.g., therapy groups). For example, Waller, Okamoto, Miles and Hurdle (2003) examined how family members affected drug use/resistance among Native American adolescents. They found that cousins/siblings were highly influential when they promoted drug resistance. The researchers argued that the cohesiveness and intimacy of Native American family culture as well as their peer status facilitated the power of cousins/siblings in adolescent resiliency. In a study of a creativity program for immigrant/refugee children, Rousseau, Drapeau, Lacroix, Bagilishya, and Heusch (2005) found that children had higher self-esteem and lower symptomatology (e.g., depression) after completing the program. In addition, they noted that the teachers had altered
perceptions from a problem-based focus to a resilience-based focus on immigrant/refugee children.

Individual Resiliency

Some studies have focused on individual’s traumatic life events and coping strategies. For example, researchers have focused on adult survivors of child abuse. Bogar and Hulse-Killacky (2006) interviewed female survivors of child sexual abuse to identify the resiliency qualities (determinants and strategies) to function successfully as adults. They identified determinants as qualities that were innate to the women (e.g., creativity) or learned at an early age (e.g., social skills) that provided a buffer against the corrosive nature of abuse. The coping strategies reflected current strategies that women used to function in the present without denying that the abuse occurred. In a study of cancer patients, Gotay, Isaacs and Pagano (2004) reported that survivors were more resilient, but not more optimistic, than patients who did not survive. In both studies, researchers concluded that resilient individuals face their problems realistically and do not have an idealized/denial-based view of their situations. However, individuals take a proactive attitude that their problems will not overwhelm them.

Resiliency Themes – What can be learned from diverse studies

There are some commonalities that emerged from resiliency studies. First, resiliency can be intentional. Individuals/groups/communities are aware of the challenges that they face and make an effort to address the challenges. Second, resiliency is experienced for recent and past events. There is an effort to make meaning of events and integrate them into their current status. In addition, there might be an expectation that some experiences will never fade in importance, but the ways in which they make meaning of the events can change. Third, there is an empowerment to resilience. Even if all events cannot be changed, there is a sense of efficacy in addressing the issues that can be controlled. Sometimes efficacy is achieved through action, but sometimes it is simply achieved through a changed perspective.

The Present Study – A “Work-In-Progress”

There might be much that we can learn from resilient couples about healthy marriage. The present study will address the gap in the marital literature by interviewing spouses who have endured and resolved early marital adjustment challenges. According to Veroff, Sutherland, Chadiha, and Ortega (1993), spouses construct their own reality of their marriage, and this construction is “particularly salient in the early years of marriage” (p. 326). During the early years, couples create norms that predict their marital stability and quality. Thus, a qualitative approach allows researchers to better understand the marital processes and narratives that couples create (Veroff, et al., 1993). As this study will examine marital resilience, a qualitative (focus group) approach will be utilized. More specifically, the purpose of this study is to identify the factors that contribute to marital resilience (e.g., overcoming marital adjustment challenges) during the first five years of marriage.
Method

Sample

The participants are being recruited via flyers within a college community, so the participants will be members of the community (e.g., students, staff, faculty) and their spouses. Both partners in married relationships will be asked to participate in the study. In order to participate in the study, the partner must be (a) legally married to a member of the opposite sex for less than six years; (b) have endured some type of marital challenge during the first few years of marriage; (c) be currently satisfied with his/her marriage, and (d) willing to participate in focus group interviews with other spouses.

Procedure

The focus group interviews will take place on campus, with 6-10 couples per interview session. Spouses will then be divided into two groups (one group of husbands, one group of wives). The male primary investigator will interview husband groups; the female primary investigator will interview wife groups. The focus group questions are listed in Table 1. The same questions will be asked for wife and husband groups. The interviews will be transcribed. The transcriptions will be coded based on grounded theory (e.g., Patton, 1992).
References

Table 1

Focus Group Questions

1. Many couples enter marriage with expectations. What were some of your expectations and how well did your experience fit your expectations?

2. Please tell us about the positive aspects of your marriage during the first 2 years.

3. Often couples face challenges in the early years of marriage. We are not asking for details about the challenges, but just the general issues such as money, in-laws, or communication. What challenges did you face and how did you deal with these challenges?

4. Sometimes people get fed up during challenges and think about leaving the marriage. Were you ever motivated to leave?

5. Whether or not you ever thought of leaving, it is obvious that you stayed married. Please explain the reasons or experiences that helped you stay in the marriage.

6. After couples resolve challenges, their marriages are often different. Did your relationship change? In what ways did it change?

7. What advice would you have for couples going through a similar challenge?

8. Is there anything that we should have talked about, but didn’t?

9. Do you have any other questions/comments?
ABSTRACT: “Sex and a Founding Father: Gouverneur Morris, his Sexual Identity and his Biographers”

While sex and family are traditionally associated with women, in significant ways sex (the feelings, actions, and identities associated with eroticism) shaped and molded a variety of models of manhood in early America. Despite a superficial awareness of sexual histories of the political leaders of the founding era, we have not yet analyzed them with an eye to early American ideals of sex and masculinity – nor have we thought about how those stories are retold, and in some cases discarded, by subsequent generations. This paper examines the sexual and erotic components of manliness in the life and biographies of one of the Founding Fathers, Gouverneur Morris.

Although not as well known as other Founding Fathers, Gouverneur Morris has been rightly called one of the fathers of the Constitution. Similar to Benjamin Franklin, Morris enjoyed a varied sexual life outside of marriage in the social context of Europe. As a bachelor who played the field, he has been called by one recent biographer the “rake who wrote the constitution.” Morris’s explicit diaries offer us information on how he thought about his sexual experiences and how they informed his masculine, cosmopolitan identity.

This paper is part of a larger project that examines sex and the Founding Fathers. That project contributes to our understanding of public memory and celebration of the political leaders of the new nation by focusing on how sexuality in biographies of political leaders of the new nation has created and differentiated norms of American masculinity. Thus, this paper is part of a larger project that will shed light not only on the men known as the Founding Fathers, but on the history of sexuality in America, on changing notions of sex and masculinity, and on memory and biography.
“Honor Killing” in Muslim Societies and its Effect on Immigration to the US: A Network Approach using the Cases of Tunisia, Yemen, and the Persian Gulf States.

Honor killings are an integral part of Arab and Muslim normative structure. In this paper I discuss the importance of understanding family and tribal norms in these societies for immigration cases for people originating from Yemen, the Persian Gulf States, and Pakistan. I use three case studies that were handled in US. Immigration Courts to illustrate the complexities associated with the possible return of individuals to a society that sanctions the use of murder to restore the family honor.

Abstract

This 90 minute workshop will review the mission, vision and purpose of the National Child Traumatic Stress Network, provide an introduction to child trauma assessment, including an orientation to several different measures, and an overview of Trauma-Focused Cognitive Behavioral Therapy, an evidence-based practice for the treatment of traumatized children and their caregivers.
Sexual Orientation, Mental Health, and Service Outcomes for Youth in Transitional Living Programs

Abstract

Introduction: Although considerable attention has been paid to runaway/homeless youth, research on outcomes of youth who are involved in federally-funded transitional living programs (TLPs) has been scant. Research suggests that sexual minority youth are overrepresented among homeless youth, and that these youth are at increased risk for negative outcomes relative to their heterosexual counterparts. This presentation uses a risk/protective conceptual model to examine the impact of sexual orientation on outcomes from TLPs.

Methods: Youth participating in TLPs nationwide between 2002 and 2004 (N=1552) were interviewed upon entry and exit using the Runaway and Homeless Youth Management Information System. The dependent variable, outcome of service use (safe or appropriate exit/not; e.g., to homelessness), was modeled by sexual orientation (homosexual/heterosexual), gender, presence of mental health needs, and current substance use through logistic regression.

Results: Thirty-eight percent of participants experienced safe and/or appropriate exit from TLPs. Seven percent of the sample identified themselves as a sexual minority. Sexual orientation did not significantly predict safe exit. Mental health needs and current substance abuse decreased likelihood of safe exits.
Discussion: Although findings affirm general service research that mental health and drug use are significant risk factors, they fail to support previous research in that sexual orientation did not contribute to risk of unsafe exits. The small proportion of youth self-identifying as sexual minority may represent the presence of unanticipated barriers to services for these youth, or alternatively may represent the presence of perceived stigma inhibiting accurate reporting.

Paper session
Sigmund Freud once said to Salvador Dali, “it is not the unconscious that I seek in your pictures, but the conscious. While in the pictures of the masters, Leonardo or Ingres, that which interests me and which seems mysterious and troubling to me, is precisely the search for the unconscious ideas, of an enigmatic order, hidden in the picture, your mystery is manifested outright. The picture is but a mechanism to reveal it.”¹

The Portrait of Monsieur Bertin is the result of the Jean-Auguste-Dominique Ingres’ ability to represent the unconscious, innate spirit of his sitter (figure 1). The artist employed innovative formal devices to establish an immediate psychological connection between Bertin and the viewer. Ingres painted a “true” portrait of an individual, personified the very nature of the July Monarchy, and created a distinguished image for posterity. His rendition of a commanding, influential figure like Monsieur Louis-François Bertin recalls the way in which Roman portraiture not only indicated the status of the sitter, but also insured his or her civic immortality.² Ancient writers such as Pylobius and the Roman Senator Pliny asserted a portrait should do more than simply represent the sitter’s outward appearance; it should capture his spirit.³

Given that antiquity was lauded as the worthiest source of emulation during the Renaissance, artists were again faced with the challenge of depicting a sitter’s character. The role of portraiture echoed the Humanist interest in the dignity of human beings. Ergo, an influential individual warranted depiction for posterity. As the status of

---

portraiture was second only to the most noble and prestigious genre of history painting, Renaissance artists approached a portrait with high aesthetic consideration.

As a self-proclaimed disciple of Raphael, Ingres believed the earlier master’s work was synonymous with perfect art. He praised his hero’s genius and facility. In his comparison of the work of Michelangelo and Raphael, Ingres states:

One concludes of Raphael’s contentment, that it was of divine nature, inviolable. When considering the enormous and sublime oeuvre of Michelangelo as a product of his own heart, one sees within his work symptoms or marks of human fatigue. One has the opposite reaction to Raphael. Raphael’s oeuvre is divine because each creation appears effortlessly created, like the creation of God; his work seems to be a pure effect of the will.⁴

After praising Raphael’s Disputa, Ingres summarized the inopportune lot in his own life. “With thus [the art of painting] let us continue, and try to imitate it, to estimate it; despite being me. I am unhappy that all my life I will regret I was not born in his [Raphael’s] century. When I think three hundred years earlier, I could have truly become his disciple!”⁵ Nevertheless, Ingres translated the portraiture innovations of the Renaissance Masters exceptionally for the art of his own day by combining them with his own modern aesthetics.

During the Renaissance, formal developments in the genre of portraiture created greater immediacy for the depiction of human likeness. The three-quarter view of the

---

⁵ Jean-Auguste-Dominique Ingres, Ingres raconté par lui-même et par ses amis: pensées et écrits du peintre (Geneva: Pierre Cailler, 1947), 98. A donc continuons, et tâchons de l’imiter, de le deviner, en étant, moi, assez malheureux pour avoir à regretter toute ma vie de n’être pas né dans son siècle. Quand je pense que, trois cents ans plus tôt, j’aurais pu devenir son disciple véritablement!
sitter offered advantages over the profile portraits of the quattrocentro, in which the sitter stares off into another realm beyond the canvas. This pose provided a more naturalistic visual documentation of the subject. In Italy, the first artists to render their sitters addressing the viewer since antiquity were Leonardo da Vinci, Sandro Botticelli, and Raphael. The enduring prominence of Leonardo’s *Mona Lisa* indicates the alluring intimacy created by a gaze directed beyond the picture-plane. With this subtle change, the portrait became a means of psychological connection between the sitter and the viewer.

Raphael’s portrait of *Portrait of Baldassare Castiglione* (1514-1515) is a model of intimate directness (figure 2). The composition is comprised of only two planes: the indeterminate background and the picture-plane. There is no reference to an inaccessible landscape or a foreground, which would separate the sitter from the viewer. Whether standing inches or feet away from the painting, Castiglione’s presence commands our attention. The implied position of the viewer is just as important as the pose of the sitter. The pose indicates the subject’s attitude toward the viewer and by extension, the world in which he lives. For example, in portraits of rulers we invariably find ourselves looking at them from below in a subservient position.

Raphael depicted Castiglione with the disposition the sitter advocated in his *Book of the Courtier*, 1528. The author calls upon the nobility to embody civility. The text was translated into many languages and served as a guidebook for rulers throughout Europe. The *Portrait of Baldassare Castiglione* captures the sitter’s confident self-possession and elegant propriety, the idyllic Humanist persona of the High Renaissance. The artist emphasizes the *riposo* (inner calm) of his subject through formal elements.
The daringly monochromatic palette of grey tones and the compositional design emphasize the sitter’s stability. Castiglione’s head and hat form a sphere, balanced atop a geometrically stable pyramid formed by his neck, arms, and upper torso. Thus, Castiglione’s figure epitomizes balance and restraint, despite his prominent socio-political station in life.

While conceptualizing the essence of Louis-François Bertin, I suggest Ingres considered the Portrait of Baldassare Castiglione. Raphael’s portrait serves as a precedent for depicting the civic import of a figure, along with his personal character and physiognomy. The provenance of the painting indicates that by 1661, King Louis XIV had acquired it for his collection in Paris, where it remains to this day in the Louvre. As a student of the state-funded Academy, Ingres would have been able to study directly from the painting. An analysis of the formal similarities and differences between the Portrait of Bertin and the Portrait of Castiglione indicate Ingres was deeply conscious of the complexity required to capture the spirit of both models on a two-dimensional surface. Consequently, the Portrait of Bertin represents Ingres’ ability to reinterpret the traditional aesthetic for portraits of the gallant and commendable as they had existed since antiquity, with his individual genius of facture and aesthetics. The Portrait of Bertin caused contemporary art critics to re-evaluate the characterization of Ingres as an artist who was detached from world in which he lived. Unlike the paintings Ingres exhibited at the Salons since 1801, critics could not refute the immediacy and veracity of Ingres’ representation of the infamous Bertin.

The social status of Castiglione and Bertin afforded them great influence in their respective eras. As respected men of letters, Castiglione is the pinnacle figure of

---

6 Provenance of the painting: Rome, 1515-1541; Mantua 1541-1661; Paris, Collection of Louis XIV, 1661.
aristocracy and Renaissance Humanism while Bertin is the penultimate example of the new wealthy bourgeoisie of the July Monarchy. Both men force the viewer to understand their prospective means of authority according to the cultural and political realities of their era. Castiglione garnered respect due to his education, cultivation, and position in a class system in which he was at the top of the hierarchy. Bertin wielded power due to his prosperity and the political influence of his newspaper, Le Journal des Débats. One communicates aristocracy; the other overturns the pre-determined elitism of aristocracy. Each portrait conveys a unique appearance and spirit in addition to how the sitter’s status in life affected their relationship with the viewer. Bertin signifies liberalism and burgeoning capitalism. Castiglione represents the reawakening of the classical pursuits, landed gentry, and the desire for social codification. Both painters render their sitters fully engaged with the viewer, using subtle artistic devices to imply that it is the sitter who determines the extent of the interaction.

In the Portrait of Castiglione, the forms comprised by shades of gray and black create a frame around the light hues of the sitter’s flesh and ashen cravat. The contrast of light and dark emphasizes the importance of Castiglione’s head as the repository of civil rationale. The texture of his rich, silky grey fur jacket, the smooth folds of the scarf covering his throat, his black velvet hat, and soft, sculpted beard suggest a sensitive subtlety of character.7 A sense of deep analysis permeates through his bluish-grey eyes. His head faintly tilts to the right as he twists his torso slightly toward the picture-plane, and gently clasps his hands. The intricate suggestions of action hidden within his calm and stable armature indicate restrained energy. Castiglione’s spirit materializes as it oscillates between disconnecting and relating to his composed physical appearance. The

---

serene composition, colours, and textures of the Portrait of Castiglione welcome the viewer, yet the restlessness of the sitter requests distance.

In her extensive analysis of The Great French Painters, Camille Mauclair describes Ingres’ portraits as “absolutely dry; they do not create mystery, but reflection and psychological curiosity. They are intense, but they cannot move the beholder.”8 The following study offers an alternative perspective to this conventional nineteenth-century interpretation. Ingres subscribed to the Academic hierarchy of genres, and lamented painting mere portraits, when he was already an esteemed history painter. However, Ingres’ own work indicates he ultimately endowed all he painted with the grandeur, monumentality, and authority of history paintings. He approached each project with the planning and preparation required for history paintings. Ingres imbued his portrait sitters with the only artistic idealism he knew, that of antiquity, the Renaissance, and his own conception of the ideal. Painting itself required no less.

Ingres won the Prix de Rome in 1801, but his studies in Italy were postponed because the French coffers were drained by the expense of the Napoleonic Invasions. Shortly after Ingres arrived in Rome in 1806, once again the government was insolvent. Without state commissions and funding, Ingres turned to painting portraits of the abundant prosperous tourists and aristocrats for sustenance. When he returned to France in 1824, Ingres had become the most sought-after portraitist in Europe. When Ingres received the commission to depict Bertin in 1832, he conceived of the project as a modern bourgeois portrait. Ingres’ abstract yet hyper-realistic facture, for which he had heretofore endured fierce criticism, mystified the art critics and public when they saw the

---

finished painting at the Salon of 1833. By the turn of the century, the Portrait of Bertin came to symbolize an entire caste, which proliferated during the eighteen years of the July Monarchy. Edouard Manet described the portrait as the “Buddha of the bourgeoisie.”

Louis-François Bertin (1766-1841) was the editor of Le Journal des Débats (The Journal of Debates), a Parisian daily newspaper that served as one of the most influential organs of the French press in the nineteenth century. Gaultier de Biauzat established the publication in 1789 to report the debates of the National Assembly. The Bertin family acquired Débats in 1799 during the rule of the Directory. Under Bertin’s editorial control, Le Journal des Débats was a prominent conduit of liberal, royalist journalism, which rallied to support the rule of the Duke of Orléans. After the Bourbon Restoration (Louis XVIII and Charles X), Bertin’s views (and those of his readers) became reality under the July Monarchy. This period of constitutional monarchy under King Louis-Philippe lasted from 1830 to 1848. Robert Bezucha describes the July Monarchy as the age of commodity, the steam-age, and the commercialization of daily life. With the establishment of the first primary education system (Guizot Act, 1833) and the technological advances in print culture for mass distribution, a nation of readers was created. The society of the July Monarchy propagated the circulation of words and

---

9 Uwe Fleckner, Jean-Auguste-Dominique Ingres, 1780-1867 (Cologne: Könemann, 2000), 78.
10 The Directory ruled France from 1795 to 1799. The Council of Ancients (les Anciens) and the Five Hundred (Cinq-Cents) elected the five members of the executive branch. In November of 1799, two members of the Directory, Paul Barras and Abbe Sieyes, plotted with Napoleon Bonaparte to overthrow their colleagues. The Coup of Brumaire succeeded and the Directory was dissolved. It was replaced by the Consulate.
Bertin gained prestige, respect, and influence as a voracious voice of the bourgeoning, increasingly wealthy and educated middle-class.

Like Raphael in his representation of Castiglione, Ingres sought to convey the spirit that pervaded Bertin’s physical appearance. Everything about Bertin suggests 
*sang-froid*. Bertin engages us directly; leans forward in his chair, legs parted, and his great claw-like hands grasp his knees as he fixes us with his gaze. The shallow foreground creates the sensation we are alone in Bertin’s domain. We push our chair back and become Bertin’s audience rather than his colleague. From any distance, and from any point of the room, he finds you and evaluates you. Yet his presence is elusive. His eyes do not remain fixed on one object as he scrutinizes all that comes before him. The position of the viewer and the viewed has been reversed. Suddenly you feel self-conscious, and anxiously wait for him to rise to shake your hand so you can leave M. Bertin’s intense presence. As Robert Rosenberg observes, Bertin’s “nearly ferocious presence is achieved by the construction of space he occupies… The resulting sense of an elusive, interior life makes the frontality of the gaze all the more hypnotic.”

Ingres had particular difficulties finding a suitable pose to render his robust, dominating sixty-six-year-old patron. Philosopher and art critic Edmond About defines portraiture as a timeless representation of the individual. In his 1857 discussion of Ingres, About considers the aesthetics of Ingres with Romantic overtones.

> M. Ingres par excellence has the quality M. Delacroix lacks. Armed with patient will, which makes immortal masterpieces, he waits in front of a figure until the figure returns to the master. It takes time to see and study, make and remake, and to follow the precept of the Boileauian

---

method. Ingres enters the life of his model and penetrates into all of his sitter’s habits. When Ingres started to paint M. Bertin, he realized that the model was not in his normal state, he was missing something. It was a large cardigan, which the journalist usually wore under his blazer, but he had taken it off that day. Ingres made M. Bertin put on the extra garment, thus, you will recognize the thickness the cardigan adds around the arms. M. Ingres does not count the sessions with his sitter; he saves neither his model nor himself; Ingres made the Duke of Orléans pose more than eighty times.  

One of Ingres’s first charcoal and pencil sketches of his sitter accentuates the curvilinear s-shape of Bertin’s standing body (figure 3). This nonchalant, relaxed position did not capture the veracity of mind and spirit housed in his vigorous yet corpulent body. A pose that captured the psychological force of his sitter finally appeared to Ingres while Bertin was participating in a heated political discussion at his home (figure 4). After months of observing and posing his sitter, it was in a moment of spontaneous intensity that Ingres found his inspiration. The artist then executed the painting in less than a month.  

Ingres delighted in the few reflective surfaces in the scene, which contrast with the chocolate pudding-like layers that form his garments. Every ripple and fold in the silk vest and velour coat is captured with meticulous accuracy. The light source from the upper-left corner is revealed by the window’s reflection onto the mahogany arm of the

---

15 About, 41. M. Ingres possède par excellence la qualité qui manque à M. Delacroix. Armé de cette volonté patiente qui fait les chefs-d’œuvre immortels, il s’installe devant une figure jusqu’à ce qu’il s’en soit rendu maître. Il prend le temps de voir et d’étudier, de faire et de refaire, et de suivre en tout point le précepte du grammaire Boileau. Il entre dans la vie de son modèle et pénètre dans toutes ses habitude... Lorsqu’il a commencé à peindre M. Bertin, il s’est aperçu que le modèle n’était pas dans son état normal, et qu’il lui manquait quelque chose. C’était un gros gilet de tricot que le journaliste portrait habituellement sous ses habits, et qu’il avait dépouillé ce jour là. Il fit rentrer M. Bertin dans ses habitudes, et vous reconnaître sous la redingote l’épaisseur du tricot qui arrondit les bras. M. Ingres ne compte pas les séances: il n’épargne ni son modèle ni lui-même, et il a fait poser plus de quatre-vingts fois le duc d’Orléans.

16 Georges Vigne, Ingres (New York: Abbeville Press, 1995), 188.
chair and Bertin’s belt buckle. The monochromatic sepia tints and grayish-brown modeling produce a dense atmosphere. The dim and heavy brown and black colours that comprise the sitter’s realm in the bottom half of the painting are alleviated by only a tiny slice of the crimson-coloured chair seat, revealed between Bertin’s parted legs. Through the careful incorporation of the royal colour red, the artist integrated the political stance of his sitter into the composition.

Ingres once expressed how he used reason to capture the truth in painting: “The most important thing is to be directed by reason in order to distinguish truth from forgery. With it alone, one can learn to discriminate clearly between them, aided by continual exposure to the beautiful.”\(^1\) Ingres was willing to emphasize the abstract pictorial demands of the flat painting surface at the expense of naturalism. He constructed forms in an illusionistic manner, akin to the Renaissance understanding of a painting as a “window,” while responding to the two-dimensionality of the canvas in a truly modern way. The irony of Ingres’ aesthetics is the extent to which he forgoes illusionism in response to the flat picture-plane, despite his reverence for the formal ideals of the Renaissance.

Ingres’ contemporaries acknowledged the microscopic accuracy of his paintings, which some art historians since have considered realism. Uwe Fleckner explains, “Ingres did not in fact structure his painting in a realistic manner, in spite of the representational exactitude of all the pictorial details... The character and nature of the subject are not grasped in photographic reproduction... The Portrait of Louis-François Bertin proclaims

---

the semanticization of formal values that have become autonomous.” In his depiction of Bertin, this involved anatomical and dimensional abstraction of symbols produced with scrupulous clarity. For example, the modeling on the side of the chair provides the illusion of three-dimensionality, but the back of the chair curving around Bertin’s left torso is rendered as a flat area of local colour. Bertin’s left arm is foreshortened, but if he were to stretch his arm out, it would be much shorter than his right arm. Additionally, the length between his elbow and wrist would inaccurately dwarf the shortened length between his shoulder and elbow. In essence, Ingres utilized pictorial effects to flatten the space, yet through the precision of his miniaturesque treatment of details, the forms appear realistic.

In his preparatory sketches, Ingres observed and recorded the nature of his sitter with line drawings. By averting his eyes from colour, the portraitist captures the permanent sub-structure beneath the shell of elaborate dress and ornaments, which conceal true character. Through his technique of perfecting and abstracting anatomy and depth for the most powerful pictorial effect, Ingres idealizes his sitter, while maintaining the accuracy of their individual features and spirit. For instance, he provided a symbolically superficial rendering in *Napoléon I on the Imperial Throne Bonaparte*, 1806 (figure 5). The portrait is drained of dynamism. It indicates a scientific method of observation and a conservative facture indicative of stability and immobility associated with the preservation of institutions. Ingres self-effacing brush-stroke and linear clarity correlate with the pretense of tranquility within the government after the French Revolution.

---

18 Fleckner, 78.
Salon of 1824

Traditionally in art historical scholarship, the Salon of 1824 is cited as the exemplar for the dichotomy between Classicism (ancients) and Romanticism (moderns). The former represented by Ingres, who exhibited the *Vow of Louis XIII*, the latter by Eugène Delacroix, who showed the *Massacre at Chios* at the Salon. Ingres painted in a style coined *le beau* (the beautiful). His work was associated with classical academic theory and the conservative control of art during the ancien régime. Conversely, Delacroix’s style was identified with the liberal, progressive, and anti-academic aspects of Romanticism.

Martin Rosenberg utilizes the commentary of two contemporary art critics, Marie-Henri Beyle Stendhal and E. J. Delécluze, as the basis of his argument about the rivalry between the Classical and the Romantic. Stendhal was one of the leading advocates for abolishing the classical principles in art. He considered the work of the Renaissance Masters an example of technical excellence, but it was not to be imitated. In contrast, Delécluze considered Raphael’s work worthy of emulation. He regarded Raphael as “the greatest painter of all the modern schools.” Stendhal admired Raphael’s authenticity for his own time, but he believed the ideal of the Renaissance could not communicate the complexities of the current age. Focusing on the ideological debate between Classicism and Romanticism, however, tends to eclipse any investigation into other aspects of the 1824 Salon. I suggest both Ingres and Delacroix represent Romanticism, albeit with different aesthetics and facture. Both artists shared the desire to capture the metaphysical

---

21 Rosenberg, 321.
truth of their respective subject matter. Additionally, both conceived of their role as artists within the entire history of art, and as such considered their work a unique contribution to human achievement.

**Salon of 1833**

In his description of the Salon of 1833, Gustave Planche records the sensation created by Ingres’ portrait:

> For the past month the crowds of promenaders have been swarming to see the *Portrait of M. Bertin the Elder*. Without understanding, or even remotely suspecting, the innumerable questions of historical and critical interest, which this important work has raised, they have fallen under its spell. As best they can, they study the details of the head, portrayed with such marvelous perception and, with an almost childish pleasure, they examine the tactile qualities of the materials and the conspicuousness of the armchair; the simplicity and strength of the pose enraptures them and they never weary of contemplating with fascinated absorption the eyes and lips, so expressive and speaking.²²

Scholar Francis Jourdin posits the positive response to the *Portrait of Monsieur Bertin* at the Salon of 1833 was a reaction to the authority conveyed by the portrait in comparison to the uproar created by Romanticism.²³ Daniel Ternois explains that any praise of *Bertin* stems from the accurate depiction of Bertin and his socio-historical position.²⁴ The reception of the portrait may initially have been linked to the social status of the sitter, however, because Ingres rendered Bertin with such virtuosity and vivacity, it forced art critics and members of the public who heretofore had disregarded or

---

admonished Ingres to evaluate the work with fresh criteria, particularly in when it was seen in 1846 and 1855.

Contemporary poet, novelist, and art critic, Théophile Gautier applauds Ingres for Bertin’s penetrating insight into the very essence of the sitter and the socio-political realities in which he lived. In his evaluation of the painting, Gautier writes:

The portrait produced one of the most difficult tasks in art that a painter can propose; -- the Great Masters alone, Leonard de Vinci, Titian, Raphael, Velasquez, Holbein, Van Dyck succeeded in this task -- M. Ingres has the right to be involved in this famous entourage; no one has made a portrait better than he has. He adds an internal resemblance to the external likeness of the model; beneath the physical portrait, he paints the moral portrait. Is the magnificent pose of M. Bertin not the revelation of an entire era, as he rests his fine and muscular hands on his hefty knees, like a bourgeoisie Caesar… Replace his coat with a fold of crimson, and he will become a Roman emperor or a cardinal. Such as he is, he is the honest bourgeois under Louis-Philippe, and the six volumes of Doctor Véron do not tell any more about this departed age.25

In his description of the Salon of 1833, professor and critic Charles Lenormant states that because of the Portrait of Bertin, “M. Ingres stands alone in the exhibition, more isolated than his students would like, a bit pale like a phantom, but a phantom of such stature, proportion, and aspect that living creatures dare not risk comparison with

25 Théophile Gautier, *Les Beaux-arts en Europe*, première série (Paris: Michel Lévy Frères, 1857), 163-164. Le portrait élevé jusqu’à l’art est une des tâches les plus difficiles qu’un peintre puisse se proposer;-- les grands maîtres seuls, Leonard de Vinci, Titien, Raphaël, Velasquez [sic], Holbein, Van Dyck, y ont réussi.—M. Ingres a le droit de se mêler à cette illustre phalange; personne n’a fait le portrait mieux que lui. A la ressemblance extérieure du modèle il joint la ressemblance interne; il fait sous le portrait physique le portrait moral.—N’est-ce pas la révélation de toute une époque que cette magnifique pose de M. Bertin de Vaux appuyant, comme un César bourgeois, ses belles et fortes mains sur ses genoux puissants… Remplacez la redingote par un pli de pourpre, ce sera un empereur romain ou un cardinal.—Tel qu’il est, c’est l’honnête homme sous Louis-Philippe, et les six tomes du docteur Véron n’en racontent pas davantage sur cette époque disparue.
Ingres painted not only a “true” portrait of an individual and personified the very nature of the July Monarchy, he also created a poignant image for posterity, regardless of the sitter’s identity.

At the Salon of 1834, Ingres exhibited the *Martyrdom of Saint-Symphorien*, for which he had dedicated over two years of work. He considered it a religious history masterpiece. Accordingly, Ingres was particularly sensitive to the degrading criticism the painting received. Accusations of artistic imperialism dominated the critical discourse at the Salon. Liberal and conservative critics alike ferociously condemned the epic monument. The artist was profoundly distressed that his monumental religious painting was not a source of unifying admiration, and vowed never again to exhibit at the Salon.

A year later, Ingres solicited and received a post at the French Academy in Rome. Ingres upheld his protest against the Salon, however, under distinct stipulations he would exhibit the *Portrait of Bertin* in public two more times.

**Galerie Classique Exhibition, 1846**

The praise of the *Portrait of M. Bertin* increased exponentially when it was shown in 1846 at the Galerie des Beaux-Arts. The exceptional response to the *Portrait of M. Bertin* is illuminated when considered in light of the search for new superlatives and conceptions of individuality and modern identity, after the inconsistent social signifiers of the early nineteenth century. In *Curiosités esthétiques* Charles Baudelaire includes a

27 Ingres was a professor at the École des Beaux-Arts from 1829 to 1834; he then served as president from 1834-1850.

28 Ingres was the director of the French Academy in Rome until 1841.
review of Le Musée Classique du Boulevard Bonne Nouvelle.29 “Every thousand years a
spiritual ideal appears. We are grateful to have this exhibition of 1846, during our
lifetime. Thus, the year 1846 offered the sincere, enthusiasts of the fine arts the pleasure
of seeing ten paintings by David, and eleven by Ingres.”30 Baudelaire asserts:

M. Ingres proudly exhibits a special show of works
spanning his whole life, or at least a sample from each time-
period of his life, in short, all the Genesis of his genius. M.
Ingres has refused to exhibit at the Salon for a long time,
with reason. His admirable talent is collapsed in the Salon
setting by the mobs, where the public, dazed and tired,
submits to that which shouts the loudest. M. Delacroix
requires a superhuman courage to face so much criticism
annually. When a less hostile setting in which to exhibit
presented itself Ingres made superb use of the occasion.31

At the unique, tranquil setting of the Galerie des Beaux-Arts, viewers could
become emotionally involved with the Portrait of Bertin. Understandably, Ingres
participated in the exhibition under very specific conditions. The show was a charity
event for the emergency fund of the Société des Artistes. The theme was a celebration of
the French classical tradition since 1900, but Ingres had a room dedicated to his work
alone. The exhibition included the paintings of Jacques-Louis David, Anne-Louis

---

29 Le Musée Classique du Boulevard Bonne Nouvelle was more commonly referred to as the Galerie des
Beaux-Arts exhibition of 1846, but was also called the Galerie Classique Exhibition or the Bazar Bonne-
Nouvelle (a department store adjacent to the Galerie).
30 Charles Baudelaire, Curiosités esthétiques (Lausanne: Éditions de L’Oeil, 1956, 1868), 92. Tous les
mille ans, il paraît une spirituelle idée. Estimons-nous donc heureux d’avoir eu l’année 1846 dans le lot de
notre existence; car l’année 1846 a donné aux sincères enthousiastes des beaux-arts la jouissance de dix
tableaux de David et d’once de Ingres.
31 Ibid., 97. M. Ingres étale fièrement dans un salon spécial tableaux, c’est-à-dire sa vie entière, ou du
moins des échantillons de chaque époque, bref, toute la Genèse de son génie. M. Ingres refuse depuis
longtemps d’exposer au Salon, et il a, selon nous, raison. Son admirable talent est toujours plus ou moins
cultué au milieu de ces cohues, où le public, étourdi et fatigué, subit la loi de celui qui crie le plus haut. Il
faut que M. Delacroix ait un courage surhumain pour affronter annuellement tant d’éclaboussures. Quand
à M. Ingres, doué d’une patience non moins grande, sinon d’une audace aussi généreuse, il attendait
l’occasion sous sa tente. L’occasion est venue et il en a superbement usé.
Girodet, François Baron Gérard, Antoine-Jean Gros, Pierre-Paul Prud’hon, Theodore Géricault, Paul Delaroche, Ary Scheffer, and Léon Cogniet. Ingres was persuaded to enter his final official public exhibition at the 1855 Universal Exposition in Paris. The critical reaction to the 69 works he displayed was mixed; some conservative reviewers hailed him as an artistic messiah, while progressive critics denounced his style as prosaic and completely irrelevant for the modern age. Ingres was venerated for posterity at the Exposition, however. He was the first artist to become a Grand Officer of the Legion of Honour.

In his widely read book *Grammaire des arts du dessin*, French art critic Charles Blanc (1813-1882) states:

> For a century, artists have surpassed their predecessors in exaggerating the exceptional, heightening the accidental, to represent certain strange types, certain temperaments engendered by the crossing of races and the current of new thoughts. In our days, in his portrait of Bertin, Ingres indicated with rare power the strength of his model; merely by the attitude he caught after having observed him for months. In this admirable portrait, we find the indelible features of an individual that it would be impossible to confound with any other… Yet how profoundly individualized is the physiognomy of the original, not only by the questioning expression of the piercing eye, the slight disorder of the hair, the taper finders of the puffy hands, whose optical physiognomy completes the moral physiognomy of the portrait.

In his critique of the *Vow of Louis XIII*, Stendhal discourages Academic Neoclassical painters like David and Ingres from choosing subjects that demand a great depth of expression. He considers Ingres a distinguished draughtsman, but lacking a

---

necessary celestial fire to add soul and expression to his figures. He notes, “David’s school, while very skillful in depicting the muscles that cover the human body, is not capable of doing faces that express accurately a given emotion.”

Thirteen years later, Baudelaire argues that it is Ingres who is capable of creating “real portraits, which is to say ideal reconstructions of individuals.” In reference to the Portrait of Bertin he adds, “open your eyes, foolish nation, and say whether you have ever seen painting that is more sparkling and flashy, or even of greater tonal sophistication?”

The unexpected praise of the Portrait of Monsieur Bertin reveals a contemporary re-evaluation of Ingres’ aesthetic capabilities. The public and critics responded to the intense and evocative nature of the Bertin. Despite the established categorization of Ingres’s work (as early as 1824) as an antiquated symbol of irrelevant, remote, academic classicism, the viewers at the 1833 Salon, the Galerie des Beaux-Arts, and the Universal Exposition of 1855 could not deny the modern reality encapsulated by the portrait.

Abstract

Adolescents’ capacity to regulate strong emotions is an important aspect of successful adolescent development. To date, no measure has been available to assess adolescents’ ability to regulate their strong emotions. This study used the MACS, an adapted version of the Affective Control Scale (Chambless & Williams, 1982), to survey over 2100 high school students, aged 12-18 years. A further 1200 of these completed a follow-up survey. The findings indicated that, in general, males had an increased fear of positive emotion and anger, whereas females had an increased fear of negative emotions of depression and anxiety. Females were also less able than males to take charge of their strong emotions. In addition, fear of negative emotions was greatest for girls aged 14 years. The MACS proved to be a useful and dependable way of ascertaining adolescents’ emotional functioning.
Adolescent Regulation of Strong Emotions: Age and Gender Differences

The capacity to control or regulate emotions and related behaviours is a major developmental task (Cicchetti, Ganiban, & Barnett, 1991; Dodge & Garber, 1991; Eisenberg & Spinrad, 2004). The construct of emotion regulation (ER) has been reported in the literature as spanning a number of dimensions, including physiological, behavioural, cognitive (Shipman et al., 2003), motivational and biological (Halle, 2003). This diversity has lead to considerable differences in the way emotion regulation, and its dysregulation, have been operationalised within empirical studies. As a consequence, questions have been raised as to its utility as a scientific construct, with assertions being made that it is “diffuse, overly inclusive and poorly defined” (Cole, Martin, & Dennis, 2004). Cole et al. stress the importance of researchers providing working definitions to improve clarity and methodological rigor while (Bridges, Denham, & Ganiban, 2004) further argue that any definition needs to have a strong theoretical underpinning. A widely accepted definition of ER was put forward by Thompson (1994, p 27-28) who suggested that ER “consists of the extrinsic and intrinsic processes responsible for monitoring, evaluating, and modifying emotional reactions, especially their intensive and temporal features, to accomplish one’s goals”.

Much of the research conducted on ER has focused on infancy, and school-aged preadolescent children (Shields & Cicchetti, 1997; Walden, Harris & Catron, 2003), but few studies have investigated the regulation of strong emotions, particularly in adolescents. Current research indicates that the salience of emotion regulatory goals increases with age (Carstensen, 1995) and emotional control may likewise increase with age (Gross, Carstensen, Pasupathi, Tsai, Gottestam & Hsu, 1997). The instability of emotions in early adolescence may be related to the variability
of hormone levels during this developmental period (Buchanan, Eccles & Becker, 1992).

Hormones have been shown to have effects on the experience of positive and negative affect, with puberty related to an increase in negative affect (e.g. Brooks-Gunn, Graber & Paikoff, 1994). Higher risk for emotional and behavioural difficulties exists for adolescents who go through the predictable, normative events of pubertal onset and school transitions, together with experiencing other changes like family disruption, relocation to a new community, or the initiation to the romantic sphere (Simmons & Blyth, 1987). In particular, adolescent romantic attachments contribute to emotional highs and lows (Feiring, 1996).

A problem with this area of assessment is that there is no comprehensive psychometric instrument that taps adolescents’ perceptions of the fear of losing control over their strong emotions. Therefore, the current study investigated the assessment of strong emotions in adolescence and focused on the development of a self-report measure of fear of losing control over strong emotions. The present study used the Affective Control Scale which measures “fear of losing control over one’s emotions or of one’s behavioural reactions to emotions” (Williams, Chambless, & Ahrens, 1997). The ACS was originally constructed as a self-report measure for use with adults, and was selected because it had demonstrated excellent internal consistency, good test-retest reliability, and convergent and divergent validity (Berg, Shapiro, Chambless & Arens, 1998).

Method

Participants

Male (N = 794) and female (N = 1101) secondary school students (N = 2,128), aged 12 to 18 years (x = 14.53, SD = 1.44), participated voluntarily in this study (see Table 1). Two hundred
and thirty three participants failed to identify their gender. Of the 18 secondary schools approached (representative of high, middle and low SES areas), eight schools consented to participate, representing a 44.4% response rate. Seven of these schools were located in the South Metropolitan region of Perth, Western Australia, with five schools (N = 1679) representative of the private education system, and two (N = 449) representative of the public education system, including one school located in a coastal town 200km from Perth. Data from a third public high school was excluded from analysis due to the lateness of its arrival.

Materials

The original adult scale, the Affective Control Scale (ACS), developed by Williams (1992, cited in Williams, et al., 1997 was modified for the current study. The language of items was simplified for use with adolescents aged 12 to 18 years. Item 10 “having an orgasm is scary for me because I am afraid of losing control”, was removed since its content was considered unsuitable for younger aged adolescents. Other items were reworded based on an initial consultation between clinicians from the South Metropolitan Child and Adolescent Mental Health Service and the primary researcher. Ambiguous terminology was broken down using
more simple and adolescent-friendly language, and extended sentences were shortened to increase understanding. Additional changes to the wording of questions were made based on piloting the questionnaire with three adolescents aged 12, 13 and 17 years. Some further changes were made and the scale was again piloted with five adolescents aged 12 to 17 years. The average time taken to complete the final 41-item version of the Modified Affective Control Scale (MACS) was approximately 10 minutes.

The MACS, in keeping with the adult version, consists of four sub-scales that measure fear of anger, fear of depressive mood, fear of anxiety and fear of positive emotion. Individual sub-scale scores and overall scale scores are computed from the 41 items. The higher the mean score, the higher the perceived fear of emotion/s. The original scale format was retained. This required participants to rate each item on a 7-point Likert scale, from ‘very strongly disagree’ to ‘very strongly agree’, with a neutral mid-point. The ‘Anger’ sub-scale consists of 8 items, the ‘Positive Affect’ sub-scale 12 items, the ‘Depressed Mood’ sub-scale 8 items, and the ‘Anxiety’ sub-scale 13 items. For the purposes of data collection, the scale was renamed the Adolescent Emotion Survey. The internal consistency of the modified total scale (Cronbach alpha = .91) was similar to that of the original ACS (Cronbach alpha = .94) developed by Williams (1992, cited in Williams et al., 1997). The survey contained no identifying information other than date of birth, gender and grade.

Procedure

Members of the research team approached school principals by way of a phone call to determine willingness to participate in the study. Interested principals were then sent a research package containing an introductory letter, a principal information sheet, a participant information sheet, a
parental information sheet, associated consent forms and a copy of the MACS. Meetings were arranged with interested principals to further discuss the objectives and commitments required. Parental consent for adolescents to participate in the study was sought according to school preference and/or policy. Some schools sought direct parental consent while others informed parents via newsletters, asking parents to contact the school if they did not want their son or daughter to participate.

Schools either elected to administer the surveys themselves, or alternatively, a member of the research team administered the surveys. The survey was administered according to a standard protocol, in a classroom setting during normal class times. All participants were provided with an information sheet and were required to fill out a consent form prior to completing the survey. They were reminded that participation was voluntary and that anonymity was assured. When completing the surveys, participants were asked to reflect on how they had been feeling over the past two weeks. The administrator collected completed surveys.

Surveys were coded and data entered directly onto a web page designed specifically for the current study. It was reasoned that data entry via the web page would lead to reduced data entry errors and in fact, < 0.1% of data entry errors occurred, which was minimal given the large data set involved. Someone other than the person who had entered the data carried out crosschecking of data manually. In addition, cases in which more than 50% of responses were left unanswered (e.g. the entire back page was left blank) were removed, as were cases in which there was an obvious response pattern, for example, all neutral responses. This resulted in the exclusion of 140 participants (6.58%) and a final sample of 2128 adolescents.
Results and Discussion

Two by two (gender x grade) between groups analyses of variance were conducted to test the significance of between group means. As seen in Table 2, in relation to gender, females scored significantly higher than males on the Fear of Depression and Fear of Anxiety subscales while males scored significantly higher than females on the Fear of Anger and Fear of Positive Emotion subscales. Overall, there was a trend for females to score higher than males across all grades on Fear of Depression and Fear of Anxiety and for males to score higher than females on Fear of Positive Emotion. Significant differences in between group means for grade were also revealed and further explored using Tukey’s post-hoc analyses. Results were mixed, with grade 10 students scoring significantly higher than grade eight and grade nine students on the Fear of Anxiety subscale and significantly higher than grade 11 and grade 12 students on the Fear of Anger subscale. Grade 8 students also scored significantly higher than grade 12 students on the Fear of Anger subscale. On the Fear of Emotion subscale, Grade 10 students scored significantly higher than grade 9 and grade 12 students.

The results indicate that fear of depression and fear of anxiety is most problematic for female students. In particular, adolescents fear of strong emotions is more salient at Grade 10 than at other ages. Of interest is the finding that Grade 8 adolescents also have a strong fear of anger, which appears to peak in Grade 10 and dissipate somewhat by Grade 12.

These results are generally supportive of the view that adolescent emotions are variable. However, this study is the first of its kind to investigate the regulation of strong emotions
Table 2  Subscale total mean scores and standard deviations across gender and grade (N = 1878)

ABSTRACT

NIKAHNAMA (MARRIAGE CONTRACT): A SOLUTION TO INDIAN MUSLIM WOMEN’S PROBLEMS?

In India, the Muslim Personal (Family) Law (MPL) has been subjected to debate and discussion for the past three decades. The bone of contention among others things, revolves around the ease with which Muslim men can divorce their wives, and maintenance on divorce. The issue has been politicized on the one hand by the BJP --- a right wing political party, couching the unreformed MPL in terms of appeasement to the Muslim minority and on the other hand Th e All India Muslim Personal Law Board (AIMPLB) by playing the card of identity politics has blocked reform grounding its argument that MPL is based on the Shariat and therefore not subject to change

Reform from within the community rather than the state has been perceived as a more acceptable way of bringing about social change. The preparation of a model marriage
contract (nikahnama) has been proposed to safeguard the interest and welfare of Muslim women. This paper traces the announcement of the marriage contract by the AIMPLB, the responses and debate thrown up since its release as covered in the English media. The period of coverage is from 2002 to 2006. The model Nikahnama has been received with mixed reactions with some hailing it as an important step forward and others pointing to the lack of any original content to address women’s issues. The content analysis of the media reports highlights the diversity in the Muslim community, the unreasonableness of one standard contract fits all and the emergence of several breakaway Personal Law Boards. The major gain appears to be that Muslim women have come out in the open to take up the cudgels on their behalf. They have been empowered as they give voice to their own needs. The nikahnama debate has only served to skirt the issue of an objective assessment of MPL. The politicization has also played a role in an objective assessment of MPL which no doubt is in need of reform in light of both the problems faced by women and to keep up with India’s modernizing and globalizing spirit.
ABSTRACT

Occupational Stress and Turnover Intention among Software Professionals: The Effects of Telecommuting

Occupational stress and turnover intention have been subjects of considerable research. However, telecommuting, though a widely studied organizational policy to reduce occupational stress and turnover intention in most parts of the world, it has not been a subject of research in India. Keeping this in mind, the present study examined whether the four occupational stressors (work overload, lack of career development, lack of decision latitude and work-family conflict) significantly directly predict turnover
intention among software professionals and secondly, the moderating effect of telecommuting on these stressors-turnover intention relationship. The participants were 210 software professionals from two private software companies in New Delhi. Both quantitative (standard scales) and qualitative (structured interviews) methods were used to collect the data. Results based on multiple regression and path analyses, indicated that lack of career development and lack of decision latitude were significantly directly predicting turnover intention. Besides these stressors, from the interview data, inadequate pay, perceived job alternatives, poor-team co-ordination emerged as responsible for turnover intention. Telecommuting was helpful in reducing stress level due to lack of decision latitude and turnover intention independently, but it failed to buffer the stressors-turnover intention relationship. Organizations can take initiatives to provide telecommuting, so as to reduce employees’ stress level and turnover intention.
United Nation’s Resolution 1325 Provides Hope for Women of Our Future

“Building a lasting peace that sustains post-war economic, political, and social development requires the full participation of all citizens.”

“Peace agreements, early recovery, and post-conflict governance do better when women are involved.” –Noeleen Heyzer, Executive Director of the United Nations Development Fund for Women (UNIFEM)

Introduction

During conflicts women become widows, victims of sexual violence, and primary caregivers of their families. While trying to keep their children safe they must also find innovative ways to provide for their families. This task can sometimes become more difficult in the midst of conflict because one’s family could expand to include parents and members of extended families. When a country crumbles to ruins all hands need to be available to rebuild the state. Since women are a majority of the survivors of a conflict, they can also be a vital asset to the reconstruction process in a postwar region. Women should be more involved in the peace building, stabilization process; however, in some countries their role in the post-conflict reconstruction is not supported or encouraged.

On October 31, 2000, in its 4213th meeting, the Security Council recognized this shortfall in post-conflict reconstruction and adopted resolution 1325. This document mandated the participation of women in peace processes and acknowledged the role women could play in establishing and maintaining peace in postwar regions. It also aimed to protect women of armed conflicts. State parties complying with the resolution are

expected to promote women’s participation in the decision-making and peace processes, include gender components in field operations when appropriate, protect women in armed conflicts and guard them from gender based violence, and to mainstream gender issues in reports submitted to the UN Secretary-General regarding peacekeeping missions and other issues relating to women and girls.5

Resolution 1325 definitely has increased the attention given to women’s role in post-conflict reconstruction, but the implementation of this mandate has been slow. In a September 2006 report to address the progress of the resolution since its adoption, the Secretary-General proclaimed there are gaps and challenges with implementing the plan. As a result, the UN is currently seeking recommendations of how to accelerate the resolution’s implementation.6

Seeing as women are a majority of the survivors of conflict they must be incorporated in the reconstruction process as members of the transitional governments, policy makers, and heads of committees or reconstruction and development projects. Countries’ leadership must seek advice and creative ideas from women keeping in mind that women will not only be the forerunners rebuilding communities but will also be a majority of the recipients of government and other donors’ resources. From this prospective women can provide valuable knowledge about the best means to implement certain projects. Women if put in leadership positions during the reconstruction process can also lobby for certain resources to be given to the people because they may be more

aware of what is needed in the post-conflict areas. For these reasons, involving more women in the reconstruction process is important and countries that implement resolution 1325 can use it as a guide of how to increase women’s involvement in post-conflict reconstruction.

This paper will first present a resolution 1325 compliance checklist to provide a general overview of the different policies and principles a state enforcing resolution 1325 should aim to uphold. Then, it will report on Afghanistan and Liberia, two post-conflict states with a history of violence against women. Now that these states are forging forward with new leaders, constitutions, and administrations, efforts are being made to comply with resolution 1325 and empower women as the countries transform into peaceful states with viable and stable economies.

This paper also includes a discussion about specific measures taken by the Governments of Afghanistan and Liberia to implement resolution 1325. Furthermore, it highlights actions of NGOs and other non-state actors to empower and protect women as the resolution mandates. Finally, prior to the conclusion, this paper lists lessons learned from Afghanistan and Liberia’s post-conflict reconstruction processes. This list provides feasible ideas that can be used by future leaders of post-conflict reconstruction missions.

**Resolution 1325 compliance checklist**

- Implementing and complying with resolution 1325 is an on-going process for all member states of the UN. The resolution’s overall objective is to involve more women in peace processes and post-conflict reconstruction, but it also insists that states take additional actions to protect women and children of conflict situations.

---

Below is a resolution compliance checklist that can be used as a guide to measure the level of effort a state is putting forth to abide by the terms of resolution 1325. It may be initially impossible for one state to continuously perform all of the tasks below. However one may hope that in the future, more ideas and states’ renewed commitment to the resolution can result in state leaders creating more innovative ways to involve women in post-conflict situations and civil society as a whole.

State implements humanitarian and human rights laws that protect the rights of women and girls during and after conflicts.

- State mainstreams a gender perspective into peacekeeping operations and where appropriate, ensures that field operations include a gender component.

- State provides or conducts special training for all peacekeeping personnel on the protection, special needs, and human rights of women and children in conflict situations.

- State requests that the Secretary-General provide training guidelines and materials on the protection, rights, and the particular needs of women, as well as on the importance of involving women in all peacekeeping and peace-building measures. In addition, the state requests that the Secretary-General ensures civilian personnel of peacekeeping operations receive similar training.

- State increases representation of women at national, regional, and international decision-making levels as well as increases women’s involvement in creating and implementing mechanisms for the prevention, management, and resolution of conflict.
✓ State encourages the Secretary-General to implement his strategic plan of action to increase women's participation at decision-making levels in conflict resolution and peace processes.

✓ State urges Secretary-General to appoint women as special representatives and envoys to pursue good offices on his behalf and the state provides the Secretary-General candidates for such assignments.

✓ State urges the Secretary-General to expand the role and contribution of women in UN field-based operations among military observers, civilian police, human rights, and humanitarian personnel.

✓ State urges other member states to increase their voluntary financial, technical, and logistical support for gender-sensitive training efforts spearheaded by UN entities such as the United Nations Fund for Women, the United Nations Children's Fund, and by the United Nations High Commissioner for Refugees.

✓ State calls “actors involved, when negotiating and implementing peace agreements, to adopt a gender perspective, including: (a) The special needs of women and girls during repatriation and resettlement and for rehabilitation, reintegration and post-conflict reconstruction; (b) Measures that support local women's peace initiatives and indigenous processes for conflict resolution, and that involve women in all of the implementation mechanisms of the peace agreements; (c) Measures that ensure the protection of and respect for human rights of women and girls, particularly as they relate to the constitution, the electoral system, the police and the judiciary.”

---

✓ State insists parties of an armed conflict to respect international law applicable to the rights and protection of women and girls as civilians. State calls on all parties of an armed conflict to take special measures to protect women and girls from gender-based violence, such as rape and other forms of sexual abuse.

✓ State emphasizes the responsibility of all States to put an end to impunity and to prosecute those responsible for genocide, crimes against humanity, war crimes. It is important for states to exclude these crimes, when possible from amnesty provisions.

✓ State calls upon all parties to armed conflict to respect the civilian and humanitarian character of refugee camps and settlements, while especially taking into account the particular needs of women and girls.

✓ State encourages all those involved in the planning for disarmament, demobilization, and reintegration to consider the different needs of female and male ex-combatants and to take into account the needs of their dependants.

✓ State expresses its willingness to ensure that Security Council missions take into account gender considerations and the rights of women. State may even take thorough actions to conduct consultations with local and international women's groups.

✓ State invites the Secretary-General to carry out a study on the impact of armed conflict on women and girls, the role of women in peace-building and the gender dimensions of peace processes and conflict resolution. Then according to the resolution, the Secretary-General is expected to submit a report to the Security
Council on the results of this study and to make this available to all Member States of the United Nations.

☑ States requests the Secretary-General, where appropriate, to include in his reporting to the Security Council, progress on gender mainstreaming throughout peacekeeping missions and all other aspects relating to women and girls.

☑ State remains actively involved in complying with and upholding the standards of resolution 1325.

AFGHANISTAN

Brief history of conflict and violence against women

Prior to 1979, Afghan women enjoyed significant rights and had access to educational and professional opportunities. However, with the invasion of the Soviets, years of internal civil wars, followed by the Taliban takeover, life and rights for women changed drastically. During these years of internal strife women were repressed and even denied access to vital health care because male doctors were not permitted to examine females and female medical practitioners were few in number if not nonexistent in some rural cities.

In 1988, the Governments of Afghanistan and Pakistan signed the Geneva Accords, which was a series of five agreements designed to settle the major differences between the two countries. The Accords also called for U.S. and the Soviet Union’s noninterference in the internal affairs of both countries. In addition to ensuring Afghan refugees’ safe return, the collective document also guaranteed the Soviets’ withdrawal

---

from Afghanistan by February of 1989. Finally, Afghanistan would be rid of the oppressive government that took over the country in 1979.

Unfortunately, the mujahidin, or Muslim guerrilla warriors who considered themselves engaged in a jihad, were not apart of the negotiations that produced the Geneva Accords, and therefore, did not accept the terms. After the withdrawal of the Soviets, militia groups continued fighting even after the Najibullah regime assumed power until 1992. The Najibullah regime lacked the support of the people and did not manage to cease militia fighting. As a result, following the regime’s fall, civil wars further destroyed Afghanistan from 1992-1996. The country crumbled to ruins and many inhabitants fled into exile.

Two attempts to establish peace within Afghanistan came in the form of the Islamabad Accord, which was signed in March 1993, and the Jalalabad Accord, which ordered militias to be disarmed. Unfortunately, both accords were unsuccessful in resolving the internal conflicts of the state. In fact, the Jalalabad Accord was signed but never fully implemented. Therefore, the fighting continued, civilian deaths increased, and more people were displaced. An environment of anarchy evolved.

The chaotic environment in Afghanistan provided the perfect opportunity for the Taliban to rise to power in the mid 90’s. Some even welcomed the new leadership that promised to return to the core Islamic values of the Koran and to provide the people of Afghanistan with stability. The Taliban as it imposed fundamentalist Islam on the people of Afghanistan, also conducted public beatings and executions, forced prayer, and banned

---

music, art, and films.\textsuperscript{14} The gravest violence and repression towards Afghan women took place under the leadership of the Taliban.

The Taliban regime became known for its human rights violations and atrocities against women, girls, and minority populations. Afghanistan under the Taliban was a country of origin and transit for women and children trafficked to Pakistan and other Gulf states for the purpose of sexual exploitation and labor. The Taliban government took no measures to protect women from trafficking, and in fact, it played a role in trafficking women, as well as was connected to women’s disappearances, rapes, kidnappings, and forced marriages.\textsuperscript{15}

Under the Taliban leadership women’s rights to work and education were also violated. The leaders of the regime issued strict orders prohibiting women from working regardless of personal circumstances and schools were closed to all girls.\textsuperscript{16} This situation was devastating for women who were widows and forbidden by law to work so they were incapable breadwinners for their families. Women found themselves relying on their sons and entire families prayed that the available male children were able to acquire jobs that paid reasonable wages. Unfortunately, for widowed women who were unsuccessful at bearing sons, their options for socio-economic survival were very limited.

By 2001, the U.S. renewed its interest in Afghanistan after learning that the events of September 11\textsuperscript{th} were spearheaded by the terrorist group, Al Qaeda, and the group’s leader, Osama bin Laden, was confirmed to be residing in the southern region of the country. On October 7, 2001, the United States officially began a military campaign

targeting bin Laden’s facilities as well as Taliban military and political assets. Kabul finally fell on November 13, 2001.

Efforts to restore Afghanistan promptly began. Afghan factions assembled in Germany in December 2001 and created the “Bonn Agreement,” which called for the Afghan Interim Authority to be formed and positioned in Kabul by December 22, 2001. Hamid Karzai was named the Chairman. Later, the government was renamed the Transitional Islamic State of Afghanistan (TISA). TISA successfully drafted a new constitution that was ratified on January 2, 2004.17

**Role of Afghan women postwar: Government steps to implement 1325**

The U.S. intervention in Afghanistan, followed by the fall of the Taliban, provided the country with an opportunity to start anew and amend some of the harms done to the women and minority populations of the country. Afghanistan appeared immediately willing to empower women and involve them in the post-conflict reconstruction process when it included two women on the first post-Taliban grand council.18 Then, TISA created the Ministry of Women’s Affairs to show how much they valued women’s participation in the government and to ensure that women’s issues were addressed and their rights were protected in the future. A woman, Madame Habiba Sarabi, was even named Minister of Women’s Affairs.19 In 2004, Sarabi was one of two female ministers. Dr. Sohaila Siddiqi, the other female Minister, led the Ministry of Public Health.

---

Another measure to ensure women’s participation in the decision-making bodies of a government is to implement a quota system requiring a specific number of women candidates and representatives. In Afghanistan, the 2004 constitution mandated a quota in Article 83, and the electoral laws reserved at least 25 percent of the seats in the lower house of parliament for women. According to the law, at least two representatives from each province to the lower house must be women. In addition, the president has the power to appoint people to one third of the seats in the upper house but at least 50 percent of his appointees have to be women.\textsuperscript{20} 

It is unclear if these changes to the Afghan constitution were direct results of the country’s efforts to implement resolution 1325. However, the Organization for Economic Co-operation and Development (OECD) commended Afghanistan for its efforts to involve women in its reconstruction process as early as 2003 so the resolution must have at least been on the minds of the policy makers as a result of the positive attention received the year before. It is possible that the women’s presence on the transitional government and the international community’s pressure to ensure Afghan women of the future receive more rights and freedoms than they had in the past drove government leadership to implement a quota system which would guarantee female participation in the government.

Afghanistan put forth efforts to comply with the first area of resolution 1325, which addresses women’s participation in the decision-making bodies and peace processes. However, succeeding paragraphs will show that the government did little to

address the other three areas of resolution 1325, especially when it came to safeguarding women from gender based violence.

**Nongovernmental organizations’ (NGOs) and other non-state actors’ efforts**

NGOs understand the power that money can have on a state’s reconstruction process and in some cases they will attempt to get donors to tie assistance to mandates requiring recipient states to abide by certain policies or international agreements. This was definitely the motivation of NGOs in Afghanistan when they were rallying for invitations to major donor meetings, before they pushed for meetings with the transitional government of Afghanistan. In fact, some women’s rights activists supported by the UN Development Fund for Women (UNIFEM), met with donors in Europe prior to the major international donors’ meeting that took place in Tokyo in January 2002, to get a head start on presenting their reconstruction recommendations.

Then, specific groups, acting through the Working Group on the Rights of Afghan Women, submitted additional recommendations to the donors in Tokyo. Some of their proposals included: tying received aid to the level of women’s participation in the decision-making reconstruction process, make Afghanistan assess gender’s impact on interventions, require that 50 percent of the beneficiaries of aid be women, ensure that the Ministry of Women’s Affairs is adequately resourced, and insist that NGOs assisting with reconstruction efforts be funded.\(^\text{21}\) The Working Group, in addition to attempting to ensure rights for women, was also pushing international donors to encourage the TISA to comply with aspects of resolution 1325. Unfortunately, it is unclear which recommendations were accepted by the donors and required of the TISA before receiving

funding. Nevertheless, that does not negate the actions of the women’s groups because they could have potentially influenced international donors.

In 2003, a coalition of Afghan and Afghan American women drafted an Afghan’s Women’s Bill of Rights, which they later submitted to Afghanistan’s president, Hamid Karzai. The bill requested rights for women such as, mandatory education for girls, equal gender representation in the grand councils, criminalization of sexual harassment and domestic violence, and the right to marry and divorce (according to Islamic law). Government leaders recognized the document and even assured the coalition some aspects would be incorporated into the constitution. However, none of the features of the bill were integrated into the 2004 constitution. On a positive note, though, the constitution does include a clause that men and women “have equal rights and duties before the law.” 22 Yet, this clause does leave a lot of room for individual interpretation and is based on the country’s existing laws. Therefore, if Afghanistan ever adopts an unjust law in the future it just means that men and women will have equal rights and duty before that unfair law.

More successful non-state actors have been entities of the UN. By being present in Afghanistan they are able to remind the leaders of the importance of developing and implementing mainstream gender perspectives into post-conflict reconstruction policies. When possible they addressed the country’s existing gender inequalities and emphasized the need to have women participate in decision-making forums and within the government. The entities have also linked a gender perspective to technical assistance

---

22 PBS “Women in Afghanistan: Afghan Women’s Rights,”
http://www.pbs.org/independentlens/afghanistanunveiled/women.html
and training in employment, health, and education. As a result, the government and people of Afghanistan are constantly reminded of their gender issues and how to incorporate gender components into local training programs. This provides Afghan leaders with more examples of how to more thoroughly implement resolution 1325.

Shortfalls hindering Afghanistan’s progress

As aforementioned, trafficking of women was a huge problem under the Taliban regime and continues to be a poorly addressed issue today. Despite this reality, the government as of June 2006 had not enacted an anti-trafficking law. Instead, the government references kidnapping and criminal statues when prosecutions against human traffickers do make it before the court. Most prosecutions, nonetheless, do not result in convictions because the country lacks the resources to investigate and prosecute such cases. At times, victims of trafficking are sent to jail rather than their traffickers. The corrupt government officials and law enforcement officers allegedly taking part in the illegal practice are also avoiding persecution. The government also lacks the ability to provide victims of trafficking shelters, medical care, or legal aid, but the NGOs in the country, who also have limited resources, are at least providing some women with shelters.

On another note, a factor that may have contributed to the limited rights awarded to women in the 2004 constitution could have been the mentality of some of the leaders at the time. For example, in the opening of the 2003 grand council conference, the chairman proclaimed to the women present, “God has not given you equal rights because under his

---

decision, two women are counted as equal to one man.”25 The rights of women were significantly more advanced before 1979, but given the time that has lapsed since then it will take a while for that level of female liberty to once again exist in Afghanistan. The leaders may have changed with elections and more women can participate in government, but the mentality of certain male leaders and other members’ of society’s mindset towards women reiterates the reality that Afghan women have lost a significant amount of influence. It is no wonder many women groups pushed to include the Women’s Bill of Rights in the constitution because that would have been an enormous step towards women regaining some of their former socio-economic and identity status.

Despite the shortfalls presented, the success of the government should not be ignored. In reality, additional challenges affect Afghanistan at the moment. For example, the country is dependent on narcotics production and trafficking. In truth, Afghanistan produces about 90 percent of the world’s heroin supply and is on the verge of becoming a “narco-state.”26 Furthermore, some scholars, such as Barnett Rubin, define Afghanistan as a “conflict-prone” state that is avoiding war simply due to the international presence still remaining in the country.27 Therefore, the government’s inability to fully implement resolution 1325 and other progressive policies may be slightly justified at the moment, but that excuse cannot be used forever.

LIBERIA

**Brief history of conflict and violence against women**

On December 24, 1989, a small insurgent group, the National Patriotic Front of Liberia (NPFL), led by Charles Taylor, invaded Liberia from the Ivory Coast. Taylor was the Deputy Minister of Commerce under President Samuel Doe until he was imprisoned for embezzlement of government funds and then escaped from jail to build rebel forces in the northern part of the Ivory Coast.\(^{28}\) His invasion was a catalyst that precipitated a civil war and subsequent fighting that plagued Liberia for the next fourteen years. Within the first six months of his fighting efforts, Taylor gained local support, which gave him the momentum to continue his rebellion efforts.

During the first civil war, which took place 1989 to 1996, 20,000 people were killed and millions were displaced. Taylor’s actions were successful the first few months, but then he was halted from capturing Monrovia by the Economic Community of West African States’ 1990 intervention. In the midst of the fighting two additional rebel groups, the Independent National Patriots Front of Liberia (INPFL) and the United Liberation Movement of Liberia for Democracy (ULIMO) were formed. INPFL killed Samuel Doe and ULIMO fought with NPFL.

By October 1990, an Interim Government of National Unity (IGNU) was formed in Gambia, but the insurgent groups refused to work with IGNU and continued fighting. Taylor eventually agreed to the formation of a five man transitional government and consequently, special elections were held on July 19, 1997. To no one’s surprise Taylor and members of his party won the elections and people assumed peace would commence.

It is speculated that Liberians voted for the National Patriotic Front leaders because they feared war would have continued if Taylor lost. One positive aspect concerning Taylor’s leadership is that some women did have government positions in the lower and upper houses of the bicameral legislature. In the lower house women held five of the 64 seats (7.8 percent of the entire body) and five out of 26 seats in the upper house (19.2 percent of the entire body) following the 1997 elections.

After the civil war, rather than aid Liberia in its efforts to reconstruct, Taylor put most of his attention into the Revolutionary United Front (RUF), a rebel group fighting in Sierra Leone. He supplied the guerilla group arms in exchange for diamonds. By 2000, the UN was taking actions to undermine the RUF and reprimanded Taylor for his contributions to Sierra Leone’s unrest. An 18-month ban was placed on the sale of diamonds and sanctions were imposed against Liberia. The sanctions, along with the growing animosity towards Taylor for not alleviating some of the Liberians’ poverty and high unemployment, angered many Liberians and resulted in Taylor’s former adversaries regrouping outside of Monrovia. Once again, violence erupted beginning in mid-2001 and the UN was forced to put an arms embargo on the country from 2001-2003. After the rebel groups gained control over two thirds of Liberia their pressure forced Taylor to resign and flee into exile. Finally, the fighting groups signed a peace agreement and the people agreed to a power sharing government.

During the civil war human rights violations against women occurred including rape and coerced sexual slavery.\textsuperscript{32} Other reported violent acts against women that specifically occurred from 1989 to 1994 include: beatings, numerous strip searches, and tied up detentions in rooms with armed guards. In addition, some women were singled out and accused of being apart of a particular ethnic group. Ethnic cleansing also occurred during the civil war and those women not killed during the cleansing process were subject to become cooks for soldiers or fighters. In such individuals’ care women were also susceptible to rape (sometimes rape with objects), beatings, and other gender based violence.\textsuperscript{33}

The results of a 2003 survey showed that “74 percent of a random sample of 388 Liberian refugee women living in camps in Sierra Leone reported being sexually abused prior to being displaced from their homes in Liberia. Fifty-five percent of them experienced sexual violence during displacement.”\textsuperscript{34} Since most of Taylor’s attention was on diamonds and fighting in Sierra Leone, no initiatives were taken to protect women during the conflict or prevent the trafficking of women and children. In fact, the U.S. Department of State Trafficking In Persons Report (TIP Report) for 2003 claims the government and rebel groups forcibly conscripted women to serve as porters, forced laborers, combatants, and sex slaves. Some women were lucky enough to escape from the

Turay-Kanneh, RN, “Violence Against Women During the Liberian Civil Conflict,” The Journal of the American Medical Association, Vol. 279 No. 8 (February 25, 1998), pp 625-629.

oppressive rebel groups using them as sex slaves, but would later be recaptured by a
different group, who required them to be “bush wives,” which are cooks, cleaners, and
sex slaves of the fighters.\textsuperscript{35} It is now evident that some government officials were directly
responsible for the internal and international trafficking of women as well as other forms
of violence towards women but nothing was done to prosecute such individuals. The
government was not doing anything to investigate trafficking cases or assist victims.
NGOs were the only actors attempting to supply at minimum shelter to victims of
trafficking.\textsuperscript{36}

By 2004, the fighting was over but protection of women was still lacking and the
structure of the internally displaced persons camps in Montserrado County in Liberia was
actually fostering an environment for sexual violence against women rather than
hindering it. Resolution 1325 calls for gender perspective in peacekeeping when
appropriate. This means that camps should have been set up with efficient lighting and
female bathhouses and latrines distant from male facilities, which may have contributed
to the women’s safety. As a result of the rampant rapes, women later treated in health
clinics tested positive for at least one sexually transmitted infection.\textsuperscript{37}

\textbf{Liberian women get a chance to get involved: Government steps to implement 1325}

Parties who drafted the Liberian peace accords appeared to want women involved
in the reconstruction process. Women were permitted to take part on the various reform
commissions and transitional bodies and Article 28 of the accords called for “gender

equality in national politics.” Prior to the 2005 elections, of the 75 members of parliament four were women. In addition, there were three women ministers out of the 21 member cabinet and the Ministry of Gender and Development, similar to Afghanistan’s Ministry of Women Affairs, already existed.

The Liberian camps for displaced persons may not have complied with resolution 1325, but the disarmament, demobilization, and reintegration (DDR) assembly points did meet the requirements of resolution 1325. Liberian leaders must have taken heed of advice from campaigns spearheaded by UNDP and UNIFEM aimed at raising awareness about incorporating gender concerns in the national disarmament, demobilization, and reintegration programs. Not only was Liberia’s DDR site fenced, but separate compounds were provided for women, men, and children. In addition, gender specific assessments were taken and counseling was also provided to the occupants. Women who experienced violence during the civil war could finally begin their healing process with professional counselors. Both mental and physical rehabilitation post-conflict are important to a country’s reconstruction.

In regards to trafficking of women, the National Transitional Government of Liberia (NTGL) took initiatives to address the issue starting in 2005. After June, the NTGL and the National Transitional Legislative Assembly took part in bi-monthly anti-trafficking task force meetings. Eventually, the government also closed shelters involved in children trafficking and fraudulent adoptions. In addition, NTGL established a

39 Ibid.
Women’s and Children’s Protection Section of the police, which was to concentrate on human trafficking and assist with protecting victims in local NGO shelters. Government officials were also provided further education and training on how to combat trafficking. The government welcomed the UN Children’s Fund (UNICEF) to train 15 officers about how to protect children and then, another 15 officers participated in a UN sponsored anti-trafficking training of trainers.\textsuperscript{42}

\textbf{NGOs and non-state actors’ efforts}

In 2004, a group of Liberian women came together to present a resolution to NTGL advocating a quota system be incorporated into the election law reforms. The women wanted a fair chance to take part in Liberian politics and were asking “that every political party that qualifies for the elections earmark a minimum of 30 percent [of their] seats for women in their candidates’ list. Also every political party that qualifies for the electoral process earmark a minimum of 30 percent [of their] representation for women in decision-making positions within their parties,” according to Lema Gbowen, a women’s rights activist.\textsuperscript{43} This issue sparked a major debate amongst the acting government officials and local constituents. Many argued against implementing a quota system because they feared it would give women an advantage they did not earn. In contrast to Afghanistan, the women’s group’s efforts were unsuccessful and Liberia did not amend the election laws to include a quota system. In the 2005 elections women were able to secure eight out of 64 seats in the lower house (12.5 percent of the entire body) and five of the 30 seats in the upper house (16.7 percent of the entire body).\textsuperscript{44} Liberia also became

\textsuperscript{42} U.S. Department of State, Trafficking In Persons Report (June 2006), p 272.
\textsuperscript{44} Inter-Parliamentary Union, “Women in National Parliaments,” http://www.ipu.org/wmn-e/classif.htm
the first African country to elect a female head of state, Madame President Ellen Johnson-Sirleaf.

Liberia may not have adopted a quota system, which would have secured a minimum level of women’s participation in government. However, the election of President Johnson-Sirleaf signifies Liberian’s confidence in her leadership potential. Liberia made history following its 2005 election and given the success of President Johnson-Sirleaf’s administration she may set precedence for more women being elected to different sectors of the government in the future.

On another note, rape was used as a weapon against women during the Liberian civil war and shortly following the peace accords. It continues to be a problem that plagues women of Liberia because they are still awaiting justice to be served or constantly remembering the horrors of their sexual violation. In 2005, the Association of Female Lawyers of Liberia (AFELL) drafted a new rape law to replace the previous vague legislation that resulted in many rapists going unpunished. Their draft included serious proposals such as: those who rape a person under eighteen years old should face life in prison, rape suspects should go to jail and receive no options to post bail pending their trial, those to rape an individual over eighteen could potentially face thirty years in jail, and gang rapists could receive the death penalty or life in prison as their punishment. Furthermore, the law called for consensual sex within the confines of marriage and husbands who forced their wives to have sex could spend ten years in prison if found guilty.\footnote{Jonathan Paye-Layleh, “Getting Tough on Liberian Rapists” BBC News (29 July 2005), http://news.bbc.co.uk/2/hi/africa/4725263.stm} AFELL was definitely on a mission to make rapists take heed of their actions
and face tougher consequences before the court of law. Therefore, more would be deterred from committing such violence against women.

The government of Liberia reviewed the draft and with assistance from the Office for the UN High Commissioner for Human Rights and the Department of Peacekeeping Operations created its own new rape law.\textsuperscript{46} The new rape law was passed on January 17, 2006; the day after President Johnson-Sirleaf was inaugurated. Liberia did make some changes to the submitted draft, for example, the maximum penalty for gang rape was changed to life imprisonment. AFELL, nonetheless, did win their fight to ensure suspected rapists were not released on bail before their trials. The final bill also addressed rape with objects and the raping of boys.\textsuperscript{47} The two current challenges are educating the public about the new law and their rights and improving the judicial system. In the past, rapists avoided prosecution because the weak judicial system was slow and the country lacked prosecutors. These problems still exist but President Johnson-Sirleaf is determined to see that no rapists go unpunished so justice and judicial reforms are expected soon.

Branches of the UN were also working hard in Liberia to assist the country in implementing the guidelines of resolution 1325, and the leaders of Liberia welcomed the assistance. According to the September 2006 Security Council “Report of the Secretary-General on Women, Peace, and Security,” the Department of Peacekeeping Operations, the UN Development Program (UNDP), and UNIFEM provided leadership training in Liberia to increase women’s participation in the elections. In addition, the Department of Peacekeeping Operations, UNDP, the UN Population Fund (UNFPA), the Department of

Political Affairs, the UN Educational, Scientific, and Cultural Organizations (UNESCO), the World Food Program (WFP), and the UN Institute for Training and Research (UNITAR) conducted gender sensitive workshops and trainings about resolution 1325 for civilians, military, humanitarian personnel, national, and local NGOs. 48 Since the government welcomed the assistance and did not hinder the groups’ actions this act contributed to the implementation of resolution 1325. Educating the public about a policy is a tremendous first step towards implementation. Another program developed by UNAIDS, UNFPA, UNIFEM, and the Department of Peacekeeping Operations, which addressed gender issues as well as HIV/AIDS in post-conflict reconstruction and was successful in Sierra Leone, was replicated and implemented in Liberia. Once again, the country was presented with another means to address gender issues, but this time in conjunction with a health topic that is affecting so many of Africa’s people.49

**Shortfalls observed in Liberia**

The efforts that NTGL made to address trafficking in 2005 are worth merit. However, a major shortfall is the two years it took the government to acknowledge and address the issue through legislative action. The delay could be attributed to the fact that members of the 2003 NTGL were allied with rebel groups involved in trafficking during the civil war. Therefore, due to ally relations the government did not take tough steps to combat trafficking. It was not until June 2005 that the government passed a statute prohibiting all forms of trafficking but the one-year sentence minimum punishment was

not a deterrent to professional human traffickers.\textsuperscript{50} Passing the anti-trafficking legislation was a major step in the right direction but the punishment accompanied with the crime did not signify the gravity of human trafficking or show that the leaders of Liberia highly valued the need to combat this inhuman violation of international law. The current government of Liberia is still overcoming the challenges of rebuilding the country after its civil war and it has not made amendments to the 2005 anti-trafficking law. There is only hope that the government will continue initiatives to educate the public and officials about trafficking as well as strengthen the law, increase the penalties, and successfully convict at least one person for the brutal crime.

\textbf{Lessons Learned from Afghanistan and Liberia}

The lessons learned listed below highlight specific actions taken by the Governments of Afghanistan and Liberia, the UN, and NGOs. The list attempts to provide advice to others about successful measures that can be taken to implement or comply with resolution 1325, as well as, emphasizes further steps that must be taken. Many actions of the governments, UN, and NGOs in these two countries were in accord with the Resolution 1325 Compliance Checklist. Therefore, these same or similar actions can be taken by other leaders and governments if they would like to further implement resolution 1325 in their country or ensure that they are complying with the resolution. However, states and nongovernmental entities should not limit their actions to this list, but rather continue to seek more creative ways to involve women in post conflict reconstruction and peace processes.

\begin{itemize}
\item \textbf{Women should be involved from the start.} Putting women on the transitional
\end{itemize}

\textsuperscript{50} U.S. Department of State, Trafficking In Persons Report (June 2006), p 272.
governing bodies is the best first step to ensuring their participation in immediate
decision-making bodies. This is no guarantee that women will be elected in the next
elections or even become president as in Liberia’s case, but at least women’s issues will
be presented and addressed in the transitional meetings and possibly by the administration that follows.

➤ **Quotas can be an effective tool.** In Afghanistan, the implemented quota system resulted in 25 percent of the elected officials being women representatives. This means that women were involved in the decision-making bodies and the reconstruction process that followed, which is specifically what resolution 1325 mandates. In a region where women were repressed for decades and religion was used a means to justify female inferiority, a quota is potentially the most effective tool to ensure women are involved in Afghanistan’s future government administrations. In Liberia, such a policy was not accepted. However, in contrast to Afghanistan, Liberia has a history of women’s involvement in the government prior to the civil war and even during Taylor’s leadership. With that being said, quotas are not necessary for all postwar states to adopt but they can be effective in achieving the specific goal of involving more women in decision-making bodies and the reconstruction process.

➤ **NGOs meeting with donors can be an invaluable experience.** As mentioned earlier, it is unclear what effect the Afghan groups’ meetings with international donors played on the aid given to Afghanistan. Nonetheless, such meetings can be invaluable because they establish a line of communication between donors and NGOs. Sometimes, NGOs are the only source to provide interveners with facts about what is going on the ground in post-conflict states. They can also make donors aware of the immediate issues
the people are facing and help donors decide what matters need to be addressed first and how. As a result, the reconstruction project can be more successful. The fact that some NGOs are biased and will push for their beneficiaries’ aid first should not be ignored but the point is that the insight they can provide is valuable. Nonetheless, pressure from local or international NGOs can impact the stages of a reconstruction project tremendously.

➤ **Local groups should present legislation proposals to the government.**

Although, governments will not always accept the recommendations from groups that does not mean the groups should not attempt to influence the minds of the decision makers. In Afghanistan, the women groups were not successful in getting the government to pass a Women’s Bills of Rights, but in Liberia the effect was just the opposite. The government passed a rape law that included many of the recommendations from AFELL. Regardless, of the final result, proposals submitted to the government at least reiterate women’s issues to a country’s leaders. Such proposals can directly and indirectly affect the legislation of the government regarding such issues and may present the officials with new ideas on how to resolve existing problems.

➤ **Simply creating new legislation and women ministries is not enough.** Drafting legislation shows the international community that a country is addressing issues such as trafficking or violence against women in their country. However, passing laws is not the same as implementing them. Great steps must be taken to implement a law so that it is enforced and upheld. Tough legislation must be accompanied by harsh penalties to truly deter potential law violators. In addition, the public must be aware of the law and their rights. As soon as criminals are aware that the potential consequences for their actions have changed they may alter their behavior and stop committing the crime. Furthermore,
in order for a law to be effective the judicial system must be equipped to prosecute law violators. Law enforcement officials must also aid in the law’s implementation by arresting violators and investing claims. New legislation must sometimes be tied with judicial reform and rule of law improvements.

On another note, governments that evolve from postwar states tend to create ministries that address women’s issues such as violence and gender inequality. Establishing government bodies that concentrate on such issues is a great measure to ensure that women’s matters are not overlooked or forgotten. However, these ministries must be backed with financial resources and led by effective leaders at minimum. In order for such ministries to fulfill their missions and implement programs that benefit society they need resources. If the women’s ministry is pushing for the empowerment of women but cannot actually provide women with micro-credit or training to improve their skills and overall social status then their missions appear to be ineffective jargon, which can result in a loss of confidence in the ministry and the government as a whole. Legislative power would also make these bodies even more effective but that is something that is best to come later in time after the fragile state’s government is better developed, proven to be effective, and legitimized by the people.

➢ A change in social mentality is a must. The comments of the chairman of the grand council in Afghanistan in 2003 are a prime example of why the victims of the conflict and even the leaders spearheading change need to be “reeducated” following a conflict. Given, changing the mindsets of people takes time but an effort should be made to jumpstart the mentality reshaping process. Different ethnic groups need to learn how to live amongst each other without war and all people need to learn how to treat men and
women equally. Sometimes starting with the youth is the best means to reeducate society and begin the social reformation process because if one can reshape the minds of the youth then they are shaping better leaders for the future.

➤ **Sometimes entities of the UN are the best bodies to show countries how to implement UN resolutions.** The presence of UN entities in Liberia showed local groups and leaders how to incorporate gender perspectives in field missions as well as how to address AIDS and other issues facing the country. Since the UN composed resolution 1325, they seem like the best candidates to educate and train a country’s officials about the policy. Although, in some cases, leaders of NGOs or private organizations that are well educated about the policy and its general interpretation could also act as entities to assist countries with resolution 1325’s implementation.

In some cases the goals of a UN resolution are not clearly articulated in the policy and it takes UN assistance to show states how to implement the ideals of the legislation in society. In fact, interpreting resolution 1325 in order to transform it into programs that complied with each component of the mandate was one of challenges of states implementing the resolution, according to the Secretary-General’s 2006 report. Therefore, states should welcome training assistance from the UN or personally invite UN entities and staff to assist in implementation efforts.

**Additional challenges to implementing resolution 1325**

Six years after the adoption of resolution 1325 the Secretary-General composed a report to update, monitor, and review the policy’s implementation. Countries’ efforts to implement resolution 1325 are highlighted in this report. It also discusses gaps and

---

challenges to implementation. A few will now be mentioned to show that several countries faced similar challenges in implementing the resolution. In fact, some of the challenges are identical to those faced by the Governments of Afghanistan and Liberia.

The greatest challenge faced by conflict and post-conflict states is the “lack of stability and security; violence, including gender-based violence; poverty, discrimination, democracy, deficits, impunity, and weak public institutions.” Both Afghanistan and Liberia dealt with these issues following their wars because institutions were not present within their countries to immediately combat any of these issues. However, it is remarkable that the international community did come to their aid and their respective transitional governments did attempt to address some of these issues one step at a time. Honestly, this makes the progress that both countries made to implement resolution 1325 all the more outstanding. They did some things sooner than other developed countries did which were not coming off the brink of civil wars and physical destruction.

The Secretary-General also noted insufficient funds and human resources have been allocated to women, peace, and security activities, which aid in a state’s implementation of resolution 1325. He proclaims the resources allocated to these three areas do not correspond to need, but instead are dependent on media attention, strategic interests, political will, and in some cases donors. Hopefully, with the creation of more ministries that address women’s issues and with the international community paying more attention to the violence against women, this issue of little resources being put

towards women, peace, and security initiatives will change. Afghanistan and Liberia have established such ministries but only time will tell if they adequately supply their leaders addressing women’s issues with the funding they need as their economies develop.

On another note, member countries of the UN also reported “inadequate understanding by their staff of such concepts as gender analysis and mainstreaming.” 54 As a result, “there were difficulties in translating gender mainstreaming into programmatic action.”55 The best means to address this issue, in some cases, is to request the assistance of UN entities in one’s country when attempting to implement resolution 1325. The Department of Peacekeeping Operations and the Inter-Agency Network on Women and Gender Equality are two examples of entities with such experts and the Secretary-General noted in his report that they were “not sufficiently utilized.”56 Liberia and Afghanistan are two great examples of what can happen if one utilizes the assistance of UN entities.

Lastly, when attempting to address and issue and see if efforts made are improving the lives of women, it is important to have accurate statistics that track changes. “Regular reporting, effective monitoring systems, as well as access to and use of sex-disaggregated data, gender-specific indicators” must be done so that improvements in women’s care across the globe is recorded.57 When the numbers began to show grave improvements then other countries can observe and better analyze what was done to

55 Ibid.
57 Ibid., p 10.
accomplish such goals and potentially implement similar programs domestically. The first step is properly collecting such information and then sharing it with others.

**Conclusions**

The greatest challenge to fragile post-war states, who have succumbed to ruins and gone years without an efficient government, is their lack of the necessary resources, both financial and human, to fully implement international laws and recommendations. This also is the case with implementing resolution 1325. Immediately following a war, many states receive billions of dollars in assistance from international donors, but typically there are no means to accept and fairly distribute such funds to the public. An abundant amount of corruption and misappropriation of money can take place. Afghanistan and Liberia, following their peace agreements and still today, continue to face challenges during their post-conflict periods.

The implementation of resolution 1325 is a collective effort. As Rachel N. Mayanja, the Special Adviser to the Secretary-General on Gender Issues and Advancement of Women, said, “The full and effective implementation of resolution 1325 would require all the will and creativity the international community could muster.”

New states or those starting anew, tend to have the liberty to take more progressive steps and incorporate the latest international laws and recommendations into their governmental structure, rather than older countries who have to sometimes reform their systems to comply with international standards. Maybe future successful post-conflict states will continue to be the best examples of resolution 1325’s implementation. However, by no means is conflict a prerequisite for implementing resolution 1325 in a

---

country. Many states, such as the United States, have adopted laws to comply with the resolution and ensure that within the realms of potential future conflicts, women will be protected and involved in the peace processes.

CASE STUDY

Title:
Demand Driven Research: University Community Partnerships for Sustainable Communities

Over the past 10-15 years, universities and colleges have partnered with neighborhood institutions and non-profit organizations to develop programs and projects to enhance and improve the quality of life in communities and also to enhance the research being done at universities. This university-community partnership model promotes the role of communities as resources for knowledge and universities as key community assets and anchors in the community with valuable resources. In the workshop, we will discuss how to develop these partnerships, the dynamics of these relationships (i.e. equity, conflicts, mutual benefits, negotiating), and how this model can contribute to sustainable urban neighborhoods. In addition, this workshop will assist academics in keeping a pulse on the current pressing issues and needs facing urban areas and in turn, develop relevant, need-based research. Findings from a case study currently in progress – the New Directions project, a project funded by the U.S. Department of Housing and Urban Development’s Office of University Partnerships, focusing on the North Lawndale community in Chicago, Illinois – in addition to past experiences, will be referenced as examples.
Title: The Role of a Rural Newspaper in the Battle Over Integration, 1955-1969: A Case Study

Abstract

The U.S. Supreme Court’s ruling in Brown v. Board of Education of Topeka, 347 U.S. 483 (1954), which explicitly outlawed racial segregation of public education facilities on the grounds that the doctrine of "separate but equal" public education could never truly provide black Americans with opportunities or facilities of the same standards available to white Americans, did not result in the immediate desegregation of America's public schools. In the South, most public schools would not be desegregated until about 1970 under the Nixon administration. The state of Virginia declared a policy of “massive resistance” to school desegregation, implemented through a series of laws forbidding integrated schools from receiving state funds and establishing tuition grants given to students to allow them to attend private schools of their choice. When, in 1958, Federal courts ordered public schools in Warren County, Charlottesville, Norfolk and Arlington to integrate, Virginia Governor Lindsay Almond ordered the closings of schools in those jurisdictions. When the Virginia Supreme Court declared in January, 1959, that the state’s efforts to resist desegregation were unconstitutional, “massive resistance” at the state level ended.

But in many communities, defiance remained. This paper is a case study of one such community, Nelson County, Virginia, where true integration of the public schools was forestalled until 1969. Using minutes of the Nelson County School Board, interviews with some of the participants, editorial comments in the local newspaper, the Nelson County Times, and other sources, this paper shows how a rural community came to accept the inevitable without resorting to violence or other means that would have poisoned race relations for many years beyond the forced integration of the public schools. Indeed, Nelson County’s experience since 1969 might be seen as a model of good race relations despite the efforts by the local newspaper and officials to maintain segregation.
TITLE: Body Shape Perceptions and Social Acceptability of Body Shapes among Undergraduate College Women: Does Ethnicity Make a Difference?

TOPIC AREA: Cross-disciplinary (psychology and sociology)

PRESENTATION FORMAT: Verbal presentation

AUTHORS: Christy Greenleaf, Yvonne Liebig, Scott Martin

DEPARTMENT AND AFFILIATION: Kinesiology, Health Promotion, and Recreation Department, University of North Texas

PHONE NUMBERS: 940-565-3415
Body Shape Perceptions and Social Acceptability of Body Shapes among Undergraduate College Women: Does Ethnicity Make a Difference?

**Background and Objectives:** Previous research has suggested that cultural differences may shape body image and body shape perceptions. Caucasian women, for example, often report more negative body image and greater body dissatisfaction compared to African American women (Altabe, 1998). On the other hand, African American women tend to be more satisfied with their bodies, have higher body self-esteem, and be more accepting of larger body shapes than either Hispanic or Caucasian women (Altabe, 1998; Blaine & Williams, 2004; Latner, Stunkard, & Wilson, 2005; Rubin, Fitts, & Becker, 2003). While differences in body image and body satisfaction have been examined, research has not addressed ethnic differences in body shape perceptions. Specifically, are differences in what women consider “thin,” “skinny,” “fat,” “overweight,” and “obese” based on their ethnicity? Further, little is known about the perceived social acceptability of different body shapes within ethnic groups. Thus, the purpose of this study was to examine body shape perceptions and the perceived social acceptability of body shapes among Caucasian, African American, and Hispanic college women.

**Method:** Participants included 285 undergraduate women (130 Caucasian, 103 African American, 52 Hispanic) ranging in age from 18 to 30 (M = 20.70, SD = 2.14). As part of a larger study, the women completed a survey packet that included a demographic survey and the Figure Rating Scale (FRS; Stunkard, Sorenson, & Schlusinger, 1983). The participants were asked to select the ideal female body shapes for their ethnic group. Subsequently, participants were asked to consider their ethnic group and (a) identify the female body shapes that represent the words ideal, skinny, thin, overweight, fat, and obese and (b) rate the social acceptability of a female being skinny, thin, overweight, fat, and obese.

**Results:** Two separate MANCOVAs were conducted: (a) body shape perceptions of ideal, skinny, thin, overweight, fat, and obese and (b) social acceptability of body shapes. BMI was entered as the covariate and self-identified ethnicity was the independent variable. A significant multivariate effect was found for body shape perceptions (Wilks’ Lambda = .70, F (12, 444) = 8.23, p < .001, partial eta² = .18, power > .999) and social acceptability (Wilks’ Lambda = .66, F (10, 543) = 12.23, p < .001, partial eta² = .19 power > .999). Follow-up univariate analyses revealed significant ethnic differences in the women’s perceptions of ideal body shape, Caucasian women selected smaller figures than both African American and Hispanic women. Caucasian women, compared to Hispanic women, selected smaller figures for skinny. African American women selected significantly larger figures for the term overweight compared to both Caucasian and Hispanic women. African American women also chose larger figures to represent the term fat compared to Caucasian women.

Univariate analyses revealed significant ethnic differences in participants’ ratings of the social acceptability of being skinny (p < .001), thin (p < .001), overweight (p < .001), fat (p < .001), and obese (p < .001). Caucasian women rated being skinny and thin as more socially acceptable than either African American or Hispanic women. Hispanic women also rated being skinny and thin as more socially acceptable than African American women. Caucasian women rated being overweight and fat as less socially acceptable than either African American or Hispanic women and rated being obese less socially acceptable than African American women.

**Conclusions:** Ethnic differences in the perceptions of weight- and body shape-related words are consistent with previous body image research suggesting that Caucasian women idealize a thin physique more so than African American and Hispanic women. Future research needs to determine if and how differences in body shape perceptions, as well as social acceptability ratings, are related to health behaviors, such as physical activity and eating habits.
Helping Students Cope with the Threat of a Power Language: A Study of Student beliefs and the Linguistic Power Struggle in Puerto Rico’s Universities

Víctor R. Quiñones Guerra
Doctoral Student, International Educational Development

Teachers College, Columbia University
Department of International & Transcultural Studies

525 West 120th Street TC Box 122
New York, NY 10027

E-mail: vrq1@columbia.edu

Abstract:

Helping Students Cope with the Threat of a Power Language: A Study of Student beliefs and the Linguistic Power Struggle in Puerto Rico’s Universities

This study seeks to identify the linguistic beliefs and practices of undergraduate students from Puerto Rico (PR) and how these factors influence their ability to learn English. Although the main language in PR is Spanish, as a territory of the United States of America (USA) English is an official language that is taught at the islands schools. Students in PR are taught English from kindergarten through high school. Still, many lack basic English language skills when they arrive to college. Hence, this study questions: How do students negotiate their identities given their bi-national affiliations and how does this impact their ability to learn English? Findings will help explore and project the extent to which literacy in English will grant graduates access to further social and economic development. One-hundred undergraduate students from Puerto Rico participated in the study. Participants were first asked to complete a questionnaire of 20 open-ended questions. Subsequently 20 participants were interviewed for a more in-depth understanding of beliefs that function as language barriers. Preliminary findings depict how certain social, political and historical factors negatively influence student’s receptivity to learning English in light of the threat of losing their language. Recommendations will include linguistic practices that enable students to become bilingual without losing their linguistic and cultural values.
INTRODUCTION

The purpose of this class project was to conduct a fashion count and gain hands on experience utilizing this type of consumer research method. The project was conducted in the spring of 2005. Sunglasses were chosen as the fashion item to investigate because they are a popular fashion accessory (in 2003, total sales reached $1.9 billion (Frost, 2004)) and a necessity to protect your eyes from harmful UV rays (Mesazaros, 2005). The observations comprising the fashion count were limited to college aged women because this consumer market is typically fashion conscious.

Fashion counts are a type of consumer research which is used by the fashion and retail industry to gage consumer behavior in an attempt to forecast consumer’s future behavior and predict future trends. Forecasting sunglasses, and other consumer goods, is important because fashion retailers need to be able to see how trends evolve to make accurate predictions of future market needs. Trends are always shifting so it is important to be able to anticipate upcoming
trends to meet consumer demand. When used in conjunction with other consumer behavior research fashion counts add realism to trend forecasts.

Within this paper is a review of literature describing the industry’s opinion regarding current and future trend for sunglasses as well as literature relating to past trends. This review was necessary in assisting the researcher in the development of an instrument for use in conducting the fashion count. As a result of this process the project incorporated the following aspects of sunglasses as elements included in the fashion count: frame type, frame color, lens color, frame material, decoration, and frame size. The fashion count was conducted and the results and a discussion are included.

**REVIEW OF LITERATURE**

While many consider sunglasses to be only a trendy accessory, the most important reason for wearing sunglasses is to reduce glare in normal sunlight activity (Sunglass Association, n.d.). According to the Sunglass Association the best pair of sunglasses is one that the consumer wants to wear almost all of the time no matter how trendy they may be. Other important considerations include comfort and protection against harmful UV rays.

According to *Accessories* magazine, the most fashionable sunglasses for the summer of 2005 included such styles as cat-eye frames, logos, rhinestones, bright colors, “Jackie O” styles and vintage inspired frames (Lu-Lien Tan, 2005; Parker, 2004a; Parker 2004b). The most popular were oversized frames in black, dark brown and gold, lenses in black and dark brown, wide rectangular frames, tan, glamour plastics, logos, and rhinestones. Also expected to be right on trend were the girl aviators, which are flattering to many face shapes because of their structural lines and wrap-around sunglasses, considered sporty chic, which shield eyes from
practically everything (Gordon, 2004). Parker (2004a) stated that the colors for spring included purples, deep pinks, berry colors and shades of green, teal and blue. Popular lenses tints for spring 2005 were predicted to come in gradients and sheer tints that balance large frames and prevent them from overpowering the face.

Porsche Designs, Rocawear and BCBG all developed and introduced sunglass collections for the spring 2005 season. Porsche Designs decided to branch out from the car manufacturing business into luxury goods including eyewear, selling approximately 9 million pairs of their Porsche pilot sunglasses in the winter of 2004 (Drier, 2005). While New York based eyewear manufacturer, Colors in Optics Ltd., launched two licensed collections with BCBG and Rocawear. The re-launched BCBG line “is tailor-made for a customer with a bold approach to fashion and herself” and the Rocawear collection is a reflection of the music world, focusing on music videos (O’Keefe and Holt, 2004, p. 12).

There have been many developments in lenses for sunglasses over the years. There are several lens options available that can be made of either glass or plastic and can have special high-tech treatments. These lens options include mirrored, gradient, polarized, photochromic and tinted. Mirrored lenses have a thin layer of metallic that may cut down on the visible light that reaches the eyes. Gradient means the lens is tinted dark on the top and fades to no tint on the bottom. Polarized lenses reduce glare from pavement or water surfaces. Photochromic lenses are sun-sensitive and transition from light to dark according to the sun or lighting conditions. A tinted lens means that the lens has a color called neutral density gray that will shade but will not change the perception of color (Nellis, n.d.). Also, there are lenses that have selective filtration that only reduce certain rays (Sunglass Association, n.d.)
METHODOLOGY

A fashion count was conducted on sunglasses to determine the frequency of different styles worn by college aged women. An instrument was created by the researcher to aide in recording the data that were collected. Included in the instrument were: shape, frame and lens color, size, material, and decoration. The shape category relates to the frame shape. Frame shapes expected included aviator, butterfly, geometric, oval, square, rectangular, round, wide rectangular, and wrap around. Frame color indicates the color of the frame itself. Expected frame colors were berry, black, blue, clear, dark brown, gold, gray, green, iridescent, pink, purple, red, silver, and white. The same with lens color, which include: berry, black, blue, clear, dark brown, gold, gray, green, iridescent, pink, purple, red, silver, tan, and orange. Space was left within each section of the instrument to record information that the researcher did not expect to encounter.

A total of two hundred college aged women (approximately 18 to 24 years old) were observed on the campus of a medium sized southern university in the United States. The fashion count was conducted during the spring semester of 2005, in early April. These women were observed in two outdoor, high-traffic locations on the university’s campus. Data were collected between classes or during the lunch break on various days of the week. On the observation days, the weather was sunny enough for people to actually need to wear sunglasses.

FINDINGS

Wide rectangular frames were the most popular style worn by the women (23.2%), but only by a slight margin (Table 1). The oval style follows close behind the rectangular (21.5%). As indicated in Table 1, rectangular (17.7%), butterfly (12.7%), and wrap around frames (9.7%)
were also quite popular. These styles flatter most face shapes including oblong, square, round, oval, and heart (Parker, 2005b).

Four frame sizes were observed. While medium sized frames seem to be the most popular (33%), thin and oversized are tied for the being the second most worn (27% each) (Table 1). Frames were observed as being made of either metal or plastic. Two out of three women observed were wearing plastic frames rather than metal (66% to 34% respectively) indicating an overwhelming preference for plastic frames.

Table 2 shows the frequencies of frame and lens colors. By far the most frequent color was black (36%) with dark brown (22%) and gold (14%) trailing farther behind. When examining the occurrence of various lens colors once again black was by far the most popular (43%). With a count of less than half of that of black, was dark brown (19%) and then tan (14%). Overall the most popular style was black, medium sized plastic wide rectangular frame with black lenses.

DISCUSSION

After reviewing the findings, the researcher determined that black was the main color for frames and lenses, with dark brown and gold also observed may increase in popularity. Lenses in tan and iridescent colors could replace the basic black. The researcher predicted that, for this market, it was possible for plastics to continue to grow in popularity past the spring 2005 season. According to Accessories Magazine, rimless frames could increase in popularity over time.

Overall, the findings are very similar to the projected summer trends for 2005 outlined in the review of literature section. Compared to the trends outlined in the fashion magazines, the women on this university campus were very close to being considered fashionable and having

Trendy eyewear. This means that it is safe for area retailers to buy and stock the fashionable sunglasses as suggested in the magazines read by their customers. Most college women don’t “lag” in terms of fashion adoption and are willing to spend money to have latest fashions.
This information can be used by local retailers to determine which styles of sunglasses they should carry in their store for the next season in order to maximize their profits. By carrying styles desired by local consumers, retailers could increase the amount of money that is spent in a specific area. This can be good for the local economy because consumers will be spending their money locally and will not have to travel long distances to find specific styles or just to go shopping.

**CONCLUSION**

Judging by the data collected an increase in aviators and wrap around frames in gold and brown colors with faintly tinted, iridescent, or mirrored lenses can be expected for the summer of 2005. While plastics will continue to remain popular, metals will become more and more popular over time. As the American population becomes more and more obsessed with designer brands, we will see an increase in high-end sun wear with the logo right up on the face of the consumer, as this ensures that the logo will be noticed almost immediately (Parker, 2005).

Because sunglass trends are constantly changing, using a fashion count to determine current consumer behavior and comparing that to industry’s perception of fashion can provide retailers with information they can use to plan their stock needs. This can be a crucial research method to use before making any purchases.

A cross-cultural study of address terms

----A survey of Americans and Chinese in a U. S. university environment

Introduction

Address terms are a very interesting aspect of sociolinguistic studies. How one addresses others often reveals social and interpersonal relationship with one another. In cross-cultural situations, choices of address terms often reflect cultural differences. In other words, every culture or society has its own rules or norms governing the choice of addressing terms that are appropriate for use between two or more people engaged in linguistic interaction or conversation.

Although past literature directly related to cross-cultural (American and Chinese) study of address terms is scarce, quiet a number of studies have been made on monolingual address terms over the past few decades. Of the relevant studies, many have noted the role of “politeness” and “solidarity” and differential power in the speakers’ choice of address terms (Brown & Ford, 1961; Moles, 1978; Hong, 1985; Cheung, 1990; Mao, 1999; Huong, 2000). Moles (1974), in his study of the usage of address terms, pronouns, and languages by Quechua-Spanish bilinguals in Peru, found that address terms illustrated different degrees of respect besides confidence. Jayapl (1986) examined address terms in Tamil and found certain correlation between various types of Tamil address terms with social variables. Huong (2000) notes from his study of politeness in modern Vietnamese that Hanoi speakers consider politeness to be not only an individual communicative strategies, but also an observance of social norms of behavior. Many others have investigated the linguistic changes in terms of choices of address terms with
societal changes (Fang & Heng, 1983; Cheung, 1990; Ju, 1991; Song, 1994). But all these studies were concerned with mono-cultural settings—most often in a Chinese culture. It would be interesting to investigate language change as concerns address term choices in a multi-cultural and multi-linguistic environment such as in the United States. Wardhaugh (2002) summarizes a variety of social factors that usually govern our choice of terms: particular occasion, the social status or rank of the other, gender, age, family relationship, occupational hierarchy, transactional status, race or degree or intimacy. He also indicates that different societies and cultures certainly have different norms or preferences in their choices of address terms. China and the United States are two distinctive countries with quiet different cultures. One important assumption for this study is that those societal and cross-cultural differences must be reflected in their choices of address terms. This study intended to investigate common forms of address terms in the two cultures—Chinese and American. The main purpose of this study was to investigate cross-cultural variations or differences in the choices of address terms though some common rules that govern the choice of address terms such as politeness and solidarity will also be examined. This study also investigated the changes that occurred among the Chinese students studying in the U.S. as concerns their choices of address terms. Two hypotheses will be examined in this study: 1.) Differences between Americans and Chinese in their choices of address terms are governed by cultural rules (norms) such as politeness, solidarity, status classification as well as by contexts or styles; and 2.) the Chinese students here, who are undergoing the process of assimilation and acculturation, will tend to accommodate the American culture and be more like the Americans in their choices of address terms.
Method

Variables and address terms

In this study the following variables and address terms were included:

1.) cultural background (two levels): Chinese and American; 2.) age (range); 3.) gender; 4.) education; 5.) profession; 6.) linguistic style such as formal, informal, intimacy, etc.; and 7.) address terms: no name (NN), first name (FN), full name (FN+LN), last name (LN), and title + last name (TLN).

Sample

A total of 51 subjects (27 Americans and 24 Chinese) comprised the sample. Of these 27 Americans, 25 grew up in the United States, and 2 grew up in other Western countries (Australia and Canada); 15 were females and 12, males, and 21 were Euro-Americans, 2, African Americans and 4 were other minorities. The age ranges for the Americans are: 11 are between 20-35; 4, between 36-45; and 12, above 45. In terms of education, 21 did or are doing graduate studies, 2 attended two- or three-year college studies, 4 had 4-year college. In terms of profession, 7 are university faculty, 14, graduate or college students, 4, business-persons, 1, school teacher, and 1, unidentified.

As for the Chinese respondents (11 females and 13 males), they all grew up in China and all except two came here to study or do research. Their age ranges are as follows: 14, between 20-35; 8, between 36-45; and 2, above 45. Thirteen received or are receiving graduate degrees, 9 received 4-year college, and 2 had two- or three-year college education. By profession, except two, the Chinese respondents are currently USC students, pursuing graduate degrees.
**Instrument & Procedure**

The instrument was a self-made 12-item survey, which was constructed in two equivalent versions—one for the American participants and the other for the Chinese participants. In order to examine the language change, in the Chinese version, this 12 items were measured twice—one set referred to their experiences before they came to the United States and one set referred to their experiences now. The instrument addresses how the participants from two different cultures make their choices of address terms in various occasions, for example, formal, informal, orally and in writing. The survey for the Americans was posted through the USC LINGGRAD (Linguistics Graduate Student Organization) email network and the version for the Chinese were posted through USC FACC (Friendship Association of Chinese Student and Scholars) email list-serve. I also personally administered the survey to some Americans (graduate research assistants) at the Office of Program Evaluation, and some faculty members at the Program of Educational Psychology, Research and Foundations, USC College of Education. The total responses were 51 (27 for Americans, and 24 for the Chinese).

**Results**

The Kolmogorov-Smirnov tests of population difference (an alternative to Chi-Square test) on the 12 items indicated that while the two groups (Americans and Chinese-then) significantly ($\alpha=0.05$) differed on five items (i.e., informal greeting to superiors, informal letter-writing, expecting to be addressed by subordinates, addressing a stranger...
for help and addressing younger family members), the two groups (Americans and Chinese-now) differed significantly only on one item (informal greeting to superiors).

As illustrated in Table 1.1 below, while about 52% of the Americans chose first name (FN), and 48% chose no name (NN) for informal greeting to friends, and the percentages were reversed for parting, the Chinese responses were diversified: although about 46%, and 42% of the respondents would choose NN for informal greeting and informal parting, a considerable percentage (38%, and 29%) of the respondents would choose LN or full name (FULL) in the two informal settings when they were in China. Changes for the Chinese are obvious: while only 17% of them would use FN before coming to the US, now about 63% would choose FN for informal peer greeting, and for informal parting, the increase in the percentage of respondents who chose FN is .38.

Table 1.1

*Comparison of Survey Responses by Group (Informal/Familiar Greeting and Parting) (%)*

<table>

<td>16.7</td>
</tr>
<tr>
<td>Chinese -2</td>
<td>33.3</td>
<td>62.5</td>
</tr>
</tbody>
</table>

Notes: a. NN=No Name, FN=First Name, LN=Last Name, FULL=Full Name, and TLN=Title+Last Name.
b. Chinese-1 refers to their responses on the prior-to-America experiences whereas Chinese-2 refers to their responses on the current experiences in the United States.

As for informal greeting to superiors, status consciousness is reflected by the fact that for both cultural groups a majority of them (52%, and 83% respectively) would
choose TLN although sharp differences can also be found: about 44% of the American respondents would use either NN or FN, none of the Chinese respondents would choose NN or FN when they were in China. Though about 21% of them now would choose FN, none of them would do so before coming to the U.S.

Table 1.2

*Proportion of Responses to Informal-Greeting-to-Superior Setting (%)*

</tr>
<tr>
<td>Chinese-2</td>
<td>20.8</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: Notations and symbols are same as in Table 1.1.

As for informal letter-writing, not much differences were found between the two groups: although small portion of the Chinese used LN or FULL and none of the Americans use either of them, great majority of the respondents for both groups would use FN in informal letter-writing.

Table 1.3

*Proportion of Responses to Informal Personal Letter-Writing Setting (%)*

<td>8.3</td>
<td>8.3</td>
<td>4.2</td>
</tr>
</tbody>
</table>

Note: Notations and symbols are same as in Table 1.1.

When addressing superiors formally, Chinese respondents tended to use TLN more often than the American respondents. Still cultural differences are reflected by the fact
that while about 29% of the American respondents chose either NN or FN to superiors, none of the Chinese would do so.

This difference is more salient when we compare the situation for formal-letter writing. While 63% of the Americans would choose FN even for formal occasion, about 80% of the Chinese would use either TLN or FULL before. Some change on the Chinese respondents is reflected by the fact that while none would use NN or FN before, now about 38% would use either of them.

Table 1.4

</tr>
</tbody>
</table>

Notes: “O” stands for “other”. Most of the answers in this category indicate that their choices depend on situation/style/interlocutors. Other annotations and symbols are the same as in Table 1.1.

When addressing family members, the American and Chinese respondents did not differ much. Both Americans and Chinese respondents would choose either kinship terms, or nicknames or first names. When Americans address younger ones, in terms of
descending percentage, the order is FN-NIN-KN whereas when they address older or elder ones, the order is KN-FN-NIN. For the Chinese respondents, the order is the same: KN-NIN-(FN) for both occasions though a couple of them would use TLN when addressing the elders.

In terms of language change, the Chinese students now tend to use FN more frequently on both occasions than when they did in China.

<td>29.2</td>
<td>29.2</td>
</tr>
</tbody>
</table>

Notes: KN=Kinship Name, NIN=Nickname, other symbols and annotations are same as in Table 1.1.

As illustrated in Table 1.7 below, when seeking help from a stranger, most American and Chinese respondents now will use request routine (i.e., excuse me), but language change can be found in the Chinese responses to pre- and post-American experiences: Before they came here only 4.2 would use request routine while 91.7% of them would use (honorific) title, but now about 96% will choose request routine and none will use the (honorific) title.

Table 1.7

Proportion of Responses to Addressing-a-stranger-for-help Setting (%)

</tr>
<tr>
<td>Chinese (Now)</td>
<td>4.2</td>
</tr>
</tbody>
</table>

Note: NN=greeting=no name, RR=request routine.
When asked how they would expect to be addressed by subordinates, about equally one third of the Americans will choose NN, FN or TLN, but a majority (92%) of the Chinese respondents would choose TLN when they were in China. Changes to the Chinese students were also obvious: while only a couple of them would expect to be addressed by NN, and none would expect to be addressed by FN, 8% of them now would expect to be addressed by NN, and 54% would expect to be addressed by FN.

Note: Notations and symbols are same as in Table 1.1.

Table 1.9 illustrates the results of responses to a question about their consideration/motivations in the same and cross-cultural contact. A similar pattern was found for both cultural respondents: a majority of the American and Chinese respondents will choose “politeness” as the most important for both occasions, and about one-fifth to one-third of the Americans and about one-fifth to a quarter of the Chinese will choose “respect” as most important consideration for same and cross-cultural situations respectively.

b. The number in bracket refers to the counts of respondents under that category.
c. Due to the missing data, the responses of Chinese here only refer to the post-America (now) experiences.
Table 1.11 and Figure 1.1 and 1.2 illustrate the overall comparison in some informal and formal settings. When summing up the data across four informal settings (informal greeting to a friend, informal parting, informal letter-writing, and informal greeting to a superior), 50% of total responses for the Americans indicated FN (first name), and 36% indicated NN (no name) whereas only 27% of the total responses for the Chinese (Pre-America experience) indicated FN, 25% indicated NN, and 23% indicated TLN. However, dramatic change is found for the Chinese (Post-American experience): 54% of the total responses now indicated FN though the response pattern for NN and TLN did not change much. When summing up the data for the two formal settings (formal letter-writing, and formally addressing a superior), the difference is obvious: a great majority of the Chinese would/will choose TLN (81%) whereas 48% of the American respondents will choose TLN although 44% of them will still use FN to address on formal occasions.

Figure 1.2 Comparison of Responses to Some Formal Settings By Group

Discussion and Conclusion

As illustrated by the data, several findings are worth discussing and inferences may be drawn from them. First of all, my hypothesis that differences between Americans and Chinese in their choices of address terms are governed by cultural rules (norms) seemed to be supported by data. Most of the American respondents tend to use either FN or NN in most informal settings and even in some formal settings or status conscious settings (for example, formally addressing one’s familiar superiors or writing a formal personal letter). In comparison, the Chinese respondents under the context in China would use diversified choices—more percentage of them than the Americans would concern the status classification and choose TLN even in informal settings. As for the formal settings
where social status are conscious, most Chinese respondents (much more percentage than the Americans) would choose the more respectful TLN. As noted by Brown and Ford (1961), TLN indicated inequality and unfamiliarity while (mutual) FN indicated equality and familiarity. One explanation for the differences between the two cultural groups is that although China has been undergoing rapid social change toward more egalitarian and equality, its cultural rules or linguistic norms are deeply rooted in social hierarchy and status consciousness while the United States is a more democratic and equal society. Thus, using FN or NN reinforce “familiarity” or “solidarity” for the Americans whereas using the title conscious address terms for the Chinese helps them express their “humbleness” or “politeness” or “respect”.

Secondly, age may be also an important factor that determined the respondents’ choice. While most of the Chinese respondents belong to young or middle-age groups, about 44% of American respondents are above 45. In most contexts, it is quite appropriate for the elders/older ones to address the younger ones by first name or greeting plus no name in both American and Chinese cultures.

Thirdly, the Chinese respondents are a special group, representing of those who came to the United States to study, and who have been undergoing acculturation or assimilation, and undergoing a process of linguistic change. They are well-educated intellectuals, bilingual (fluent in English and Chinese) and sensitive to linguistic changes—their acculturation to the American culture may have already begun far before they came here. Giles and Powesland (1975) observe: “Accommodation through speech can be regarded as an attempt on the part of speaker to modify or disguise his persona in order to make it more acceptable to the person addressed.” Accommodation theory
certainly interplayed in the Chinese respondents’ language change in terms of the choices of address terms.

Finally, my analysis is based on self-reported data for artificially-constructed scenarios, and the respondents’ answers were based on their memories. Obviously, the patterns or the conclusions I’ve drawn are more a reflection of what these groups THINK or SAY they would do in these various scenarios than what they actually do. Moreover, limited by the data-collection, even if the findings of this study are valid in its own right, they cannot be generalized to the American and Chinese communities at large without constraint. The results would be at best only typical of college or university communities, especially for the Chinese respondents, who to certain degree reflect the Chinese student (intellectual) community, studying at American universities and/or colleges. For future study of the same topic, it is recommended to use a more representative and stratified sample. It would be of relevant interest to compare respondents in the mainland China with those immigrants of Chinese who have lived in the US for some years. The length of their stay in the US may be also an interesting factor for it is an indicator of the degree of their assimilation to the American mainstream culture among other social factors.

ABSTRACT

Teachers’ Assessment Practices and Fourth Graders’ Reading Literacy Achievements: An International Study

Shiqi Hao

Majority of the literature in assessment was critical of traditional selected-response formats of assessment and argued for performance assessment, claiming that the latter has advantages over the former type assessment in that it measures abilities and skills of a wider range and is more aligned with those skills required in the real world. In addition, it is often stated that performance assessments generally tap high-order thinking skills. These views, however, are typically not based on data or empirical research. This dissertation study, using the data of the four English-speaking nations (i.e., Canada, England, New Zealand and the United States) from the Progress in International Reading Literacy Study (PIRLS) 2001 database, investigated the relationship between teachers’ assessment practices engaged for formative and summative purposes and their fourth graders’ achievement in the three aspects of reading literacy (i.e., reading for acquiring and using information, reading for literacy experience and overall reading literacy achievement). This study also investigated the relationship between a school level SES variable (i.e., percentage of students from economically disadvantaged homes in a school) and school mean reading literacy achievement scores, and whether a relation existed between this school SES variable and teachers’ assessment practices.

HLM analyses indicate a slightly negative relation between teachers’ performance-based assessment practice engaged for summative purposes and their students’ scores on the three aspects of reading literacy although no apparent relationship
was found between teachers’ performance-based assessment practice engaged for formative purpose and their fourth graders’ reading literacy achievement. The findings supported a negative relation between school level proxy SES index (i.e., school percentage of students from economically disadvantaged homes) and mean school student reading achievement. Moreover, the findings indicated that teachers from poorer schools (i.e., schools with higher percentage of students from economically disadvantaged homes) appeared to use more frequently performance-based assessment than teachers from richer schools (i.e., schools with lower percentage of students from economically disadvantaged homes).

The relationship between nutrition and child mental health in response to natural disasters in Indonesia: A literature review
By Latifatul Hasanah

Abstract

Aim: to analyse the link between nutrition and mental health in order to response better to child mental health in relation to natural disasters in Indonesia. Objectives: examining child mental health in emergencies, understanding relationship food, nutrition and child mental health in emergencies, analysing evidence on combined nutrition and psychosocial interventions in child mental health, proposing evidence-based practice to response better to child mental health in relation to natural disasters in Indonesia. Methods: Relevant studies and articles for child nutrition and mental health are searched for by using library search engines. When the databases provided only an abstract of a study selected, the CISTI database is used as a strategy to generate the complete article. Further materials are collected by browsing websites of governmental and international organizations such as the WHO, the UNICEF website and also contact some experts in this area. The main key words are “nutrition”, “child/children”, “mental health”, “psychosocial”, and “interventions”. Other key words such as “food shortages”, “food insecurities”, “emergencies”, “assessment”, “stimulation” and “health” were used in combination with the main key words. Inclusion criteria: the materials were published from 1990 to 2005, both English and non-English materials and the materials have to discuss or cover evidence-based research and evidence-based recommendation practice related to nutrition and child mental health. Possible limitations: the research may miss some unpublished documents. Intended outcome: to give a baseline literature review of the importance of combined interventions in disaster response in Indonesia that may change the disaster policy or plan or practices to better address child mental health associated with natural disasters.
Developmental Relief Response to 2001 Drought in Southern Zambia

From 2001 to 2003 one of the worst food security crises in over a decade struck the southern region of Africa due to prevailing drought conditions. By the end of September 2002, it was estimated that nine million people were in need of food aid and by March 2003 another 14.4 million would join their ranks. To address this crisis, the United States Agency for International Development (USAID) and Food for Peace (FFP) funded the Consortium for Southern Africa Food Security Emergency (C-SAFE), a multi-country, multi-agency response composed of CARE, Catholic Relief Services and World Vision. C-SAFE was to provide food aid and developmental relief to Malawi, Zambia and Zimbabwe using a new “regional” approach. The objectives were to 1. Protect and/or improve the food intake of vulnerable groups, 2. Increase/maintain productive assets among targeted vulnerable communities and households, and 3. Increase resilience to food security shocks among those vulnerable communities and households. During the life of the project, objective one was mostly realized, and some of objective two. Objective three, increasing resiliency to food security, did not occur, but C-SAFE efforts paved the way for future funding efforts to do so.

Key Words: food security, Zambia, USAID, drought, developmental relief

Title: Assessing the Quality of Academic Journals: The Case of Social Work

Topic area: Social Work

Presentation type: Paper session

Author: Rebecca L. Hegar, Professor

Department & Address: School of Social Work
University of Texas at Arlington
Box 19129
Arlington, TX 76019-0129

E-mail: rhegar@uta.edu

Phone: 817/272-5357 (office)
 Assessing the Quality of Academic Journals:  
The Case of Social Work 

Publishing in academic journals is a central task and preoccupation for social scientists. Not only is publication in peer-reviewed outlets the primary way scholars influence their fields, but personal publication records are critical at many junctures in academic life: hiring, tenure, promotion, merit review, and post-tenure review (Holden, Rosenberg, & Barker, 2005; Seiple, 2003). Because of the importance of peer-reviewed publication, the problem arises of how to evaluate the worth of specific contributions to the academic literature. All disciplines struggle with the issue of the comparative prestige or importance of different outlets for scholarship, particularly with the ranking of academic journals (e.g., Amin & Mabe, 2000). Schools of Social Work have entered into the exercise of ranking journals relatively recently, and debate still rages over the advisability of rankings, as well as over alternative bases for rankings.

This paper considers issues surrounding the ranking of academic and professional journals, including practices in other social sciences disciplines as well as in social work. It compares published rankings of social work journals that employ different approaches, including impact factors based on frequency of citation (Furr, 1995; Journal Citation Reports, 2005), familiarity or reputation among faculty (Cnaan, Caputo, & Shmuely, 1994; Sellers, Perry, Mathiesen, & Smith, 2004; Sellers, Mathiesen, Smith, Perry, 2006), and mixed criteria including longevity and visibility (Williams, 2002). The author concludes that, despite differences in method of ranking, a substantial degree of consistency emerges in
the journals that repeatedly are placed among the top 20 social work journals. This finding is presented graphically in tables showing side-by-side rankings of journals using different methods of assessment.

The paper concludes with discussion of the implications of using ranking systems to help establish the value of published scholarship. For example, the use of journal rankings in tenure decisions may discourage pre-tenure faculty from publishing in fields that fall outside the purview of the best regarded journals. The paper presentation invites discussion of the practice of ranking journals from the perspectives of the disciplines represented at the session.

The early Christian (Coptic) period in Egypt has received little attention compared to the Pharaonic, early Greco-Roman, and Islamic periods. This is partly due to the oversight of Coptic materials by early antiquarians, historians, and archaeologists who focused on the Pharaonic period. Thus, there is still much to learn regarding this phase of Egypt’s history, especially when using a multidisciplinary approach.

Egypt has been extremely religious throughout its history. Many secular customs and daily practices were based on religious doctrine. As Christianity began to arise in the Roman Empire, the Egyptians started to embrace this new theology as well. As a result, Christianity has early foundations in Egypt. It is believed to have started in Alexandria with Saint Mark around A.D. 43. However, Christianity did not spread throughout much of Egypt until the monastic movement in the third and fourth centuries. During the first and second centuries, Alexandria was a main religious center in the Roman Empire. Although Christianity flourished in the Mediterranean city, there was still a pagan presence and, as such, influence. Thus the Christianity of Alexandria in this early period was heavily embedded in Platonic philosophy. In addition, Gnosticism and Judaism flourished in Alexandria, having an impact on the Christians in the city. By the third century, monasticism became very popular throughout Egypt and monasteries were being built along the Nile and in the desert.

There are many documents that mention this early period in history. However, like most texts from earlier periods, they do not always inform later researchers about every aspect of the culture. Therefore, it is up to the scholar to fill in the blanks. This concept serves as the basis of this paper, where visual culture, archaeological, and historical methods and research have been used in order to gain a better understanding of the early Christian period in Egypt. This research is based on archaeological excavations conducted at Tell El-Hibeh, Middle Egypt for the last three summers, an examination into the early art of the Coptic Church, and comprehensive research on early church histories and writings from monks. The result of blending the data from this multidisciplinary research ultimately provides a more complete picture of the early Coptic Church.
Was Keynes Right?
Does Current Year Disposable Income Drive Consumption Spending?

John J. Heim
Department of Economics
Rensselaer Polytechnic Institute
110 8th Street
Troy, NY 12180
heimj@rpi.edu

Abstract: In the Keynesian consumption function, current income is asserted to be the main determinant of consumption. This paper examines the extent to which the Keynesian consumption function explains 1960 - 2000 U.S. consumption patterns. The results are compared to the longer term average income variables suggested by Friedman’s Permanent income Hypothesis and Ando and Modigliani’s Life Cycle Hypothesis as the income variable affecting consumption. We find variance explained by the consumption function drops dramatically when multi-year average incomes are substituted for the Keynesian current income variable. However, when added to the Keynesian function as a second income variable, they increase explained variance from 88% to 90%, compared to the Keynesian income variable alone. This small amount suggests that their may be a small portion of the U.S. population whose consumption decisions follow the more complex formulations suggested by the Permanent Income and Life Cycle hypotheses, while the simpler current income formulation used by Keynes appears to characterize the consumption function of most of the population.

The General Theory of Employment, Interest and Money (Keynes 1936) suggests that the major determinant of current year consumption spending is current year income. So, for example, the portrayal of the consumption - income relationship in Ruggles & Ruggles (1956) classic text on National Income Accounting uses the relationship between 1936 income and consumption levels to illustrate this relationship. Kuznets’ 1952 American Economic Review paper on the marginal and average propensity to save (and consume) also focus on this current year consumption/saving - current year income tie. Typically, “IS/LM” chapters in textbooks example characterize Keynes’ relationship as one in which current year income determines current year consumption. To some extent, this is done implicitly by the failure to denote any difference in time period for the income and consumption variables. See for example the Mankiw (2006, Cptr.10) or Bernanke’s (2005, Cptr.9) Macroeconomics texts.

1 John J. Heim is clinical associate professor of economics at Rensselaer Polytechnic Institute. He has benefited greatly from discussions on various topics with colleagues in the economics department at R.P.I. All responsibility for errors, of course, remains his own.
Keynes did however note that (p.97) full adjustment to consumer spending to income changes might be less than instantaneous, especially during relatively short periods after an income change. But this seems to be the sole qualification to the general notion that current income drives current consumption.

Subsequent work by Friedman (1957) - the “Permanent Income Hypothesis”, and by Ando and Modigliani (1963) - the “Life Cycle Hypothesis” are predicated on the notion that expected levels of income over a longer time horizon determine consumption, not just current year income. Roughly speaking, this longer time horizon refers to some average of anticipated and/or previously experienced yearly. For example, Mankiw, discussing the Permanent Income Hypothesis, notes “permanent income is average income”, and his formulation of Modigliani income variable implies the same, since the income variable times the number of years worked is given as the definition of total lifetime earnings. This of course is only true if the income variable is average income. (Mankiw, 2006, pp. 472, 476),

Our purpose in this paper will be to statistically test the Keynesian consumption function on U.S. data 1960-2000, using current income as the definition of the income level that affects consumption. Other variables will be added to the function to control for other things thought to affect consumption, such as wealth, interest rates and access to consumer credit. We will then replace the current income variable with both adaptive expectations-based and rational expectations-based estimates of likely average income over time. Our goal will be to see if longer period average income variables are more successful at accounting for variance in consumption spending than just the Keynesian current income variable alone.

**The Basic Keynesian Function:**

Keynes argues in chapter 8 of *The General Theory of Employment, Interest and Money* (1936) that income, wealth, fiscal policy (taxes) and possibly the rate of interest might influence consumption. However, he felt

… income…is, as a rule, the principal variable upon which the consumption-constituent of the aggregate demand function will depend…. (p.96)

though

…windfall changes in capital-values will be capable of changing the propensity to consume, and substantial changes in the rate of interest and in fiscal policy may make some difference (pp.95-96)…

where “fiscal policy” is a reference to tax levels. In chapter 9 he also notes other factors that might affect the level of consumption spending: precautionary saving (for unknown, but potential, future needs), saving for known future needs (like retirement), and saving to finance improvements in future standards of living.

Hence, we can sum up Keynes by saying his determinants of consumption spending included after tax income, wealth, and the interest rate, and a desire to save.
To these, our Keynesian consumption function below will add a “consumer credit crowd out” variable. Prior studies by this author (Heim 2007) strongly suggest another aspect of fiscal policy, the government deficit, systematically reduces savings available to finance larger consumer purchases, such as cars, homes and furniture, or even credit card spending on smaller consumer purchases. This is the same sort of crowd out effect commonly discussed as adversely affecting investment.

Keynes also argued (p. 97) that the proportion of total income saved would grow as income grew, resulting in falling average propensity to consume as income grew.

Source: Ruggles & Ruggles, (1956, p.306)

Of course, a declining APC means the function has a positive intercept, as is commonly shown in textbook presentations of the Keynesian consumption function.
In another study (Heim, 2007a), this author found that regression results on a modified Keynesian function of the following type explained about 88% of the variance in consumer spending in the 1960 - 2000 period:

\[
C_0 = \beta_1 + \beta_2 (Y-T_G)_0 + \beta_3 (T_G - G)_0 - \beta_4 (PR)_0 + \beta_5 (DJ)_{-2}
\]

where

\((Y-T_G)_0\) = Total income minus taxes, defined as the GDP minus that portion of total government receipts used to finance government purchases of goods and services, i.e., total government receipts minus what’s needed to finance transfer payments in the current period.

\((T_G - G)_0\) = The government deficit (interpreted as a restrictor of consumer as well as investment credit. Usually we will disaggregate this into two separate variables in regressions: \(\beta_{3A} T_{G(0)}\) and \(\beta_{3B} G\). because we found the effects of each on consumer spending to differ, with the tax variable the more important. (See Heim 2007)

\((PR)_0\) = An interest rate measure, the Prime rate, for the current period. This rate is a base rate for much consumer credit.

\((DJ)_{-2}\) = A stock market wealth measure, the Dow Jones Composite Average, lagged two years

**METHODOLOGY**

All data used in the study is taken from the Council of Economic Advisors’ statistical appendix to the *Economic Report of the President, 2002*, Tables B2, B3, B7, B26, B54, B60, B73, B82, B90, B95 and B110. All data are expressed in real 1996 dollars, or converted to same using the GDP deflator in Table B3.

First difference versions of this modified Keynesian function (1) were used in regressions to reduce the distorting effects of multicollinearity and non-stationarity inherent in most time series models:

\[
\Delta C_0 = \beta_2 \Delta (Y-T_G)_0 + \beta_3 \Delta (T_G - G)_0 - \beta_4 \Delta (PR)_0 + \beta_5 \Delta (DJ)_{-2}
\]

or, entering separately the revenue and government spending components

\[
\Delta C_0 = \beta_2 \Delta (Y-T_G)_0 + \beta_{3A} \Delta (T_{G(0)}) - \beta_{3B} \Delta (G)_0 - \beta_4 \Delta (PR)_0 + \beta_5 \Delta (DJ)_{-2}
\]

Each regression below shows the estimated marginal effect (regression coefficient) for the explanatory variables, the t statistic associated with it, the percent of variance explained and the Durbin Watson autocorrelation statistic. Throughout the remainder of the paper, marginal effects with a t-statistic of 1.8 are significant at the 8% level, 2.0 are significant at the 5% level and t-statistics of 2.3 and 2.7 are significant at the 3% and 1% level respectively.
Because of the simultaneity between C (or its component part, M) and Y inherent in these equations, two stage least squares estimates of \( \Delta(Y-T_G)_0 \) were developed, using the remaining right hand side variables as first stage regressors. Newey-West heteroskedasticity corrections were also made.

Findings

The Keynesian Model: A Consumption Function Using Only Current Income

Using the variables described above, our regression estimates for the Keynesian consumption function are as follows:

\[
\Delta C_0 = 0.73 \Delta (Y-T_G)_0 + 0.47 \Delta (T_G-G)_0 , - 6.92 \Delta PR_0 , + 0.56 \Delta DJ-2 , \quad R^2 = 83\%
\]

\( \text{t} \) \quad (20.0) \quad (4.2) \quad (-2.4) \quad (2.7) \quad \text{D.W.} = 1.7

This regression shows all of the variables Keynes cited as determinants of consumption to be statistically significant at the 2% level or better. They are shown in order of their contributions to explained variance when entered in step-wise fashion. Disposable income accounts for 68% of the variance when entered first, more than any other variable, as Keynes suggested. When consumer credit limitations are added, represented by the size of the government deficit, explained variance increases from 68% to 78% - more than for any other variable entered second after disposable income. Subsequently adding the interest rate variable increases it to 81%, and adding the wealth variable raises it to 83%.

However, preliminary testing consistently indicated that increases in the government deficit due to lowering taxes had a more systematic negative effect on consumer spending, presumably by adversely affecting credit availability, than did increasing government spending. Our research here does not permit definitively examining why, but one hypothesis is that the Federal Reserve may be more likely to increase the money supply just before or during periods of increased deficits due to government spending, but not when the deficit increases due to tax reductions. As a result, in future analyses, we will use the disaggregated form of the government budget deficit shown below:

\[
\Delta C_0 = 0.66 \Delta (Y-T_G)_0(+\text{Keynes}) + 0.52 \Delta T_G(0), + 0.10 \Delta G_0 , - 7.23 \Delta PR_0 , + 0.42 \Delta DJ-2 , \quad R^2 = 88\%
\]

\( \text{t} \) \quad (26.6) \quad (5.2) \quad (0.5) \quad (-3.0) \quad (2.2) \quad \text{D.W.} = 1.8

This will now become our baseline Keynesian model. We will then measure the success of other models against this model using multi year income averages to reflect adaptive or rational expectations models of how income affects consumption, as per Friedman and Modigliani.

First, we will attempt to see if consumer spending is driven by only past income history over a number of recent years, i.e., an average or permanent income. This we will call the adaptive expectations version of the income variable because it averages current income only with incomes earned in the past. It views any change in this years’ income above a multi-year average as transitory in nature, not warranting a major expenditure shift.
Further below, we shall also test a rational expectations formulation, using expectations of income to be earned in the future (using actual income earned in the future as a proxy for “rationally expected” income). We will also combine this with past income to find an average of lifetime income, at least from the perspective of what’s been happening in the recent past and likely to happen in the near future. This we will think of as a “Life Cycle” or “Permanent average income variable, after Modigliani and Friedman.

Adaptive Expectations Models:

Our definition of adaptive expectations is that people view their permanent or life cycle income as an average of incomes they have been used to receiving in the past. Below we present results for several possible definitions of this income average, varying the number and combination of years in the past that constitute the average. The subscripts on the income variable denote the years included. The Keynesian “current income only” result from above is restated first for ease of comparison with the non-Keynesian results.

\[
\Delta C_0 = \gamma (\Delta (Y-T_G)0) \gamma + \gamma \Delta T_G(0) \gamma + \gamma \Delta G_0 \gamma + \gamma \Delta PR_0 \gamma + \gamma \Delta DJ \gamma R^2 = 88\% \\
\text{D.W.} = 1.8
\]

\[
\begin{align*}
\Delta C_0 &= .66 \Delta (Y-T_G)0_{(Keynes)} + .52 \Delta T_G(0) + .10 \Delta G_0 - 7.23 \Delta PR_0 + .42 \Delta DJ \gamma R^2 = 88\% \\
\text{D.W.} &= 1.8 \\
\Delta C_0 &= .55 \Delta (Y-T_G)1 \gamma + .43 \Delta T_G(0) + .20 \Delta G_0 - 9.11 \Delta PR_0 + 1.06 \Delta DJ \gamma R^2 = 42\% \\
\text{D.W.} &= 2.1 \\
\Delta C_0 &= .54 \Delta (Y-T_G)2 \gamma + .71 \Delta T_G(0) - .08 \Delta G_0 - 6.20 \Delta PR_0 + .84 \Delta DJ \gamma R^2 = 32\% \\
\text{D.W.} &= 1.3 \\
\end{align*}
\]

The regressions above show that when the Keynesian current income variable \(\Delta (Y-T_G)0\) is removed from the regression and replaced by an average of several recent past years incomes, the amount of variance explained by the income variable drops considerably. In models that rely totally on prior year income averages, explained variance drops from 88% in the Keynesian model to 31% - 48%. Only in models where the income average included current income as well as past years’ income were the results even close to the Keynesian model, with explained variance only falling from 88% to 65% - 81%. Even here, the best result, 81%, was only obtained by using a two year average that weighted current income more heavily (50%) in computing the average than in the other models.
Hence, the data do not seem to support an explanation of the average consumer’s behavior consistent with an adaptive expectations formulation of Friedman’s permanent income or Modigliani’s life cycle hypotheses.

However, if we test the hypothesis that some portion of Americans may be Keynesian, while others are more Friedman/Modigliani in their behavior, we find that the test results support such a theory, though only marginally when adaptive expectations alone are used. The results are shown in the following six additional regressions:

\[
\Delta C_0 = 0.57 \Delta(Y-T_G)_0 + 0.14 \Delta AV(Y-T_G)_{0,1,2,3,4} + 0.55 \Delta T_G(0) - 0.02 \Delta G_0 - 7.27 \Delta PR_0 + 0.33 \Delta DJ_2 \quad R^2 = 88%
\]

\[
(t) \quad (10.8) \quad (1.8) \quad (5.4) \quad (-0.1) \quad (-3.2) \quad (1.5) \quad DW = 1.6
\]

\[
\Delta C_0 = 0.54 \Delta(Y-T_G)_0 + 0.17 \Delta AV(Y-T_G)_{0,1,2} + 0.54 \Delta T_G(0) - 0.09 \Delta G_0 - 7.72 \Delta PR_0 + 0.37 \Delta DJ_2 \quad R^2 = 89%
\]

\[
(t) \quad (7.2) \quad (1.6) \quad (5.3) \quad (-0.4) \quad (-3.7) \quad (1.8) \quad DW = 1.5
\]

\[
\Delta C_0 = 0.50 \Delta(Y-T_G)_0 + 0.20 \Delta AV(Y-T_G)_{0,1} + 0.51 \Delta T_G(0) - 0.03 \Delta G_0 - 7.90 \Delta PR_0 + 0.40 \Delta DJ_2 \quad R^2 = 89%
\]

\[
(t) \quad (5.2) \quad (1.6) \quad (5.5) \quad (-0.1) \quad (-3.5) \quad (2.0) \quad DW = 1.5
\]

\[
\Delta C_0 = 0.59 \Delta(Y-T_G)_0 + 0.11 \Delta AV(Y-T_G)_{0,1,2,3,4} + 0.55 \Delta T_G(0) - 0.02 \Delta G_0 - 7.27 \Delta PR_0 + 0.33 \Delta DJ_2 \quad R^2 = 88%
\]

\[
(t) \quad (15.1) \quad (1.8) \quad (5.4) \quad (-0.1) \quad (-3.2) \quad (1.5) \quad DW = 1.6
\]

\[
\Delta C_0 = 0.60 \Delta(Y-T_G)_0 + 0.12 \Delta AV(Y-T_G)_{0,1,2} + 0.54 \Delta T_G(0) - 0.09 \Delta G_0 - 7.72 \Delta PR_0 + 0.37 \Delta DJ_2 \quad R^2 = 89%
\]

\[
(t) \quad (14.4) \quad (1.6) \quad (5.3) \quad (-0.4) \quad (-3.7) \quad (1.8) \quad DW = 1.5
\]

\[
\Delta C_0 = 0.60 \Delta(Y-T_G)_0 + 0.10 \Delta (Y-T_G)_1 + 0.51 \Delta T_G(0) - 0.03 \Delta G_0 - 7.90 \Delta PR_0 + 0.40 \Delta DJ_2 \quad R^2 = 89%
\]

\[
(t) \quad (15.5) \quad (1.6) \quad (5.5) \quad (-0.1) \quad (-3.5) \quad (2.0) \quad DW = 1.5
\]

This dual hypothesis formulation of how income affects consumption adds from 0% to 1% more to explained variance than the current income variable alone. However, the added average income variable is only significant at the 10% (t=1.8) or 11% (t=1.6) level. For many, this would not constitute sufficient evidence that any significant portion of the population is of the (adaptive expectations version) Friedman Modigliani type.

Multicollinearity of the average income variable with the current year income variable could be, but does not seem to be, the reason for the low t-statistic in the six equations. For example, in the 6th equation below, where the average income variable is comprised of current and immediate past year income levels, the correlation between this variable and the Keynesian current income variable is only 0.17. By comparison, in the equation using current income and a three year average income (current and past two years), the correlation is far greater: 0.66. However, in both cases the average income variables' t-statistic is the same (t =1.6).

if you drop the Keynesian current disposable income variable from the joint hypothesis, leaving only the Friedman/Modigliani hypothesis, R^2 falls substantially, from 88-89% to at least 80% and usually much less. The relatively high 80% is only for the two-period average \(\Delta AV(Y-T_G)_{0,1} \) which includes current income, the one closest to the Keynesian formulation \(\Delta AV(Y-T_G)_0 \). Without the Keynesian current income variable as part of the average, other past income averages explain even less variance, usually much less.
However, if we drop the Friedman/Modigliani average income variable (at least in its adaptive expectations form), explained variance drops a maximum of one percent. Hence, it would seem that most consumers are Keynesian, with current year income driving the consumption behavior data. At best a small fraction may exhibit Life Cycle/Permanent Income Hypothesis behavior (at least of the adaptive expectations type).

Note: In the six equations above, software limitations only allowed 2SLS estimates of $\Delta(Y-T_G)_0$, but not the income averages containing the current year’s income. However, in previous tests comparing 1SLS and 2SLS results, when only an average income variable was used, we did not find any change in regression results when a income average containing current income was a one stage vs. a two stage estimated variable.

### Rational Expectations Hypotheses:

Our definition of rational expectations is that people view their permanent or life cycle income as average incomes received in the past and/or reasonably expected to be received in the future, based on the best available information. Below we present results for several possible definitions of the rational expectations income “average” that might determine current year consumption. The Keynesian “current income” result is also restated immediately below for ease of comparison.

</tbody>
</table>
Here, the results are generally worse than the findings for the earlier-tested adaptive expectations models which used only an average income variable. For any number of forward lags here, (e.g., 0,+1,+2,+3) the rational expectations equation has a lower level of explained variance than the previously tested adaptive expectations model with the same lags, but backward rather than forward, e.g., (e.g., 0,-1,-2,-3). In this case, the difference is 60% vs. 67%.

What is most similar about these equations and the earlier adaptive expectations equations is that, generally, those without current income in the average explain less variance in consumption than those with current income in the average.

Hence, a rational expectations version of average income, when used as the only income variable in the consumption function, does not do well. However, it is possible that some parts of the population behave this way, while the rest - a larger group - behave in more Keynesian fashion. If so, we should test both income variables separately in our consumption function and they should explain different portions of the variance in consumption spending. In the equations below, we test the dual hypothesis that a portion of the population responds to income changes in a Keynesian fashion, the rest respond according to the various rational expectations formulations shown above. Again, we also include the simple Keynesian equation to facilitate comparison.

\[ \Delta C_0 = 0.56 \Delta (Y-T_G)_0 + 0.18 \Delta AV(Y-T_G)_{-1,-2,-3,0,+1,+2,+3} + 0.53 \Delta T_G(0_0) - 0.054 \Delta G_0 - 6.07 \Delta PR_0 - 0.40 \Delta DJ_2 \]

(t) \hspace{1cm} (13.4) \hspace{1cm} (2.5) \hspace{1cm} (7.6) \hspace{1cm} (-0.3) \hspace{1cm} (-3.5) \hspace{1cm} (-1.5)

\[ R^2 = 87\% \hspace{1cm} D.W. = 1.8 \]

\[ \Delta C_0 = 0.57 \Delta (Y-T_G)_0 + 0.16 \Delta AV(Y-T_G)_{-1,-2,-3,0,+1,+2,+3,+4} + 0.56 \Delta T_G(0_0) - 0.04 \Delta G_0 - 6.81 \Delta PR_0 - 0.24 \Delta DJ_2 \]

(t) \hspace{1cm} (14.5) \hspace{1cm} (2.3) \hspace{1cm} (6.7) \hspace{1cm} (-0.2) \hspace{1cm} (-3.5) \hspace{1cm} (-0.8)

\[ R^2 = 86\% \hspace{1cm} D.W. = 1.8 \]

The results clearly indicate that rational expectations models of Modigliani/Friedman average income variables are more systematically correlated with movements in consumption than are adaptive expectations models. All have t-statistics between 2.3 and 3.1, indicating significance at least at the 3% level to well above the 1% level. The t-statistics on the average income variable are the generally the strongest for averages that include one or two years of both future (a proxy for estimated future earnings) and past earnings, and also contain the current year's income in the average. Nonetheless, though statistically significant, adding the rational expectations averages only slightly improve on the results from using adaptive expectations averages. There, we saw 0-1% increases in explained variance adding the averages to the Keynesian model, from 88% to 89%. Here we see at best a 1-2% - point increase in explained variance from 88% to 90%. This suggests that at best, only a small number of Americans relative to the total population involve themselves in more complex weighing of past and future income potential when deciding what level of consumption is appropriate their income level.

Note: In the last equation of the series immediately above, the correlation between the two income variables is .17. This would not suggest multicollinearity is responsible for the relatively low t-statistic on some of the average income variables is the last series of results. Other averages have higher correlations between the income variables, and have even higher t-statistics. For the current income variable and the average of the 5 periods from two forward to two past, the correlation coefficient is .54, but the t-statistic is 3.1. This again suggests the results may not be heavily distorted because of multicollinearity.

DOES THE EXCHANGE RATE REALLY AFFECT CONSUMER SPENDING?

John J. Heim

**Abstract:** This paper examines the extent to which changes in imports or exports of U.S. consumer goods and services occurs in response to a change in the exchange rate, 1960 - 2000. The data used are taken from the *Economic Report of the President, 2002*. The findings indicate that an increase in the trade weighted exchange rate of about one percent is associated with an increase in imports of consumer goods of approximately $1 billion dollars. The same level increase seems associated with a decline in consumer goods exports of about $0.75 billion dollars.

For years now, the rhetorical battle in the United States has raged over whether the Chinese exchange rate is kept artificially high, thereby making it possible for Americans to buy many Chinese Yuan for each dollar they are willing to spend. This makes foreign goods seem cheap compared to American counterparts. Similarly, the more Yuan it takes to buy a dollar, the less American goods (exports) the Chinese are able to buy.

The argument is also made that if only the Chinese would lower their managed exchange rate to some "reasonable", but usually undefined, level, trade would again be fair, and a large portion of the trade imbalance between the two countries would disappear. Similar arguments are sometimes made regarding the exchange rates with some other American trading partners, such as Japan.

The question is, are American purchasing decisions as between domestic and foreign goods really that much affected by changes in the exchange rate between the United States and its major trading partners? That is an empirical question, and the one which this paper seeks to explore. We will examine the affect of changes in the exchange rate 1960-2000 on consumer goods imported into the U.S., and on consumer goods exported from the U.S.

**METHODOLOGY**

All data used in the study is taken from the Council of Economic Advisors’ statistical appendix to the *Economic Report of the President, 2002*, Tables B2, B3, B7, B26, B54,

---

1 John J. Heim is clinical associate professor of economics at Rensselaer Polytechnic Institute. He has benefited greatly from the intellectual stimulation provided by his colleagues in the economics department at R.P.I. All responsibility for errors, of course, remains his own.
B60, B73, B82, B90, B95 and B110. Additional data on multilateral trade weighted value of the dollar, i.e., the foreign exchange rate, is taken from Table B110 of the *Economic Report…, 2001* and Table B108 of the *Economic Report…, 1997*. Exchange rate values 1960 - 1970 were assumed constant at 1970 levels, per the Bretton Woods protocols. All data are expressed in real 1996 dollars, or converted to same using the GDP deflator in Table B3.

To study the effect of exchange rate changes on consumption of domestically produced and imported consumer goods, it was necessary to adopt a theory of consumer demand for consumer goods. Essentially, this paper postulates a Keynesian theory of demand for consumer goods (described below) and assumes that in general, the determinants of the demand for imported consumer goods are the same as those mentioned in Keynes (1936) for domestically produced consumer goods, with the addition of two other variables: a “crowd out” variable to control for periods of limited consumer credit availability, and an exchange rate variable.

The Basic Keynesian Function:

Keynes argues in chapter 8 of the *General Theory of Employment, Interest and Money* (1936) that income, wealth, fiscal policy (taxes) and possibly the rate of interest might influence consumption. However, he felt

\[\text{... income...is, as a rule, the principal variable upon which the consumption-constituent of the aggregate demand function will depend....}(p.96)\]

though

\[\text{...windfall changes in capital-values will be capable of changing the propensity to consume, and substantial changes in the rate of interest and in fiscal policy may make some difference (pp.95-96)…}\]

where “fiscal policy” is a reference to tax levels. In chapter 9 he also notes other factors that might affect the level of consumption spending: precautionary saving (for unknown, but potential, future needs), saving for known future needs (like retirement), and saving to finance improvements in future standards of living.

Hence, we can sum up Keynes by saying his determinants of consumption spending included after tax income, wealth, and the interest rate, and a desire to save. To these, our consumption function below will add a crowd out factor as also being the result of fiscal policy (via government deficit effects on savings available to finance consumer or investment credits) and the exchange rate.

Keynes also argued (p. 97) that the proportion of total income saved would grow as income grew, resulting in falling average propensity to consume as income grew.

Typical tests in the late 30’s and early 40’s using cross-sectional data seem to verify this. For example, Ruggles & Ruggles (1956, p.306) attempt to describe the Keynesian function in their classic text on national income accounting. They use using the income and consumption patterns of almost 40 million U.S. families in 1935-36 to illustrate a declining average propensity to consume/increasing average propensity to save as
income increased. Their data are shown in Table C1. Note that about half of all personal saving was done by the top ½% of all income recipients – those families earning $15,000 or more, and that the bottom two income groups had negative savings, i.e., average propensity’s to consume greater than one. Data like this have provided our standard, though somewhat - even if only slightly – oversimplified (no provision for wealth or interest rate effects), interpretations of the Keynesian consumption function.

Source: Ruggles & Ruggles, (1956, p.306)

Of course, a declining APC means the function has a positive intercept, as is commonly shown in textbook presentations of the Keynesian consumption function.

In another study (Heim, 2007a), this author found that regression results on a modified Keynesian function of the following type explained about 90% of the variance in consumer spending in the 1960 - 2000 period:

\[ C_0 = \beta_1 + \beta_2 (Y - T_G)_0 + \beta_3 (T_G - G)_0 - \beta_4 (PR)_0 + \beta_5 (DJ)_{-2} + \beta_6 (XR)_{-2} \]

where

\( (Y - T_G)_0 = \) Total income minus taxes, defined as the GDP minus that portion of total government receipts used to finance government purchases of goods and services, i.e., total government receipts minus what’s needed to finance transfer payments in the current period.

\( (T_G - G)_0 = \) The government deficit (interpreted as a restrictor of consumer credit. Usually we will disaggregate this into two separate variables in regressions: \( \beta_{3A} T_G(0) \) and \( \beta_{3B} G \) because we found the effects of each on consumer spending to differ, with the tax variable the more important.

\( PR_0 = \) An interest rate measure, the Prime rate, for the current period. This rate is a base rate for much consumer credit.

\( DJ_{-2} = \) A stock market wealth measure, lagged two years.
XR-2 = The trade-weighted exchange rate, lagged 2 years. In some regressions, an average of the XR value for the past two years is used, denoted XR_{AV12}.

First difference versions of this modified Keynesian function (1) were used to reduce the distorting effects of multicollinearity and non-stationarity inherent in most time series models:

\[ \Delta C_0 = \beta_2 \Delta(Y-T_G) + \beta_3 \Delta(T_G - G) - \beta_4 \Delta(PR) + \beta_5 \Delta(DJ) + \beta_6 \Delta(XR) \]

or

\[ \Delta C_0 = \beta_2 \Delta(Y-T_G) + \beta_3 \Delta(T) + \beta_4 \Delta(G) - \beta_5 \Delta(DJ) + \beta_6 \Delta(XR) \]

We will test these hypotheses using regression analysis using different levels of lag in the exchange rate variable from no lag (current year value) to -3 lag (the exchange rate value 3 years ago), and we will estimate the regression using the average exchange rate value for the past two years (average of -1 and -2 lags).

Each regression below shows the estimated marginal effect (regression coefficient) for the explanatory variables, the t statistic associated with it, the percent of variance explained and the Durbin Watson autocorrelation statistic. Throughout the remainder of the paper, marginal effects with a t-statistic of 1.8 are significant at the 8% level, 2.0 are significant at the 5% level and t-statistics of 2.7 are significant at the 1% level.

Because of the simultaneity between C (or its component part, M) and Y inherent in these equations, two stage least squares estimates of \( \Delta(Y-T_G) \) were also developed, using the last five right-hand side variables as regressors. Newey-West heteroskedasticity corrections were also made. Testing for autocorrelation was also done. Where the autocorrelation variable’s coefficient was found significant at the 5% level, it was included; otherwise no correction was made.

FINDINGS

Early tests on total consumption indicated that only the two year lag and average of one and two year lagged values of the exchange rate were systematically related to consumption. Nonetheless, we also present below the results obtained using the current exchange rate, the one and the three year lagged versions of this variable.

Baseline findings for the model, absent only the exchange rate variable, are also given. They allow us to determine the amount of additional variance explained by adding the exchange rate variable. The extent to which adding the exchange rate variable increases explained variance need to be evaluated with care, since order of entry in an equation can affect how much additional variance is explained. This is a major problem when there is significant multicollinearity between the last variable entered and the explanatory variables already in the model. One important sign of success in avoiding this problem is finding little or no change in the estimated marginal effects (regression coefficients) of the variables already in the regression when the exchange rate is added.
Our first set of statistical analyses examine the effect of the exchange rate on total consumption, i.e., consumption of both domestic and imported consumer goods (C) as “C” is used in the GDP identity,

\[ Y = C + I + G + (X-M) \]

Results are shown below for the baseline consumption function without the exchange rate variable, and for the additional equations adding the exchange rate (with from 0 to 3 year lagged values).

Using the (T-G) form of the deficit causes marginal, but not fundamental changes to parameter estimates, suggesting that first differencing has been helpful in removing instability of estimates due to multicollinearity effects. Notice however, that because the two components of the deficit seem to have different marginal effects on credit availability, consolidating them into one variable with one estimated average marginal effect reduces explained variance a bit.

\[ \Delta C_0 = .73 \Delta (Y-\bar{T}_G) + .47 \Delta (T_C-\bar{G}) - 6.25 \Delta PR_0 + .52 \Delta DJ_2 - .95 \Delta XR_{AV12} \]

\( R^2=85\% \)

\( \) (25.4) (4.6) (-2.0) (3.0) (2.0) D.W. = 1.9

Our results using the two year lag or average one & two year lags is consistent with the notion that a one-point increases in the trade weighted exchange rate (then), making imports cheaper, increase current year demand for consumer goods by an estimated $0.76 - $1.14 billion dollars.

At this point, we cannot tell if this represents an increase in demand for imported goods only, without decreasing demand for domestic goods. It might also be a net increase resulting from a larger increase in imports demand, partially offset in “C” by a substitution-effect decline in demand for domestically produced consumer goods. However, regression models below dealing with just the demand for imports indicates that exchange rate increases are correlated with an increased demand for imports of
roughly the same magnitude. These findings seem to imply, somewhat surprisingly, that while demand for imports may increase with increases in the prior year or two year ago exchange rate, demand for domestically produced consumer goods may not fall much due to substitution effects when those rates change.

The two stage least squares/heteroskedasticity/autocorrelation correction process left results on all variables essentially unchanged compared to traditional, single stage least squares results (not shown here), except to markedly strengthen the t-statistic on the income variable and weaken slightly the average exchange rate for the past two years as a systematic influence on total consumption compared to the 2-year ago exchange rate. Note that the most systematic impact of the exchange rate on total consumption appears to occur when we use the 2-year ago version alone, or perhaps the average exchange rate for the past two years.

We might hypothesize that the reason for this delay in consumer reaction to a change in the exchange rate is a delay in the process of adjusting product prices to changes in the exchange rate. This might occur because orders for many consumer goods, e.g., cars, parts provided by car parts suppliers or woods for furniture, are made well in advance of payment, pursuant to multi-year price contracts. However, this is merely a hypothesis. Determining the reason for the two year or past two year average exchange rate being the most consistent with the theory that exchange rates systematically affect consumption is beyond the scope of this paper.

Above, we used both the (T\textsubscript{G}-G) and the disaggregated form of the government deficit (T, G separately) (in addition to the Prime interest rate) to assess the impact of scarcity of consumer credit on consumer demand. The need for additional variable(s) beside the Prime rate to capture the total effect of credit scarcity ("crowd out") is not surprising. In another study currently underway (Heim 2007b) compelling evidence is found that the prime rate, a base rate for much consumer credit, is institutionally adjusted by the banking community to reflect changes in the federal funds rate. Therefore, used alone, it is not as fully indicative of credit availability as a supply and demand driven interest rate might be.

Next, we will look at how total U.S. imports vary with changes in the determinants of consumer demand. Again we start with the baseline model, which does not include the exchange rate, and observe how adding the exchange rate augments our results:

\[
\Delta M_0 = 0.15 \Delta (Y-T_G) + 0.21 \Delta T_G + 0.07 \Delta G_0 - 0.08 \Delta PR_0 + 0.06 \Delta DJ_2 + 0.71 \Delta R(1) + 0.48 \Delta R(2) \\
(4.8) (3.4) (-0.6) (-0.7) (0.3) (4.9) (3.0) \\
R^2 = 87\% \hspace{1em} D.W. = 1.9
\]

\[
\Delta M_0 = 0.15 \Delta (Y-T_G) + 0.30 \Delta T_G - 0.22 \Delta G_0 - 2.27 \Delta PR_0 + 0.84 \Delta DJ_2 + 0.63 \Delta XR_0 \\
(5.8) (6.7) (-2.6) (-1.8) (7.3) (2.5) \\
R^2 = 85\% \hspace{1em} D.W. = 1.5
\]

\[
\Delta M_0 = 0.15 \Delta (Y-T_G) + 0.31 \Delta T_G - 0.28 \Delta G_0 - 1.66 \Delta PR_0 + 0.84 \Delta DJ_2 + 1.06 \Delta XR_1 \\
(6.5) (6.7) (-3.8) (-1.4) (6.7) (5.6) \\
R^2 = 87\% \hspace{1em} D.W. = 1.8
\]

\[
\Delta M_0 = 0.16 \Delta (Y-T_G) + 0.27 \Delta T_G - 0.29 \Delta G_0 - 2.22 \Delta PR_0 + 0.89 \Delta DJ_2 + 0.94 \Delta XR_2 \\
(6.1) (6.1) (-3.0) (-2.0) (7.2) (5.0) \\
R^2 = 86\% \hspace{1em} D.W. = 1.7
\]
\[ \Delta M_0 = 0.16 \Delta (Y-T_G) + 0.30 \Delta T_{G(0)} - 0.30 \Delta G_0 - 1.68 \Delta PR_0 + 0.85 \Delta DJ_{-2} + 0.92 \Delta XRAV_{12} \quad R^2=88\% \\
(\text{t}) \quad (6.8) \quad (7.4) \quad (3.6) \quad (-1.5) \quad (6.7) \quad (7.7) \quad \text{D.W.}=1.8 \]

\[ \Delta M_0 = 0.15 \Delta (Y-T_G) + 0.21 \Delta T_{G(0)} - 0.07 \Delta G_0 - 0.18 \Delta PR_0 + 0.05 \Delta DJ_{-2} + 0.08 \Delta XR_{-3} + 0.70 \text{AR}(1) + 0.49 \text{AR}(2) \quad R^2=87\% \\
(\text{t}) \quad (4.6) \quad (3.3) \quad (-0.6) \quad (-1.8) \quad (0.2) \quad (0.5) \quad (4.6) \quad (2.9) \quad \text{D.W.}=1.8 \]

and using the (T-G) form of the deficit leaves most estimates virtually unchanged:

\[ \Delta M_0 = 0.16 \Delta (Y-T_G) + 0.30 \Delta (T_G-G) \quad - 1.68 \Delta PR_0 + 0.85 \Delta DJ_{-2} + 0.92 \Delta XRAV_{12} \quad R^2=88\% \\
(\text{t}) \quad (8.1) \quad (7.5) \quad (-1.6) \quad (6.8) \quad (8.2) \quad \text{D.W.}=1.8 \]

Here again, our results are consistent with the theory that the demand for imports is significantly and positively affected by the exchange rate. During the 1960-2000 period, the exchange rate varied between 84 and 143, with a mean value of 107 (1973 = 100 for this index). An average increase in consumer imports of about $0.92 - 1.06 billion is found to accompany a one index point (or about 1%) strengthening of the dollar, i.e., increase in the exchange rate.

Even changes in the rate during the current year show some correlation with changes in total imports, though not as much as changes for the prior year or two. In this and subsequent analyses, we interpret the lesser change found when using the current year value of the exchange rate as akin to an errors-in-variables problem. That is, we viewing the current year rate as an imperfect substitute for the prior year or prior two years’ rates, which seem more systematically related to consumption, biasing the current year coefficient downward.

Our next analyses will attempt to separate consumer imports out of total imports. The data available in Table B104 of the statistical appendix to the *Economic Report of the President, 2002* breaks down all U.S goods imports into only the following categories:

**Total Imports**
- Petroleum & Petroleum Products
- Industrial Supplies and Materials
- Capital Goods, Except Automotive
- Automotive
- Other

(No comparable breakdown of services is provided in the various appendix tables.)

Some of these clearly are not consumer goods categories. For other categories, such as automotive, petroleum and “other”, some portion (not clearly identified) are consumer goods. We will try several alternative definitions of consumer imports, defining them as total imports minus either

- (only) the capital goods category,
- the capital goods category and the industrial supplies and materials category, or
- capital goods, industrial supplies and materials and half of the value of the petroleum products.

The results of these analyses are shown below.
The first analysis defines consumer goods imports as total imports minus capital goods imports (\(M_{m-k}\)):

\[
\Delta M_{m-k} = 0.11 \Delta (Y-T\mathcal{G})_0 + 0.27 \Delta T\mathcal{G}(0) - 0.08 \Delta G_0 - 2.30 \Delta PR_0 + 0.51 \Delta DJ_{-2} + 0.45 AR(1) R^2 = 86% \\
(\text{t}) \hspace{1cm} (4.7) \hspace{1cm} (4.2) \hspace{1cm} (-0.8) \hspace{1cm} (-2.2) \hspace{1cm} (6.8) \hspace{1cm} (2.6) \hspace{1cm} D.W. = 1.7
\]

\[
\Delta M_{m-k} = 0.11 \Delta (Y-T\mathcal{G})_0 + 0.28 \Delta T\mathcal{G}(0) - 0.16 \Delta G_0 - 3.00 \Delta PR_0 + 0.59 \Delta DJ_{-2} + 0.67 \Delta XR_0 R^2 = 87% \\
(\text{t}) \hspace{1cm} (5.9) \hspace{1cm} (6.2) \hspace{1cm} (-2.5) \hspace{1cm} (-2.9) \hspace{1cm} (8.6) \hspace{1cm} (3.8) \hspace{1cm} D.W. = 1.5
\]

\[
\Delta M_{m-k} = 0.11 \Delta (Y-T\mathcal{G})_0 + 0.29 \Delta T\mathcal{G}(0) - 0.23 \Delta G_0 - 2.39 \Delta PR_0 + 0.59 \Delta DJ_{-2} + 1.05 \Delta XR_{-1} R^2 = 90% \\
(\text{t}) \hspace{1cm} (7.3) \hspace{1cm} (6.3) \hspace{1cm} (-4.1) \hspace{1cm} (-2.4) \hspace{1cm} (8.0) \hspace{1cm} (6.3) \hspace{1cm} D.W. = 2.1
\]

\[
\Delta M_{m-k} = 0.12 \Delta (Y-T\mathcal{G})_0 + 0.25 \Delta T\mathcal{G}(0) - 0.24 \Delta G_0 - 2.96 \Delta PR_0 + 0.64 \Delta DJ_{-2} + 0.89 \Delta XR_{-2} R^2 = 88% \\
(\text{t}) \hspace{1cm} (7.7) \hspace{1cm} (5.7) \hspace{1cm} (-3.2) \hspace{1cm} (-3.0) \hspace{1cm} (8.9) \hspace{1cm} (4.6) \hspace{1cm} D.W. = 1.8
\]

\[
\Delta M_{m-k} = 0.12 \Delta (Y-T\mathcal{G})_0 + 0.29 \Delta T\mathcal{G}(0) - 0.23 \Delta G_0 - 2.39 \Delta PR_0 + 0.59 \Delta DJ_{-2} + 0.91 \Delta XR_{AV12} R^2 = 91% \\
(\text{t}) \hspace{1cm} (9.1) \hspace{1cm} (7.0) \hspace{1cm} (3.8) \hspace{1cm} (-2.7) \hspace{1cm} (8.0) \hspace{1cm} (8.4) \hspace{1cm} D.W. = 2.1
\]

Using the \((T - G)\) form of the deficit leaves the estimates virtually unchanged:

\[
\Delta M_{m-k} = 0.12 \Delta (Y-T\mathcal{G})_0 + 0.27 \Delta T\mathcal{G}(0) - 2.40 \Delta PR_0 + 0.92 \Delta XR_{AV12} R^2 = 91% \\
(\text{t}) \hspace{1cm} (11.0) \hspace{1cm} (7.3) \hspace{1cm} (-2.8) \hspace{1cm} (8.3) \hspace{1cm} (9.0) \hspace{1cm} D.W. = 2.2
\]

Here again we find a highly systematic, positive relationship between the changes in the exchange rate and changes in (this definition of) consumer goods and services imports. Again, lagged values of the exchange rate seem to be the ones driving current demand for imports, with the one year and two past year average lag most systematically related. Again the results suggest about a $1 billion increase in consumer imports accompanies a 1 index point increase in the trade weighted exchange rate.

Next, we try approximating the value of imported consumer goods as total imports minus imported capital goods and industrial supplies and materials. Doing so, we get :

\[
\Delta M_{m-ksm} = 0.08 \Delta (Y-T\mathcal{G})_0 + 0.25 \Delta T\mathcal{G}(0) - 0.61 \Delta G_0 - 3.61 \Delta PR_0 + 0.46 \Delta DJ_{-2} + 0.50 AR(1) R^2 = 86% \\
(\text{t}) \hspace{1cm} (4.9) \hspace{1cm} (5.5) \hspace{1cm} (-0.3) \hspace{1cm} (-3.8) \hspace{1cm} (5.5) \hspace{1cm} (4.6) \hspace{1cm} D.W. = 1.7
\]

\[
\Delta M_{m-ksm} = 0.08 \Delta (Y-T\mathcal{G})_0 + 0.21 \Delta T\mathcal{G}(0) - 0.6 \Delta G_0 - 3.21 \Delta PR_0 + 0.59 \Delta DJ_{-2} + 0.73 \Delta XR_0 + 0.44 AR(1) - 0.38 AR(2) R^2 = 89% \\
(\text{t}) \hspace{1cm} (6.3) \hspace{1cm} (5.4) \hspace{1cm} (-1.0) \hspace{1cm} (-3.6) \hspace{1cm} (11.3) \hspace{1cm} (3.8) \hspace{1cm} (2.7) \hspace{1cm} (2.2) \hspace{1cm} D.W. = 1.9
\]

\[
\Delta M_{m-ksm} = 0.08 \Delta (Y-T\mathcal{G})_0 + 0.26 \Delta T\mathcal{G}(0) - 0.16 \Delta G_0 - 3.54 \Delta PR_0 + 0.54 \Delta DJ_{-2} + 1.07 \Delta XR_{-1} R^2 = 91% \\
(\text{t}) \hspace{1cm} (5.6) \hspace{1cm} (6.0) \hspace{1cm} (-3.5) \hspace{1cm} (-4.0) \hspace{1cm} (9.7) \hspace{1cm} (6.1) \hspace{1cm} D.W. = 2.3
\]

\[
\Delta M_{m-ksm} = 0.09 \Delta (Y-T\mathcal{G})_0 + 0.20 \Delta T\mathcal{G}(0) - 0.17 \Delta G_0 - 3.96 \Delta PR_0 + 0.66 \Delta DJ_{-2} + 1.11 \Delta XR_{-2} - 0.42 AR(2) R^2 = 90% \\
(\text{t}) \hspace{1cm} (9.2) \hspace{1cm} (4.3) \hspace{1cm} (-2.6) \hspace{1cm} (-3.4) \hspace{1cm} (12.6) \hspace{1cm} (5.7) \hspace{1cm} (-2.1) \hspace{1cm} D.W. = 1.9
\]

\[
\Delta M_{m-ksm} = 0.09 \Delta (Y-T\mathcal{G})_0 + 0.25 \Delta T\mathcal{G}(0) - 0.18 \Delta G_0 - 3.57 \Delta PR_0 + 0.55 \Delta DJ_{-2} + 0.92 \Delta XR_{AV12} R^2 = 93% \\
(\text{t}) \hspace{1cm} (10.0) \hspace{1cm} (6.7) \hspace{1cm} (3.6) \hspace{1cm} (-4.6) \hspace{1cm} (9.3) \hspace{1cm} (9.1) \hspace{1cm} D.W. = 2.3
\]

Using the \((T - G)\) form of the deficit leaves the estimates virtually unchanged:
Again we find that adding the exchange rate variable adds as much as 6% to the variance explained, showing a significant influence of the rate on consumer import spending, by this definition of consumer imports. An average increase in consumer imports of about $0.92-$1.11 billion is found to accompany a one index point (or about 1%) strengthening of the dollar, i.e., increase in the exchange rate. We again interpret the lesser change found when using the current year value of the exchange rate as akin to an errors-in-variables problem, viewing the current year rate as an imperfect substitute for the prior year or prior two years’ rates, biasing the result downward.

Next, we try approximating domestically produced consumer goods from the data available to us as total C minus imported capital goods, imported industrial supplies and materials, and ½ of all imported petroleum:

\[
\Delta M_{m-ksmp} = 0.10 \Delta (Y - T_G)_0 + 0.24 \Delta (T_G - G_0) - 3.52 \Delta PR_0 + 0.56 \Delta DJ_{-2} + 0.94 \Delta XR_{AV12} \quad R^2 = 92%
\]

Again, using the (T – G) form of the deficit leaves the estimates virtually unchanged:

\[
\Delta M_{m-ksmp} = 0.10 \Delta (Y - T_G)_0 + 0.24 \Delta (T_G - G_0) + 4.57 \Delta PR_0 + 0.51 \Delta DJ_{-2} + 1.12 \Delta XR_{AV12} \quad R^2 = 93%
\]

Again, using this definition of consumer imports, our results are about the same, and adding the exchange rate variable to the demand for imports equation adds about 7% points to explained variance. A one index point change in the exchange rate is associated with a rise in imported consumer goods and services of $1.12 - $1.33 billion.

Graph 1 below plots the closeness of the fit between the level of consumer imports and the explanatory variables in the equation second above. The right scale measures, in billions of 1996 dollars, the predicted (“fitted”) value (green line) compared to the actual value (red line) of the change in imports each year 1962 - 2000. The left scale measures, in billions, the difference between the estimated and actual values for each
year. The blue line at the bottom of the graph shows this enlarged view of the gap shown in the upper curves.

Graph 1

\[
\Delta M_{m-kmp} = 0.08 \Delta (Y-T) + 0.25 \Delta T + 0.19 \Delta G + 4.57 \Delta PR + 0.51 \Delta DJ + 1.12 \Delta XR_{AV/12} \quad R^2=93\%
\]

Impact of Exchange Rate on U.S. Exports in Consumer Goods:

A simpler model was also run to determine the extent to which changes in total exports were determined by changes in the U.S. trade weighted exchange rate. The model is extremely simple, testing how systematically, and in what direction, total exports (and imports) moved as the exchange rate changed, controlling only for the sizable differences in the size of the economy between 1960 and 2000 (using the disposable income variable used previously in this study). Similar analyses were done for just consumer goods and services exports and imports.

Below we have shown the model used and the resulting sign, magnitude and statistical significance of the exchange rate variable: Two stage least squares, heteroskedasticity and autocorrelation controls were used, as in earlier statistical tests.

</tbody>
</table>

The best results are obtained when we hypothesize that it was last year’s exchange rate that is systematically related to exports. For imports, our results are about the same as for the more elaborate models estimated earlier: imports seem sensitive to both the one and two year lagged exchange rates.

Overall, the results we get are what theory leads us to expect. For total exports and for exports of consumer goods, one point increases in the exchange rate are highly statistically significantly associated with a decline in exports of about $0.76 billion for consumer exports, about $0.91 billion for all exports.

Increases in the exchange rate are again found significantly related to increases in imports. The findings here suggest about a $0.47 - $0.77 billion increase in consumer imports for a one point increase in the exchange rate. This is lower than the results for the more sophisticated imports model used earlier in this paper, probably because of the less adequate model specification here. (With the earlier specification the effects of a one point change were closer to $1 billion on average.) For all imports, the change was found to be about $0.62 - $0.74 billion for all exports.

**CONCLUSIONS**

Overall, then it does seem as though the exchange rate has an important influence on both U.S. exports of consumer goods and U.S. imports of consumer goods, and in the theoretically expected way. On average, our results suggest approximately a $1 billion dollar change in current year imports will occur for each on point change in the trade weighted exchange rate during the past year or two. Our findings also suggest a likely change in current consumer goods exports of about $0.76 billion for the same size change a year earlier in the exchange rate.

Left for further study is the issue of how domestically produced consumption varies with the exchange rate, which is only slightly, and inferentially dealt with here, with somewhat
surprising results. Also left for further study is the question of why import demand seems to lag exchange rate changes by one or two years.

Abstract

“Minding” Knowledge:
Leaving the Body Behind

By Elizabeth Hendrix
Doctor of Philosophy Candidate in Instructional Leadership

In this paper, using Max van Manen and Maurice Merleau-Ponty's phenomenology as my theoretical framework, I endeavor to understand the meaning of the body within schools and add to the dearth of literature in educational research pertaining to the body in core classes. My research questions guiding this study are: how is the body situated in the secondary core classroom; what is the meaning of the body in secondary schools; and what meaning(s) do teachers in public high school core classes give to the body?

Philosophers and scholars such as Cancienne (2002), Damasio (1994), Grumet (1988), Oliver (2002), and Snowber (2002) have addressed embodiment and the problems with the mind and body split, though with different lens, philosophies, and issues pertaining to the body. Cancienne (2002) and Snowber (2002) explore movement (specifically dance) as a way for teachers to theorize and do research. Damasio (1994), a neurologist, critiques the mind/body split as well as simplistic divisions and argues that emotions are essential to rational thinking. Similarly, Grumet (1988), a feminist educational scholar, disputes the mind/body split and binaries, and she adds, “To bring what we know to where we live has not always been the project of curriculum, for schooling, as we have seen, has functioned to repudiate the body, the place where it lives, and the people who care for it” (p. 129). Likewise, Oliver (2002) in her work on “bodily knowledge” points out the repudiation of the body in schools and addresses the dearth of research on the body in secondary schools in particular.

In my research, I intend to add to our knowledge of the body and the body’s meaning in the core curriculum, which has not been adequately addressed in the scholarly research thus far. I contend that the body is objectified in our schools and our curriculum.
Thus, the body is left out of most core classroom activities and becomes included in the hidden curriculum that secondary students are exposed to in their core classes. Drawing on phenomenology and embodiment theories, I maintain that a deeper understanding of the body's meaning in schools could inform and influence curriculum decisions and students' engagement, creating a healthier and more embodied learning environment, which would benefit both the teachers and students.

Fears of Redistribution, Decentralization and Secession: Evidence from Bolivia’s Referendum for Departmental Autonomy*

Werner L. Hernani-Limarino
Preliminary Version
December, 2006

Abstract

Recent years have witnessed strong movements toward decentralization and secession. The former Soviet Union, Yugoslavia, Czechoslovakia and Serbia and Montenegro have disintegrated. Movements for regional autonomy and even independence have gained larger support in Bolivia, Canada, Spain, France and Italy. What is the importance of redistributive politics in explaining decentralization and secession outcomes in a democratic polity? This paper attempts to answer this question building a simple rational choice model in which individuals’ preferences over alternative institutional regimes are derived from their economic and social consequences. The model predicts that, in a national referendum, relatively rich (poor) people in relatively rich regions and relatively poor (rich) people in the relatively poor regions will support (oppose) decentralization and secession. As a consequence, relatively rich (poor) regions will have an absolute majority supporting (opposing) decentralization. The national outcome will depend on the gaps between regional and national median incomes and the sizes of the population in each region. An important quality of the model is that it has sharp quantitative implications. Given information on regional and national median incomes, and the proportion of an electoral pool whose income is below these levels, the model predicts the proportion of the electoral pool that will support or oppose decentralization. I use data from Bolivia’s referendum for departmental autonomy and estimates of per-capita household income indicators to contrast observed vs. predicted voting outcomes. The model accounts for almost 2/3 of the variation in voting behavior. The fit is surprisingly good in light of model’s simplicity. This result suggests that fears of redistribution play an important role in shaping decentralization and secession outcomes, at least in the Bolivian case.

Redistribution Fears,
Decentralization and Secession:
Evidence from Bolivia’s Referendum for Departmental Autonomy

Werner L. Hernani-Limarino

1. Introduction

Recent years have witnessed strong movements toward decentralization and secession. The former Soviet Union, Yugoslavia, Czechoslovakia and Serbia and Montenegro have disintegrated. Movements for regional autonomy and even independence have gained larger support in Bolivia, Canada, Spain, France and Italy. What factors motivate decentralization and secession movements and what is their likelihood of success in different political regimes and in different economic environments are interesting and (relatively) unexplored issues in political economy.

Bolton and Roland (1997) and Alesina and Spolaore (1997) construct interesting theories that explore the factors that motivate decentralization and secession outcomes. Bolton and Roland highlight a basic trade-off between the gains of unification (in terms of efficiency) and the costs (in terms of lost control on political decisions). Their model emphasizes political conflict over redistribution policies as central to break-up or unification decisions. When income distributions vary across regions and the efficiency gains from unification are small, separation occurs in equilibrium. When all factors of production are perfectly mobile, all incentives for separation disappear. Alesina and Spolaore highlight a basic trade-off between the benefits of large jurisdictions and the cost of heterogeneity of large and diverse populations. Their model implies that democratization leads to secessions, in equilibrium one generally observe an inefficient number of countries, and the equilibrium number of countries is increasing in the amount of economic integration.

Panniza (1999) and Arzaghi and Henderson (2005) used cross country data to analyze the factors that are correlated with more decentralized expenditure and tax powers. Panniza finds that the degree of fiscal decentralization - measured as the percentage of central government revenues (expenditure) on the total (central plus local) government revenues (expenditure), is positively correlated with county size, income per-capita, ethnic fractionalization and level of democracy. Arzaghi and Henderson find that the degree of decentralization - measured by indices of the local governments’ power and share in national government consumption, is positively correlated with income per capita, population, land area, and the degree of population concentration in the largest (typically capital) city.

Undoubtedly, many economic, political and cultural factors shape decentralization and secession movements, and their likelihood of success. This paper does not attempt to articulate a full theory of the determinants of decentralization and secession outcomes, but to evaluate the contribution of a single isolated factor: fears of the rich that the poor use their great numbers to redistribute to themselves. In some way, I attempt to estimate the effect of a cause rather than the causes of an effect.
In order to do that, I build a simple rational choice model that links redistributive politics and decentralization and secession outcomes in a democratic polity. The choice between centralized and decentralized regimes is modeled as a dynamic full information game. First citizens vote over alternative regimes in a national (regional) referendum. Then, equilibrium policies are determined in a direct democracy. Policies are determined by local governments if a national (regional) absolute majority supports the decentralization proposal. Otherwise, they are determined by a central government. After equilibrium policies are determined payoffs are computed and the game ends.

A key assumption of the model is that citizens are rational. Rationality does not mean that individuals always act according to some simple postulates or that only individuals – not social groups, matter in a society. Rationality means that individuals - or social groups, have well-defined preferences over the different economic and social consequences that follow from alternative regimes. They support or oppose a decentralization proposal depending on whether they are economic winners or economic losers under that particular regime. Therefore, distributional conflict between the relatively rich (who dislike redistributive taxation), and relatively poor (who are more in favor of taxation that would redistribute resources to them) plays an important role in my explanation.

Distributional conflict has been at the hearth of interesting political economy issues. The seminal study of Meltzer and Richard (1981) explained the increase in government expenditure -as a proportion of national income, in the United States during the 20th century by the fact that a voting franchise had been extended to the poor. They show that what matters for the equilibrium level of taxation is the relationship between the income of the median voter and the average income in society. The effect of increasing the franchise– adding poor people who were previously disenfranchised – is that it reduces the income of the median voter relative to the mean, and this tends to increase the preferred extent of redistribution that the median voter desires. Acemoglu and Robinson (2005) theory of democratization process also highlight the importance of distributional conflict between the rich and the poor as key factor to explain democratization processes. Since democracy is more redistributive to the poor, the poor prefer democracy to non-democracy. Therefore, when the poor have sufficient political power, democracy is much more likely to arise to secure redistribution policies not only today but also tomorrow.

The document is organized as follows. Section 2 presents the theoretical model. Section 3 contrast predicted vs. observed outcomes using data from the Bolivia’s Referendum for Departmental Autonomy. Section 4 describes the timing correlation between the rising political power of the poor in Bolivia and the decentralization and secession demands. Section 5 highlights some issues that were left open and points to some fruitful extensions of the model.

2. A Simple Model of Redistributive Politics and Decentralization Demands

This section presents a rational choice model that links redistributive politics with decentralization and secession outcomes. First, I derive political preferences from individuals' maximizing behavior. Then, I characterize equilibrium policies in a direct
democracy. Finally, I characterize equilibrium outcomes of two regime choice referendum games: a national referendum on regional autonomy, and a regional referendum on regional autonomy.

2.1. Political Preferences

Consider an endowment economy with an infinite number of citizens, indexed with the letter i, where i ∈ (0, 1]. Notice that we normalize the size of the population, N, to 1. Assume that individuals’ preferences are described by a utility function U(c_i, G), defined over individuals’ own consumption, c_i, and the level of government spending on a public good, G. Since G is a public good then it is not indexed by i. The provision of a public good simultaneously benefits all individuals. Unlike G, c_i is a private good, if individual i consumes a private good nobody else can. Notice that the utility function is taken to be the same for all individuals.

Assume also that these utility functions are linear in consumption of the private good,

\[ U(c_i, G) = c_i + v(G), \]

where v is an increasing \((v_G > 0)\) and strictly concave function \((v_G G < 0)\). These conditions correspond to the idea that marginal utility is positive (more is better), but diminishing (more is less better the more you have).

Assume that individuals’ endowments are exogenous. Individual i has a fixed endowment of income of y_i, which is distributed according to some cumulative distribution function F(y) with associated density function f(y), over the support \([1, \infty)\). Assume also that the mean endowment of income, \(\overline{y}\), is greater than the median, \(y_m < \overline{y}\). These assumptions are motivated by the fact that real world income distributions are close to log normal and skewed to the right.

Notice that in this model there are no economic decisions such as how many hours to work or how to allocate income between different types of goods. Thus individual i's consumption, c_i, is simply determined by individual i's income level and the level of the tax rate, \(c_i = (1 - \tau) y_i\), where \(\tau\) is the rate of proportional income taxation. Therefore, we can write an individual’s indirect utility function (the maximized value of utility), as a function of the government policy variables and his income:

\[ V_i (\tau, G) = V(y_i | \tau, G) = (1 - \tau)y_i + v(G). \]

Equation (2) expresses individual utility as a function of government policies, \(\tau\) and G. Since there are no real economic decisions, once we know \(\tau\) and G, we know the indirect utility. These two policies are not independent. They are linked by the government budget constraint:

\[ G = \tau \overline{y}, \]
Notice that I assume that the government can only spend on $G$ what it raises in tax revenue $\tau y$. Substituting for $G$ from (3) into (2), we obtain the indirect utility function over one policy variable, the linear tax rate, $\tau$:

$$V_i(\tau) = (1 - \tau)y_i + v(\tau y).$$

$V_i(\tau)$ defines the indirect utility of voters over the linear tax rate, $\tau$. It is straightforward to derive each individual $i$'s preferred tax rate from this indirect utility function. The ideal point (political bliss point) of individual $i$, denoted by $\tau_i^*$, will be defined as the tax rate $\tau$ that maximizes $V_i(\tau)$. This tax rate can be characterized as the solution of a simple unconstrained maximization problem. In order to satisfy the first-order condition, I set the derivative of $V_i(\tau)$ equal to zero:

$$-y_i + v_G(\tau_i y) y = 0$$

This first-order condition, (5), says that the ideal tax rate of voter $i$ has the property that its marginal cost to individual $i$ is equal to its marginal benefit. The marginal cost is measured by $y_i$, individual $i$'s own income, since an incremental increase in the tax rate leads to a decline in the individual $i$'s utility proportional to his income (consumption). The benefit, on the other hand, is $v_G(\tau_i y) y$, which comes from the fact with higher taxes there will be more public good provision. A marginal increase in the tax rate starting from $\tau_i$ increases the tax revenue by $y$. At $\tau = \tau_i$, total tax revenue and therefore the level of the public good is $\tau_i y$, hence the marginal increase in the individual’s utility from public good provision is $v_G(\tau_i y)$. The product of these two terms gives the marginal benefit from higher taxation. Notice that individual $i$ typically has an interior ideal tax rate, i.e. $\tau_i \in (0, 1)$, since, though he dislikes paying taxes, he does value the public good. The ideal point of individual $i$, $\tau_i$, comes from weighing these costs against benefits.

Notice that, holding $y$ constant, the higher is $y_i$ the lower is $\tau_i$. This follows because when $y_i$ rises, the left side of (5) increases, hence for (5) to hold, $\tau_i$ must change so that the right side, $v_G(\tau_i y)$, must also increase. Since $v$ is a strictly concave function the greater is $\tau_i$ the lower is $v_G$, thus for $v_G(\tau_i y)$ to increase, $\tau_i$ must fall. As $y_i$ rises, the costs of taxation go up but the benefits do not change. This implies the intuitive result that rich people prefer lower tax rates and less expenditure on public goods than poor people. This type of distributional conflict, the difference in the attitudes of the relatively rich and the relatively poor towards taxes, is the source of the results in this paper.

Finally, note that equation (5) can be rewritten to obtain a close form expression for individual $i$ policy preferences:

$$\tau_i^* = \frac{1}{y} v_G^{-1}\left(\frac{y_i}{y}\right)$$
2.2. Political Equilibrium in a Centralized Regime

Rationality implies that each citizen evaluate different tax policies according to their implications for his income and utility, and support the policy that he prefers the most. Since taxes are proportional to income, they are redistributive: relatively richer people will prefer lower taxes and lower public good provision, while relatively poor people will prefer higher taxes and higher public good provision. How can we aggregate the wishes of different groups, some of whom prefer one policy, while some others prefer another? Whose preferences will prevail? To answer this question we need to find some type of collective choice mechanism that allows a society to choose an equilibrium policy, i.e. a “political equilibrium”.

I assume that equilibrium policies are determined in a direct democracy where all individuals (above a certain age) can vote and voting determines which policies get adopted. A well known result in democratic politics is Arrow’s (1951) (im)possibility theorem. This theorem states that, under very weak assumptions, a democracy will not be able to make coherent decisions, i.e. it will not be possible to aggregate individual preferences into a “social welfare” function summarizing “society’s preferences”. Fortunately, under some mild restrictions on preferences it is possible to show that a social welfare function exists.

Proposition 1: Single Peaked Preferences

Policy preferences of voter i, described by equation (6) are single peaked, i.e. if \( \tau'' < \tau' < \tau_i^* \) or, if \( \tau'' > \tau' > \tau_i^* \), then \( V_i(\tau'') < V_i(\tau') \).

**Proof:** See Appendix A

It can be shown that if political preferences are single peaked then there exist a “social welfare” function that summarizes society’s preferences (Austen-Smith and Banks, Theorem 4.1 page 96). Since we need a sharp prediction of society’s choice, I use the Median Voter Theorem (MVT) to characterize the political equilibrium. The MVT establish that, in a situation with single-peaked preferences, not only a social welfare function exists but also that the outcome can be characterized by the ideal point of the median voter.

Proposition 2: The Median Voter Theorem

---

1 Undoubtedly, there are important features missing from the model. In practice, most democratic societies are representative democracies, where individuals vote for parties in elections, and the winner of the election implements policies. Even in this case, parties rarely make a credible commitment to a policy, and run not on a single issue, but on a broad platform. In addition, parties may have partisan (ideological) preferences as well as simply a desire to be in office. Sometimes policies are determined by legislative bargaining between various parties, or by some type of deal between presidents and parliaments, and not by the specific platform offered by any party in an election. Last but not least, interest groups influence policies through non-voting channels, including lobbying and in the extreme, corruption.
Consider a set of policy choices $T \in \mathbb{R}$, let $\tau \in T$ be a policy vector, and let $m$ be the median voter. If all individuals have single-peaked preferences over $T$, then majority voting with an open agenda always has a determinate policy outcome: the ideal point of the median voter, $\tau_m^*$.

**Proof:** See Appendix A

Together proposition 1 and 2 establish existence and uniqueness of a political equilibrium. Furthermore the MVT permits a closed form characterization of the equilibrium tax rate: the median voter political bliss point, $\tau_m^*$:

$$
\tau^c = \tau_m^* = \frac{1}{\bar{y}} v_G^{-1}\left(\frac{y_m}{\bar{y}}\right)
$$

where the sub-index $m$ refers to the median voter. The super-index $C$ denotes that this will be the political equilibrium under a centralized regime. Notice that since we have established that tax preferences are monotonic in income, then the median voter is the person who is exactly at the middle of the income distribution.

In a decentralized regime equilibrium policies will be determined within each region. Therefore, in a decentralized regime the equilibrium tax rate will characterize by the regional median voter political bliss point:

$$
\tau^d_j = \tau_{mj}^* = \frac{1}{N_j \bar{y}_j} v_G^{-1}\left(\frac{y_{mj}}{N_j \bar{y}_j}\right)
$$

where $N_j$ is the size of the population, $y_{mj}$ the mean income and $\bar{y}_j$ the median income of region $j$. The super index $D$ denotes that this will be the political equilibrium in a decentralized regime.

The tax rates determined by (7) and (8) are the basic prediction for what will happen in a direct democracy under a centralized regime and a decentralized regime, respectively. The usefulness of the MVT is not only that it produces a sharp prediction for the outcome of voting, but also that it allows us to build models which have empirical content predictions.

Notice that anything that makes the public good more valuable, for example, a shift of the $v(\cdot)$ function increasing its slope $v_G(\cdot)$ everywhere, leads to greater public good provision and therefore greater taxes. The public good become more valuable for everybody, including the median voter, whose preferences determine equilibrium policies. Notice also that what matters for the equilibrium policy is not the shape of the whole distribution, but simply the comparison between the mean, $\bar{y}$, and the median, $y_m$. When the median becomes relatively poor compared to the mean, i.e. $y_m/\bar{y}$ falls, the equilibrium tax rate $\tau_m^*$ must increase. Since $v$ is a strictly concave function, the lower is $y_m/\bar{y}$ the higher is $v_G$. 
Intuitively, when the median voter, who is at the middle point of the income distribution, becomes poorer relative to the mean, he would like to redistribute more resources towards himself. In this model, this can only be achieved by increasing taxation and investing more in the public good. Therefore, a bigger (proportional) gap between the mean and the median, i.e., a smaller $y_m/y$, leads to higher taxation and higher public good provision. This comparative static result was the main focus of Meltzer and Richard’s paper. They noted that, with the extension of a voting franchise to poor segments of the society, the gap between the median income of those with the right to vote and the mean income in society, widened, i.e., $y_m/y$ was now smaller, and this increased the demand for redistribution, pushing up taxes and public expenditures.

Before analyzing regime choice games I will make the model much simpler. I assume that $v()$ is a logarithmic function. Under this functional form assumption the distribution of political preferences will be given by:

$$\tau_i = \frac{1}{y_i}$$

And the centralized and decentralized equilibrium tax rates will be, respectively, given by:

$$\tau^c = \frac{1}{y_m}, \text{ and } \tau^d_j = \frac{1}{y_mj}.$$

2.3. Regime Choice Referendum Games

Now, suppose that citizens of this polity have to decide in a referendum whether to stay in a centralized regime or switch to a decentralized regime. There are two types of referendums that can be used to decide for or against decentralization: a national referendum and a regional referendum. In national referendum, policies are determined regionally if and only if a national absolute majority supports decentralization. Otherwise, they continue to be determined by a central government. In a regional referendum, regions with an absolute majority supporting the decentralization proposal acquired the right to determine their policies in autonomy. In the remaining regions, those with an absolute majority against the decentralization proposal, policies are determined by a central government. The next two propositions establish the equilibrium voting outcome for both types of regime choice referendum games.

**Proposition 3.** Equilibrium in a National Referendum Game

Consider the following dynamic full information game. In the first stage citizens, with political preferences described by equation (9), are asked to vote whether they prefer to stay in a centralized regime or switch to a decentralized regime in a national referendum. In the second stage, equilibrium policies are determined in a direct democracy. If a national absolute majority supports decentralization, policies are determined regionally. Otherwise,
they continue to be determined by a central government. After equilibrium policies are determined payoffs are computed and the game ends.

Then, the proportion of a given electoral poll, \( k \), in region \( j \in J \), who will vote against decentralization, will be given by:

\[
P_k[NO] = \min\{F_k(y_m), F_k(y_{mj})\} + 0.5 \abs{F_k(y_m) - F_k(y_{mj})}
\]

where \( F_k() \) is the income distribution of the electoral poll, \( y_m \) the national median income and \( y_{mj} \) is region’s \( j \) median income.

**Proof:** See Appendix A

An implication of proposition 3 is that, in a national referendum, regions with median income higher than national median income will have an absolute majority supporting decentralization, while regions with median income lower than national median income will have an absolute majority opposing it. The national outcome will depend on the gaps between regional and national median income and the sizes of the population in each region. Formally, the proportion of at a departmental level who will vote against the decentralization proposal will be given by:

\[
P_j[NO] = \min\{F_j(y_m), F_j(y_{mj})\} + 0.5 \abs{F_j(y_m) - F_j(y_{mj})}
\]

and the proportion of the national electoral poll who will vote against decentralization will be given by:

\[
P[NO] = \sum N_j P_j[No]
\]

**Proposition 4:** Equilibrium in a Regional Referendum Game

Consider the following dynamic full information game. In the first stage citizens, with political preferences described by equation (9), are asked to vote whether they prefer to stay in a centralized regime or switch to a decentralized regime in a regional referendum. In the second stage, equilibrium policies are determined in a direct democracy. Regions with an absolute majority supporting the decentralization proposal acquired the right to determine their policies in autonomy. In the remaining regions, those with an absolute majority against the decentralization proposal, policies are determined by a central government. After equilibrium policies are determined payoffs are computed and the game ends.

Assume that regions have different median incomes, i.e. \( y_{mj} \neq y_{mk} \) for all \( j \neq k \in J \). Then, the proportion of a given electoral poll, \( k \), in region \( j \in J \), who will vote against decentralization, will be given by:

\[
P_k[NO] = \min\{F_k(y_{m[-j]}), F_k(y_{mj})\} + 0.5 \abs{F_k(y_{m[-j]}) - F_k(y_{mj})}
\]
where $F_\delta()$ is the income distribution of the electoral poll, $y_{mj+[~j]}$ the median income of the coalition that excludes regions with median income higher than region’s $j$ median income $y_{mj}$.

**Proof:** See Appendix A

An implication of proposition 4 is that, whenever regions have different median incomes, full decentralization will be the sure outcome of a regional referendum. Intuitively, this occurs because in the relatively rich regions an absolute majority will support decentralization. This will give them the right to determine their equilibrium policies in autonomy. Therefore, the median income of the remaining coalition of regions will be reduced, creating relatively rich regions in the coalition. In a full information game, citizens of the relatively rich regions in the coalition will anticipate this outcome, and have an absolute majority supporting decentralization. Then, they will gain the right to determine equilibrium policies in autonomy, which will reduce the median income of the remaining coalition further. The process will continue until the second poorest region separates from the poorest region.

Formally, the proportion of the electoral poll opposing decentralization in each region will be given by:

\[
P_j[NO] = \text{Min}\{F_j(y_{mj+[~j]}), F_j(y_{mj})\} + 0.5 \text{ abs}\{F_j(y_{mj+[~j]})-F_j(y_{mj})\} \leq 0.50
\]

Notice that our model allows us to have sharp quantitative implications on the voting outcomes that will be expected if decentralization and secession outcomes are determined exclusively by redistribution concerns. Whether redistributive conflicts are in fact important in shaping decentralization and secession outcomes is an empirical question that I address in the following section.

**3. Empirical Evidence: Bolivia’s referendum for departmental autonomy**

How important redistributive conflicts are in explaining decentralization and secession outcomes is an empirical question. An important quality of our model is that it has sharp predictions on the expected voting outcomes. Given information on the regional and national median income, and the proportion of an electoral pool below these levels, the model can predict the proportion that will support or oppose decentralization. This quality allows us to estimate the percentage of the variation in observed voting outcomes that can be explained by our simple model of redistribution politics.

**3.1. The Data**

Observed voting outcomes come from Bolivia’s Referendum for Departmental Autonomy. On July 2, 2006 Bolivia has conducted a national referendum to determine whether people prefer to stay in a centralized regime or move to a decentralized regime. I describe the political process that lead to the referendum in section 4. An important point to note is that neither the referendum question nor the referendum law specified the political,
administrative and fiscal duties that regions will receive if the proposal was accepted by a national absolute majority. To be more precise, the question on departmental autonomy ask people whether they agree on elections for departmental authorities and desconcentration of normative and administrative powers as well as economic resources according the new constitution and laws. Ironically elections of departmental authorities had already taken place on December 12, 2005, more that five months before the referendum was conducted; and the new constitution and laws are still under discussion now.

Voting outcomes can be disaggregated by department, electoral circumscriptions, electoral districts, electoral zones, electoral recants and electoral books. Bolivia is politically divided into 9 departments: Chuquisaca, La Paz, Cochabamba, Oruro and Potosi belong to the west region; Tarija, Santa Cruz, Beni and Pando belong to the east region. For electoral purposes departments are divided in 3 to 15 electoral circumscriptions, which contain between 1 to 27 electoral districts. Electoral districts contain between 1 to 9 electoral zones, which group 1 to 55 electoral recants. Electoral recants are public facilities, usually public schools, where people emit their vote. Electoral recants group between X and X electoral books, which group between 10 and 325 citizens.

Predicted voting outcomes are based on estimates of the relevant income distribution indicators. Disaggregated information on the distribution of per-capita household income is available from household surveys only at a departmental level. However, in order to construct predicted voting outcomes we do not need information of the full income distribution of the electoral poll but only of the proportion of the poll that is below national and regional median income. I use Elbers et. al. (2003)'s approach to construct micro-level estimates of these magnitudes. Their approach takes advantage of the detailed information contained in household surveys and the comprehensive coverage of census data to construct geographically disaggregated welfare indicators.

Table 1 presents some descriptive statistics of national and departmental per-capita household income distributions. Appendix B displays Epanechnikov kernel density and cumulative distribution estimates. Per-capita income distributions were normalized so that national median income is equal to one. Clearly, in terms of median and mean income, departments of the west (east) region are relatively poor (rich). Departments of the west (east) regions also seem to be relatively more (less) unequal, although a much more analysis is needed to arrive to definitive conclusion. Both, relative poverty and inequality of the departments of the west are in part explained by the higher share of rural and indigenous population.

---

3 This methodology have been used in more that XX countries to construct spatial poverty and inequality maps. In Bolivia, Hernani-Limarino (2006c) and UDAPE-INE (2003) construct poverty and inequality estimates at the municipality level for the years 1992 and 2001, respectively.
4 Indigenous people are defined as those that learn to speak in an indigenous language, speak in an indigenous language and identified themselves as indigenous. Mestizo people are defined as those that either lean to speak in indigenous language, or speak any indigenous language or identified themselves as indigenous. See Hernani-Limarino (2006b)

Source: Bolivian National Electoral Court for the observed voting outcomes, and author's calculations for the predicted voting outcomes.
Figure 1 Predicted vs. Observed Voting Outcomes
(Percentage of the Electoral Poll who Oppose Decentralization)

Panel A: At the departamental level

\[ P_{\text{No}} = -0.800 + 2.646 P_{\text{No}} \]
with \( R^2 = 0.63 \)

Panel B: At the electoral circunscription level

\[ P_{\text{No}} = -0.309 + 1.710 P_{\text{No}} \]
with \( R^2 = 0.66 \)

Panel C: At municipality level

\[ P_{\text{No}} = -0.394 + 1.804 P_{\text{No}} \]
with \( R^2 = 0.67 \)

Source: Bolivian National Electoral Court for the observed voting outcomes, and author's calculations for the predicted voting outcomes.
3.2. Observed vs. Predicted Voting Outcomes

Table 2 and Figure 1 present scatter plots that contrast predicted versus observed voting outcomes. Notice that our model correctly predicts whether an absolute majority will oppose or support the decentralization proposal at the departmental level: An absolute majority oppose decentralization in the relatively poor departments (Chuquisaca, La Paz, Cochabamba, Oruro, Potosi); while an absolute majority support the proposal in the relatively rich departments (Tarija, Santa Cruz, Beni and Pando). However, our model underestimates the magnitude of people opposing and supporting decentralization in departments of the west and east regions, respectively. This fact suggests that regional ideologies over alternative regimes may also play a role in determining decentralization and secession outcomes.

To estimate the percentage of the variation in observed voting outcomes that can be explained by our simple model of redistribution politics. I run an OLS regression estimation of the observed voting outcomes on the predicted voting outcomes. The results are:

\[ P_{ij} = -0.800 + 2.646 P_{ij}^f \]

\[ \begin{array}{cc}
(0.392) & (0.771)
\end{array} \]

with \( R^2 = 0.63 \). Notice that the slope estimate is greater than one, which confirms that our model underestimates the magnitude of people opposing and supporting decentralization in relatively rich and poor departments, respectively. More importantly, our simple model of redistribution politics explains two thirds of the variation of voting outcomes at the departmental level.

Recall that our model predicts that rich (poor) people of relatively rich regions and poor (rich) people of the relatively poor departments will support (oppose) decentralization and secession. Notice that, due to the aggregation of votes, we can not be sure that the correlation between observed and predicted voting outcomes at the departmental level is indeed due to redistributive conflicts. The best alternative to quantify the importance of redistributive conflicts will compare predicted vs. observed voting outcomes at the individual level. However, since this type of information is not available, I estimate the importance of redistributive conflicts comparing predicted vs. observed voting outcomes at the two levels of desegregation that report significant welfare estimates: electoral circumscriptions and municipalities.

Panel B presents the comparison for 70 electoral circumscriptions. The OLS estimation results are:

\[ P_{i} = -0.309 + 1.710 P_{i}^f \]

\[ \begin{array}{cc}
(0.072) & (0.147)
\end{array} \]

with \( R^2 = 0.66 \). Panel C presents the comparisons for 314 municipalities. The OLS estimation results are
\[ P_{m[No]} = -0.394 + 1.804 P_{m[No]} \]
\[
(0.038) \quad (0.070)
\]

with \( R^2 = 0.67 \). Overall, the model accounts for 2/3 of the variation in voting behavior. The fit is surprisingly good in light of model’s simplicity. These results suggest that that, at least in the Bolivian case, the choice between centralization and decentralization in a direct democracy can be explained by redistributive conflicts. Specifically, fears of the rich that the poor use their great numbers to redistribute to themselves play an important role in shaping decentralization and secession outcomes.

4. Rising Political Power of the Poor and Decentralization and Secession Demands

The evidence presented in the previous section suggests that redistributive conflicts are important to explain decentralization and secession outcomes in a democratic polity. Are they important to explain decentralization and secession demands? Notice that, at least in the short run, national and regional income distributions do not change much. Then, it is difficult to argue that redistributive conflicts by themselves explain decentralization and secession demands. In this section, I show that there has been a significant increase in political power of the poor, which has triggered the fears of redistribution. Both the increase in political power of the poor and the fears that this power will be used to implement redistribution policies may play a role explaining the recent decentralization and secession demands in Bolivia.

4.1. Rising Political Power of the Poor

Recent years have witnessed an increase in political power of left-wing movements and political parties in Bolivia. Figure 2 presents the voting percentage obtained by political parties grouped according to their political inclination. Clearly there has been a huge rise in the political power of left-wing parties in the last two elections. In particular, the last presidential election has marked an icon in the history of Bolivian politics. Evo Morales, the leader of the Movement Toward Socialism MAS has won by absolute majority for the first time in the Bolivian democratic era. The last election was also the one with greater participation. The abstention rate on 2005 was only about 15% while the average rate in past elections was above 25%.

---

6 In some way, an increase in political power of the poor can be seen as a democratization of the political process. After all, fears of the rich that the poor use their great numbers to redistribute to themselves can only arise under a democratic regime.

7 Most historians and political analysts will agree that the first relatively fair democratic election was held in June 29, 1980. Only “qualified” people were allowed to vote before 1952 and there were an absurd amount of electoral fraud in the elections between 1952 and 1980. See Mesa-Gisbert (2006) and APDH (1978) for details.
Figure 2. Rising Political Power of the Left
(Voting Percentage)

Note: Left, Center-Left, Center-Right, and Right give the voting percentage, with respect to the total number of valid votes, obtained by parties with such political inclination. The rate of abstention gives the percentage of people who were registered to vote but did not vote.

Source: Author's calculations based on presidential elections results. See Appendix C for details.

Acemoglu and Robinson (2005) define political power as the capacity of a group to obtain its favorite policies against the resistance of other groups. Therefore, another approximation of the degree of the political power of the poor is given by the nature of policies and laws that had been applied in the last years. Table 3 presents an account of the most salient facts, including laws and decrees, of Bolivian politics. Notice that on February 2003, Sanchez de Lozada had to withdraw a labor income tax proposal after more than 30 people killed in violent protest and on October 2003, he was forced to resign after more than 80 people were killed and hundreds were injured in violent protests over gas exports. From this tragic events emerge the “October Agenda” with two major demands: A national Gas Referendum to decide energy and gas policy, and a Constituent Assembly to re-write the entire constitution. The Gas Referendum was called on May 2004 (decree 27507) and was held on July, 2004. The Constituent Assembly was called on July 2005, confirmed on March 2006, and held on July 2006.

Carlos Mesa, Sanchez de Lozada successor, was also forced to resign on June 2005 due to large scale protests. The head of the Supreme Court, Eduardo Rodriguez, had to assume as interim president and call for early elections. On December 2005 elections were held and Evo Morales, an indigenous left-wing leader, was elected president. Morales
became not only the first indigenous president but also the first president to win by absolute majority in the democratic era. In his first year of government he has issued to major redistribute policies: decree 28701 putting energy industry under state control and Law 3545 aiming to expropriate unused land for redistribution to the landless poor.

4.2. Decentralization and Secession Demands

Demands for greater departmental autonomy are relatively new in Bolivia. Why decentralization and secession movements become suddenly important? Why decentralization now and not before? Notice that the first meeting that demand decentralization was held on June, 22, 2004, 8 months before the “October Agenda” was launched. The second autonomic rally was held on January 28, 2005, 8 days before Evo Morales assumed as president. The third, and most important meeting demanding autonomy and even independence was held on December, 15 2006, sixteen days after the land reform law was approved.

In the spirit of Meltzer and Richard (1981) and Acemoglu and Robinson (2005), I argue that the correlation in the timing of the decentralization and secession demands and the increase in political power of the poor suggest that fears of redistribution are related to who has political power in a democracy, and what they want to do with it. In particular, I believe that decentralization and secession demands in Bolivia were triggered by fears of the relatively rich of the increasing political power of the poor.

5. Conclusions

This paper applies rational choice theory to build a simple model that links redistributive politics with decentralization and secession outcomes. The choice between centralized and decentralized regimes is modeled as a dynamic full information game. First citizens vote over alternative regimes in a national (regional) referendum. Then, equilibrium policies are determined in a direct democracy. Policies are determined by local governments if a national (regional) absolute majority supports the decentralization proposal. Otherwise, they are determined by a central government. After equilibrium policies are determined payoffs are computed and the game ends.

A key assumption of the model is that citizens are rational. Rationality assumes that individuals have well-defined preferences over the different economic and social consequences that follow from alternative regimes. People support or oppose a decentralization proposal depending on whether they are economic winners or economic losers under that particular regime. Therefore, distributional conflict between the relatively rich (who dislike redistributive taxation), and relatively poor (who are more in favor of taxation that would redistribute resources to them) plays an important role in my explanation. The model predicts that, in a national referendum, relatively rich (poor) people in relatively rich regions and relatively poor (poor) in the relatively poor regions will support (oppose) decentralization and secession. As a consequence relatively rich (poor) regions will have an absolute majority supporting (opposing) decentralization. The national outcome will
depend on the gaps between regional and national median income and the sizes of the population in each region. The model also predicts that in a regional referendum decentralization occurs with probability one.

An important quality of the model is that it has sharp quantitative implications. Given information on the regional and national median income, and the proportion of an electoral pool whose income is below these levels, the model predicts the proportion of the electoral poll that will support or oppose decentralization. I use data from Bolivia’s referendum for departmental autonomy and estimates of per-capita household income indicators to contrast observed vs. predicted voting outcomes. Overall, the model accounts for almost 2/3 of the variation in voting behavior.

Two reasons justified the choice of such a simple model. First, although the model is only a crude approximation to reality, it is a useful way to simplify the answers to complex questions. An often cited principle of theoretical modeling of social phenomena is the so-called Occam’s razor. This principle states that one should not increase the number of entities required to explain a given phenomenon beyond what is strictly necessary. In other words, one should look for a high degree of parsimony in formulating answers to complex questions. Second, an explicit assumption of the model is that individuals are rational. This implies that individuals understand the consequences of their actions and they evaluate different alternatives, including centralization vs. decentralization, according to their assessments of their economic and social consequences. It is much more likely that people understand how different regimes lead to different outcomes when the mechanisms that operate are simple rather than complex.

A major implication of these results is that the key actors in the fight for and against decentralization and secession are not regional or ethnic groups, but income classes. In the spirit of Marx and Engels (1872) accounts of history and politics, the model emphasize that the conflict of interest is between the rich and poor. High proportional income taxes will take more money from the rich (who have greater incomes), and consequently, the rich would be generally more opposed to high taxation than the poor. Then, rising political power of the poor might lead to decentralization and secession demands in relatively richer regions.

It is important to notice that my intention here was not to articulate a full theory of the political economy of decentralization and secession outcomes, but to evaluate the contribution of a single isolated factor: fears of the rich that the poor use their great numbers to redistributive to themselves. This does not deny that many other factors may be at play. In particular, I do not deny the importance of ideological preferences over regimes or inefficient public good provision as potential determinants of decentralization and secession outcomes. To empirically analyze the contribution of these factors in shaping decentralization and secession outcomes is an interesting area for future research.

Another natural extension of the model is to analyze the importance of the form in which people hold their assets for redistributive politics I assume that individuals’ income is exogenous, which implies that individual’s assets are not directly taxable. In other words, the government chooses simply to taxes income, irrespective of how it is generated, and that individuals do not have the option of using their human capital or physical capital in other
activities. However, taxation can be applied on are typically generated from assets, such as land, physical capital and human capital. For example, land is immobile, while physical capital to some extent is mobile. This gives the owner of physical capital an option that a land-owner does not have. Similarly, land is much easier to redistribute than physical capital. Human capital, the skills, education and experience embodied in people, on the other hand, is practically impossible to redistribute. In all cases, although the theoretical extensions are relatively simple the empirical counterparts would require new data.

Finally, I must emphasize that this paper does not discuss the potential welfare effects of decentralization. There is a vast literature on this issue that I do not address. However, I must say that my own reading of this literature is that there are no general theorems on whether decentralization is welfare improving or not. Different types of decentralization may be efficient or not depending on the model’s explicit and implicit assumptions. Therefore, arguments supporting or opposing decentralization in a particular country should try to evaluate whether the institutional framework match the conditions for a successful decentralization program and not take decentralization effects for granted.

6. References

Hernani-Limarino, Werner (2006b). “Dimensiones del Ser Indígena y Procesos de Mestizaje Cultural en Bolivia”. Documento de Trabajo 0X/06. Fundación ARU.

Appendix A.

Proof of Proposition 1:

Notice that strict quasi-concavity of \( V_i(\tau) \) is sufficient for single peaked political preferences. It is easy to check that \( V_i(\tau) \) is strictly concave because \( v(G) \) is strictly concave. This can be establish by taking the first and second derivatives of (4):

\[
\frac{\partial V_i(\tau)}{\partial \tau} = -y_i + v_G(\tau) \text{ and } \frac{\partial^2 V_i(\tau)}{\partial \tau^2} = v_{GG}(\tau) < 0
\]

The first derivative may be either positive or negative, but the second derivative is clearly negative since \( v_{GG} < 0 \). This implies that \( V_i(\tau) \) is a concave function, and therefore quasi-concave. This then implies that preferences are single peaked Q.E.D.

Proof of Proposition 2:

Imagine the individuals are voting in a contest between \( \tau_m \) and some policy \( \tau' > \tau_m \). Because preferences are single peaked, all individuals who have ideal points less than \( \tau_m \) strictly prefer \( \tau_m \) to \( \tau' \). This follows because indirect utility functions fall monotonically as we move away from the bliss points of individuals. Since the median voter prefers \( \tau_m \) to \( \tau' \), this individual plus all the people with ideal points smaller than \( \tau_m \) constitute a majority, so \( \tau_m \) defeats \( \tau' \) in a pairwise vote. The same argument applies where \( \tau < \tau_m \). Q.E.D.

Proof of Proposition 3:

Since this a sequential game, we solve the game backward induction to find the SGPN equilibrium of the game. A rational voter will contrast equilibrium policies under both regimes and choose the regime that favors him most. Since this is a full information game voters know that in a centralized regime equilibrium policies will be determined by the political preferences of the national medium voter, while in a decentralized equilibrium policies will be determined by the regional medium voter. Therefore, he will vote in favor of the decentralization proposal if and only if his policy preferences are closer to the preferences of the regional medium voter, and vote against in the opposite case. More formally, citizen i in region j voting outcome will be given by:

\[
\text{vote}_{ij} = \begin{cases} 
\text{Yes} & \text{if } d(\tau_{ij}, \tau^c) \geq d(\tau_{ij}, \tau^p) \\
\text{No} & \text{if } d(\tau_{ij}, \tau^c) < d(\tau_{ij}, \tau^p) 
\end{cases}
\]

Notice that in our model voter’s political preferences are inversely related to voter’s income. Consider a region with median’s income below the national median income. People
with lower than the regional median income will prefer to set the tax rate at $1/tuj$. Half of the People with incomes above the regional medium income but below the national medium income will also prefer this tax rate. Now consider a region with median income above the national median income – say a “richer” region, citizens with incomes below the national mean will prefer to set the tax rate at $1/tm$. Half of the people with incomes above the national medium income but below the regional median income will also prefer this tax rate. Therefore the proportion the proportion of the regional electoral poll who will vote against decentralization will be given by: equation (11) and the proportion of the national electoral poll who will vote against decentralization will be given by equation (12). \(Q.E.D.\)

**Proof of Proposition 4:**
Order regions from richest to poorest, by proposition 3, relatively rich regions will have an absolute majority supporting decentralization. This will give them the right to determine their equilibrium policies in autonomy. Therefore, the median income of the remaining coalition of regions will be reduced, creating relatively rich regions in the coalition. In a full information game, citizens of the relatively rich regions in the coalition will anticipate this outcome, and have an absolute majority supporting decentralization. Then, they will gain the right to determine equilibrium policies in autonomy, which will reduce the median income of the remaining coalition further. The process will continue until the second poorest region separates from the poorest region. \(Q.E.D.\)

Abstract

This project applies the communication theory of identity to messages in the public health area of older adults being physically active and investigates whether using the theory to reframe the messages is consistent with or can contribute insights into the construction of possible scripts to facilitate health promotion.

The paper contrasts the findings of an identity discourse analysis of the text of a physical activity promotion pamphlet for older adults with the results of a preliminary qualitative interpretive research project investigating the personal and social identity of a sample of 50-65 year olds expressed through favourite recreational activities.

The sense of identity expressed by the interviewees forms the basis for suggestions about reframing the health promotion messages around older adults and physical activity.

Introduction

Enjoyment is a major factor in developing and maintaining any behavioural characteristics, good or bad. The initial aim of this qualitative interpretive project was to examine ‘discourses of enjoyment’ in recreational activities for the 50-65 year old age group, as these were not a big emphasis in the promotional literature on ‘active ageing’ documentation, which focuses on physically active behaviour.

While the interviews were being conducted it became apparent that individuals were expressing their sense of personal and social identity. This was considered very valuable input into the issue of older adults and recreation, including being physically active. It was decided, for the purposes of the current project, to make identity in recreation the focus of research.

The project asks the question- is the communication theory of identity useful to assist with talking about identity and recreation? Can it help with health promotion initiatives aimed at promoting physical activity for the older age group? Can the technique of re-framing be facilitated by an understanding of identity and identity construction in health promotion material?

Literature review

The project is influenced by two complementary approaches to the challenge of health promotion involving behaviour modification. One suggests a technique called reframing to alter a health promotion message to reflect the identity of a target audience. The other is the technique of discourse identity analysis used for the analysis of the physical activity promotion pamphlet.
The communication theory of identity (CTI)

Hecht (1993) developed a communication theory of identity (CTI) out of investigations into inter and intra ethnic communication, suggesting four identity frames – personal, enacted, relationship and communal. He reasoned that communication was an enactment of identity. For Hecht identity has multiple loci described as four layers which are intertwined and sometimes contradictory but which cannot exist in isolation from each other. He advocated an analysis of several layers to achieve richness of data use.

Hecht stated (2005 p. 263) when describing the four layers:

Identity is stored in a personal layer as self-concept, self-image, self-cognitions, feelings about self and/or spiritual sense of self-being.

Identity is enacted in communication through messages. The self is seen as a performance, as expressed….

Identity is a mutual product, jointly negotiated and mutually formed in relationships through communication [there are three levels here-]

First, an individual constitutes his or her identities in terms of other people through social interaction……Second, an individual identifies him-or herself through his or her relationship with others. …Third, a relationship itself is a unit of identity.

A group is also a place where identity exists.

The application of CTI to areas other than ethnicity, such as illness and technology, has been fruitful. In the current project CTI is applied to the issue of health promotion.

Re-Framing

Slater (2006) builds on the communication theory of identity, suggesting that health promotion messages which do not appeal directly to personal and social identity are not going to be successful.

Given that many health promotion campaigns report little in the way of lasting behaviour change, Slater suggests that an alternative approach is necessary. For Slater, theories of behaviour change (2006, p. 156) ‘are far from adequate as a basis for developing communication content, communication strategies, and even, in some cases, evaluation designs.’

He suggested reframing the messages, saying (2006 p. 155) ‘Framing …refers to the social priorities and values with which a topic is implicitly associated, as a function of the context of a text or message.’ Reframing then, changes the focus of health promotion messages to incorporate a sense of personal and social identity. This idea is utilised in this paper.
Discourse analysis and identity

Discourse analysis, according to Damon and Holloway (2002, p. 10) 'appreciates that language or discourse...is a strategy which people use purposefully to try and create a particular effect'.

Discourse analysis can be used to examine the construct of identity in documents, such as the Australian 2005 active living pamphlet of the study. Benwell & Stokoe (2006) talk about commodified identities where identity is linked to consumption. Coupland and Gwyn agree (2003 p. 4) saying 'maintenance and positive presentation of the body involve regimes in pursuit of sociocultural norms of desirability that are almost invariably focused on youth, health and beauty'.

Discourses on active ageing are now being emphasised in the health promotion literature, linking into the emphasis on youth and health, and the nostalgia for it.

The Active Ageing discourses

The most common discourse of ageing is, as Hepworth states (in Coupland and Gwyn, p. 89) a 'biomedical one of decline' where growing older creates anxiety and a fear of illness and loss of independence. Hepworth (2002 p. 105) also discusses Gullette's alternative view of ageing and identity discourses where 'confronting the paradox of the ageing body, Gullette accentuates the notion of the core self, which she defines as 'a narrative of the persistence of the self engaged in a lifelong struggle to maintain individual integrity... a journey of the self into the future rather than a nostalgic fixation on an identity that has been buried somewhere in the past with the body of a previous identity'.

The idea of a core identity is a useful concept for looking at how older adults express their identity. The discourse of decline is currently counteracted by the discourse of 'active ageing' where the focus is on maintaining activity to maintain health.

'Active Ageing' is a popular discourse for encouraging older people to move more and to improve their overall health. It is a government discourse in Australia as in many other countries, where a realisation of the economic implications of an ageing population has given rise to strategies for addressing the problems of ageing, characterised by increased medical costs and dependent living arrangements.

Bauman et al (2002 p. 119) in an Australian government report ‘Getting Australia active’ acknowledged that being active has many benefits, which need to form part of health promotion initiatives:

There is also a need to explore the importance of physical activity in terms of social and productive activities, and to examine ways of motivating the 'young old' to become more active. It may be advantageous for communications to focus on contributions to community and maintaining 'a sense of purpose and meaning in life' Brown et al, 1999, rather than on 'prescription' of activity for aerobic or strength benefit.

The concept of ‘Active Living’ for older adults has also been characterised by Bercovitz (1998 p. 319) as ‘a rapid retreat of the welfare state from social
responsibility for fitness and health’. Writing in Canada, Bercovitz analysed the discourses of ‘lifestyle, empowerment, community and collaboration’ and predicted a continuation of this emphasis which we see today.

Rudman (2006 p. 181) states this position even more emphatically:

the personal ‘freedom’ promised with the idealised life practices is ultimately illusory, because they oblige older people to resist ageing through relentless projects of self –reflection and improvement, self-marketing, risk management, lifestyle maximisation and body optimisation.

This project acknowledges this perception of the active ageing discourse, but seeks, by focussing on the lived experience of those interviewed to develop the alternative concept of core identity and its relevance to health messages.

**Methods**

**Interviews**

For the project 30 volunteers from the 50-65 year old age group were recruited via an advertisement in the local paper and an ‘active ageing’ website. Volunteers were interviewed about their five favourite recreational activities (these could be either active or passive activities) - where and how they enjoyed them, how they found out about them and who they did them with.

A qualitative interpretive methodology was employed to find out, in their own words, how this sample enjoyed recreation. They were also asked to self-rate their own health on a scale from 1 poor to 5 excellent, with all volunteers rating themselves as good to very good.

Other papers from this project have focussed on a range of topics to do with the findings. The focus for this paper will be on those findings which present active recreational activities as an expression of social and personal identity.

**Document analysis**

The second qualitative research method employed was document discourse analysis. The text of ‘Choose health: be active – a physical activity guide for older Australians’ (produced in 2005 by the Commonwealth of Australia, the Repatriation Commission and the Australian Sports Medicine Federation) was analysed to examine the construction of identity presented to the target audience.

**Findings**

**Identity construction in a health promotion pamphlet**

The booklet ‘Choose health: be active’ (2005 p.2) is aimed at ‘people who are not currently building 30 minutes of physical activity into their daily lives’, but it also
targets those who are active (2005 p.5) saying ‘if you are already active, consider doing more activity—more time, more effort, more often. Be active in as many ways you can’. In effect, this means everybody in the target age range, (fifty years and over) so the social and personal frames can be analysed to understand what is the communication strategy being suggested.

It is however, hard to imagine that someone who is not already physically active would be attracted to this publication. The booklet contains sections on physical activity guidelines, getting started, making a plan, an actual monthly activity planner and diary, some ‘kettle’ (to be done while the kettle is boiling) stretching and balancing exercises and encouragement for those with chronic health problems, such as osteoporosis, heart problems and diabetes and tips for balancing activity with healthy eating.

The identity constructed by the guidelines is a composite of those who are confident and motivated enough to undertake a program of physical activity. This is a major weakness for those for whom identification with individual messages is essential for them to feel a connection. The pictures in the pamphlet are of older adults successfully undertaking physical activity—including some female members of parliament (a highly select group, both blonde and trim) MPs for the government departments which have put together the guidelines.

The tone is confident and reassuring—chronic health problems can be helped by activity, after consultation with a health professional. If you are not mobile—there are chair-based activities which can be substituted. The tone is also top down—the guidelines are handed down rather than having the sense of being written or compiled by the target age group, which is not stated, but reads like fifty years and older.

The assumption is that you will self-motivate, have the confidence to start something new and resume exercise if you have stopped your program for any reason. There is a section on ‘Excuses… and how to overcome them’ which list a composite of common reasons for not exercising such as, fear, lack of money, lack of facilities, or a lifetime aversion to being active—and very general solutions which often require the participations of others. The quoted excuse ‘I’m afraid I will wear out’, which is not linked to anyone real, carries the solution ‘you will wear out more quickly if you do nothing’. This solution is more like a telling off than a helpful suggestion.

How is this helpful to someone who is fearful, looking for advice, encouragement, reassurance and some activity they can identify with, enjoy and feel connected to?

The ‘kettle exercises’ describe the exercise and say generally what they are for e.g. ‘for strength and balance’ but do not say what they will feel like to your body or suggest some essential and enjoyable activities you need balance for.

Suggestions for motivation include putting your walking shoes by the door and giving yourself gold stars on the fridge for successfully completed activities. This implies a competitive sporting discourse where you are competing with yourself for rewards for being active. It does not suggest what the rewards might be, but they clearly cannot be anything which detracts from the program, such as eating, or drinking.

How does CTI apply to this document? Thinking about the four identity frames of Hecht can be useful for looking at what is suggested. As stated earlier, the four layers are self-concept, identity enacted through messages, jointly negotiated through relationships and identity expressed through being part of a group.
The guidelines are for everyone and no-one. Some actual statements are included but the identity of the speaker is unclear, their age and gender is suggested by an illustration near the quotations, but their age is not identified and there is no life story or experience suggested.

The richness of identity and relationships in the lives of older adults is not an emphasis of this document. The few quotations used focus on activity not self-concept. There is some acknowledgement of group identity and the importance of social interaction, but an awareness of the breadth of lives of adults in the target age group and how they feel about themselves and where they are situated in their lives is not presented.

Bearing in mind Slater’s suggestion that people need to identify with the activities or health promotion ideas presented, a sense of identity is not strong in this publication. Real people are not well represented. Positive feelings of happiness, being involved, interacting, moving, and drawing on a lifetime of experience and achievement are not emphasised.

Identity as expressed in interviews

The awareness of identity communicated by those interviewed for the project, indicates that CTI might be useful here. The four frames will be illustrated by statements from the interviewees as they talked about their lived experience of the enjoyment they experience through recreation.

Recreation is a strong part of their identity on all of the levels and they happily communicate this fact. ‘Who am I?’ is realised through recreation and communicated via a series of self-reflections reinforced by years of experience.

Helen talked about the strain of caring for elderly parents and using movement to keep calm:

Oh, it makes me feel euphoric, and normal, and healthy, and I use it for stress as well, because it—and that’s actually when I took up the gym, when I had my elderly parents, and I couldn’t find the switch to turn off, and that was the only time that I was totally engaged with something and I wasn’t thinking about it. And now, I’m using it because it makes me feel good, it calms me, I love to look and in the Botanic Gardens you’ve got the autumn colours and that appeals to my artistic sense, and also it’s helping to lower my cholesterol which is something I have to watch, through my…it’s hereditary…situation. So, I’m lucky. Doing that is what I love to do, so it’s easy.

Marie is conscious of keeping up her strength for everyday tasks by swimming:

Since I’ve been swimming regularly, my arms are stronger and that makes it easier in the workplace, easier domestically doing housework because you’ve just got more muscles there. And, I’m very conscious that as people get older, they often lose their shoulder muscles, you know, that just hanging washing on the line becomes a real chore for them. ...I mean not when you’re my age but you know, in twenty years time, so I hope that I keep up swimming and I won’t have that problem.
Evan uses walking to have a good think about things

I suppose the walking – of the activities I’ve mentioned, the one which has the most, I guess, sense of routine about it is the short walk around the neighbourhood – the 30 minute walk and it would be possible to just get bored with that. But I find it’s quite a good device of clearing the mind, of just chewing things over, so I get started on it, and because it’s a familiar thing and my mind wanders and so the walk is half done by the time I surface and then I start to be aware of the walk.

Bob is determined to enjoy surfing and enthusiastically describes the exhilaration of catching a wave:

I mean, I’m able to do the things when I was young, and it’s a nice feeling to know you can do those as you get older. I mean, we all recognise to some extent that we’re you know, ageing, but it’s important I think for a person’s mind-set and confidence to still be able to keep doing the sorts of things they did when they were very young. So I’m very pleased to be able to keep doing that and that’s what would drive me on. I intend to keep surfing well into my 70s and 80s, if I can manage it. I have slightly elevated blood pressure but I put that down to the fact that I’m working for a living and I monitor that fairly carefully, and that’s another reason why I exercise.

If the wave is steep, often you have to take a considerable steep drop down the face and that requires you being able to set the rail of the board into the wave and the feeling of the wave and so it’s – these are instinctive manoeuvres that you don’t think about – it all happens in your head, and it’s a bit like you’re on autopilot. But when it’s happening, your body responds and that’s one of the beautiful things about surfing, is that it’s very instinctive, very remarkable. In fact, when you finish, when you flip off a wave, you come to the end of it, you think back and you think, now what did I just do then? And you have to go back over it in your mind because it all happens so quickly. But, you know, you get this marvellous elated thrill about the fantastic thing that you’ve just done. You’ve just got to think down and think what was it I just did. So all of those things you need to consider. But, it’s legs, it’s arms, it’s upper torso and lungs.

Paula enjoys the camaraderie and the laughter of rowing:

I’m—when I’m sitting out on the water with that group of people in the boat—and we’re just finished a race, or we’re about to begin a race, or we’ve just had a really good row, and we have a lot of laughter—and er, it’s just refreshing, and sort of exhilarating and freeing. And you’re out in the fresh air; it’s mind-cleansing…

And it’s the social component too, you know. I’m not very good at doing things on my own, which is one of the reasons for rowing was to force me out of my, you know—comfort zone. And you can’t put things off if people are waiting for you, so that’s a very good feature too.

Meg’s sense of fun is reinforced by unexpected moves on the dance floor

If you can’t laugh, and we quite often laugh we’re out of the dance floor and I’ll do something or he’ll do something and we just crack up laughing. And it’s
– that's the way to go. You've got to laugh. If you don't laugh, you're a sad person, so we laugh a lot. And he will say, "Where did that come from?" We'll just crack up. That's it. I've ended up on the floor a couple of times with my skirts up around my neck, but, hey, I've got knickers on, and it doesn't matter.

Felix combines a good walk with a good meal and company:

It energises me, being out in open air. I mean, apart from the fact of using my body, it just does seem to be out – being out that is good for my feelings about life. So basically it makes me feel good and when I finish I feel good, you know. There's just nothing like coming home after a good solid walk and cooking a hot meal and having some wine. [laughing]

And has modified his camping needs:

Oh well, apart from – we've got good shoes, so the shoes, raincoats or it could be a good quality backpack, but that's about it. We're not, you know, yeah, we don't take it too seriously. Oh, we have – I mean, in the past we've always had bush walking tents, but I think that was the part of my identity that I let go of slowly and I just kept clear. So I did have a lot of gear at one stage for overnighting

Raymond likes the ritual of riding a bicycle to the market:

I mean, that's just such a ritual in my life which almost – however – and I always ride in with my panniers, and no matter how knackered I am on a Saturday morning, that's often the time when I do feel – probably because I'm more relaxed, you know, that's the let down after the week – I'm often feeling really knackered, but I always come home feeling happier.

Myra has allowed herself to relax now that she has retired and has started to lift weights:

I've been, in my life always very determined and I've been very governed by duty. So I was at the critical stage [stress-wise]. I don't do that now, anything I do has got to be fresh enough. I'll go and do something that I like, enjoy and rate dearly.

Pat still enjoys the tennis group she joined 30 years ago to do something for herself;

At the time I really needed something in my life besides the children. I mean the children were always welcome there as well, so there was always someone there to look after them. Yeah, and there's been the same, some of the women have been the same there for all that, you know, all that 30 years, so you know, come from all areas, and we sort of say that's our weekly laughing time, because we have a bit of a chat. There's always plenty of laughter there, so that's a very important thing I reckon. So that's the tennis.

Gwen is very active and walks a lot in her volunteer job so needs to be fit for that:
I do notice things like that if I am walking somewhere with perhaps another member of the family, perhaps my husband or one of my daughters and I think they’re not quite as fit as what I am, because I’ve noticed I can run around the tennis court better since I’ve been doing the swimming and I don’t seem to get as tired as early as perhaps I would have way back, so those things I’m noticing

Ron talked about how good fishing made him feel:

Well, it’s a bit more of a relax, because it gives you time to sit and think because you’re not pulling in fish all the time unfortunately... each wave looks much the same, they’re all different as well, so you can sit there and be mesmerized and staring at something that doesn’t change much, like a fire. You can look into and reflect on other things, so it’s a very gratifying, very quiet time. I remember times where I was down on a big beach with big surf .. and occasionally you’d get excited because you’d get a nip on your line. It’s that little tingle feeling in your right hand...

These interviews show a strong sense of personal and social identity, reinforced through recreation. Activities are enjoyed alone, in small groups, in large groups and with a partner. There is an enthusiasm and appreciation of what makes the activity enjoyable and how it affects relationships and skills needed for a purposeful life.

Discussion

Reframing

From the sense of identity expressed by those who volunteered for interviews and looking at the sense of identity expressed in the document, it is possible to suggest a different more inclusive framework for the guidelines.

An awareness of how people in the age group spend their time can be reflected in the way the health promotion material links to people, to ways of life and to activities which are enjoyed and which are made richer by specific examples illustrating feelings, relationships and life experience. This is the reframing suggestion made by Slater – make health promotion messages part of something people can identity and relate to.

For example – the guideline about being active twice a day could be enriched by listing something that people enjoy which happens to involve moving around. Perhaps it could be a description of a dance group and what they dance to and how that makes them feel. Or it could include a feeling about place and how that is calming and how people solve problems while they walk and get to have a look at how other people are arranging their gardens – and get some gardening hints for their own gardens.
It would also include an emphasis on friendships and the social aspect of some activities, as well as acknowledging the need for individual space, which is also an important part of who we are.

The whole being active emphasis could be reframed as ‘who am I?’ and ‘How can I keep doing the things which are important to me and keep being the person I am and want to be’. Being active needs to be reframed as part of our identity, not an artificially constructed part of who we are. Telling someone ‘inactivity is a health hazard’ is not likely to generate a positive reaction – but may generate a feeling of panic, inadequacy or denial, where it is all too difficult.

Saying instead – ‘what do you enjoy? ‘what do you need to keep on doing it?’ What would you like to do more of? might generate more interest. Acknowledging the range of activities people enjoy and seeing how being active benefits existing enjoyment is also another way of linking health promotion initiatives to real life situations. For example, someone who enjoys sewing or quilting might benefit from an understanding of how the major muscle groups used for these activities can be developed and maintained. They can then pass this understanding on to others.

This approach may have the possibility of being more meaningful to the general population than an exhortation to do 30 minutes of moderate physical activity on most days of the week. Being active and being healthy is obviously useful for every part of life, but focusing on enjoyment and on what people see as their core identity is much more likely to attract their attention.

Conclusion

The aim of the project was to look at the idea of reframing health promotion messages using the communication theory of identity. This was done using the qualitative interpretive methods of interviewing and document analysis, with the focus on active recreation for older adults.

In particular the concept of identity was examined in a recent health promotion booklet on physical activity for older adults and also examined in a series of interviews where older adults talked about themselves and how they enjoyed active recreation.

It is suggested that the health promotion messages might benefit from a reframing, using real life interpretations of the concept of a core identity, as expressed in their own words by the target age range. It is important to acknowledge the richness of lived experience and lifelong realisations which are vital to the age range and to combine this acknowledgement with useful knowledge about how to maintain the enjoyment and enthusiasm displayed.

The next step is to design a research project to examine the effect of reframed messages.

Names of interviewees have been changed.

The author wishes to thank Ms Carolyn Jones for her assistance with the interviews.

Bronx, NY 10458

shhsu@fordham.edu

March 14, 2007
Objectives & Expected Outcomes

After ten years of its début, blog is now a wide-spread international medium. Its users are blogging in various ways: some users treat it as a bulletin board, such as Howard Dean’s campaign blog, who previously ran for nomination of presidential candidate; another utilize it to share his/her ideas on certain issues, such as Lawrence Lessig’s blog, a law professor who is basically concerned with the open resources and the innovation on the Internet; another use it to record their interests, such as cooking, traveling, reading, etc.; still another treat it as live journals. But why people choose to do all these via an online medium rather than an offline one. Are people self-creating via blogging? Are they lonely and/or need a community network? Are they eager to be seen and to prove their existence just as Bishop Berkeley says, “to be is to be perceived”?

This project will focus on international students’ use of blog and will investigate the reasons why they blog.

While international students carry their own cultures with them into a foreign culture, their blogs could function differently from other bloggers’ and could be influenced by more various reasons than other bloggers’. They might blog their school lives, social activities, traveling experience, etc. in the host country as a record of different life experience to network and communicate with family and friends back home en masse rather than via individual e-mails, or to seek for emotional support to confront all kinds of difficulties in the host country. They might blog to discuss all kinds of issues back home. They might also blog to affirm their existence and counter the anonymity they often experience in everyday life, or to reassert their “authentic” selves to longstanding friends and obtain a security in the sense of reasserting their “true” selves, which could be self-created on the Internet.

Methodology

The subjects of this project are international students, who must be foreign-born students and bloggers, in New York City, according to Institute of International Education, where hosts more than thirty thousand international students in its metropolitan area. Thus the city should provide a big enough and diverse enough population to the project. Students will be contacted via the mailing list of Metro International Organization, who reaches about 4000 international students and about 1200 visiting Fulbright students in the city.

I will initially administer an online questionnaire to gather general information of bloggers’ internet use experience and their blogs. Based on the questionnaire, I will conduct further in-person interviews with each subject and examine their blogs to see how different people blog differently and how their cultural backgrounds influence
Shu-Chun Hsu
Abstract

blogged content. When I examine their blogs, I will look for deeper motives in blogging—whether their blogs match their initial claims. For example, I will ask them what they usually describe in their blogs. In the follow-up interview, I will ask them to recount a specific experience they described in their blogs. Then, I will examine their blogs to see in what ways the written description matches or differs from their spoken account. This is a good research method, because they will be describing the incident to me in a one-on-one interpersonal “real-life” context, while their blog account is intended for dissemination to people who they may or may not know in the virtual world. Furthermore, I will try to explore why there is a match or difference by investigating their own culture and applying psychoanalytic theory to the mentality of their blogging experience.
The study of chronic psychiatric patients’ perceptual experience of social skills and self-efficacy

hshuang@ctust.edu.tw

Abstract

The foundation of psychiatric mental health nursing is the relationship between nursing staff and patients. When taking care of psychiatric patients by therapeutic relationship, nursing staff need to know their patients, so that they have to know patients’ perception and what the patients care. Therefore, this study takes the rehabilitation nursing of chronic psychiatric patients as the example to discuss the patients’ perceptual experience of social skills and self-efficacy. Data collection is conducted with questionnaires by purposeful sampling, of which the objects are the cases of psychiatric rehabilitation. This study gets 200 valid questionnaires, and adopts the statistical analysis methods such as frequency distribution, percentage, average, standard deviation and analysis of variance.

According to this study, chronic psychiatric patients are conscious that their social skills of “I could properly interrupt people’s talks” and “I could keep my body or emotions steady when facing others’ provocations” are a little bit insufficient and so are the self-efficacy of “I think that my abilities or conditions are good, and I won’t encounter many hardships when looking for a new job or changing my job” and “when I am looking for a job, I always think that many occupations are not difficult for me.” Besides, both the educational level of chronic psychiatric patients and participating in occupational training or not have great influence on the patients’ social skills and self-efficacy. The average values of social skills and self-efficacy of those with college (or above) educational background are obviously higher than the values of those with the educational level below college degree. And, the average values of social skills and self-efficacy of those participating in occupational training are also obviously higher than the values of those not participating in occupational training.

Therefore, this study proposes that psychiatric mental health rehabilitation nursing needs to combine community training and educational resources to strengthen the social skills and self-efficacy that chronic psychiatric patients need to adapt to the society.
Daughters of Abraham: A study in interpersonal relationships

Daughters of Abraham: A study in interpersonal relationships

Abstract:

The Daughters of Abraham was formed after September 11, 2001 in an effort to explore the distinctives of the Muslim, Christian, and Jewish faiths and to work for restorative justice. As Janice Harris Lord, the founder states “The group has continued to grow in number, but more importantly, it has grown beyond mutual education and tolerance to genuine respect and love for each other.”

Involvement in the Daughters of Abraham has and will continue lead to restorative justice. This was first suggested to me when a Jewish woman said that she had never been able to trust a Christian woman before she spent time with this group. Even the name can be looked at in the context of recategorization, in which the categories of “us” and “them” are included in a superordinate “we” category. What could be a better name to recategorize Muslim, Jewish, and Christian women than as Daughters of Abraham.
Statement of problem

The Daughters of Abraham was formed after September 11, 2001 in an effort to explore the distinctives of the Muslim, Christian, and Jewish faiths and to work for peace. As Janice Harris Lord, (2003) the founder states “The group has continued to grow in number, but more importantly, it has grown beyond mutual education and tolerance to genuine respect and love for each other.” So if we look at this group through the eyes of a social psychologist what do we see? Rather than state this phenomenon in terms of genuine respect and love, this paper will view this in terms of reduced prejudice. To explain this phenomenon of reduced prejudice, we will look first look at intergroup contact.

The theory

In 1954, Gordan Allport described the effect of intergroup contact on reducing prejudice.

Prejudice…may be reduced by equal status contact between majority and minority groups in the pursuit of common goals. The effect is greatly enhanced if this contact is sanctioned by institutional supports (i.e., by law, custom or local atmosphere), and provided it is of a sort that leads to the perception of common interests and common humanity between members of the two groups. (p. 281)

So there are four basic conditions that precipitate the reduction of prejudice by group contact. We will look at these four conditions in the Daughters of Abraham.
• Equal status is seen between groups. The meetings are rotated at a Jewish synagogue, Muslim mosque, and Christian church. Although the leader/founder of the group is a Christian, each month the group is facilitated by a woman of the host church.

• The two groups are working towards superordinate goals, or common goals based on co-operation. The stated goal of this group is expressed as "working for peace"

• Social and institutional support is given. The synagogue, mosques, and churches give use of their facilities for these meetings.

• Perceptions of similarities between groups. This group is called the Daughters of Abraham, and the common narrative of each religious tradition is acknowledged.

Pettigrew’s (1998) work with intergroup conflict added an additional condition, which is friendship potential. This is described as interactions sustained over time and with resulting self-disclosure. In Nagda and Truelove’s (2004) study of an intergroup educational initiative, they evaluated friendship potential along with a learning process “that involves sharing and learning about racial/ethnic identities, introspective learning about one’s own group and bridge building across differences.
The Types of Theories

Theories may be either a set of laws, axiomatic or causal process. Or the set of statements of a single theory may be organized as any of these three forms, such as the Reynolds’ example of *The Exercise of Influence in Small Groups*. In this paper we will look at Intergroup Contact Theory first in all three forms and then focusing on the causal process.

**Allport’s Original Form**

Prejudice…may be reduced by equal status contact between majority and minority groups in the pursuit of common goals.

**Set-of-Laws Form**

Law: In groups of equal status and in pursuit of common goals, if contact between majority and minority groups, then prejudice reduction.

Situation: In Daughters of Abraham, Jewish, Muslim, and Christian women have equal status and pursue common goals; they have contact.

Therefore: Women in Daughters of Abraham have prejudice reduction.

**Axiomatic Form**

Scope Condition: The theory applies only to groups with equal status between groups and in pursuit of common goals.
Axioms: If contact between majority and minority groups, then prejudice reduction

**Causal Process Form**

Figure 1 shows the causal process that forms this theory, and helps to place the pursuit of common goals as an active part.

![Causal Process Diagram]

One of the advantages of looking at this theory in the light of the causal process is that it enables the researcher to break down the theory and realize that the process of pursuit of common goals must be looked at in addition to intergroup contact. The mission statement of Daughters of Abraham, is stated as follows, “The Daughters of Abraham believe in and actively work towards peaceful and non-violent solutions to problems.” And this major focus is broken down in several areas:
- Community Service
- Coordination of Youth Presentations
- Publications

All of these may be looked at in terms of common goals, although all members of the group do not participate equally in these areas.

As the women in DOA become more involved and spend time in interaction, there is friendship potential. In Nagda and Truelove’s (2004) study they found that the friendship potential and prejudice reduction was enhanced by “sharing and learning about racial/ethnic identities, introspective learning about one’s own group and bridge building across differences.” Figure 2 below integrates the friendship potential in prejudice reduction.
In Allport’s (1954) terms “Prejudice...may be reduced by equal status contact between majority and minority groups in the pursuit of common goals.” So we will look at the two key abstract concepts in this theory, first prejudice and secondly intergroup contact. Both of these abstract concepts are not related to any unique spatial or temporal time setting. To better define prejudice, let's look to Allport (1954, p. 9) again, "Ethnic prejudice is an antipathy based upon a faulty and inflexible generalization." As we break down this definition, Allport incorporates the attitude (antipathy) and the belief (faulty and inflexible generalization). Both prejudice and generalization may be looked at in a concrete situation, such as the Daughters of Abraham meetings.

Key abstract concept

In looking at this group, the abstract concept prejudice would be presented in the more concrete terms of negative attitudes and beliefs toward Christians, Muslims, and Jews by the women of Daughters of Abraham in face-to-face interaction at meetings of the Daughters of Abraham for a time period, for example the monthly meetings of 2006. Allport (1954, p. 446) addresses these three religions specifically:
Islam is more than a religion; it is a well-knit cluster of related cultures carried by ethnic cousins who are sharply demarcated from the non-Moslem world. Christianity is so locked with western civilization that it is hard to keep in mind its original core…. Most clear of all is the case of the Jews. While they are primarily a religious group, they are likewise viewed as a race, a nation, a people a culture.

**Concrete concept operationalized**

Prejudice, the attitudes and cognitions may be measured in several ways, similar to the operationalization of “anxiety” Reynolds (p. 53) gives. Individuals, specifically those women involved in Daughters of Abraham, would be the units of analysis. Below are some thoughts on how I will operationalize prejudice in studying this group.

1. Record who sits by whom – for example, when seats are available do the Christian women sit by other Christian women or by Muslim or Jewish women?

2. Use questionnaires measuring prejudice with the women and “study the pattern of responses”

3. Analyze the conversations
   a. For content
      i. How well the differences between the faiths are are respected?
      ii. What are some of the stories?
   b. For communication patterns
i. Who interrupts whom?

ii. Does any faith monopolize?

4. Look for patterns of attendance
   a. The meetings are rotated between a Jewish synagogue, Muslim mosque, and two Christian churches
   b. Are the groups overrepresented in their own settings?

5. Use Bogardus’ social distance scale

   For example, Parrillo and Donoghue found in 2001 that white Americans had the lowest Bogardus score, a 1.07, Jews ranked 11th, with a 1.38, and that Muslims ranked second to the last or 29 with a 1.88. In comparison, African-Americans ranked 9th, with a 1.33.

   Two relational statements

   A friend asked me if the women in this group tended to be conservative and my response was that most conservative Jews, Muslims, and Christians would not be meeting with each other. In the same sense, most women who choose to be in this group typically would not have as high level of prejudice as the general public. So an associational or correlational statement concerning the concrete concept of participation in Daughters of Abraham could be stated as follows: Intergroup contact between Muslims, Jews, and Christians would have a negative association with prejudice. However, a causal statement would be that intergroup contact between Muslims, Jews, and Christians would lessen prejudice. But this causal relationship is a bit harder to measure, than
simply a correlational. Pettigew and Tropp looked at this relationship in *A Meta-Analytic Test of Intergroup Contact Theory* and found that contact does reduce prejudice, even taking self selection into account. “Longitudinal studies also have revealed that optimal contact reduces prejudice over time (e.g., Eller & Abrams, 2003, 2004; Levin, van Laar, & Sidanius, 2003), even when researchers have eliminated the possibility of participant selection.”

Another focus of this study would be the effects of common goals in decreasing prejudice. In the Sherifs camp experiment, they found that having competing groups work for a superordinate goal would create less outgroup hostility. The effects of working for common goals in Daughters of Abraham should be measured.

**Implications**

Involvement in the Daughters of Abraham will decrease prejudice, because of equal status, common goals, social support, and perceptions of similarities. This was first suggested to me when a Jewish woman said that she had never been able to trust Christian women before she spent time with this group. And one of the dimensions seen as a participant observer in this group is that Then as a sociologist I thought of Allport's Group Contact Hypothesis. Even the name of this group, Daughters of Abraham, can be looked at in the context of Allport’s work. Gaertner, Mann, Murrell, & Dovidio, (1989) derived a recategorization model, in which this intergroup contact is effective if the categories of “us” and “them” are included in a superordinate “we” category.
What a better name to recategorize Muslim, Jewish, and Christian women than as Daughters of Abraham.

Understanding the Effects of the Interaction in the Writing Center and the International Student’s Expectations on Their Future Use of the Writing Center

Maosheng Hung

I. Introduction

A. Research Problem

Since the early 1970s, the writing center has become a very unique place in American universities, colleges, and even high schools. Its core theoretical assumption—that writing is a fluid learning process which occurs in an active social context—has been very popular and widely adopted within academia. In addition, it is rapidly replacing the traditional approach to composition teaching practice (Jones, 2001). Although there is a great deal of research about the writing center during the past twenty years (Murphy, Law & Sherwood, 1996 p.xi), I find through my search of the literature that only a few studies evaluate the performance of the writing center in improving student writing skills but none investigates the efficacy of the writing center in helping international students as well as international students’ perception and perspectives about it. The current study is conducted toward these goals.

The writing center at the University of Kansas offers its services at different locations on campus. The home base is in Wescoe Hall and other locations are in the main libraries (Watson and Anschutz) and some residence halls (Oliver and Ellsworth). Normally, students can get the services from 9AM to 9 PM during the weekdays. The main purpose of the writing center at KU is to help students become good writers by having tutors guide and coach them to revise and improve their paper. When a student
walks into the writing center, the writing consultant will want to know what he or she would like to work on and what goals he or she has for his or her writing. The session is primarily based on the tutee’s request.

Generally speaking, a session lasts about thirty minutes. Because graduate-level writing is more demanding, the KU writing center offers one hour “appointments” exclusively for graduate students. However, these appointments are extremely limited, and only one appointment is available per student every week. For those who don’t make an appointment in advance, they can only have a regular session, which lasts for thirty minutes.

From the viewpoint of many students (especially international students), faculty members and administrative staff at KU, the writing center is supposed to help students enhance their writing skills by “proofreading” their paper. However, a great number of international students complain a lot about its functions and practice. I have been hearing some of my friends talking about their feelings and experiences of being in the writing center. They thought that after they brought their paper to those “professional” writing consultants, then their paper should be fine to turn in. However, when receiving their paper from their professor, they realized that the paper still had some problems, either because they got a bad grade on it or because there were still many grammatical errors pointed out by their professor. In addition, they described when sitting in the center, they were asked to do some work, which they did not think was related to helping improve their articles. For example, normally in the beginning of the consulting session, they would be asked to read the whole paper out loud rather than the consultant did it himself or herself. Many of my friends felt very uncomfortable about this practice. They even had
no idea why they had to do so and how this would help them. I personally had the same experience that made me not return to the center for almost a year. From my own perspective, this read-out-loud strategy might work for native speakers of English to find mistakes in their article, but it is not effective for international students, because of their limited grammar knowledge. Owing to these issues, I became interested in investigating what’s going on in the writing center at KU and what makes many international students not like it.

**B. Research Questions**

This research mainly focuses on the experiences of those international students who do not like the writing center at KU. Therefore, the research questions are devised toward this particular community as opposed to all of the international students. They are as follows:

1. What were the expectations of the international students who had had bad experiences in the writing center at KU whenever they visited it? What was the actual practice of the writing center?

2. What previous experience(s) did they have in the writing center? How did they feel about it/them?

3. What factors made them have a negative view about the writing center and influenced their future use of it?

**C. Significance of the Study**

As I mentioned in the beginning of this study, from the perspectives of many students, faculty members and even administrative staff at KU, the function of the writing center is supposed to help those who need assistance in their writing. International
students especially need it, since English is not the native language of most of them. One year ago, I had a chance to observe in the KU writing center for more than fifteen hours for the class I was taking. I figured that most of the students coming in the writing center were international students. The writing center seemed to have become a place where international students would go and ask for help in their writing. Hence, in order for the KU writing center to function more effectively and for foreign students to get more and more assistance on their schoolwork from the writing center, this study can provide the writing center staff with very valuable information for reconsidering the objectives of their practice and the functions of the writing center. The other subgoals of this study are trying to grasp the following issues:

1. to understand what international students usually expect the writing center to help them

2. to discover what procedures and strategies the writing consultant normally utilizes to help their tutees and how they interact with each other in a writing session

3. to investigate the causes that decrease international students’ motivation to use the writing center for help

4. to help myself and those current FL (foreign language) teachers understand the needs of our students and then try to come up with good methods to help them (the students) in terms of their writing skills

5. to apply the results of this research to other universities in the United States

D. Conceptual Framework

The conceptual framework of this study consists of two parts—the literature review and my own experience. In terms of the literature review, some studies demonstrate that
the writing center has a great impact on student writing ability improvement. For instance, Doris Sutton and Daniel Arnold (1974) conducted a study by dividing a sample of basic English composition students at a community college into two groups—control and experimental groups. In the control group, students received “standard classroom” freshman composition lessons, whereas in the experimental group, students received instruction in composition at a writing center through one-on-one tutorials. Then, the researchers compared the grade point averages of these two groups at graduation and concluded that the students in the experimental group had accumulated significantly higher GPAs than the ones in the control group.

John Sadlon (1980) did a similar experiment in which the experimental group consisted of students assigned to attend writing center tutorials on a weekly basis and the control group of freshman attending composition classes without tutorials. The results showed that all of the students in the experimental group did at least as well as those in the control group when measured by grades in a second semester freshman composition course and that many who received the tutorials did far better than those who received the traditional freshman composition approach. Afterwards, Carol David and Thomas Bubloz (1985) used a pre- and post-test design for their research. They put a sample of students who failed freshman composition in the writing center to enhance their grammar skills. They found a statistically significant improvement in grammar skills on post-tests after the students in their sample had received individualized instruction focusing on error correction and increased understanding of grammar rules. In addition, Linda Wills (1984) revealed that after some five hundred college freshman students were exposed to one-on-
one tutorials at a writing center, their mean scores on an error-recognition test improved significantly.

On the contrary, some research indicates that the writing center doesn’t help improve student writing ability much. For example, James Bennett, in his 1988 doctoral dissertation, examined the effects of required writing lab assignments upon the writing performance of community college composition students. He compared grades given by a panel of composition teachers to assignments submitted prior to the intervention with those given by the same panel to assignments submitted after the tutorials at the writing center. Then, he found out that there was some improvement indicated by the results but it was not at a statistically significant level. Moreover, David Roberts (1988) compared the effectiveness of credit-bearing courses offered by two writing centers to effectiveness of conventional classroom instruction. The findings of his study pointed out that in the light of writing quality, understanding of writing process, and levels of writing apprehension, the courses offered by the writing centers was a little more effective than the conventional classroom instruction, but again the variance did not meet the study’s criteria for statistical significance.

From the aforementioned discussion of previous research, there is no absolute answer about the effectiveness of the writing center in improving student writing skills. Also, no study is found discussing how well the writing center helps international students and how international students value the writing center in terms of its function, practice and effectiveness. Therefore, the current study is conducted toward investigating international students’ perception and perspectives about the KU writing center to understand more about the efficacy of the KU writing center. The following is what the
writing center at KU should typically do and the role it should typically assume according to their mission statement:

1. It will provide qualified writing consultants who support the academic mission of the university.
2. It will create an environment that is accessible, comfortable and productive.
3. It will help students understand and practice writing-to-learning for writing in all subjects now and for writing in the future.
4. It will help students understand practice many strategies effective writers use, from brainstorming to editing.
5. It will support students’ growth as a writer and provide the expertise, the resources, and the space and time to work with them on their writing.
6. The writing consultants are students’ peers who have completed a course and continue to learn through staff education workshops. They are tutors, not teachers, trained to coach and guide students.

With regards to my own experience, when I first started my master’s studies at KU three years ago, I went to the writing center to get my assignment proofread. I had a very bad experience at that point, because everything there was completely different from what I had expected. I originally thought the writing consultant would help me look at my article and find out those grammatical errors, followed by correcting them for me. However, instead of focusing on my grammar, she emphasized the content of my article. After the session was finished, I was really upset with her practice and never visited the writing center until after a year when I took a class with the former writing center director. From then on, I came to realize that the content part was also very important for good
writing. However, for most of the international students, grammar correction is still their first need to be met when they go to the writing center.

A research article written by John Truscott argues that grammar correction in L2 writing classes should be abandoned for three reasons: (a) Substantial research shows it to be ineffective and none shows it to be helpful in any interesting sense; (b) for both theoretical and practical reasons, one can expect it to be ineffective; and (c) it has harmful effects. This argument is consistent with the practice of the writing center, but doesn’t match many international students’ need. Hence, one of the main purposes of this study is to investigate if grammar correction is the most important concern of international students and if it is the main issue that makes many international students not like going to the writing center very often.

II. Methodology

A. Data Collection & Methods

The data in this study were collected from two sources. The main source was based on five interviews, and the supportive one on two observations.

1. Interview

In this study, interview is the main method used to investigate the research questions and collect data. In total, I conducted five interviews. Each of them lasted around twenty five to thirty minutes. I interviewed three of them in Jayhawk Tower A, one at her own house and one in JRP. Most of the sites are where the participants live, except for JRP. The advantage for doing the interview at their place is that it’s quiet and no other people
would bother and interrupt our conversation. Also, the quality of the recordings would be much better than in the public place.

In order to make myself, a novice researcher, feel more comfortable beginning an interview, I started with my own friend. Rubin & Rubin (2005, p.80) points out that being relaxed on the part of the interviewer may lead to a thoughtful and rich interview. Moreover, before formally asking the participants questions and tape recording, I usually spent a few minutes chatting with them, trying to make them relaxed so that they could elaborate more on their responses. As Rubin and Rubin (2005, p.115) indicate, “Some interviewees are nervous and may lack confidence that they can answer your questions. In this first stage, you may want to spend a little time tactfully reassuring the conversational partners that they are competent…. When chatting with them, I also introduced myself (including my research role) and the purpose of the study (Rubin & Rubin, 2005, p.116). Furthermore, after finishing an interview, I asked the interviewee if he or she would like to be identified in this research (Rubin & Rubin, 2005, p.116). They all gave me their permission to mention their name. Therefore, their names can be found in the introductory section of Sampling and beside quotations.

Rubin & Rubin (2005, p.110) mention that “the researcher needs to keep a record of what was said for later analysis.” Hence, I also tape recorded the content of each interview, followed by transcribing it verbatim, including pauses and hesitations.

2. Interview Protocol

My original interview questions were developed based on my own experience of visiting the KU writing center. I began my questions with the locations and open hours of the KU writing center, through the practice of the center, the interaction between the tutor
and the subject, to the perception of the subject toward the consultant and the entire
writing center. I came up with six main questions. Under each main question, I also had
several follow-up and probe questions (see Appendix 1). I tended to design all the
questions to be open questions so that all the interviewees could offer as many responses
as they could. However, after I did my pilot study with my classmate in class and my first
interviewee in Tower A, I figured out that there were some leading questions on my list.
Then, I started to revise them and ended up with the current questions that I used to ask
the rest four interviewees (see Appendix 2). Aside from the leading questions, I tried to
remove or change some questions that would only retrieve answers like “yes” or “no”
from my subjects. The purpose for doing this was to have all my participants thoroughly
describe their experiences and opinions to enrich the whole study and to make the
findings of the study more complete.

3. Selection of Samples

I used the “Snowball Sampling” approach to select interviewees for this research
(Merriam, 1998, p.63). Totally, there were five people interviewed. I started with a
Taiwanese friend, whose name is Yuru Lee. She is currently pursuing her master’s degree
in linguistics. She has studied at KU for more than 2 years. She goes to the writing center
whenever she needs to turn in her paper. My second interviewee is Yuru’s roommate,
whose name is Sooa Im. She comes from South Korea. Yuru recommended her to me
because she knew that Sooa could also offer very useful and insightful information for
the topic I was working on. Sooa is a doctoral student in the Art History department. She
began her studies at KU two years ago. But she has visited the writing center only once.
Before she came to KU, she was pursuing her master’s degree in the same field at
Rutgers University, New Jersey. The third interviewee of mine was referred by Sooa. Her name is KyungAe Keum, who is also from South Korea and is doing her PhD in audiolodgy (from the department of Speech Language and Hearing). She has studied at KU for two years as well. She goes to the writing center approximately three times a semester.

Yuka Naito-Billen, my fourth interviewee, comes from Japan. She was recommended by my Japanese classmate, Mishizu, who took this course last year. Yuka is also a doctoral student and majors in foreign language education. She finished her master’s in music therapy at KU and has studied here for six years. However, during these six years, she just visited the writing center twice. My last interviewee, Essa Alrehaly, is a master’s student in science education. We take the same class in Qualitative Research together this semester, but I don’t know him very well. I happened to recognize that he might offer very insightful information about my topic due to a class activity. Therefore, I included him as one of my interviewees. He had been studying at KU for three year since he came here from Saudi Arabia. However, he had visited the writing center only twice.

4. Purpose of Sampling

One of the reasons that these people were selected as my participants in this study is that all of them have had a bad experience in the KU writing center. The experience has caused many of them to turn to their own friends for help instead of using the writing center. The second reason is that these subjects come from different countries as opposed to a single one. Their opinions about the function of the writing center and descriptions of their previous experiences in it would be diverse and could make the findings of this
study more reliable and generalizable. In addition, using the “Snowball Sampling” procedure to choose samples can make the results more valid by preventing the outcomes from being biased by the interviewees with whom the researcher is acquainted.

5. Observation

The second (supportive) element of the data collection process consisted of observing two sessions in the writing center located in the Watson library and the Anschutz library respectively. During each of the sessions, I focused on the interaction and conversation between the tutor and the tutee along with the tutor’s consulting procedures and strategies. I also wrote down details about the tutee’s requests for the consultant and the physical properties of the writing center (Merriam, 1998, p.97-98).

In terms of the first observation, it was conducted in the writing center on the third level of the Watson library. When I entered the center, a receptionist was looking into the screen of his laptop, two tutors were helping their tutee and the other tutor was surfing the Internet. After I explained my intention to the receptionist, he introduced me to the only available tutor and asked me to have a seat until the next student came in for a new session. I waited there for fifteen minutes and there arrived an American undergraduate student. The tutor asked the tutee if she minded that I observed the session and she said no. Then, they started their consulting session and I began my observation. For this session, the student’s paper was to apply to a job position. The tutor who helped her majored in two areas—Religious Studies and Linguistics.

The next day, I changed the place of observing. I went to the writing center in the Anschutz library. In addition to a receptionist, there was only one tutor available at that moment. When I got there, three students already signed up and waited for their own
session. I followed the same procedures from my last experience and told the receptionist about my intention for coming there. Likewise, she asked me to be seated and wait for the next session. This time, the session I observed consisted of a tutee, who was a Chinese graduate student in linguistics, and a tutor, who was an undergraduate student in English and Journalism. The student’s paper was summary of a journal article and was written for one of her linguistics classes. The content of these two observations will be further discussed in the following section of research findings in conjunction with the interview data.

After observing, I immediately reviewed my notes to increase their completeness and legibility, and the resultant field notes were then available for analysis. These observations allowed for comparative analysis of my observation data with the interview data in order to locate patterns of consistency or discrepancy.

Merriam (1998, p.100-101) points out four possible stances that a qualitative research can hold. The first one is complete participant—“The researcher is a member of the group being studied and conceals his or her observer role from the group so as not to disrupt the natural activity of the group.” The second one is participant as observer: “The researcher’s observer activities, which are known to the group, are subordinate to the researcher’s role as a participant.” The third one is observer as participant: “The researcher’s observer activities are known to the group; participation in the group is definitely secondary to the role of information gatherer.” The last one is complete observer: “The researcher is either hidden from the group or in a completely public setting such as an airport.” In this observation, I functioned as an observer as participant.
The tutor and the tutee both knew what I was doing. Most of the time, I observed their interaction as opposed to joining them.

D. Data Analysis

Whenever I finished an interview or observation, I organized it and turned it into a detailed transcript or field note. When I had all the transcripts and field notes ready, I began my analysis. I first recognized relevant concepts, themes and patterns in my data. Then, I figured out a brief label to designate each concept and theme, followed by marking in the interview and observation text where the concepts or themes were found. After I physically coded the interviews and field notes, I sorted the data by grouping all of the data units with the same label into a file. In this case, I can look for how the concept or theme was seen overall, and then examine for subtle differences in the way the concept or theme was used (Rubin & Rubin, 2005, p. 207-208). In terms of the data that clearly seemed unrelated to the purpose of the study, I did not further examines or categorize them. Overall, the first consideration for identifying emerging categories was related to the research questions and guiding questions. The second was semantic homogeneity based on conceptual similarities between utterances.

E. Validity & Credibility

In order to make this research more valid and credible, I used several strategies. First of all, I included in my study people that I didn’t know and people from different countries to see if they all had the same or similar patterns. Second, I utilized “Snowball Sampling” to select my participants. I asked my friend, the first interviewee, to refer me to her roommate and her roommate then referred me to her friend. Merriam (1998, p.63) indicates that this strategy is “perhaps the most common form of purposeful sampling.”
Third, I went to the writing center in the Watson library to observe a consulting session. Then, I compared what my interviewees said and what I actually observed to come up with some similar and different patterns (Triangulation). Maxwell (2005, p.112) shows that this approach “reduces the risk of chance associations and of systematic biases due to a specific method, and allows a better assessment of the generality of the explanations that one develops.” Merriam (1998, p.204, 207) also suggests this strategy. In addition, this method helped test the validity and reliability of my research findings (Maxwell, 2005, p.113). Last, after I transcribed all the interviews, I presented each of them to the respective participant for confirmation of the content (Respondent Validation in Maxwell, 2005, p.111; Member Checks in Merriam, 1998, p.204). The reason for doing this was to avoid some biases and misunderstandings from my own part as a researcher.

In terms of the first strategy, owing to various cultural backgrounds, people from different countries might have diverse perceptions or opinions of what’s happening in the writing center. Therefore, in order to make this research more generalizable and more trustworthy, I tried to collect my interviewees from as many different nations as I could. Also, using the “Snowball Sampling” approach can avoid Maxwell’s so-called “Reactivity” that is “the influence of the researcher on the setting or individuals studied” (Maxwell, 2005, p.108). If the interviewees I included in this research were people I knew, they would have provided the answers that I personally wanted to help complete my study. This will make the findings of this research biased and invalid.

Regarding my last two strategies, adding an additional method to collect, which is “observation” in this study, can further support the evidence from interviews and increase the validity and credibility of the research. Furthermore, as Maxwell (2005, p.108)
mentioned that the subjectivity of the researcher is one of the main causes resulting in the research bias. As a result, presenting the transcription to the subject for confirmation of the content can decrease the researcher bias and make the results of the study more believable and readable.

**F. Ethical Issues**

Before the five interviewees were asked to participate in the study, they were presented a consent form in which the right of the participant, the purpose of this research, the use of this study and the contact information of the researcher etc. were all included. If the participants didn’t feel like being part of the study, they could withdraw from it any time (Rubin & Rubin, 2005, p.104). In addition, after finishing transcribing the interviews, I provided my interviewees with the rights to look over the transcriptions and edit them, followed by asking if they would like to be identified in this study (Rubin & Rubin, 2005, p.101). These were the approaches I used in this study to protect my interviewees.

**III. Findings**

After analyzing the data from the five interviews and two observations, I found out that all of the international students I interviewed or observed visit the writing center mostly because they have an assignment due and need to have a native English speaker look at it to make sure that the paper has no grammatical errors. However, some bad experiences they had in the writing center have made them have a negative view about the center or even influence their future use of it. As Essa (a master’s student in Science Education) said in the interview, “I quit really. Because I think they don’t help me at
all…. My experience with the writing center is that they almost don’t help at all…."
These experiences, after I collected and analyzed, are related to three major categories. The first one is the policies and practice of the KU writing center. It includes some subcategories such as open hours, locations, session time, tutor arrangement, late openness, and insufficient tutors. Some of them complained that the open hours and locations were inconvenient for them. Some of them indicated that they were not allowed to choose the consultant they liked. Many of them even suggested that the session time and the number of the tutor should be increased (Quotes related to these points and the sequent ones are provided in the detailed analysis that starts on p.20).

Second, some issues on the part of the tutor also cause a great number of complaints from the interviewees. For instance, some participants are not comfortable with the consultant’s procedure/strategy--reading out loud. Some pointed out that when they were reading their article out loud, the tutor was not listening and paying attention. It turned out that they (the tutor and my interviewee) had to go over the whole paragraph(s) again from the beginning, which wasted a lot of time. Furthermore, none of the interviewees trust the consultant in helping them with their paper, because they all think these tutors are just undergraduate students and do not know anything in their (my interviewee’s) field. One more issue my interviewees also mentioned is the tutor’s attitude. Some of them said that when they were in the process of reading their paper, they figured that the tutor was sometimes absent-minded. For example, the tutor would look at his or her watch or the clock on the wall without paying attention to the tutee’s reading. My field notes from the two observations also provide some evidence about this phenomenon. One of the tutors, while helping her tutee, kept fiddling with her hair and
the other one always took out her cell phone from her pocket to see if somebody had called her or left a message to her.

I add the third category, which relates to the tutees (the interviewees) themselves. The relevant subcategories under it are their expectations towards the tutor/writing center, their comparison with the school they attended, and asking for their friend’s help. From the data I collected, the purpose of all the interviewees for going to the writing center is to have a native speaker proofread their article and correct all their grammatical errors. However, they complained that more than often, when they got their assignment back from their professor, there were still some mistakes pointed out. Sometimes, the professor would ask them to go to the writing center to ask for help, although they had already done that. One of the interviewees talked about the writing center in her previous university—Rutgers University. She complained that the tutors in KU’s writing center were mostly undergraduate students. They worked for the writing center just to make money. The tutors in Rutgers University were teachers in the Applied English Center. They were more experienced and better at helping international students. One of the interesting finding in this study is that all of the interviewees all prefer asking their own friends to help proofread their paper. One of the reasons is that they don’t have to make an appointment with the writing center and go there on time. It’s more flexible to ask their own friend for help in terms of time.

In the following section, I will talk about each of separate findings supported by quotes from my interviews or field notes to capture the real answers that address my research questions. As I mentioned previously, I categorized the data I collected into
three major parts—the Writing Center, the Tutor and the Tutee. The details of them are all presented and analyzed below.

A. the Writing Center

The policies and practice of the KU writing center is the first major category that will be discussed here. It is composed of six subcategories. They are open hours, locations, session time, tutor arrangement, late running, and insufficient time. The analysis begins with open hours.

1. Open hours

The writing center at KU has its open hours: 9am-4pm at Wescoe Hall, 11am-3am at Anschutz Library, 6pm-9pm at Watson Library and 6pm-9pm at Oliver Residence Hall. These times only apply from Monday to Thursday. On Fridays, the writing center doesn’t have evening consultations available for students and no service is for Saturdays. On Sundays, only Watson Library offers evening consultations.

It’s very interesting that not all of my interviewees knew about the time schedule the KU writing center offers. Many of them just knew the schedule(s) of the place(s) they used to visit. However, two out of the five interviewees expressed their dislike of the writing center’s open time. They said that it usually conflicted with their class or working schedule. As one interviewee noted:

…but I more frequently went to the writing center in Wescoe. It seemed to open at 8 am and close around 4pm. Then, in addition, the one in Watson Library started at 6 pm and ended at 9 pm. But it was sometimes inconvenient for me, because the one in the Wescoe usually opened during the time when we needed to go to class. Normally,
when you got out of your class, it would be always after 3 pm. But at that time, if you had any report due the next day, then you couldn’t ask people to proofread your article immediately… (Yuru Lee, a master’s student in Linguistics)

2. Locations

As I mentioned previously, there are several locations at KU where students can go and ask for help. They are Wescoe Hall, Watson Library, Anschutz Library and Oliver Residence Hall. The data I gathered show that most of my interviewees tended to go to the writing center in Wescoe more often than other locations. Many of them thought that the locations were fine with them and also worked for them. Only Yuru had something to say. She said, “… I feel that the locations in the libraries would be very inconvenient for those living off campus and even in the dorms, especially after the weather gets cold….”

3. Session Time

According to the policy of the KU writing center, if a graduate student doesn’t make any appointment in advance and walk in the center directly, he or she can just have thirty minutes for a session. However, if he or she makes an appointment, then he or she can have an hour for a session. Even so, all of my interviewees still thought that time was very limited and insufficient for them to finish proofreading their paper. When they couldn’t finish correcting their article within a session, they had to come back again for another session. According to them, they normally had to return to the writing center at least three or four times to get their assignment done. That’s very time-consuming for them. All of the interviewees had the same argument as the following quote I took from Essa:
About the time, they said this is not enough time to deal with that [the assignment]. Sometimes, they just told me you have to fix this problem, but they don’t tell me in which way I have to fix it, you know. I said, ‘no, you have to help me.’ They said, ‘your time is limited. Because there are some people, some international students waiting, we can’t deal with all of them. So you can have another option. You can send your assignment via the Internet.’ I tried this way, but they don’t really look at my assignment only after three or four days later, sometimes after my due date for my assignment done, you know…. You will not be able to finish your assignment in one period…. I have to come [to the writing center] again at least four times…. (Essa Alrehaly, a master’s student in Science Education)

4. Tutor Arrangement

Some of the interviewees also pointed out that sometimes they could meet a good tutor, who really helped them a lot and gave them useful advices on their assignment. For example, the tutor would “correct sentence, give some information how to organize writing, put his effort to help and guide me to organize in an American writing way, because we are accustomed to my country’s system. So he really helped not only grammar but format.” (KyungAe Keum, a doctoral student in Audiology) Therefore, they would hope that they could have the same person help them next time when they came back to finish the rest of their article or to have a new assignment proofread. However, in fact, they couldn’t pick their favorite consultant to assist them. Instead, the manager in the writing center would pick one for them no matter if they liked him or her. This also
leads to some complaints from the interviewees such as wasting time. The following quote illustrates the theme mentioned.

…So when you come again, the other guy [the manager in the writing center] don’t give you the guy you originally got last time…. They change people who originally helped you. So you have to go over the whole assignment again. It’s very disturbing and wasting time. (Essa Alrehaly, a master’s student in Science Education)

5. Running Late

Among all the interviewees, only one complained that the KU writing center didn’t open when it was supposed to. When this happened, people working there didn’t say anything and even ignored that she was present, which made her feel very upset. The following quote express her anger:

Sometimes, I find them insincere. For example, when I went to the writing center, they were supposed to start the service at twelve, but nobody was there. I waited them for ten minutes and they came late, and just only one consultant arrived and the other person just manage the consulting. Uh….she didn’t explain what’s going on in the writing center….(KyungAe Keum, a doctoral student in Audiology)

6. Insufficient Tutors

When trying to categorize my interview data, I found out that Essa and KyungAe both mentioned that there were normally many students waiting in the writing center, but
only few tutors were working there. Hence, they sometimes had to wait. The field notes from my observations offer evidence to support their statement. When I did my second observation in the Anschutz Library the other day, I found out that a lot of people were sitting in the writing center area talking to each other. At that moment, I thought that all of them were either tutors or tutees and were being in their session. However, I was mistaken. After the Chinese girl I observed came in and signed up, I heard that the manager asked her to wait for thirty minutes, because they just had two tutors helping out there and two students were already waiting. What I personally observed was exactly the same as what Essa and KyungAe complained about:

…And I was just kind of waiting and waiting. So after twenty or thirty minutes, she [the manager] just tried to assign me into another place [means to another tutor]…

(KyungAe Keum, a doctoral student in Audiology)

B. the Tutor

The second major category that will be analyzed here is related to the part of the tutor. It is also the part that the interviewees complained about most. There are several issues under this title—the tutor’s procedures/strategies, profession/knowledge, attitude and skills/training. They are discussed in sequence below.

1. Procedures/Strategies

According to my interviewees and my observations, before starting the consulting session, the tutor would normally ask the tutee of the following questions: what is your article about? What subject is this article written for? What would you like to work on?
Then, the consultant would ask him or her to read his or her assignment out loud by telling them that this strategy could help them find their own mistakes. Regarding this practice—reading out loud, Yuka (a doctoral student in Foreign Language Education) said, “After that [I read my article out loud], they went over sentence by sentence, and make better sentence, improve each sentence. But it takes forever. So usually they finished like one page out of a five-page paper.” Essa (a master’s student in Science Education) described, “I feel not comfortable with that [reading out loud], and I think I spent a lot of time, because my reading slow. So I spent most of my time just correct one page.” These interviewees both expressed that the reading-out-loud strategy was very inefficient and time-consuming.

2. Profession/Knowledge

After I finished each of the observations, I had a short talk with the consultant to know about their professional background. Both of them are undergraduate students at KU. One majors in English and Journalism and the other in Religious Studies and Linguistics. In addition, one of the students working in the KU writing center told me that there were currently eighteen writing consultants offering services in the center. Twelve of them were undergraduates and only six of them were graduates (two-thirds are undergraduates). These findings are congruent with what all of the interviewees criticized in this research. They all indicated that tutors in the writing center were mostly undergraduate students and they knew very little about their (interviewees’) professional field. As a result, my interviewees normally just asked them to correct their grammar as opposed to focusing on their content. All the interviewees agree with the following quote from Sooa:
Uh…but uh…in terms of content, I don’t think any consultant in the writing center could help my writing. My content is very specific topic in art history. They [consultants] don’t have any idea about my topic. I don’t think they have knowledge background about my field. I feel more comfortable to ask my friend in my department to help and read my paper, because they know what I’m talking about. (Sooa Im, a doctoral student in Art History)

3. Attitude

Another interesting thing has something to do with the tutor’s attitude while the interviewees were reading their paper out loud. Four of my interviewees stated that when they followed the consultant’s instruction to read, they figured that he or she was neither listening nor paying attention. Instead, he or she was looking somewhere else or talking to other consultant or friend. I also noticed this interesting phenomenon from my observations. For the first session I observed, the tutor fiddled with her hair throughout the session. For the second one, the consultant constantly took out her cell phone from her pocket to see if somebody had called her or left any message to her. These minor actions would normally lead tutees to think that the tutor’s attitude was bad. The following quote is from one of the interviewees. It expresses his feeling when the tutor didn’t pay attention to what he was asked to do:

They are not listening carefully about it [my reading]. Sometimes, I see this in their face. Sometimes, they are looking at time. I feel not comfortable. So I am gonna end it
as soon as possible. (Essa Alrehaly, a master’s student in Science Education)

4. Skill/ Training

Two interviewees indicated that helping international students proofread their assignment also needs some skills or training. They both complained that the consultant in the writing center only knew how to speak English. They had no idea how to explain grammar to international students and how to deal with their questions. Like KyungAe (a doctoral student in Audiology) said in the interview, “it seemed like they were also learning how to help people. So, they also, you know, kind of getting kind of training by the experience [advising people].”

C. the Tutee

1. Expectations

The purpose of all my interviewees for visiting the writing center was to have a native English speaker look at their grammar and correct it. However, some of them were very disappointed at the consultant’s practice, because their paper still had a few mistakes found out by their professor after their assignment was returned. Sometimes, their professor would suggest they go to the writing center and ask for help, although they had already done that. Yuru has experienced the same situation as Essa on this issue:

Before I go to the writing center, I thought they’re gonna handle everything…. They are gonna fix my grammatical mistakes. They gonna rephrase some sentences. They gonna told me the perfect or the special item I have to use in this place or that place. But really they didn’t do that. (Essa Alrehaly, a master’s student in Science Education)
2. Comparison with Previous School

Among the five interviewees, only Sooa (a doctoral student in Art History) has the experience of being tutored in the writing center of other universities. She finished her master’s studies at Rutgers University, New Jersey. She described that the writing tutors in her previous university offered more professional assistance to all the students at the university than those at KU. She said, “They [Rutgers University] also have a writing center. One of the things is I found that here [the writing center at KU], those consultants are young. But the writing center in Rutgers, the consultants there are kind of professional. They are teachers in Applied English Center. I had a regular consultant. I don’t really go to many [consultants]. I had just one consultant. And I always made an appointment with her. She is a teacher. And she is like forty years old. And she’s really good at it [advising students]. The consultants in my previous school are more professional than those at KU.”

3. Friends

Very surprisingly, all of my interviewees expressed that they all prefer asking their own friend for help in proofreading their article rather than having a tutor in the writing center assist them. From the interviews, I found out that different interviewees chose different friends for help for different reasons. For instance, Sooa likes asking her American classmates in her department to correct her paper, because they know her field and can focus on the content of her assignment. Yuru often goes to her Taiwanese friend, because they speak the same language so that she can get her intention and meaning across easily. KyungAe has the feeling that “my [Korean and American] friends are more
willing to help me, because they’re more familiar to me and they know my concerns in
detail. And it’s easier for us to communicate with each other and get my questions
across.” Yuka thinks that proofreading is the task of the consultant in the writing center.
If they don’t do this work, who will do it? However, they don’t actually do it. So she
normally asks her American friends to help her, because they would do the consultant’s
work for her. As for Essa, his perspective is the same as Yuka’s. He is disappointed that
the tutor in the writing center doesn’t always do their job very well.

IV. Conclusions and Implications

Obviously, grammar correction is the first priority that the international students
want the tutor in the KU writing center to do for them. It is also one of the main factors
that affect the international students’ future use of the writing center. As my interviewees
indicated, although they had had the writing consultant look at their paper, their professor
still could find out some grammatical mistakes, which sometimes would influence their
grade. Also, when they asked the tutor questions about grammar, many of them couldn’t
explain their answers very well. As a result, the writing center needs to increase training
on the part of the tutor in terms of grammar knowledge and explanation so that not only
can the international student’s paper be more correctly proofread, but their writing skill
can also be greatly enhanced.

In addition, my interviewees are not satisfied with the qualification of the tutor in
the writing center. Many of them do not think that the writing consultant can help them
with the content of their assignment. One of the main reasons is that most of the
consultants are undergraduate students and they do not know anything about my
interviewees’ field. As a result, in order to be able to serve more international graduate students, the writing center should consider hiring some native speakers of English who are graduate students from different disciplines.

In terms of session time, only thirty minutes or an hour for an international graduate student to get his or her paper proofread is actually insufficient. Many of my interviewees complained that they normally can not finish correcting their article within a session, so they have to keep going back to the writing center many times. They all hope that the writing center can extend the consulting time and arrange the same tutor to help them so that it can save them a lot of time for not coming back again and get their work done at a time.

In this study, the last but not the least important finding I would like to mention is that four of my interviewees were not content with the tutor’s attitude. They all expressed that when they followed the tutor’s instruction to read their paper out loud, he or she was listening. Instead, he or she was looking somewhere else or talking to other tutor. My observations also indicate the same problems. Consequently, the consultant in the writing center should pay attention to their attitude when they are helping their tutee. Moreover, they should try to focus on the tutee’s reading and writing and avoid talking to others or showing absent-mindedness during the session. In this case, international students would feel much safer to ask them for help and more trust them in correcting their mistakes.

The aforementioned points are what most of my interviewees complain about and have problems with. They are also good tips for the writing center at KU to improve their service quality. Hopefully, this study can also offer useful and helpful suggestions for the
writing centers in many universities in the United States to increase their effectiveness in assisting international students.

V. Reflection

Generally speaking, my experience of doing this research was full of some unexpected difficulties and challenges—from thinking of interview questions, through doing interviews and observations, to analyzing the data and writing up the results. For instance, I originally thought my first interview protocol looked pretty good, but it turned out to be not a good one. It had many leading questions and questions that would only retrieve “yes” or “no” from my interviewees. I figured this out right after my pilot study with my classmate and the first interviewee. Then, I spent a lot of time going over the questions again and again to come up with a new list of more workable questions. The goal was finally achieved by many revisions. Another challenge was transcribing interviews. Owing to the fact that all of my interviewees are not native speakers of English, I had some difficulties understanding their accent and had to rewind the tape back and forth many times to get an accurate transcription of what they said. In terms of the whole process, this step was one of the most time-consuming procedures.

In the future, if I have another opportunity to conduct qualitative research like the one I did this time, I would consult some well-experienced qualitative researchers (like my professors or colleagues) for the interview questions I will have developed. I would use them as my interviewees in my pilot study and have them give comments on my questions, followed by revising or removing the ones that are inappropriate. Hopefully, this approach would help me shorten some time in designing interview questions. In
addition, whether or not I will transcribe the interview verbatim depends upon how long it will take. If it takes more than thirty minutes, I will just come up with an overall summary of the interview and have the interviewee examine the content. On the contrary, if it takes less than thirty minutes and the number of interviews is not many, I will continue doing the verbatim transcribing to fully describe my interviewees’ experiences.

In the course of doing this study, I also found out that it would be very helpful to collect rich data if the interviewee could see the interview questions before he or she participated in the interview. In my case, I showed my questions to my interviewees and allowed them some time to think about the questions before I started to tape record their answers. Doing so not only enabled my interviewees to logically answer each of the questions, but also enabled me to follow my research protocol more easily.

In all my interviews, I used two tape recorders to record my interviewees’ experiences. This strategy benefited me in some ways. The first one is when I was transcribing the interviews, it’s always easy for me to push the wrong button and erase some contents of the interview. Having a second set of data prevented me from having to redo the interview. Second, some of the recordings didn’t have good quality, such as the interviewee’s voice was not clear or there was too much background noise. In this case, the second data helped.

With regard to the limitations of this study, insufficient participants might be the main problem for generalization and reliability. Although I have tried my best to choose people from different countries, most of the interviewees are from Asia. They all come from a very similar cultural background, so they might have the same perceptions toward what happened to them in the KU writing center. In order to have richer data to know if
what these interviewees perceived is different from what people from other areas did, I need to include more variety of people in my next research to enhance the reliability and generalize the findings of the research.

From this study, I learned that teaching international students how to write a good article is not an easy job. It takes a lot of patience and energy. It also needs good training and skills in teaching. Above all, a writing teacher/tutor should know how to explain grammar to help international student improve their writing skill. The results of this research gave me many insights into how I should teach writing to my future students back in my country, Taiwan. I expect that other foreign language teachers can also benefit from this study.

Furthermore, when conducting this research, I had tried my best to pick up every useful piece of knowledge from each class discussion and my professor’s research experiences to make my first qualitative research paper complete. It can be said that I had a very wonderful learning experience by doing this study. I believe that this precious experience will be definitely carried over into my future career as a teacher and researcher.
Appendix 1

Interview Questions

1. As far as I know, the writing center at KU has its open hours and locations. Do they work for you? Can you elaborate on your answer?

2. Can you tell me in what situation(s) you would be motivated to visit the writing center?
   - Before you first visited the writing center, what were your expectations?

3. Can you describe your previous experience(s) in the writing center?
   - Can you tell me about how the writing consultant helped you during a session? What procedures and strategies did he or she use?
   - Can you describe your feeling(s) about the consultant's practice and what you did to respond to it?
   - Can you talk about how your liked the interaction between the consultant and you?

4. What's the consultant’s attitude towards you as an international student in the writing center? Can you describe it?
   - Was he or she racist against you?
   - Was he or she paying attention to your questions?
   - Was he or she trying his or her best to help you?

5. Have you ever visited any place like the writing center before? Or have you ever asked your English-speaking friend(s) to help you with your writing? Can you tell me how that experience was different from your experience in the writing center?

6. What do you like most about the writing center and what do you like least about it?
• In what ways do you feel like not visiting the writing center again? Can you talk about that?
Appendix 2

Interview Questions

1. The writing center at KU has its open hours and locations. How do you think of their accessibility to you? Can you elaborate on that?

2. Can you describe in what situation(s) you would be motivated to visit the writing center?
   - What were your expectations whenever you visited the writing center?

3. Can you talk about your previous experience(s) in the writing center?
   - Can you tell me about the procedures and strategies the writing consultant normally used in helping you?
   - Can you describe your thoughts or feelings about the consultant’s practice?

4. What’s the consultant’s attitude toward you as an international student in the writing center? Can you describe it?

5. Have you ever visited any place like the writing center before? Or have you ever asked your English-speaking friend(s) to help your writing? Can you talk about how that experience was different from the one(s) in the writing center?

6. What do you like most about the writing center and what do you like least about it? Can you elaborate on your answer?

Teachers’ productivity and perceived self-worth in Taiwan

Abstract

This study explored factors that influence teachers’ productivity and its relationship with perceived self-value. There are 194 teachers participating in this study: 65 senior high school teachers, 45 junior high school teachers and 83 elementary school teachers respectively. All participants are requested to fill in “Teacher Productivity Inventory” (Cronbach α=.91) and “Perceived Self-worth Inventory” (Cronbach α=.78). The results indicated that:

(1) There were significant differences in teacher productivity of various individual background in terms of age, school type taught, years as a teacher, educational background, and numbers of published works.

(2) There were significant differences in self-worth of various individual background in terms of school type taught, numbers of published works.

(3) Teacher productivity and perceived self-worth are highly correlated.

(4) Career attempt, the awareness of environmental support, and teaching enthusiasm are good predictors of perceived self-worth.

Keywords: teachers’ productivity, perceived self-worth
DEPRESSION AS A BARRIER TO EMPLOYMENT IN THE TANF (TEMPORARY ASSISTANCE TO NEEDY FAMILIES) POPULATION

Abstract
ABSTRACT

DEPRESSION AS A BARRIER TO EMPLOYMENT IN THE TANF POPULATION

II. RESEARCH PROBLEM

The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA) reformed the nation’s 60 year old welfare system from one of entitlement – Aid to Families with Dependent Children (AFDC) to one of temporary assistance – Temporary Assistance to Needy Families (TANF). The goal of PRWORA was to transition welfare recipients from welfare to employment, accomplished through limiting lifetime welfare cash benefits to 60 months. But many barriers to employment, including depression and other mental health disorders, have prevented individuals from successfully making the transition. This study examined depression’s affect upon the transition from welfare to work by looking at its associations with employment and welfare usage.

III. RESEARCH QUESTION(S)

Questions for this research focused on depression and how it may be a barrier to individuals transitioning from welfare to employment. First the association of depression and employment was examined to determine if depression symptoms are associated with lower levels of employment. Second, the association of depression and duration of welfare was analyzed to determine if depression resulted in more welfare usage (duration on welfare). Psychological distress variables (i.e. education, income, hardships, marital status, parental status) were examined in terms of their association with depression, employment, and duration on welfare.

IV. RESEARCH METHOD, ANALYSIS

This study attempted to determine if depression is a good predictor of employment status and duration of welfare. This research is a cross-sectional, non-experimental, quantitative study using secondary data analysis to examine the relationship between depression and employability in past and present welfare recipients in a south-central state in the United States. This secondary data analysis utilized data collected for a welfare reform evaluation in the same south central state. A path diagram was developed to graphically express the complexity of the relationships between variables of psychological distress, (i.e. educational attainment, hardships, race, negative life events, number of children, and marital status) and depression, and to examine the associations
of depression, employment, and welfare usage. Structural equation modeling was utilized to analyze these relationships.

Instruments

The survey instrument originally designed to examine welfare and self-sufficiency was developed using items from standardized scales including self-assessment of depression symptoms, a self-esteem, and measure of life events scales.

Analysis

Structural equation modeling was utilized as the method of multivariate analysis. A model was developed in line with empirical and theoretical information from the literature review. Specifically, co-variance among all exogenous variables was examined. Second, psychological distress variables (i.e. education, hardship, race, life events, parental status, and marital status) were examined as exogenous variables in terms of their associations with the variable of main interest, depression. Third, the model examined the association between depression and all other endogenous variables (i.e. earnings, number of months employed, number of welfare episodes, and number of months in most recent welfare episode). Although the main focus of the research is the association of depression to the endogenous variables, the literature supports the association of several of the exogenous variables with employment and welfare usage. Consequently, to examine direct and indirect effects of exogenous variables education, hardship, and race, on earnings, number of months employed, and number of welfare episodes, paths were added to the model (See Figure 1.0 below).

Figure 1.0. Path Diagram for the WSSS Data—Initial Model
After testing, the original model was revised to exclude co-variances among the exogenous variables with non-significant p values. Indicated by modification indices was the addition of paths and the reduction in the chi square value as a result of adding the paths in the model. Also, modification indices indicated co-variance between error terms resulting in paths being added between these error terms. Non-significant co-variances among exogenous variables were removed from the model. A revised model was generated and tested.

V. Summary of Results

Results revealed a good fitting revised model that well represents the observed data as indicated by the following model fit indices: chi square = 57.700, p = .136; RMSEA = .043; and CMIN/DF = 1.228.

Further results from the research project suggest that depression is negatively associated with earnings and length of employment, and positively associated with welfare recidivism. In addition, psychological distress variables, hardships and negative life events, were positively associated with depression and single women had significantly more depression symptoms than their married counterparts.

Race/ethnicity plays a dominant role in earnings; African Americans transitioning from welfare to work earned significantly less than their Caucasian counterparts. Race was not found to be significantly associated with the number of months of employment, welfare recidivism, or the number of months of welfare benefits used.

VI. Implications for Social Work Practice/Policy

PRACTICE IMPLICATIONS

The direct and moderating effects of depression suggest social work practitioners must be competent in mental health intervention, and incorporate both the biological and sociological causes of depression. Although sociological causes of depression have been researched extensively, this perspective is less utilized in treatment planning. For example, hardships, and negative life events are very much related to macro level issues of socio-economic status, neighborhood disadvantage, and race discrimination. Consequently, social work practice strategies to reduce depression and other mental health problems must include not only micro, but macro level interventions of advocating for resource reallocation to reduce aggregate hardship found in populations residing in disadvantaged neighborhoods. Reallocation of resources to help overcome negative life events such as alcohol/drug abuse, legal, and financial problems must occur on the community level where high concentrations of negative life events are occurring. The positive association between negative life events and depression, and hardships and depression, and the disproportionate amount of depression found in welfare populations suggests that social work interventions designed to alleviate depression must include sociologically-based strategies. The reduction of these community hardships will result in reduction of psychological distress experienced by individuals living in disadvantaged
communities, and can result in the reduction of depression. The reduction of depression can then enable individuals to function in a manner conducive to economic self-sufficiency.

Case Management

Case management must move toward a rigorous management of clients with psychosocial needs in order to help individuals meet the goal of moving from welfare to work. The welfare population is heterogenous with varying levels of strengths and needs. Consequently, case management must be conducted in a way that reflects this. Assessment tools must be used to screen for clients who may need mental health intervention which means case managers must be trained to assess and intervene. While many clients may easily make the transition from welfare to employment, this research has demonstrated the need for customized case management for a ‘hard to serve’ population hindered by multiple barriers.

POLICY IMPLICATIONS

Policy makers must continue to address welfare outcomes, but must also keep in mind the complexity of the factors that plague this population. Depression and other barriers greatly impact employability; consequently, outcomes must be examined not only economically, but socio-economically. For example, the state in which this research was conducted ranks in the lower 20 percentile in its per capita spending on mental health. Increased resource allocation for mental health intervention is a necessary policy revision. Policy must reflect the appreciation for the complexity of transition from welfare to work.

Depression is shown to have both direct and indirect effects on employment and welfare usage. Currently, exemptions on time limits are given to recipients who experience domestic violence and related hardships which affect the ability to transition. While social workers are intervening with recipients who are suffering from depression and other mental health disorders, policy changes which also exempt those with mental health disorders may be in order.

Though many physically and mentally disabled recipients move from welfare to social security disability benefits, the link between these two benefits should be improved in order to smoothly move eligible individuals from the welfare rolls to Social Security disability benefits. Policy should be explicit in terms of how to expediently transition disabled individuals from welfare to Social Security. Implementation of the policy should include the readily available Social Security eligibility information to respondents. That information should be systematically distributed through both welfare and Social Security case management personnel.

Much of the success of welfare reform was evaluated in terms of the reduction of the welfare rolls. But as time progressed, researchers looked at the outcomes of former welfare recipients in terms of well-being. Specifically, researchers examined the physical and mental well-being of individuals as well as financial well-being. What was discovered was that although the welfare rolls had been reduced drastically, many former recipients were plagued with multiple barriers to family well-being. The reduction of
welfare rolls must be accompanied by other forms of evaluation including multiple measures of family well-being. Policy should specifically outline how the goals of welfare reform are to be evaluated including evaluation of family income, employment patterns, employment benefits, child well-being, and educational attainment of both welfare recipient and children. The success of welfare reform must be measured not only in terms of the reduction of welfare rolls, but in terms of family well-being.
Post-Apartheid South Africa in the Global Economy

by Ajani Husbands
“At the center of all (our multilateral) engagements I have mentioned is the critical question of our time, of how humanity should respond to the irreversible process of globalization.... These include poverty, underdevelopment, the growing North-South gap, racism and xenophobia, gender discrimination, ill health, violent conflicts and the threat to the environment...We must and will actively continue to engage the rest of the world to make whatever contribution we can to ensure that the process of globalization impacts positively on those, like the millions of our people, who are poor and in dire need of a better life.”

Thabo Mbeki, Budget Vote of the President in the National Assembly, June 13, 2000

Introduction

This snippet from Thabo Mbeki’s speech is part of his Global Initiative, in which he sets the outline for South Africa’s placement in the face of globalization. On the outset of South Africa’s liberation from Apartheid, it seems that there has been a palpable global pressure on determining South Africa’s standing in the changing world. Part of this is due to the immense popularity of Nelson Mandela and his role as an international role model for the fight against freedom and injustice. In short, he set the bar high. After 1994, South Africa could not retreat into political isolation to work out its own future, nor did it want to. The crumbled wall of Apartheid left South Africa newly exposed to the world and South Africa embraced the situation.

Thabo Mbeki’s speech at the National Assembly outlines a South Africa that is not only very analytical of the facets of globalization, but is determined to act as a force for good, particularly for other developing countries. Mbeki’s speech continues by mentioning the necessity to restructure the UN, review the functions of the IMF and World Bank, and to analyze the agenda of the WTO and the G7. On the surface it appears that Mbeki’s 2000 speech is a call to arms for developing nations; his words are of a nature that implies that South Africa will lead the charge towards a restructured global economy that sees to the best interests of developing nations, especially the least-developing countries (LDCs) in Africa.

A large part of the perceived success of Mbeki’s speech and South Africa’s global role depend on how we choose to define development, in particular, sustainable development. This definition will be the scope with which we measure South Africa’s proposals for the global
economy as well as serve as the tool with which we analyze South Africa’s measures for self-improvement, i.e. its own economic policies.

Defining Development

There are many ways in which to define sustainable development. The most common definition is that of Brundtland’s, which states: "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs." This is a rather broad definition and, though true, does not go into enough depth to suit our needs for the common era. Sustainable development today must encompass a wide range of factors in order to account for the pressing issues of the day. “Green” energy, labor standards, gender equity, and access to clean water are all issues that spring up when the words “sustainable development” are brought into the playing field. In the case of South Africa, specifically, sustainable development would most of all encompass attempts at post-Apartheid reconciliation.

Apartheid was infamous for its legacy of excluding Black South Africans from social and economic advantages. The Apartheid system was so successful that integrating Blacks into the “norm” of South African productive society became a challenge arguably greater than abolishing the effects of the Jim Crow system in the United States. Whereas Jim Crow had a profound demoralizing effect on the Black population of America, its effects on the social and economic status of the American Negro have been noticeably lessened, by most counts, since the advent of the Civil Rights Movement. Apartheid, however, had a stranglehold effect on not only the morale of Black South Africans, but was just as effective at building seemingly unshakeable walls with which to prevent Black South Africans from taking an equitable part in South African society. Apartheid successfully set up a system of “separate development,” paving the way for
two separate tracks of development between White South Africans and Black South Africans. The evidence is quite astonishing. Holistically, South Africa has a Gini coefficient of inequality of 57.8, making it one of the most unequal countries in the world.\textsuperscript{4} This is a direct result of “the asymmetrical nature of South Africa’s development… [which] produced a first/third world society: an industrialized, urban, technological society running in parallel with an impoverished rural hinterland.”\textsuperscript{5} In order for South Africa to move towards any type of sustainable development, tearing down the lingering effects of Apartheid exists as a massive prerequisite. In essence, whereas we acknowledge the South Africa case for sustainable development is one where the Brundtland definition wholeheartedly applies, we also acknowledge that within this definition one must speak specifically of equitable rights among ethnic groups, as that this is perhaps where the greatest source of inequity and unsustainability lies. Successfully integrating former marginalized groups into South African society will have a chain reaction. Not only will it prove to be of an overall benefit for South Africa in macro-economic terms, but it will also provide the necessary base of support for initiatives that fall in line with the more conventional sense of development, such as the aforementioned issues of labor rights, gender equity, and environmental issues. For instance, one cannot fight for labor rights when the entire community is bereft of job opportunities. One cannot concern themselves with issues of sustainable environmental use when the greatest concern is finding a meal for the day. Because these issues (joblessness and poverty) are very closely tied with the effects of Apartheid, it is certain that sustainable development encompasses addressing these issues.

\textit{South Africa’s Role in the Global Economy}

Such is South Africa’s task as it enters the global arena, to not only eradicate its own evils of Apartheid, but to do so in a manner that lays a foundation for varying layers of
development to build upon. The pressure South Africa faced to eradicate a discriminatory system that at one point the greater part of the world condemned is the same pressure the country faces in order to use its status as an economic heavyweight (comparatively speaking) on the world’s poorest continent as an example of what is possible given the right opportunities.

Mbeki’s speech hints at what is now considered to be a vital part of South Africa’s role in Africa, that of the self-proclaimed global investigator and protector for the third-world. Though the validity of South Africa’s ability to take on this role is easily questionable, it is not difficult to see how a great number of development and political analysts have come to this conclusion; the answer is simply Nelson Mandela.

In a famed 1993 article in *Foreign Affairs*, Nelson Mandela lays the foundation for what will be South Africa’s relationship to the global economy. Within the article, he states that “the concerns and interests of the continent of Africa should be reflected in our foreign policy choices,” as well as definitively stating:

> “South Africa cannot escape its African destiny. If we do not devote our energies to this continent, we too could fall victim to the forces that have brought ruin to its various parts. Like the United Nations, the Organization of African Unity needs to be attuned to the changes at work throughout the world. A democratic South Africa will bring to an end an important chapter in Africa’s efforts to achieve unity and closer cooperation, but it will not close the book.”

Thus is the beginning of what analysts refer to as the “heroic” mentality for South Africa’s foreign policy, a mindset that quickly runs into several problems. In the Mbeki and Mandela speeches that were becoming more and more frequent around this time, one of the common themes was the common economic needs of southern Africa. However, due to South Africa’s unique economic success, the country immediately placed itself in a quandary. As seen in Figure 1, South Africa represents almost 66% of the Southern African Development Community (SADC) economy. There is not a nation within the region that comes close to having the economic prowess of South Africa. What then results is a conflict of interests. South
Africa cannot possibly hold the same economic concerns as its surrounding partners; these are countries beset on all sides by the traps and pitfalls of globalization. Amidst them is the virtual anomaly of South Africa, an industrial engine with more economically in common with the West than with Africa.

This paradox has been a crippling point for South Africa’s credibility in the realm of foreign policy. On the one side, the country, at least in rhetoric, wants to desperately stand up for impoverished African nations and ensure an eventual equality in the world order. This is evident in the stance the country took in favor of debt relief for the world’s poorest nations. On the other side, there is no denying that South Africa is an industrialized nation with economic needs and concerns vastly different from its African counterparts. As such, there is an inherent disparity between the policies and procedures it must advocate for itself, and the policies and procedures that would be best for its African counterparts. The result has been a situation in which South Africa presents itself as the leader of a rollback community of African nations, but in practical policy recommendations, proceeds as a reshaper in the global community.

This same paradox can be seen in South Africa’s domestic policy. The country is in desperate need of fast acting policies to reverse the damming effects of the Apartheid regime, in particular, by creating a means of sustainable development for the entire country and not merely a handful. The exacerbation of South Africa’s numerous woes can be tied directly to Apartheid, including various environmental dilemmas, severe unemployment, poverty skewed along racial lines, intense crime activity, and human rights violations. Instead of addressing these issues with heavy-handed restructuring policies, South Africa’s domestic policies seem to be geared more towards advancing its macro-economic agenda than towards being a leader in social innovation.
This paper will use the similarities between South Africa’s multilateral agenda and the country’s domestic policies to express the fact that the country is in fact not leading the charge for an intrinsic change in the global economy that would benefit the world’s poorest nations, but is instead choosing to focus on a series of macro-economic policies both domestically and internationally that, in rhetoric, are beneficial to its poorest citizens and to the poorest parts of the African population, but, in action, pan out to be exceedingly harmful to these very populations.

**South Africa’s Multilateral Agenda**

South Africa’s multilateral agenda can be divided into four time periods: the ‘heroic’ period from 1994 to early 1996, the uncertainty/recalibration era from 1996 to 1997, a ‘routine’ era of multilateral orientation from 1998 to 1999, and the return to the heroic agenda from 1999 to present.9

The first time period found South Africa attempting to define itself as a voice for the economically and socially oppressed, especially in Africa, leading to South Africa’s unilateral opposition of the execution of Nigerian journalist Ken Saro-Wiwa by the Nigerian government.10 Unfortunately, South Africa was the only country on the continent to oppose the execution, leaving the country politically isolated amidst rumors of pro-Westernism from its counterparts. There were additional failed measures of heroism that led the country towards its undefined period of global interaction. These included the failed negotiations Nelson Mandela mediated between Mobuto Sese Seko and Laurent Kabila, attempts at resolving a crisis in Libya, and several other diplomatic endeavors that did not go as planned.11 As such, the country moved into a period of multilateral haze, in which they implemented what was jokingly referred to as ‘ad hoc diplomacy.’12 However, the country benefited from this time period in that by not making
any major waves, so to speak, they gained approval from a variety of international circles. This helped to pave the way for the first few months of the Mbeki presidency, which began to refocus its efforts on serving as a heroic world player. This self-styled role of heroism and its apparent conflict with the needs of the African continent is the focus of our analysis in this section.

*Debt Relief*

Several stances held by South Africa made it clear that although the country would like to be known as a spokesperson for Africa, its own economic and political needs overrode the heroic agenda and set it firmly as desirous of being known as an emerging industrial nation. Perhaps no situation shows this better than the Global Debt Relief Campaign. Although South Africa advocated for debt relief for the world’s poorest nations, which were located primarily in Africa, the country made a defiant stance against any debt relief for itself, with the adamant statement made by the South African Director General of Finance, Maria Ramos, that “South Africa has no debt to write off.”\(^{13}\) Though this was not entirely true (the country was actually in debt R377 billion due to foreign national debt accumulated by the ANC-led government\(^{14}\)), the point was made that the South African case is not the African case. Nonetheless, refusing to support the Global Debt Relief Campaign altogether would have been political suicide. The country would have lost its support base, that of the African continent, and would be quelled as a potential spokesperson for developing countries. At the same time, South Africa was compelled to appear as an emerging international leader to the developed world. Doing so meant that it could not classify itself as one of the world’s poorest countries. In essence, this led to South Africa playing both sides; the country sought “to stifle the anti-debt argument domestically, whilst differentiating the South African case internationally”\(^{15}\) The South African position to the Global Debt Relief Campaign was a clear indication of where the country stood, or sought to
stand, in relation to both the developing world and the developed world. A more in depth analysis of the duality of South Africa’s international politics can be obtained by looking at the country’s involvement in the World Trade Organization.

**South Africa and the WTO**

South Africa has made it clear that its position on sustainable development is one that firmly believes an increase in trade is tantamount to an increase in development. In a 1999 speech, President Mbeki asserted South Africa’s dedication to a neo-liberal ideology towards trade and development “by praising the IMF, the World Bank and the WTO as examples of the kind of ‘human intervention’ that is needed”¹⁶ in order to bring about economic benefit to the world’s poorest countries.

This argument has two distinct halves. The first is the vein of study showing that a net increase in trade does not necessarily bring about sustainable development nor equitable development. Instead, it continues the tradition of the global economy that keeps poorer countries involved in what can be termed as a Colonial Division of Labor (CDOL). Following this logic, South Africa would be in support of the Stewart and Ghani argument that “trade should be the servant of development, not its master.”¹⁷ These sentiments are also echoed by Kofi Annan and the UN in an argument stating that trade is able to effectively serve the needs of development only when both sides play fairly,¹⁸ insinuating that industrialized countries must drop their subsidies and other trade blockages in order for developing countries to gain a foothold on the global playing field, bringing up the second half of the argument; in order for a net increase in global trade to be effective, both rich and poor countries must be subjected to a liberalized trading regime. South Africa recognized this fact via its condemnation of the developed nations’ refusal to liberalize their own trading regimes. Without a liberalized Western
economy to which developing nations can export their products, these countries become ensnared in the trade trap of importing foreign goods while seeking to stabilize their own economies via exporting primary products. The end result is a downward-spiraling circle in which developing countries are perpetually in a state of to-be-developed and poverty is only exacerbated.

At the same time, South Africa becomes a clear proponent for trade liberalization and emphasizes a sense of fair play across the board by insisting that the developed countries liberalize their trade borders as well, in an effort to provide markets for developing countries to export their products. This tactic, of pushing the U.S. and EU in particular to follow through on trade liberalization, allows South Africa to build credibility among its African counterparts by showing that it is still representative of the African continent and is not beyond criticizing the Western powerhouses. Hence we have what can be seen as only a partial challenge to the WTO; South Africa has taken a stance of promoting the WTO regime “whilst putting forward propositions that would aid developing countries to cope with the liberalizing agenda of the organization.”19 This aid to development comes in the form of encouraging a relocation of “production and investment to developing countries in sectors such as agriculture where developing countries enjoy comparative advantage.”20 In essence, South Africa would still be encouraging the CDOL by promoting an agricultural-based economy on the continent, one that is able to freely export its goods, but remains a primary product exporter nonetheless. As the lowest rung on the economic ladder, primary product exports show little chance for building an intricate economic infrastructure. One could make the case that South Africa was once a primary product exporter, reliant on gold for more than 40% of its external revenues,21 and that the country is an example of a pull-yourself-up-by-the-bootstraps mentality, where mining (platinum
and gold), now account for only 5.8% of the GDP, indicating an impressive shift towards a more diversified economy and an increase in processed and manufactured goods (i.e. processed gold). The reality is, however that South Africa was never a colony in the classic sense of many of the other African countries. South Africa was constructed to be a working, viable economy as opposed to being a pool of resources to be harvested. Thus, South Africa’s gradual transition to a manufacturing economy was made with relative ease due partly to already favorable ties with industrialized nations. Nevertheless, in South Africa’s promotion of free trade, the country is itself attempting to promote positive, albeit limited, change for the African continent under the presumption that if it worked for them, it should work for others.

This middle-of-the-road strategy is quite indicative of South Africa’s middle-power position in the global economy. Though the country seeks to be known as a top international player, its power is in reality quite limited, as shown by its inability to prevent the collapse of discussions in the Doha Round due to a North-South disconnect on the very issues of agricultural liberalization. Simultaneously, South Africa’s difficulty in forging political alliances with their African counterparts is evident in that while the G20+ and the Africa Group adopted a “won’t do” strategy at the Doha Ministerial Conference, South Africa clearly acted in a “can do” manner. Acting in such contradiction to its regional partners is only sustainable due to South Africa’s rhetoric that ensures the notion that trade equals development and that additionally pins the blame of the current failures of trade to bring about economic equalization on the unwillingness of industrialized nations to cooperate.

One must also consider the potential benefits towards South Africa of adopting such a dual-sided strategy. Aside from the political benefits of attempting to gain support from both the industrialized countries and the African countries, South Africa economically stands to benefit
greatly from trade liberalization. In 2003, 35% and 12% of South Africa’s total exports were
directed towards the EU and the U.S. respectively. Increasing market access to these
industrialized countries would only increase those numbers. Of additional consideration is the
fact that South Africa “already accounts for more than two-thirds of the combined GDP of sub-
Saharan Africa, and a third of the GDP of the whole continent.” As such, a move towards
economic liberalization amongst the African countries might lead to a sort of economic flight
towards South Africa, further encouraging capital development in the country, while spelling
economic stagnation at best for many other African nations. Hence, South Africa is in a position
to benefit greatly from an economic standpoint, as well as a political standpoint, by supporting
trade liberalization. South Africa pursues this same type of win-win strategy in its regional
policies as well.

South Africa and SADC

It has often been stated that South Africa’s involvement in the SADC region, comprised
of the 14 nations in southern Africa, parallels the interaction between industrialized nations and
the developing world. Much of this claim can be seen in the SADC agreements concerning rules
of origin. Rules of origin are a set of codes and standards used to determine whether products
and goods were in fact made in the country where they claim to be from. For instance, a rules-
of-origin code may require that 55% of a product be produced in a country or that no more than
25% of a product’s value added can come from outside the country. In the SADC case, the rules
of origin were initially set at a minimum of 35% of the local content or no more than 60%
content from non-SADC imported materials being necessary for approval. At the behest of
South Africa, however, these rules were made much stricter. The current trade structure is a set
of complex codes and asymmetric prerequisites that mimic the trade regimes of highly
industrialized countries;\textsuperscript{30} this is a setup that mostly favors South Africa’s industrialized nature. There have even been complaints that the country has been \emph{dumping} its goods on other SADC countries.\textsuperscript{31} One such complaint comes from the Zambian company Chloride CA, which lodged a complaint with SADC over South Africa subsidizing its own manufacturers up to 50\% in order to sell its products for cheaper prices in Zimbabwe.\textsuperscript{32} This is ironic due to the fact that the issue of product dumping was a primary concern of developing nations against industrialized nations. Thus, South Africa again faces a paradox of reality versus interest. The country’s interest to be respected as an international player runs against the realities of the African continent.

Additionally, the country has adopted the standpoint that success can only be achieved by taking on the persona of countries already successful. Though there is truth to the concept of mimicking success to achieve success, there is also much to be said for taking a definitive stance on issues rather than attempting to play to everyone’s interests.

Nonetheless, the benefits of South Africa being considered an emerging world power by the industrialized nations at the sacrifice of building a foundation of support for rollback initiatives have done much to lure the country towards its middle-of-the-road initiatives in an attempt to someday gain full membership in the elite squadron of industrialized nations. The question now, is whether or not South Africa has shown the macro-economic flare to actually be known as a world power. And if so, then what is the cost that South Africa is willing to pay to achieve that status? This next section analyzes the success of the South African economy matched with the realization of the country’s inequality.

\textbf{South African Domestic Policy}

"No economy can grow by excluding any part of its people, and an economy that is not growing cannot integrate all of its citizens in a meaningful way."\textsuperscript{33} – South African Department of Trade and Industry
One of the primary challenges South Africa faced upon liberation from Apartheid was the order, the priority, in which it would carry out its development objectives. The two main paths of choice were to either confront the issue of stabilizing economic growth, or the issue of economic distribution. Apartheid left both of these aspects in disarray simultaneously. A prime example is seen in Table 1, which shows the dramatic differences between wages of Whites and Blacks during the Apartheid regime. This not only set the stage for socioeconomic disparities, but also for macro-economic retardation as a result of having a majority of the population impoverished. As a result of such policies, the country was left with the critical decision of how to begin the economic healing process. What South Africa attempted was to address both concerns, that of growth and that of distribution, concurrently through both the GEAR program and the BEE initiative respectively. Although each of these programs was designed to address either the macro-economic or the socioeconomic disparities leftover from Apartheid, the economic ideology of South Africa, constituted in a set of neoliberal policies, left the socioeconomic aspect severely lacking in effectiveness when compared to the moderate success of the macro-economic framework.

_Growth, Employment and Redistribution_

Though South Africa has shown consistent growth from post-Apartheid to present-day, this success has been termed as “jobless growth.” The term points not only to the population expansion that has indeed made it somewhat difficult for job growth to keep up with population growth, but more so points to the notion that South Africa’s economic prowess may be constructed without a social development factor in mind. Such a notion could be emphasized by the Growth, Employment and Redistribution strategy (GEAR) implemented in 1996, which
encompasses the country’s macro-economic Washington Consensus styled framework. These policies included:

“increasing non-gold exports, brisk expansion of private sector capital formation, a faster fiscal deficit reduction programme to contain debt service obligations, counter inflation and free resources for investment, stable exchange rates, anti-inflationary monetary policies, tariff reduction, and tax incentives to stimulate new investment in competitive and labour absorbing projects.”

The GEAR policy framework was lauded as a set of “internationally acclaimed macro-economic policies.” In terms of economic influence, these policies led to a 2.6% growth in GDP in 1997 and a 2.1% increase in 1999. The government budget deficit declined from 3.7% to 2.9% in the 1998-99 fiscal year and inflation dropped from 4.9% to 7.3% the same year. These numbers are the types of trends that are indicative of favorable Washington Consensus policies, pointing towards all the right trends. Nonetheless, this same growth strategy has been criticized for neglecting a human factor that tackles social inequities in addition to economic difficulties.

Unemployment in 1998 was estimated at 33% (in comparison, U.S. unemployment in 1998 was at 4.5%), and remains roughly the same today. Much of the unemployment can be directly tied to Apartheid. Blacks have nearly a 7x higher unemployment rate than Whites, with Black South Africans having a 26.2% unemployment rate and White South Africans having a significantly lower 4.2% unemployment rate. Historic inequities can also be seen quite plainly in land distribution; “roughly 42% of South Africa’s population of 41 million reside on 13% of the land” as a result of the forced removal policies that displaced millions of Black South African residence. Of this 13% of land, only 15% is arable (or roughly 2% of the total land). It is on this tiny tract of land that more than 14 million Black farmers eek out an existence. Needless to say, the high concentration of individuals in such a small area, combined with attempted agriculture, wreaks havoc on the environment, including inefficient use of water
resources, a loss of approximately 400 million tons of top soil each year, desertification, and pollution due to pesticides, herbicides, and insecticides.\textsuperscript{46}

There are many other environmental and social woes that, though may not affect the population disproportionately due to race, are still directly linked to the Apartheid regime. The reason for this is that Apartheid constructed a society where “state survival was equated with the maintenance of minority white privilege at the expense of all else.”\textsuperscript{47} As a result, all thoughts of sustainable development were foregone and the economy was structured in a manner to suit the population’s minority ruling class. This characterized itself through an over-consumption of resources by a small percentage of the population, and a marginalization of the rest of the population onto a minority of resources. In the sense of eliminating disparities caused by Apartheid, it would seem that addressing these deep-seeded economic and social divides would be the primary concern of the country in order to progress economically. Unfortunately this has not been the case. GEAR and similar macro-economic initiatives have taken precedent, leaving social woes to hopefully rectify themselves through an increase in GDP. There has been a small modicum of measures, however, to place Blacks on equal economic footing as Whites. However, the success of these measures has been limited at best due to the same neoliberal theology that dictates increased trade equals increased development. The most prominent of these examples is the Black Economic Empowerment (BEE) initiative.

\textit{Black Economic Empowerment}

The BEE initiative was created as a means of directly addressing the lack of Black ownership in the South African economy as a result of the Apartheid regime. To date, Black ownership exists at around 2\% of the Johannesburg Stock Exchange (JSE),\textsuperscript{48} whereas Black citizens make up 76.6\% of the country.\textsuperscript{49} The BEE initiative includes efforts to increase this
ownership and by doing so, hopes to eradicate visible inequality caused by the Apartheid era. The checklist of strategies to increase Black economic empowerment includes “ranking businesses on their purchases from black-owned suppliers; their skills development of black workers; and their efforts to increase black ownership.”\(^5\) This ranking will then be used to determine which companies receive grants, licenses, and new contracts. As such, the BEE initiative encourages businesses to increase their hiring practices of Blacks and other minorities. The BEE initiative has met with surprisingly little resistance or criticism on the claims of racism,\(^5\) as compared to affirmative action measures in the United States. Part of this is due to the widespread acceptance of the fact that Apartheid was morally reprehensible and that in order for South Africa to move forward, any after-effects must be eradicated. Unfortunately, even without the political slow-down of controversy, the BEE initiative is doomed to only be so successful for several reasons.

The BEE initiative is essentially a top-down program that instructs businesses to hire more Black workers and increase their dealings with already Black-owned firms. In order for foreign contracts to do business in South Africa, they have to work out an arrangement that adheres to the BEE mission. To date, there have been numerous BEE arrangements announced. South Africa’s largest Black-owned gold producer, African Rainbow Minerals (ARM), was successfully transferred to 43% Black ownership in 2003, far-outweighing the 25% Black ownership required of mining industries by the South African government.\(^5\) 2004 saw the arrival of Anglo American’s first black Deputy CEO, Lazarus Zims, making him “South Africa’s most powerful Black executive in a publicly traded company.”\(^5\) Though these are impressive facts and achievements, they speak to the same type of comparison that might equate the exception to the norm. What becomes billed as a testament to building bridges towards racial
equality may simply be societal exceptions that slipped through the socioeconomic confines of reality. The result is a dangerous disconnect between targeted achievements and actual social benefits; it becomes a numbers game.

There is the additional problem in that South Africa has not put resources into building an infrastructure that creates the workers and contract seekers that BEE is hoping to assist. Only 14% of Blacks have a high school education or greater, compared to 65% of whites. Schools are still segregated on the basis of user fees, where financially empowered parents can afford to send their students to far superior schools. Invariably, these financially empowered parents are white. With these types of numbers, the pool of available applicants to benefit from BEE initiatives is quite small.

Another problem is the danger of creating an isolated Black middle class that benefits from the BEE initiative but without creating opportunities for the greater proportion of the Black population to increase their economic standing as well. This is not an unjust fear, as examples of similar occurrences have been shown worldwide in small communities where, say, a Coca-Cola factory or shoe factory or any such manufacturing building opens up, creating a small pocket of wealth surrounded by institutionalized impoverishment. In the case of BEE, the isolated Black middle class results from “a massive transfer of corporate wealth to a small but growing black elite,” many of whom were former anti-apartheid activists and were very active in the post-Apartheid government. Though this sounds suspiciously paternalistic, it is not too far-fetched if one takes into account the professional connections necessary to start a business with ease, the fact that many of the top and mid-level politicians were former anti-Apartheid activists, and that South African politics are notorious for lengthy bundles of red tape (often taking four or five months for paperwork to come to fruition). Nonetheless, the emerging Black middle class
remains highly isolated, if not by attitude, then by sheer numbers. A recent study shows that 47% of Blacks are poor compared to just 1% of whites. Although the Black middle class is growing, there is not much room for transfer of wealth to the poorest of Blacks. This is where South Africa fails to address social policy in the wake of its macro-economic policies.

The presence of government efforts aimed at social reform is either virtually non-existent or ineffective. The focus of attention has been primarily on the macro-economic policies such as GEAR and the BEE initiative as indicators of overall social progress, which is directly spawned from the neoliberal ideology upon which South Africa has based its multilateral agenda. As a result, South Africa’s marriage to neoliberalism has done more harm to the country than good. Despite the country’s belief that its policies have allowed it to earn acceptance from industrialized nations, given it a place of authority among African nations, and have allowed for an increase in equity among its population while increasing its overall economic status, South Africa’s policies remain to have more of a limiting effect than a liberating aspect.

**Implications of Neoliberalism**

South Africa has taken on its current foreign policy stance as a means of pleasing everybody. Its middle-ground policies allow it to bring the concerns of African nations to the forefront of international politics, while simultaneously giving it a degree of credibility among industrialized nations. Its domestic policies have aggressively sought to carry out macro-economic reforms with the hopes of a trickle-down social benefit taking place. The truth is that neoliberal policies have provided no such benefits for South Africa. It is more accurate to say that the country is a political enigma weighed down by the possibility of ending up as a pariah on the African continent.
The South African situation is representative of the many inconsistencies and inefficient paradigms that exist in the global economy today. When one looks at the world’s leading industrialized nations and the extent of their wealth, there are common factors that led to that accumulation. Among other factors, these included numerous other countries (usually former colonies) into which to export their products, an abundance of cheap labor due either to slave labor or colonial labor, and rich levels of natural resources. Though not all of the major industrialized countries may have had all these characteristics, these traits nonetheless serve as loose guidelines for the type of conditions industrialized countries were allowed to thrive in.

Today, the fact of the matter is that developing countries do not have the luxury of attaining their wealth in the same manner that the world’s leading industrialized nations have attained theirs. The more common scenario is that developing nations are being encouraged, for all intents and purposes, to achieve a higher economic standing via the pre-approved channels of development. Currently, one of those pre-approved channels is free trade. The tagline is usually something to the effect that free trade creates economic opportunities for developing countries to stabilize and build their own economies by providing their goods with access to foreign markets. Dilemmas begin to arise when one analyzes the accompanying caveats of such deals. These usually include factors such as escalation measures that make exports disproportionately more expensive for developing countries when they seek to export manufactured goods as opposed to primary products. Additionally, developing countries are faced with the duality of the global economy in that industrialized countries can afford to heavily subsidize their farmers and producers, allowing them to export their own products into developing countries for a fraction of the cost it would take for the poorer country to produce the same product.
The South African Case

South Africa is virtually an active metaphor for the poorest of the poor attempting to gain the same prosperity of the industrialized nations by emulating their policies. Although the country is clearly on a plane of economic existence much higher than any of its African counterparts, in comparison to the world economy, the South African GDP is less than 2% of the U.S. GDP.61 Try as the country might, its efforts at being recognized as a world economic influencer are admirable at best, and overall unrealistic. There is much evidence to suggest that the country is in fact being respected by the industrialized nations. From the end of Apartheid to the present, South Africa has been appointed numerous leadership positions in the global community: Chair of SADC (1995-1999); Presidency of the UN Conference on Trade and Development (UNCTAD) 1996-1999; Chair of the Non-Aligned Movement (1998-2001); Chair of the UN Commission on Human Rights (1998-1999); Chair of the Commonwealth (1999-2002); and Executive Boards of UNESCO, UNDP, UNFPA, UNICEF, and UNHCR; G-20 (appointed in 1999).62 Simultaneously, many of these appointments can be seen as efforts of tokenism by the global community, attempts to appease the developing community by appointing one of their own to a level of perceived prestige and by showing them that by following the “rules of industrialization” they too can achieve greatness. This can be seen in the fact that South Africa was allowed in the Seattle ‘green room’ meetings at the 1999 Ministerial Conference, and was also selected to be the ‘green man’, or ‘Friend of the Chair’, at the 2002 Doha Ministerial Conference.63 South Africa was carefully selected to fill these positions precisely because the country views itself as a bridge between the North and the South. In actuality, the country serves more as a siphon from the South to the North, siphoning support, resources, and economic infrastructure from the South to support the desires of the North. If
South Africa were actually the bridge between the North and the South that it claimed to be, then the flow of traffic is certainly going one way.

On the one hand, South Africa’s actions are not any different from those that would be undertaken by any other country in its position. As was eloquently stated by Asante, “no government can be expected to justify its participation in a grouping to its people by saying that their interests should legitimately be sacrificed to those of the group as a whole.” What more alienating of a policy could there be than for a country to sacrifice the interests of its own people in order to benefit those of another country? The greater majority of the American people have a hard enough time accepting the billions of dollars that go from the United States into foreign aid each year. Imagine the political alienation the government would face from wanting to take a more direct role in the interests of foreign governments. Why then, do we expect South Africa to make this sacrifice? Why not, for instance, Zimbabwe (using the early-Mugabe era Zimbabwe as an example)? The answer is simply because South Africa presents itself as a transformative state that can protect developing nations from endemic poverty. Yet what is the point of carrying out ‘heroic diplomacy’ tactics if at the end of the day they are self-serving? That is the conundrum of South Africa: the country has made itself a bed where it proclaims that it actively seeks to protect human rights and developing countries, but has become too preoccupied, almost enamored, with the allure of international recognition that it has yet to lie in that bed. In the midst of this preoccupation is an egregious failure to protect human rights in its own borders. This is not only a failure in its responsibility of shielding against institutionalized poverty and unemployment, but also in protecting its people from excessive environmental decay. South Africa is only .07 percent of the global population but accounts for more than 2% of global carbon emissions. The country is also known for an exceptionally weak environmental
regulatory system, further condemning its people to a limited standard of existence. Even when attempting to enact social reform in order to provide its people with the restitutions from Apartheid that they need and deserve, South Africa’s limiting neo-liberal policies place the country in a continued conundrum. The country’s planned land redistribution policy fully exemplifies this dilemma.

**Land Reform**

To understand South Africa’s full dilemma in its land reform policy, one must first analyze this same policy as carried out by Zimbabwe. In both cases, land reform was billed as a means of restitution for Black farmers displaced by colonialism and Apartheid in the respective countries. Carrying out land reform, in which farm land from descendants of these original colonists would be redistributed to the Black citizens it was forcibly taken from, was described as a symbol of a new day in Africa in which the continent could stand up and begin to claim its rights against the legacy of injustices that it has endured. The actuality of the event was much different.

The Zimbabwean Land Acquisition Act, led by President Robert Mugabe, served as a forcible removal of white farmers from their land with the consequences of all but halting the country’s food production. In 2002 nearly all of the country’s 3,000 white farmers were first ordered to stop production on their land, and then later given an ultimatum to remove themselves from the premises or face criminal prosecution. As a result of the hasty land grabs, the country has suffered an immense food shortage and economic inflation that, several years prior, would have been considered unthinkable in Zimbabwe, once known as a burgeoning bread basket in southern Africa. The food shortages, loss of over 1.5 million jobs by Black farm workers, and chokingly high inflation have led to more than 70% of the population living
below the poverty line.\textsuperscript{70} The \textit{coup de grâce} of the situation is that Mugabe has distributed this farmland to close allies in his ruling ZANU-PF political party as well as to the military.\textsuperscript{71}

As the economic hegemon of the southern African region, all eyes were upon South Africa to take a stance one way or another on the issue. Though perhaps not a balanced scenario, the perception was that either the country would find a way to stand with Africa and support the land reforms in some form, or the country would side with the West and condemn Zimbabwe. Both sides had their own series of benefits and pitfalls. Siding with Zimbabwe would earn great favor with many countries in Africa, who felt that Zimbabwe was being disproportionately punished by the West because its policies affected White citizens. Siding with the West would earn South Africa continued “favorite African nation” status among the world’s heavyweight economies. The situation became more complex, however, with the fact that South Africa had for quite some time been planning its own series of land reforms on Zimbabwe’s same justification of righting past wrongs.

Because of the wall of contradiction that South Africa had built for itself in its attempts to appease the industrialized countries and its African counterparts, South Africa adopted a policy of “quiet diplomacy,”\textsuperscript{72} in which Mbeki asserts that Zimbabwe’s problems are best handled by Zimbabwe. Of all the options for diplomatic action available, quiet diplomacy is a combination of the least effective and, ironically, most logical choice. South Africa is Zimbabwe’s largest trading partner, accounting for 43\% of imports and 16\% of exports according to the IMF.\textsuperscript{73} Additionally, Zimbabwe and South Africa have a shared history in that the African National Congress (ANC), the frontline of activists for the anti-Apartheid movement was also involved in fighting against the Zimbabwean (then Rhodesian) Unilateral Declaration of Independence.
(UDI). On the other hand, however, the United States unofficially appointed South Africa as the point man to handle the Zimbabwe crisis and bring a return to order.

South Africa was caught trying to grasp a double-edged sword of diplomacy, and instead, chose to let the sword fall to avoid its own bleeding hands. In the process of trying to save itself from injury, South Africa may have cut its own feet when the sword landed. The quiet diplomacy strategy attracted immense ridicule from the world’s industrialized leaders and murmurs that South Africa may be in over its head. Also, by refusing to take a direct stand in defense of Zimbabwe, South Africa openly diminished its own stance as a spokesperson for the African continent. Though the land reform issue is literally a drop in the foreign policy bucket of South Africa’s international affairs, there is danger that if South Africa continues down the middle-road path of diplomacy, that bucket might quickly fill with failed diplomatic solutions.

An Alternative South Africa

While in South Africa, I was fortunate enough to attend a series of panel discussions hosted by the Institute for Global Dialogue (IGD), a Pretoria-based think tank that focuses on South African foreign policy as well as wide-reaching global issues. One of the discussions involved the Russian Ambassador to South Africa and the former South African Ambassador to the Russian Federation. At one point during the discussion former South African Ambassador remarked to the Russian Ambassador that the Russian foreign policy was mistakenly construing Russia as a world power, when in fact, at best, it was a regional power. He suggested that as a regional power, Russia could best serve its own interests of strengthening the region as well as stabilizing and increasing its economic standing. Though the Russian Ambassador, in noticeable shock, attempted a rebuttal in defense of his country, what he did not mention was that the same
advice is quite true for South Africa. South Africa is far from a world power, but is quite clearly a regional powerhouse. Economically and politically, South Africa has an unmatched stature on the African continent. The sad truth of the matter is that the country is stretching itself thin by attempting to be seen as having this same stature on a world scale. Although there is some truth to the notion that South Africa can contend in an industrialized world, there is just as much evidence to point out that the country will not rise beyond a certain status as long as it accedes to the rules set by those in charge, including the world’s leading industrialized nations and multilateral dominants such as the WTO and the IMF. If South Africa were to truly take measures towards increasing the social and economic equity of its citizens with the same alacrity it sought out macro-economic discipline, as well as genuinely wants to serve as a representative voice for the African continent, there are several guidelines the country might follow to bring it closer to these goals.

Policy Suggestions

The simple part of the solution would be to scale back. Taking oneself out of the spotlight or by ceasing to deliberately seek out the spotlight is critical for South Africa’s efforts of establishing a stronger sense of credibility on the African continent. South Africa’s early diplomatic history even shows that when it chose to step out of the immediate spotlight and served more as a background agent, the country was given more favoritism and less critique in the international community. Perhaps the best resource South Africa has for making statements of international importance is not Nelson Mandela, who is officially retired from the political spotlight, but the Archbishop Desmond Tutu, who continues to make profound statements on world affairs. Even as recently as late November of 2006, Desmond Tutu has been named to the head of a UN fact-finding mission in the Gaza Strip. He has been known to criticize the
current South African government as well as provide insightful commentary on world events where the Mbeki government has chosen to keep quiet, such as the Zimbabwean land tenure policies. Politically speaking, he is South Africa’s best weapon. However, he can only be definitively heard by a world audience if South Africa were to remove itself to the backburner of international affairs. This would include not seeking nomination as chair of various committees and conferences, or shying away from the ‘point man’ position it is sometimes accorded. Simultaneously, the voice of Desmond Tutu, a non-partisan Nobel Peace Prize winner and world hero, becomes proportionally heard.

The next phase of development concerns the actual policies involved in ending Apartheid’s legacy of socioeconomic discrepancies. The most appropriate solution to ending such discrepancies do not come from the government, but from good governance. Using the UNDP definition of good governance, the process “encompasses mechanisms, processes and institutions through which citizens and groups articulate interests, exercise their legal rights, meet their obligations, and mediate their differences.” Using this framework, the government is not necessarily responsible for micro-managing the development of South Africa’s most impoverished districts. Instead, the government is responsible for ensuring that there are resources available for those impoverished districts to attain a satisfactory level of sustainability. These resources are obtained and efficiently distributed through the elements of civic participation, community/NGO partnerships, and government accountability to the public. In essence, these policies do not let the government out of its responsibilities of caring for its people, but they place an increasing amount of responsibility on the citizens to take action once the opportunities are made available.
Civic Participation

Though the poverty in many parts of South Africa seems to be essentially ingrained into the way of life, there are bright spots that must be focused on in order to begin the path of development. A prime example of civic participation planting the seeds of development change is the Berakah Educational Foundation, a community-driven NGO in the Mamelodi townships that focus on providing care for orphans and at-risk youth as well as providing small economic opportunities for many of the townships women. The organization was conceived and initiated by South Africans and is sustained through the volunteer capacity of various community members. The creation of such an organization on its own is not development; if anything, the very need for such an organization is a red flag to the fact that measures for sustainable development are desperately needed in that area. What the organization does signal to, however, is the fact that even in the absence of government induced measures towards development, there are opportunities available to begin the process. Once that process has begun, however, the heavy burden of sustaining such organizations, organizations that are created to make up for the very lack of government policies to prevent the poverty that these organizations are attempting to reverse, should not rest on that organization. Instead, there needs to be an efficient system of sponsors, grants, advisors, and policies in place to help ensure that the Berakah Foundation, and organizations just like it, are able to adequately address the needs of the community.

Community/NGO Partnerships

One of the primary ways to ensure that the Berakah Foundation and similar organizations are able to carry out their intended goals is via partnerships with either outside NGOs, the World Bank, or aid programs from other countries. This is where the local South African government can step into the picture. Because organizations similar to the Berakah Foundation are equipped
with the bare minimum of staff members (most of them volunteers), resources are already stretched thin. This means that these organizations may not have the time or resources necessary to research funding opportunities and write the appropriate proposals. To alleviate this burden, the local government should make itself readily available to these organizations. This would entail not only free counseling and advice, but also desperately needed outside services such as writing grant proposals, creating websites, legal counseling, opportunities to meet with heads of other similar organizations, and even access to a development specialist who can take the time to tour the organization’s facilities, interview the staff and participants, and make appropriate recommendations. The provision of many of these services would simply require the appointment of a middle-man, so to speak, in municipal governments that can find the resources the organization needs. The fact of the matter is that there are innumerable grants available for community-led NGOs, but they lack the ability to apply or the knowledge of their existence. The North-South bridges that South Africa is so fond of building can best be served by bridging divides between struggling NGOs in the South and rich humanitarian donors in the North.

*Government Accountability*

The piece of the development puzzle that would take the most effort from the government is that of accountability. This is more than simply providing bridges to outside resources, as described in the last section. Government accountability for its people is critical in the sense that “where local governments are neither accountable nor responsive, local citizens will be reluctant to participate and this will jeopardize local economic development initiatives.”79 The necessary measures here include a responsive attitude to community concerns and pro-active solutions to community issues. In practice, this literally means removing the red tape and making government services easily accessible to the community. Perhaps it is in the form of regular
town hall meetings where community members can voice their concerns, perhaps it is constructing a plan to provide access to drinking water, or perhaps the solution is in the local government’s ability to successfully bring the concerns of its representative community to the forefront of national issues. Because each community is different it is difficult to say what in what specific ways the local government can assist them. However, in all of South Africa’s impoverished districts, townships, and neighborhoods, there is the common need for a representative who will not allow conditions to grow worse and who will actively seek solutions to existing problems.

Once these pieces are put into place on South Africa’s end, there remains the positioning of the rest of the international community, particularly that of the countries and the multilateral institutions responsible for the world’s aid programs. Addressing the realities of foreign aid is a critical factor that must be completed in order to assure the maximize resource availability for South Africa’s poorest communities.

*Liberalizing Aid*

Mapping out how the situation *should* be is always a simple process. Of course local governments should not be bogged down with bureaucratic proceedings so that they are able to address the concerns of the people. Simultaneously, foreign aid should benefit the community groups that seek to improve the living conditions of their communities. The fact of the matter, though, is that this is not the case in the world today. Foreign aid has historically been controversial in that it has either come in the form of Structural Adjustment Programs (SAPs) or a similar set of prerequisite policies before they are distributed to the recipient country. Even then, the aid is put through the threshing floor of administrative costs, political debates, and lengthy timelines, leaving a feathery, light-weight version of what may have started as a hefty
aid package. The same is true for the debt relief programs for the world’s poorest countries. Although the IMF last year approved over $4.8 billion in debt relief, much of it going to sub-Saharan Africa, the relief still comes only after the recipient countries undertake specific economic reforms. In essence, debt relief has become SAPs with the reforms being required before the disbursement of any funds. In its current form, aid is a way to subtly encourage developing nations to take on the characteristics desired of them by industrialized nations. This is not true for all aid packages, but exists as a fact for the majority of larger aid programs. There are, however, numerous smaller grant programs that are more indicative of what development-seeking communities in South Africa might need. A perfect example would be the Self-Help Fund that exists in all U.S. Embassies. These funds are given to community organizations that wish to take on a community-oriented project and are in need of additional funds. Though such funds are essentially what the Berakah Foundation needs, the problem is that funds in this format are limited. If there were to be a call on the global community to do act in the interest of other nations without increasing the amounts they already spend on doling out aid, the call would be to restructure the existing aid programs so as to meet the needs of the local community. Both Warren Buffett and newly crowned king of philanthropy Bill Gates agree that “philanthropy is a tougher game than business,” which is evident in the difficulties with which governments and multilateral organizations are creating effective aid packages. However, what both Buffett and Gates display to the world via the Bill and Melinda Gates Foundation is that by removing the politics of aid, a great deal of good can be achieved. Tying aid packages to insistence on good governance and specific economic reforms does nothing to help the nation’s poorest individuals. Perhaps it is foreign aid that should be liberalized in place of trade. In the case of South Africa, a liberalized aid regime would allow for the country’s neediest sectors to obtain the aid they need.
while the country is able to continue to devote what resources it has to macro-economic
development.

**Conclusion**

Though South Africa has shown an intense yearning to be recognized as a world player, a
global heavyweight, it is doing so at the expense of credibility on the African continent, and at
the expense of providing for its percentage of the population that still feel the brunt of
Apartheid’s after-effects. To gain the confidence of the African community, South Africa
simply needs to step off the main stage of politics and run its course as a background supporter,
offering advice here and there, but declining positions that will give the country notoriety. To
focus on its widespread poverty and economic inequality, South Africa’s best chance is to
empower local governments with the ability to assist community development endeavors. Such
assistance will provide pathways to international linkages such as grant money and foreign
sponsorships of these programs. The greatest step to be taken, however, is by the international
community. Aid must be reformed and liberalized in order for it to reach the people that need it
most. Turning aid into an apolitical matter, rather than a vehicle for political agendas, is the
most important step in assuring that resources are available for community groups in need.

Fighting Apartheid & Patriarchy: Women and Government in South Africa

By Ajani Husbands
“You will have noticed the highly significant role that women are playing... they are bringing in new tastes into African homes. After all, it is they who determine what shall or shall not be bought. The role of a hubby is to fork up and smile.”

– Nimrod Mkele, South African advertising agent, 1959

**Introduction**

Although the above words were spoken in the late 50s, one can take a quick look around South Africa to see that the general sentiment is still there. South African women have been relegated to the level of stylish accessories at best, and as undesirable externalities of patriarchy at worst. The ideology behind these words expressed may not have been indicative of an outright hatred of women but they do point to the worst sides of South African patriarchy. The above quote also points to the fact that Black women in South Africa were fighting a double battle during the Apartheid period; not only were they on the frontlines fighting for general recognition as equal human beings against an oppressive regime, but whether they knew it or not, they were fighting for their very regard as a whole person against men. This made the anti-Apartheid movement all the more intense from a women’s perspective, for it was a chance for them to lay the groundwork of equality and set the stage for a non-racialized and non-gendered society. Clearly, however, this has not been the result.

Gender disparity remains one of the greatest divides in South Africa. The country has one of the highest rape statistics in the world, where it is estimated that a woman is raped every 26 seconds and that a woman has a greater chance of being raped than of receiving an education. These numbers point to just the surface of the issues surrounding gender inequality in the country. Women are often tokenized in politics, highlighted for the fact that they are women and thus held up as a testament towards equality, when in fact the overemphasis on the very fact that they are women does nothing more than to emphasize the country’s aggravated gender divide. The focus of this paper is to analyze not only the role of women in present-day...
South African politics, but to analyze women’s role in the anti-Apartheid movement in order to bridge connections between the status of South African women today and their status during Apartheid.

Studying the role of South African women, particularly Black women, in politics will give us greater insight into how the anti-Apartheid movement was structured, as well as an indication of the transition of gender politics from Apartheid to post-Apartheid. From a cursory outlook, it appears that the status of women at the front-line fighting against Apartheid was one of a “de-gendered” nature in the sense that their roles were far from that of the stylish homemaker expressed in the opening quote. This gives the initial impression that women in South Africa were not always subject to the second-class citizenship that they receive today, but were, instead, perhaps equal members of a common struggle.

Following an analysis of women’s roles in the anti-Apartheid movement, this paper will also discuss what happened after Apartheid. One of the major perplexities of the United States Civil Rights Movement is that Black people in America became even more segregated after the advent of Civil Rights and the abolishing of Jim Crow laws than they were before. Similarly, it seems that South African women, specifically women of color, have somehow lost part of the battle against Apartheid in that they are on severely disaggregated gendered playing fields.

**Women in the Anti-Apartheid Struggle**

During the anti-Apartheid movement, women in South Africa, particularly mothers, were widely recognized for their notorious “anti-pass campaigns”³ that protested the mandatory labor passes forced to accompany Black employees at all times. Though Black women’s involvement
in these protests were groundbreaking, there were decades of earlier involvement that paved the way for such effective protests to take place.

*Charlotte Manye Maxeke*

Dating back to the 1920s, there were numerous early pioneers against Apartheid among African women. Charlotte Manye Maxeke, one of the founders of the African National Congress (ANC) was additionally one of the first organizers of the women’s section of the ANC.\(^4\) It is through this role that she led demonstrations against the very same pass-laws that were later fought against in the 50s. Specifically, she fought against the pass laws being extended to women as well as fighting to replace men as domestic workers with women.\(^5\) There are several reasons behind this two-pronged assault against Apartheid.

The pass laws that Ms. Maxeke was particularly targeting was the 1923 Native Urban Areas Act, which strictly regulated the movement of Black males between rural (Black) areas and urban (White) areas.\(^6\) The result was a segregated neighborhood system that laid the foundation for today’s townships. All males found without a pass or without a properly documented pass were taken to the nearest rural area and left there. It goes without saying that the pass laws wreaked havoc on the African family. Ernest Cole describes one such situation:

> “I knew of one young woman who came from the nearby city of Vereeniging to marry a Johannesburg man. She got permission to work and took a job there. Later she quit to be a housewife. Eventually she wanted to resume work and went to apply for new papers. “Aha,” the authorities said, “you haven’t worked in more than three months. Have you been having a baby? No? Then you have no excuse for not working and have lost your right to stay in Johannesburg.””

This story explicitly elaborates many of the problems with the pass laws. In addition to the danger of being uprooted from one’s home at any given notice, there were numerous other consequences. For instance, not only were the men required to travel great distances to seek employment and were undoubtedly in proportionately greater danger the further they ventured
into urban territories. Additionally, to extend the pass laws to women was to put women in
direct danger of being relocated, imprisoned, fined, or worse. Thus, it became necessary to
protect women from such dangers.

Ms. Maxeke’s other focus of replacing men domestic workers with women potentially
served a dual purpose. The first is that it was possibly conceived as a manner of restoring pride
in Black South African men. One of the premiere features of colonialism, slavery, Jim Crow law,
and Apartheid is its insistence on the emasculation of Black men. Dr. Joy Leary ponders the
prolonged effects of emasculation on the Black family, questioning if there might be deep-seeded
resentment between Black women and men for each one’s inability to fight off the evils of
slavery, primarily rape. She best analyzes the situation employing a passage from Carter G.
Woodson, who writes:

“When you control a man’s thinking you do not have to worry about his actions. You do not have to tell
him not to stand here or go yonder. He will find his “proper place” and will stay in it. You do not need to
send him to the back door. He will go without being told. In fact, if there is no back door, he will cut one
for his special benefit. His Education makes it necessary.”

As such, one of the greatest triumphs of slavery and other forms of oppression is to stamp out
one’s sense of self; this can be done in countless ways. Similar emasculatory efforts were put
into place against Nigerian railway workers in the colonial era, where their duties as men could
not be completed because there familial and cultural values were not honored by the colonists.
Similarly, forcing South African men to perform household chores, particularly those of cleaning
and caring for another man’s house, might have been seen as the ultimate affront to manhood.
Though the detriment this can cause the psyche is not quantifiable, the mentality of defeat
becomes visible over time. Ms. Maxeke’s efforts worked to eliminate that defeat. By seeking to
replace male domestic workers with women, she was providing an opportunity for Black South
African men to regain their sense of self.
The other positive externality to Maxeke’s strategy is that it becomes a way for women to bypass the pass laws. By protesting both the extension of the pass laws towards women as well as by fighting to replace male workers with women, Ms. Maxeke set the groundwork for an intricate strategy that would allow South African Blacks to bypass one of Apartheid’s harsher laws. If Black women were able to be employed without the use of a pass, they were, in essence, creating a loophole through which women could be openly defiant to the Apartheid system. The works of Ms. Maxele and her contemporaries were successful in that the pass laws were not put into effect for women until the mid-50s. It was at this point that Maxele’s successor, so to speak, would take the renewed struggle against Apartheid.

*Lilian Ngoyi*

Lilian Ngoyi was in many ways the direct successor to Charlotte Manye Maxeke. Ngoyi was “the first woman member of the ANC National Committee since Carlotte Maxeke’s unofficial membership between 1912 and 1930.” Additionally, she took up arms against the 1950s version of the pass laws as well as the much-despised 1953 Bantu Education Act. Ngoyi’s success with the ANC is notable for her ability to attract a wide diversity of Black women: “the church women, the nurses, the factory women, domestic servants, housewives and professional women.” The pass laws that they protested carried with them the same fears as in the 20s, those of abduction by unruly police officers and potentially being sexually assaulted. Although Ngoyi led the charge against aspects of Apartheid that affected women in particular, her achievements become remarkable in the fact that she was de-gendered in regards to her punishments by the Apartheid regime.
Ngoyi was banned for 11 years by the Apartheid regime, an order which restricted her to the Orlando township.\textsuperscript{14} Even after she was reprieved of this ordeal, she was then detained in solitary confinement for 71 days.\textsuperscript{15} The extent to which the Apartheid regime undertook to punish Ngoyi for her actions is indicative of the notion that she may have crossed the divide between serving the anti-Apartheid struggle as an assisting woman, and serving the anti-Apartheid struggle as an unquestioned leader. Her placement in this capacity would be quite unique in that her career of political activism is literally marked by her profound dedication to working with women. In 1952 she participated in the Johannesburg garment worker’s meeting; in 1955 she was sent as a delegate to the World Congress of Mothers in Switzerland; and of course, all this was during her tenure as a top woman member of the ANC.\textsuperscript{16} Ngoyi’s activities were undeniably defined by her activism in women’s affairs. Nonetheless, her punishments were as severe as those received by many of her male colleagues. Part of this may be attributed to the fact that the Apartheid regime was indeed brutal and apportioned sentences with equal disdain, whether to man or to woman. There is further evidence to support the claim that Apartheid took on a de-gendered view by the fact of its continued attempts to extend the pass laws to women, showing that there was not enough particular social differentiation between women and men. Or, rather, simply exemplifying the fact that the Apartheid regime perhaps considered men and women to be socially different, which was mentioned earlier by the plight of white women during these times, but that in the case of Africans, men and women should be made to both feel the brunt of the Apartheid legislation.

If the latter were the case, then the question arises as to where the renewed sense of misogyny in the post-Apartheid era originate? If one of Apartheid’s defining features was not that of disproportionate physical, social, and mental abuse of women, then to what factors does
South Africa owe this to be the current case for women? A clue resides in this paper’s opening quote, which already shows not necessarily a misogyny towards women, but a clear patriarchal definition of a woman’s role in South Africa. It is feasible that as the burden of Apartheid progressed, Black men, as they were being further pushed to the bottom of the social ladder, pushed down even harder on Black women. Phillip Langley elaborates on this, claiming that “it is not the elder brothers, the husbands, the uncles and fathers who exploit women, but those social forces which dominate the economic system, which encourage pre-existing inequalities.”

In this case, the encompassing effect of Apartheid would be the dominate economic system that has forced an exacerbated sense of inequality on African men and women. April Gordon offers a slightly different view in that she believes “most of women’s disadvantaged position can be attributed to African (and to some extent Western) patriarchal institutions that function to maximize the advantages of men at the expense of women and the economy.” Here, Gordon is taking the stance that the gender inequalities presented in South Africa are actually manifestations of pre-existing inequalities rather than the result of an oppressive system of Apartheid. Though she does give credence that Western institutions such as Apartheid may contribute to aggravated gender discrepancies, she holds firm to her stance that the gender inequities among Africans are remnants of forms of gender subordination that existed before colonization.

At least in the case of South Africa, Gordon’s argument cannot be fully substantiated mainly because in order to do so, one would have to perform an intricate sociological study of pre-colonial South African peoples (of which there are numerous tribes and ethnicities) in order to contend that any examples of gender discrimination today are, in fact, portions of their respective cultural norms simply adapted for the modern day. Langley offers a more tangible
analysis that can be given credence by the fact that gender discriminatory practices were not unique to South Africans and were widely practiced by Europeans. Though there were undoubtedly notable differences in expected gender roles among the clashing cultures, it is reasonable to say that Europeans settling in South Africa did not learn of misogynistic practices from South Africans. Instead, what we observe today is most likely a mixture of what Dr. Joy Leary refers to as Post Traumatic Slave Syndrome (part of which encompasses Black men seeking to lash out at Black women for being the subject of wrongs they could not avoid), and African victims of the Apartheid regime seeking to emulate the sociological norms of those who hold dominion over them in order to potentially alleviate their despair.

Organized Women’s Resistance to Apartheid

Another vehicle with which to examine women’s roles during the anti-Apartheid era is that of women’s organizations. The ANC, though leading the forefront of the anti-Apartheid struggle, was not necessarily on the forefront of the gender equality movement. Women were only allowed as full members of the ANC after 1943, and this was after the official formation of the ANC Women’s League.19 Even then, its existence was considered, rightly so, as a female appendage to a male-dominated organization, thus marginalizing women’s issues; such a structure required the extended effort of women such as Lilian Ngoyi to bring women’s issues to the front of the ANC agenda. In an effort to create an organized movement that actively sought to address women’s issues during this time, women from all races came together to form the Federation of South African Women (FSAW), existing from 1954 to 1963.20 The organization was considered widely a success not only for the fact that it was the first truly independent women’s organization not attached to a pre-existing male body, but also for the fact that it drew a
wide-reaching multiracial crowd, partially because of its ‘motherism’\textsuperscript{21} appeal, the idea of mothers securing a better future for their children. Still, even with the advent of organizations such as FSAW and later the Black Women’s Federation in 1975, addressing women’s needs was not entirely accepted among the anti-Apartheid community. Former anti-Apartheid activist, and now current South African High Commissioner in London, Cherryl Carolous, recalls that in order to be taken seriously her and her female colleagues were forced to “become one of the boys”\textsuperscript{22} in the sense that they had to actively seek a ‘male’ persona of toughness. Taking on such a mentality potentially meant the difference between serving in the front lines of the movement and the alternative of assisting as a secretary, i.e. being a ‘knitting needles guerilla’, as they were jokingly referred to.\textsuperscript{23} Women also learned that if they were to be taken seriously, their overt stances on women’s rights would have to be temporarily silenced, or at the least settled on the backburner, in place of more nationalized issues.

The picture presented of organized women’s resistance is a much bleaker image than that of the successful individuals that either preceded these organizations or perhaps led them. Whereas women’s service in the anti-Apartheid movement was exceedingly appreciated, their concerns were nonetheless seen as a derisive offshoot of the main agendas. As such, women’s issues were never fully integrated into the anti-Apartheid struggle and thus were not addressed with the same alacrity as other issues may have been. This, then, is another facet as to perhaps why South African women are seemingly worse off now than during the Apartheid regime. If the anti-Apartheid leaders would not take a formalized stance to include women’s varied agendas as part of the overarching main goals of the liberation struggle, then it is no wonder that women’s concerns are pushed to the periphery today. It is also no wonder that there still exists a spirit of tokenism in regards to women, especially in politics. Acknowledging the notion that the
ANC Women’s League was nothing more than a female extension of ANC interests in order to gather women’s support, it can be reasoned that current women ANC members of parliament and other levels of government are in place to garner that same support, as discussed in this paper’s next section.

Combining the case of women’s anti-apartheid groups along with the case studies presented of both Charlotte Manye Maxeke and Lilian Ngoyi, we are given a more detailed view of the Apartheid regime and how the structure of the very fight against Apartheid may have exacerbated any existing gender discrepancies during the actual regime itself. The challenge now remains to evaluate the damage caused by this male-female rift and locate where South Africa currently stands on gender relations.

**South African Women in Politics Post-Apartheid**

We have already mentioned some of the statistical evidence that points to the serious situation that is South African gender relations. Now, the focus is on giving these statistics meaning. For instance, Geisler points to the strong presence of an organized women’s movement in the anti-Apartheid struggle, in the ANC Women’s League in particular, as having allowed women to gain a foothold in the door of politics in post-Apartheid South Africa. The advent of independence did indeed see 111 women enter Parliament as well as the ANC using political advertisements directly targeted towards women. Upon closer analysis, however, the ANC effort to usher women into seats of power clearly becomes a measure of tokenism rather than an actual representation of ANC leadership sharing power with women. For instance, many of the women elected to power did not seriously expect to win either because of their age, their lack of political knowledge, or their lack of education. They were elected as seat fillers, as
assured support for ANC agenda items that required large bodies of votes to pass. Although it is true that there were both men and women elected to Parliament that had trouble adapting to the specific nature of government, women faced the brunt of the issue in that they were de-gendered, or at least silenced as a woman in order to maintain their positions. Thenjiwe Mtintso, former commander-in-chief of MK and ANC MP, found that being in Parliament meant “get[ting] into the status quo, being a man.”26 This is the same conundrum that women faced during the anti-Apartheid era, in which they were forced to forgo their interests as women in order to be allowed into the sphere of the liberation movement, and even then it was only the sphere’s peripheral.

The trend of marginalizing women in politics was not unique at the beginning of liberation and is not unique now. The infamous Zuma Rape Trial, in which the South African Deputy President (now former Deputy President) stood trial for raping a colleague, exemplifies this marginalization. Not only did the case bring to light many issues formerly pushed to the side, such as revamping the outdated Sexual Offense Act, it also showed the extent to which women’s concerns were pushed to the side in order to preserve an unfaltering patriarchy. South Africa is the same country in which a newly freed Nelson Mandela’s encouragement for men to wash their own clothes and cook their own food as he had done in prison was met with “muted silence from men and cheers from thousands of women,”27 thus it would be no surprise that this same country would hold a benefit concert for a Deputy President accused of rape28 while simultaneously the alleged rape victim is packing her bags to leave the country for fear of violent reprisal.29

Similar marginalization occurs with the Health Minister Manto Tshabalala-Msimang, who has been branded as ‘Dr. Beetroot’ for her health policy measures which do not focus so much on treatment of HIV/AIDS as they do on treatment of the body as a whole. Tshabalala-Msimang’s policies do not meet the international health community’s scrutiny as far as
addressing HIV/AIDS, causing a fair amount of pressure to be placed on the South African government to replace her. Although this pressure seems justified on the surface as that it is in response to a supposed derelict of duty, the call for her removal is more likely an extension of the same brand of patriarchy that forced the accuser in the Zuma Rape Trial to flee the country. The evidence points to this conclusion for two reasons. The first is that there was not a similar public outcry against Jacob Zuma. Although one cannot numerically compare the international importance of a Deputy President’s rape trial to a Health Minister’s refusal to focus on antiretroviral medication, the fact that there was virtually no international outcry against the rape scenario in comparison to the Tshabalala-Msimang situation indicates that at the least, rape is not an international concern, or even an international red flag at the moment. Added to this is the analysis that Jacob Zuma’s crime (or even supposed crime) is that of a man perpetrated against a woman, whereas Tshabalala-Msimang’s crime (or, again, supposed crime) is that of a woman perpetrated against that of an entire population, including men. Looking at the two scenarios from this point adds a new dimension of inquiry to the situations. The Health Minister, as a woman, is responsible for the role of ‘motherism’, taking care of the children of South Africa. What more offensive image could there be than the crime of a mother not caring for her children? It is with this mentality that Tshabalala-Msimang has been accused virtually of treason against South Africa.

Judging from these two instances, it can be surmised that one of the political after-effects of the anti-Apartheid movement is a further division between South African men and women as indicated on the political field. The problem this leads to is that until women’s issues are brought to the forefront of government concerns, South African women will continue to lead a degenerative life beneath that of South African men. What makes matters worse is that South
Africa is in fact leading the way in terms of representation of women in parliament and other facets of government. There is even talk of the next South African president being a woman, with the appointment of Deputy President Phumzile Mlambo-Ngcuka. The fact of the matter remains, however, that these women are mere tokens, puppets. Their positions in the South African government are that of strategically placed, assured votes. This is not gender equality and this is not the means with which to build gender equality. The current situation echoes the same sentiments of Women-In-Development (WID) scenarios that spout the ideology of women being able to attain equal status to men simply by being given the same resources. As the South African political system can attest, this is a far-fetched belief at best. If the women involved in South African government were truly able to act in favor of women rather than acting in a pre-approved political manner, then there would be at least on-the-ground solutions for many of the egregious examples of inequality that women face. Even though two out of five African households are headed by women, three out of five of those households are considered in poverty.

Policy Solutions Towards Gender Equality

In her analysis on gender and politics in South Africa, Gisela Geisler asserts that: “closing the gap also means that national policies will have to be extended and made relevant to the majority of South African women. Only the empowerment of ordinary women will guarantee that all women’s voices and priorities, truly representative of South African society, are heard at the national level.”

Though the ideal situation would allow for gender disparities to be alleviated in such a manner, this is not South African case. As Geisler mentioned earlier in her work, many of the women elected to the early Parliaments in the liberated South Africa were, in fact, ordinary women. However these women did not, and still do not, have the political clout to affect meaningful
change in the country. Geisler’s words do hold true, however, when they are taken out of the political context. By empowering ordinary women in everyday scenarios, one is providing an opportunity for South African women to lift themselves up from the daily quagmire of gender inequity. By empowering the ordinary woman with the opportunity to receive an education or with the resources to set up a career outside the home, the ordinary woman is then able to increase her sphere of influence over her household and the community. The danger with simplifying the situation into a catchphrase solution of ‘empowering ordinary women’ is that it easily leaves out the contexts by which South African women find themselves entrenched in a gendered-Apartheid. These contexts include sociological norms that became standardized during the Apartheid era and only became more indelible in the South African psyche as Apartheid raged on. Empowering the ordinary woman does not simply mean providing the resources for that woman (as a WID strategy might claim), but it must also encompass empowering the ordinary man and the ordinary child.

In an interview with the Berakah Foundation, a community-driven NGO that works primarily with orphans and vulnerable children in the Mamelodi township, Avril Elkington, the founder, relayed some of the heavier issues facing the community’s overall development. One aspect that Avril mentioned was that “one of the biggest problems we are experiencing at the moment with our children is the huge gap in the quality of education. Township kids are way behind when it comes to reading, writing and math.”32 She has found that girls suffer the most under this system in that in a household of limited resources, boys are sent to school in order to maximize the utility of an education. Empowering the ordinary women, in this case, would entail empowering the ordinary community. The effort should first be placed on providing enough resources so that potentially each child in the district could attend school without being a
burden to the family. The next phase would then entail a more personalized effort of explaining to parents why it is important for their daughters to receive an education. This type of convincing would have to come from the community, from individuals such as Avril Elkington, school officials, and other notable members of the community. What this type of community activism might reveal is that perhaps there are other reasons girls are not attending school, either because they are responsible for caring for their fathers if the mother is not able to, or because the girls are traumatized from some sort of abuse, or the school is too far and the girls risk being raped, or a myriad of other factors. However, none of these issues can be solved unless the resources are there to begin with.

Gender equality in South Africa will not happen in the Parliament and will most likely not happen in the courtroom. It will not happen attached to a male-dominated institution or organization. Instead, it will happen in the streets and in the homes. South African gender equality is intricately tied to poverty alleviation, as indicated by some of the earlier statistics. As such, plans dedicated to bringing about social change and socio-economic upliftment must not be bereft of a gender component. If the ordinary woman is to be empowered, it is to be through the vehicle of community-led efforts towards poverty reduction and community improvements. It is here, not Parliament, that South African women will be able to make their stand.

Introduction

In their paper to the 15th Annual Meeting of ISTSS at Miami, FL Anatoly V. Isaenko and Peter Petschauer presented a theoretical framework that can be used to understand the regularities of ethnic conflict (Isaenko and Petschauer, 1999, p.54). Their subsequent study of ethnic conflicts in the Caucasus as compared to ethnic confrontations in the Balkans and Central Asia showed that extreme ethnic expressions are divided into seven headings: (1) body/space, (2) use/abuse of language, (3) religious expression, (4) shared chosen traumas of history, (5) ethnic affiliation/nationality, (6) economics, and (7) state organizations. This format allows one to systematically explore theoretical and practical approaches to understanding, defining, and redefining negative ethnic expressions in a society which is at risk of deterioration into extreme ethnic abuses. This framework is important for historical analysis but can also be an effective tool for understanding an ethnic community and establishing interventions as a way to avoid extreme outcomes. By utilizing experiences from many cultural contexts it becomes apparent that all-sided societal crisis exacerbates what Nash Manning defined as principle “building blocks of ethnicity”, (here marked headings from 1 to 5) (Nash, 1989, Ch.1), calling into life an ideology of ethnocentric nationalism. This ideology sanctifies ethnonationalistic-like behavior patterns both on the state level and on the level of common people. They initiate and in the long run actualize various forms of ethnic cleansing: beginning with mild and middle ground forms and ending with elements of ethno-cultural genocide. Certain ethnonationalistic-like behavior patterns are not restricted to a particular part of the world but bear stunning similarities to the treatment of perceived ethnic enemies in all known ethnic conflicts (Isaenko and Petschauer, 1999. ch.7; Petschauer and Isaenko, 2002, p.52-74; see also Isaenko and Petschauer, 1995, p.1-13; compare to Kecmanovich, 1997). In this article I intend to demonstrate how these regularities in the regressive socio-political atmosphere of the Russian North Caucasus put Ossetians, Chechens, and Ingushians on the road that led them to Beslan tragedy. I argue that psychological underpinnings of the regularities defined and predetermined individual and group actions before, during, and in the aftermath of this momentous event that from now on is destined to play the role of deepest psycho-historical “chosen trauma” of Ossetian people (Volkan, 1991, p.3-13).

Experts agree that failure to save lives of the hostages may have had serious repercussions for Moscow and local administrations. Specialists and independent observers pointed out to several most obvious, inexcusable and blatant failures on the part of both North Ossetian administration and the federal Russian forces conducting the hostage situation. Everybody interfered and nobody wanted to take responsibility. Everybody waited for Moscow’s orders, but the Kremlin kept silent. The hectic and completely disorganized actions of those responsible for the solution to the crisis on the Russian side proved that they completely lost control of the situation. In the headquarters they were in conflict and could not decide whether to storm or to carry on negotiations. The head of North Ossetia Dzasokhov proposed to change children to 800 bureaucrats, but under the threat of arrest he was forbidden to get into negotiations with the terrorists. Witnesses testify that at the beginning of broken storm he lost his self-control and wailed,
“I am a political dead body now!” This Freudian lapse shows that even at such a moment when his people and children were dying from random mortal fire he thought first only of the political office he might lose.

Despite earlier promises to peacefully resolve the crisis, Russian Special Forces resorted to armed force, failed to keep the battleground secure from entry by civilians or exit by the militants, and were struggling to provide consistent reports of the situation to the media. Representatives of the headquarters of the operational staff in Beslan repeatedly lied about the real number of hostages in the school, considerably marking down their figures. This outraged both relatives who knew the size of the classes and the hostage takers.

Two reporters among many trying to get to Beslan to report on the siege were detained in some way or another. Andrey Babitskiy, a journalist with the Russian service of Radio Free Europe, Radio Liberty, was detained and indicted for mischief after an alleged conflict with security guards in the Moscow Vnukovo Airport and sentenced to a five-day arrest. The Novaya Gazeta journalist Anna Politkovskaya became ill on the airplane bound to Rostov-on-Don after she drank only a cup of tea on the plane. Although it has never been proven, her publisher suspects that she was poisoned. There are concerns that both incidents were provoked by the Federalnaya Sluzhba Bezopasnosti (Federal Security Service). According to a poll by Levada-Center conducted a week after the Beslan crisis, 83% of the polled Russians believed that the government was hiding at least a part of the truth about the Beslan events (Wikipedia).

To understand the behavior of politicians we need to resort to an analysis of regressive social transformation both in Russia and the North Caucasus in the course of the Chechen conflict that led to the Beslan tragedy.
Part I: Long-Standing Causes: A Failure that Transformed Chechnya and Russia

The tragedy of Beslan had become an original indicator of the unresolved “Chechen problem” whatever the official Russian rhetoric was. The seizure of hostages and deaths of hundreds of them, predominantly children, clearly demonstrated that a small but very active and radical section of Chechen society continue to fight using the most desperate means. In three months they had performed three abhorrent acts of homicidal terror: an attack on Ingushetia (6/22/04), an attack on Grozny (8/21/04), and an attack on the Beslan High School #1 (9/1/04).

An immediate reason for these manifestations of terrorism in the North Caucasus, as shared by the majority of Western experts, lies with the inability of the Kremlin to elaborate on a viable policy towards the Chechen conflict: a failure to compromise. While we do not dispute the validity of this analysis, I cling to the opinion, based on my research and personal experience1 that the long-standing roots of the region’s most recent violent history lie within the context of the catastrophic failure of the democratic state-building experiments both in Russia and in Chechnya in the 1990s. Just as in Chechnya and Russia where democratic opposition had been completely crushed by the regime of General Dudaev in the early 1990s, the attack on the Russian Parliament on October 3, 1993, by Yeltsin was a turning point.

At first, a failure came about in Chechnya. The coup of August 1991 triggered a dramatic speed up in the “Chechen Revolution.” In the long run, two hostile camps emerged: the Executive Committee of the National Congress of Chechen People (OKChN) headed by ethnocentric nationalists: Zelimkhan Yandarbiev, Movlady Udugov, S-Kh. Abumuslimov and sided with them Dzokhar Dudaev, and the pro-democratic party of the Provisional Supreme Soviet of the Chechen-Ingushian Republic, led by B. Bakhmadov, a former regional prosecutor. This second group resisted the nationalistic coup by creating an alternative popular movement for the preservation of a united Chechen-Ingushetia. They appointed an alternative date for elections and an alternative Central Electoral Commission. They even created their own home guard and occupied the building of the Republic’s Trade Unions (Terivistii Put’ k Svobode, 1993, p.376-379).

As might be imagined, the Republic now entered a period of instability. On October 27, 1991, the pro-Dudaev Central Electoral Commission carried out presidential and parliamentary elections. Dudaev was declared the nationally elected president of the Chechen Republic. This step immediately triggered a negative reaction by the democratic opposition. That reaction alone could have resulted in armed clashes between the opposing parties.

At this crucial moment, Boris Yeltsin’s administration, which had kept at a distance, decided to step in. It did so in the most inappropriate manner—at least from a traditional

---

1 Dr. Isaenko is a former native of North Caucasus; this adds a depth of information in regard to the life of the ethnic groups in the North Caucasus that many individuals have been unable to garner given the history of the former Soviet Union.
Chechen viewpoint—as historically reacted negatively to intrusions by outsiders, but especially Russians (Isaenko and Petschauer, 1995, p. 108, 111). That is why Yeltsin’s decree, “Introduction of Martial Law in Chechnya,” was viewed by the great majority of native Chechens as an act of imperial aggression. Dudaev, who immediately called on Chechens to resist by referring to the need to reestablish Chechen national pride and dignity, became a national hero.

Thus Russia’s interference reawakened dormant suspicions, reinforced the memories of past losses and the connected image of Russia as the enemy. Russia’s approach helped to revive and reopen the traumas of past humiliations and defeats that Chechens had suffered at the hands of the Russian imperial and Soviet communist governments. It also rekindled dormant hatreds, and indignant Chechens readily transferred their hostility to Moscow’s latest rulers and, as a byproduct, to the latest generation of Russians living in their republic; they were now thought of as potential traitors. The decree thus triggered ethnic cleansing of the Russian population. The stark findings of the Chechen journalist Arbi Arbiev in Chechnya and Ingushetia were not published until 1998. He revealed that 320,000 Russian residents lived in that area in 1989, after 1991 only half remained. Only those persons and families who were unable to sell their property (always at ridiculously low prices proposed by Chechens and Ingushians) and more importantly were unable to afford to move to Russia proper were left. They were not paid their salaries, they were robbed, harassed, forced out of their homes, kidnapped, and their documents and identities were destroyed (Arbiev, 1998, p. 2).

These steps were a clear violation of legal procedures by Dudaev and his ethnocentric regime and they provoked attempts by the Chechen democratic opposition to organize a counter-offensive, and less influential clans in particular backed this move because they were underrepresented in Dudaev’s entourage. By the summer of 1992 the nucleus of the opposition was concentrated on the popular movement in “Daymohk” (“Motherhood”) and headed by Salambek Khadjiev, Lecha Umakhaev and Dz. Gagkaev, three distinguished representatives of the Chechen intelligentsia. They endeavored to bring about new parliamentary elections that included full participation of the Russian speaking population. They also wanted to begin real economic reforms and restrictions on the mafia and ethnically targeted organized crime. Additionally, they wanted to reorganize the mafia-backed state government to introduce real checks and balances, and to initiate a clear division of power between branches of government (that is, the president, parliament, constitutional court and local administrations, which were elected, not appointed). They wanted to undertake these steps in the context of the Constitution of the Chechen Republic, which had been adopted on March 12, 1992, but not activated (Programmnye dokumenty . . . , 1992, p. 3-16). In spring 1993, these efforts received support from the parliamentary faction “Bako” (“Right”) that was headed by Yusup Soslambekov, a former radical nationalist and accused criminal. They also supported the mass meeting organized by the Chechen Federation of Trade Unions on April 15, 1993.

Dudaev’s reaction was immediate. With the support of ethno-nationalistic radicals, he summoned a counter-meeting. But it did not stop the pro-democratic meeting in the Theatre Square of downtown Grozny demanding the parliament defend the constitution.
Responding to this call, parliament excluded the members who were most active in the Dudaev camp and had encouraged the executive’s anti-constitutional actions. Then, with the support of the municipal council of Grozny, parliament created an alternative council of ministers and placed Yaragy Mamodaev in charge. Mamodaev had, by that time, quarreled with Dudaev and been removed by him from the post of vice premier. Parliament also established a minister of defense (placing I. Suleymenov in the position) and announced the creation of a multi-ethnic “People’s Army.” In addition to these steps it introduced some vital social measures and fixed a national referendum for June 5, 1993. The agenda included as a principal proposal the removal of the sitting president and the abolition of the institution of the presidency (Pain, 1993).

Dudaev’s move was unannounced. He closed down all opposition newspapers. And then in the early hours of June 4, 1993, his mobsters stormed the democratic movement’s stronghold, the municipal council building of Grozny. During this attack, a battalion of municipal police officers suffered severe casualties and more than 60 people were killed. The same day, Dudaev’s forces also fired on a pro-democracy demonstration. The next day, the presidential guard besieged the headquarters of the movement. Unwilling to unleash a full scale civil war, the opposition gave in and announced the cessation of all political activities. This resolution of the political crisis in Chechnya meant that the democratic experiment was defeated and the personal dictatorship of general Dudaev was established.

The attack on October 3, 1993, by Yeltsin on the Russian parliament is much better known than the events in Chechnya. How can contemporaries forget the day’s TV footage of the charred parliament building? And, as in Chechnya, this was a major turning point. In fact, it is a principal turning point in Yeltsin’s period in office and in the post-Yeltsin, Putin’s period as well.

From that point on violent solutions have become the norms for Russia proper, for Chechnya, and other areas of the North Caucasus. No matter what the official rhetoric, the Russian and non-Russian public alike understood that their political leaders and the political and mafia elite that backed them would take the most ruthless measures to attain their personal goals. This was a devastating blow at the emerging civil society in post-Soviet states. One result was that fragmented Russian populations responded with ever-growing political apathy. Another result was that oligarchs, tycoons, godfathers, bureaucrats, and regional elites grabbed the opportunity that unrestricted and unprecedented expropriation of the so-called “common” property opened for them. A further result was the strengthening of oligarchic regimes and the growth of ethnocentric nationalism and religious extremism.

Many people began to realize that a return to real economic progress and true modernization would be arduous and time consuming. The stress of economic and political uncertainty threatened to revive unresolved conflicts that had lingered just below the surface. Fewer individuals understood that the long-standing imperial and Soviet legacy was much stronger than they imagined and that in Russia (and in many other...
former Soviet Republics) a new, unprecedented variety of totalitarian rule was emerging: totalitarianism that one can call post-communist or pseudo-democratic neo-totalitarianism. This form of government can be characterized as a political system in which overall control over individuals and society is exercised by a combination of familiar and new techniques. Control is not exercised by ideology, as in the past, but through other means. These means may include elections, for example, but these are merely used as a way to exert total control over citizens and tend to undermine this process itself and the social fabric and consensus in general. Observers in the North Caucasus and Russia noticed a “multidimensional dependency” that had begun to assume both obvious and latent economic (social, cultural, legal, traditional, religious, etc.) and extra-economic forms. Such forms determine the numerous power relationships associated with coercion, violence, and the constant threat of the use of either (Polokhhalo, 1997, p. 7). Violence became esthetically welcomed. Machoism flourished. Normal people became viewed as cowards. Intellectualism was cursed as being subservient to alienate Russian or Western cultures.

**Shortage of Administrative and Political Skills; Spread of Corruption**

Political elites in the republics of the North Caucasus broadly fall into three categories: former party *Nomenklatura*, Soviet ex-servicemen and the leaders of ethnic networks (Matveeva, 1999, p. 10). At present and in the recent past, such republics like Adygeia, Karachaevo-Cherkessia, Kabardino-Balkaria, North Ossetia-Alania, and Dagestan have been headed by former party leaders.

The ex-Soviet generals emerged on the political scene in 1990-1991 and were looked upon as men of action and “national heroes” around whom ethnic groups could unite: like Air Force general Djokhar Dudaev, or general Ruslan Aushev, the commander of a Motor Rifle Division in the Far Eastern Military District. In 1992, he became the leader of Ingushetia. Another general and the former deputy commander of the Trans-Caucus Military District, Sufian Beppayev chaired the Balkar National Congress that declared sovereignty in 1996. The Lezgin National movement “Savdal” was headed by general Mughuddin Kahrimanov who called for unification of the two divided Lezgin groups into one sovereign national unit. Aslan Maskhadov, recently killed by Russians, was an ex-colonel of the Soviet army and a representative of the dominant ethnic group that enabled him to gain the presidency of the breakaway state of Ichkeria.

Powerful individuals from the younger generation, in their thirties and forties constitute the third group. They started their careers in the post-Soviet era and made their way up through personal resolve and the skillful exploitation of economic and social chaos. Gadji Makhachev, once the chairman of DagNeft in Dagestan, and Khozh-Ahmed Nukhaev, the former chairman of the Caucasus Common Market and the former deputy prime minister of Chechnya, are the most frequently cited examples. Many such individuals had criminal convictions, some of them for violent crimes (Matveeva, 1999, p. 15).

Former local party and government officials still in power at Kabardino-Balkaria, Ossetia, and Dagestan were trained to obey and implement orders from the center and to
think in terms of Moscow’s priorities. These habits were deeply ingrained. The same is true for servicemen, who, like Alu Alkhanov or Murat Zyazikov, at the behest of the Kremlin recently headed pro-Moscow administrations in Chechnya and Ingushetia. In spite of differences in origins and social background all three mentioned in the above groups of ethnic elites have one common characteristic. As Paul Henze states, “attitudes of responsibility . . . and forms of discipline and control inherent in most free-market societies (and even in many other authoritarian systems) are largely absent in all of these leaders” (Henze, 1994, p. 9-11). They quickly learned how to speak in terms of democracy, political competition, human rights, free markets and free flow of information but these concepts are inadequately understood and often exploited as slogans to attract outside support or discredit rivals. One may be surprised by the large number of specialists in linguistics, literature, folklore, archaeology, and history around these leaders and at the head of ethnocentric organizations and movements now asserting ethnic pride and national self-determination. However, all of them are ill-equipped to understand the real principles of democracy. The art of compromise and accommodation, the process for peaceful resolution of differences and setting of priorities, the rule of law as an inclusive and systematic set of legal procedures, and human rights consisting of a respect for everyone regardless of ethnic belonging, is neither deep nor widespread among ruling elites in these North Caucasus societies. Few of the newly emerged leaders show any grasp of economic realities (Isaenko and Petschauer, 1999, p. 160).

In 1991-1992, Djokhar Dudaev in Chechnya and Akhsarbek Galazov in North Ossetia encouraged the creation of informal armed structures. This sparked a spontaneous militarization of the area and of various ethnocentric movements and fronts. Moreover, the leaders of these military formations often represented local mafias and developed political and “business” agendas of their own. In the long run, official leaders failed to control them. Equally, they failed to elaborate on comprehensive strategies of coherent programs on how to promote social and economic reform to meet the avalanche of increasing problems in the region.

As Ramazan G. Abdulatipov states, “the ethnic and political elites, as well as many intellectuals proved themselves unable to work on adequate sociopolitical, economic, ethno-cultural, and moral mechanisms of self preservation . . . because they closed themselves off in their own highly narrow political interests” (Abdulatipov, 1995, p. 57-58). Another leading historian in the region—Max Bliev—showed very specifically that among ethnic leadership there began to dominate “dispositions and habits of tribal aristocracy” (Bliev, 1999, p. 316-330). Not knowing how to solve numerous problems plaguing their respective people most of them learned very well how to bargain with the Kremlin in order to stay in power and maintain their privileges under any unfavorable circumstances. Seeing all this, common populations have developed habits of thinking of their own needs as largely illicit—which they are, from Moscow’s point of view.

The disastrous results of the first Chechen adventure (1994-1996) for the North Caucasus and Russia are known and were analyzed in detail in many publications (see Tishkov, 2004). We need only stress that it immensely increased the sufferings of the average Chechens and those living in the surrounding areas; it prompted the degradation of the
last trace of legal institutions, and enhanced the rapid barbarization of life in the republics of the North Caucasus.

This barbarism implies the deterioration of capitalism into gangsterism and terrorism and the decline of traditional and local law enforcement agencies. This trend had been especially pronounced in Chechnya proper and other ethnically charged areas like Ingushetia, Dagestan, Ossetia, and Kabarda. In these areas, field commanders have made hostage-taking a lucrative business and more than 150 bands were operating independently of local authorities. Between 1996 and 1999, in Chechnya alone, thousands of Russians and a number of foreigners became hostages and slaves.

Overall a regressive tendency was depicted by the former head of the Security Council of Dagestan Magomet Tolboyev:

Different ethnic paramilitary formations strengthened themselves in the area; they receive . . . skills and experiences of carrying out military operations. . . . People are sick and tired of them: raids of brigands, kidnappings, stealing of cattle, murder and assassinations. I told them in Moscow many times, do not let people come to the North Caucasus regions that are Kabarda, Dagestan, and Ossetia. I know how (kidnapped) people live there . . . they sit like slaves in dungeons. . . . If you want to be kidnapped, go to Chechnya, Dagestan, Kabardino-Balkaria, and Ossetia. Maybe you will be ransomed afterwards, maybe you will not. If not you will be killed. . . . In Moscow the officials do not understand what the Caucasus looks like. (Tolboyev, 1998, p. 7)

Still another result was an unprecedented spread of ethnically based corruption in the region. It virtually embraced all spheres of life, but especially law enforcement agencies. These facilities are stricken by nepotism and are being staffed by ethnic relatives of those in power at the cost of professionalism and abilities to perform effectively in crisis situation. Former head of pro-Russian Chechen administration Akhmad Kadyrov, who was assassinated on May 9, 2004, had testified that 80% of all means that the federal government was providing for the reconstruction in Chechnya used to be stolen half way to the republic. Local bureaucrats used to claim 50% as bribes from the sums of compensation due to pay for the lost dwellings of victims of war. The analysis of the Accounting Office of Russian Federation confirms these facts, adding that “a considerable amount of these means ultimately finds its way to the terrorist structures of underground resistance” (Posle Beslana…, 2005, p. 3-5). A popular liberal weekly edition, Novosti Rossii (The News of Russia) states with the reference to the Moscow fund “Indem” that Western businessmen pay 33.5 billion dollars in bribes to Russian bureaucrats and officials annually. One Finnish-Russian company even issued special instructions to its employees on how to most effectively bribe Russian government officials (Novosti Rossii, February 15, 2005, p. 1-3).

In the North Caucasus, residents routinely pay bribes to the police on the roads, to the schoolteachers, and professors in the universities, to the doctors and nurses in hospitals, to the nurses in kindergartens, etc., and of course to the officials in all state and private
agencies. In Ossetia this practice even became a popular topic for bitter jokes. For example, two are talking in the streets, and one asks another: “do you know how to decode GAI?” The latter replies: “I know that in Russian it is ‘State Automobile Inspection,’ but an Ossetian may decode it as ‘gartam alkamai ish.’” That means, “I take bribes from everybody.” Still another joke has appeared. “A teacher asks a pupil of an elementary school, ‘What animal is usually grazing on the asphalt?’ The pupil reacts immediately, ‘The road police!’”

The most astounding and unmasking revelation of corruption in modern Ossetia can be found in the essay of Taimuraz Chedzemov, a retired judge and honored lawyer of the Russian Federation. He writes,

> Everybody knows that official positions are for sale in the republic. One may easily find judges with forged degrees and records. Hundreds of court verdicts are impertinent interferences into legal norms and procedures. For example, the verdicts of Industrial and Soviet regional courts, by which 228 of the most expensive imported cars were relieved from custom duties. As a result of these machinations, the amount of damages to the republican budget reached four million dollars. . . . However, the prosecutor’s office did not find any transgressions against the law in these cases, and the Supreme Court keeps silence. No surprise that 87% of residents think that the desired court verdicts could be obtained through bribes, and only 9% of Ossetian residents trust courts and law enforcement agencies. . .

In 2000, the administration of Vladikavkaz (the capital of North Ossetia-Alania-A.I.) gave to Alexandr Dzasokhov (President of the Republic - A.I.) a luxurious apartment, ostensibly for “state necessities.” It was an illegal act, since Dzasokhov had already owned an apartment in the city, and for “state necessities” he used a large country house. . . . When the public knew about this machination a person moved into the apartment that had no relations with the administration of president, or to the administration of the city. After awhile, Dzasokhov received yet another apartment in the same building. . .

When Moscow officials come on control missions they usually meet only with carefully selected auditorium, where they praised wisdom and Ossetian hospitality of Dzasokhov. Meanwhile, the real life of common people rapidly continued to decline on the background of rising palaces of republican bureaucrats (Chedzemov, 2004, p. 6-7).

As a matter of fact, the circulation of this edition was confiscated by the order of republican authorities. The oppositional resource was closed. Having failed in stopping low-level guerilla warfare of radical Islamists, local officials, however, do know how to shutdown public opinion.

I want to demonstrate further how all these longstanding and immediate reasons and factors manifested themselves in the tragedy of Beslan. As a result of the Chechen conflict, both in Russia and in the Caucasus, negative and anti-democratic tendencies received yet another strong impulse that pushed them further into a regressive projection.
While revitalizing great power illusions and nationalistic, xenophobic hysteria, Moscow failed to elaborate on a viable and comprehensive ethnic policy in the North Caucasus.

A sound failure to build in Chechnya a civil democratic state, subsequent fragmentation according to family and territorial clans into various armed formations, anarchy, bloody battles about control over what is left from economic resources and for power made it a volatile powder keg in the region. Their violence in the form of terrorism more and more often spills over into neighboring republics and territories, but also into southern and central Russia and even Moscow.

The investigating commission stated that most of the perpetrators in Beslan and elsewhere came from the families who suffered great material and human losses in the process of the Russo-Chechen War and suffered chronic unemployment—which by the way is highest in Chechnya and the other North Caucasus republics compared nationally. They represented families that suffered incredible atrocities performed by Russian troops or by local pro-Russian warlords. Some had longstanding criminal records and all of them belonged to the underground Jamaats of Islamists who had declared jihad against Russia and her allies, like North Ossetia.

Shamil Basaev said the attack in Beslan—just like in Budyonnovsk in 1995—was intended to force the Russians “to feel the same grievances that they caused the Chechens to feel” (Kavkazcenter.com, November, 22, 2004). At the end of June 2004, Basaev gave an interview to Al-Jazeera in which he threatened new terrorist acts outside Chechnya. On August 2, 2004, Aslan Maskhadov published his order urging loyal Chechens “to transfer the war on the enemies’ territory.” As a result of such attacks he planned “to bring a quick victory” to Ichkeria. Later Shamil Basaev confirmed that he had planned the seizure of the High School #1 in Beslan long before under the code name “Nord-West.” As in Budyonnovsk, his goal was to force Putin to end the war and withdraw Russian troops from Chechnya.

On August 18, 2004, the Russian Interior Ministry (MVD), sent a telegram to North Ossetian authorities. It warned the Ossetian law enforcement structures that according to “operative evidence” Chechen militants were planning to perform in North Ossetia a large-scale terrorist act similar to that of Budyonnovsk. The object targeted could be a state facility containing a large number of people. All stations, hospitals, public buildings, schools, and all roads were supposedly protected by the police, except that one which the perpetrators had planned to take a long time before. In addition, that was the one: a secondary road which had been used (and is still being used) by the international criminal group of Ossetians and Ingushians who under cover of the local police transport stolen oil from Chechnya to Ossetia. A group of 2-3 policemen were put on guard at the school in Beslan, but at the time of the attack, they were not there.

Currently at Beslan, the trial continues regarding the guilt of the chief of the district police and his deputies. Astounding facts are coming out. It appeared that the terrorists had accomplices among the rank and file of the police officials. On the eve of their raid they supposedly informed them that the route to Beslan would be completely unguarded...
because all the police would be sent to guard the highway that president Dzasokhov intended to take to Nalchik—the capital of adjacent republic of Kabardino-Balkaria. Thus the road to Beslan was left unguarded (The News of North and South Ossetia. www.Ossetia.RU. October 26, 2006)

The investigating commission established many other facts of outrageous corruption that led to the tragedy. At least five terrorists supposedly had to serve their sentences in the Russian prisons at the time of Beslan crisis. However, their Islamic Jamaats led by Shamil Basaev through corrupted connections to the police and penitentiaries bribed them out and they later took an active part in the operation. 31 year old Khanpash Kulaev from Nojai-Urt of Chechnya had been arrested as an active member of the band of field commander Rabani Khalilov, who stands behind many terrorist acts in Daghestan. But deputy to the general prosecutor of Russia Nikolai Shepel justified his release from jail, supposedly because Kulaev had an amputated hand. However it did not prevent the latter during the storming of the school in Beslan from successfully commanding four other terrorists and for hours held fire from the first floor of the school holding a lot of hostages. Ironically enough, after the tragedy, Shepel was appointed by Putin as a chief investigator of the Beslan case. Of course he did everything to hide the proof of his criminal negligence in performance of his duty by his subordinates and other officials.

20 year old Adam Iliev from Malgobeck (Ingushetia) had been arrested for creating explosives. But district court at Malgobek released him under subscription.

Isa Torshkhoev, Sultan Kamurziev and Mairbek Shebikhanov who were convicted killers and militants of paramilitary formations also were either released or acquitted by the corrupt judges of local courts in Chechnya and Ingushetia. All of them were among the most relentless attackers in the school. Just as another terrorist, Vladimir Khodov, while being wanted by Russian police openly lived in his own house in Ossetia in the village of Elkhotovo near Beslan and took part in mining railway tracks there. Local policemen knew about his connections to Islamists but took no action (Sentenced to Freedom, 2004, p. 1-2).

During the trial of the single arrested terrorist of Beslan, Nurpashi Kulaev, the surviving victim Zamesova, who lost her daughter, uttered very meaningful words: “Our police protect only its own interests and wait only for bribes. . . . But it is we who are guilty in everything what happened to us. It is we who readily gave them bribes” (“We Are Guilty Ourselves…,” 2006, p. 1). Alas it was a late repentance. It was a huge price for the policy of ethnonationalism that corrupted the society and its law enforcement agencies in particular from the inside.

Shamil Basaev carefully selected the object of an attack as well as ethnic composition of the group of attackers. By including a lot of Ingushians in the group of perpetrators he may have counted on detonating a smoldering ethnic conflict between Ossetians and Ingushians. The last demonstrations in both republics in March 2005 with renewed mutual accusations and claims over contesting territory of Prigorodnii area show that his plan at least partially may come true.
These and other synonymous facts prove that the Beslan tragedy was simply inevitable. Since that time, the real ethnic and social situation in the Caucasus has hardly changed for the better.

**Part II: The Beslan Tragedy in the context of Ethnic Extremes**

After analyzing multitude of assessments of Beslan massacre circulating in ethnic communities touched by the tragedy, and also in the state-controlled Russian media, I realized that the best model to describe my findings, using a psychodynamic frame of reference, was “regression to a paranoid schizoid phase”, in Melanie Klein’s terms. This model has been applied by Dr. Martha Cullberg Weston to describe ethnonationalistic behavior of Serbs and Croats when in the early 1990s the crisis in former Yugoslavia erupted into ethnic warfare (Klein 1975, p. 24; Weston, 1997, p.19-32). Here I need to remind that Klein had a rather provocative way of describing human relations based on her findings in child analysis. She argued that small children when dealing with incompatible and conflictual aspects of themselves resort to so-called “paranoid schizoid position”. This process includes certain phases: a) splitting off incompatible parts of the self into “good” / “bad” in order to protect “good” part from destruction; b) building a “container” as a “safe keeper” of a “good” part; and c) transformation of a “split off” part into an enemy with the “self” perceiving the “other” as a threat. The “self” then feels “persecutory anxiety” – an exaggerated feeling of dread based on projection. In this phase the dominating emotions are: envy, greed, and also fury which is very easily evoked by frustration. When matured the children are better able to handle frustration and display a more complex way of perceiving themselves and others and a more caring pattern with feelings of guilt and wishes for reparation. Dr. Weston calls it “depressive position” that is carried on into adult life. However, in stressful situations people can regress again to a “paranoid schizoid pattern” (Weston, 1997, p.24). In the end of 1980s and in the beginning of 1990s, i.e. in the time of collapse of Soviet Empire, such regressive tendencies were also evident in the Caucasus both on individual and at the group level among a broad spectrum of its ethnic members when they began to share the same stressful conditions of a societal crisis.

When the society people knew began to dissolve in front of their eyes, and when they saw that the economy was crumbling and they had difficulty surviving because their salary no longer covered their basic needs, and when they saw that at the same time their corrupted elites were flourishing like they never flourished before—they reacted with frustration and anger. This was real danger for the local elites and they also reacted immediately through channeling these grievances and redirecting them against the rule of Moscow, as in the case of Chechnya, or toward the restoration of historical justice, as with Ingushs and Balkars, or toward upgrading a people standing against other ethnic groups, as in Dagestan and in Georgia (Isaenko and Petschauer, 1995, p.110-112; Matveeva, 1999, p.11). Unresolved conflicts of the past play a very important role in the present. Often the simple revival of mutual suspicions is enough to rekindle dormant mutual hatred, and historians, political scientists, and other intellectuals certainly play a
role in reviving the past traumas and their transmission to the media and politicians, and then to the public. Ethnocentric Chechen elite skillfully impelled anti-Russian drive by reopening unresolved chosen historical traumas, unresolved territorial claims, and competition over resources and fears of cultural vulnerability (Ormond, 1997, p.96-139).

The Ossetian-Ingushian ethnic conflict was reactivated predominantly through exacerbation of “nationality” (i.e. territorial building block). A dispute over parts of the region which have seen repeated border changes and forcible population transfers within them has become a focus of ethnocentric brainwashing campaigns in both ethnic communities. Both Ingushian and Ossetian historians using the same historical sources but interpreting them differently, proved to their own satisfaction and to that of their respective peoples that this or that piece of land in the Prigorodnii and Pravoberejnii districts of North Ossetia – Alania “originally” belonged to their ancestors. Such interpretations of the past reinforce the foundations of memories of loss and the connected image of the enemy (Isaenko and Petschauer, 1995, p.109). This territorial building block in this case is closely connected to another provocative one, i.e. to the chosen traumas of shared history.

For both Chechens and Ingushians the greatest chosen trauma is their total deportation to Kazakhstan by Stalin in 1944. When in 1957 the surviving exiles were allowed to return to the region and their autonomy was restored, they found part of Prigorodnii district, that they considered theirs were still a part of North Ossetia. It was a bitter return. To make matters worse, modern Russian legislators, ignoring regularities of ethnic conflict, in 1992 adopted the controversial principle of “territorial rehabilitation of repressed people”. This added more fuel to the trauma, and Ingushians readily transferred all of their hostility to the latest generation of Russians and Ossetians living on contesting territory. Beslan is located in that area.

In my observations of political life in Ossetia, Chechnya and Ingushetia in 1990s I encountered many features of the Kleinian concept of regression to the paranoid schizoid phase. Ethnic images were split into good/bad and into we/Them categories. Everyone idealized their own ethnic group and demonized others. Ethnonationalistic leaders used propaganda aiming at creating fear, rage and insecurity about people’s safety. The mirror affect was striking. When talking to Chechens or Ingushians it was, consequently, of course, Russians / Cossacks, and Ossetians who were the aggressors. When asking Russians or Ossetians, it was Chechens and their ethnic brothers Ingushians who are responsible for the whole mess. Media in both republics used the same pictures to induce rage, simply changing the ethnic label of the victims and perpetrators. Some of them are still on display in Ingushetia.ru internet portal under the meaningful rubric: “Genocide and deportation of Ingushians from North Ossetia in 1992” (www.ingushetia.ru, photo documents; compare, Weston, 1997, p.25). At the same time Russian mass media under the tutelage of Mikhail Poltoranin, vice-premier of Yeltsin’s government, unleashed targeted campaign of dehumanization of Chechens (Cherkasov, 2005, p.9). All this became a breeding ground for group belonging, self-assertive and integrative tendencies, “brotherhood within / war-like ness without” behavior, mirror reflected prejudices, mass behavior, conformity, authoritarianism and unrestricted aggressiveness (Kecmanovich,
1997, p.3-5). Media war created a fertile soil for the destructive actions we have come to call ethnic cleansing. With charismatic leaders, like Dudaev in Chechnya and Yeltsin in Russia, using this situation for their own political goals and playing different groups (like Ossetians and Ingushians) against each other, the road was destined to warfare. Before the Russian invasion in 1994-1996, 20,000 non-Veinakhs (i.e. non-Chechens-Ingushians) were murdered and 250,000 left Chechnya saving themselves from ethnic cleansing.

Subsequent Russian defeat resulted in strengthening of Islamic radicals; they added to the Chechen resistance a terrorist dimension. In 1999, pursuing their magic dream of creating Islamic Imamat from Caspian to Black Sea without Russians, they invaded neighboring Dagestan, which ignited second Russian-Chechen war. In both wars of a population of 1,270,000 approximately 200,000 perished, including non-Chechens and 3-400,000 became refugees. 20,000 children suffered physical disorders, and tens of thousands became orphans. Currently from 5-10% Chechens and Ingushians sympathize with radical Islamists and are ready to take part in the acts of terror against “alien” civilian population. “Every month losses of lives among Chechen civilians due to different reasons amount to 50 people killed and every year Chechnya looses 2-3 thousands killed, kidnapped, or missed without any traces” (Novosti Rossii [“The News of Russia”], November 19, 2004, p.1; see also Pain and Popov, 1995, p.2-3; Souleimanov, 2004, p.1-3).

North Caucasian Jaamats of radical Islamists and ethnocentric nationalists are behind all significant acts of terrorism in the region in 1990s and in the beginning of 2000s. Overall, they have exceeded 2000.

- April 9, 1996. Bombing of the railway station in the North Caucasian town of Pyatigorsk; Chechen women were involved for the first time.
- 1997. Individual homicide terrorists killed more then 100 Russian public figures. Some of them with their families.
- October 8, 1999. The biggest individual homicide attack on civilians in the Cossack village Mekenskaya (Chechnya). A Chechen resident opened random fire and killed 34 Russians, including a 10 year old child.
- May 9, 2002. Kaspiysk (Dagestan). An explosion during a Victory Day military parade killed 32, including 12 children, and injured 130 others.
December, 2002. Groznyy (Chechnya). Two heavily loaded with explosives trucks driven by 43 year old father and his 17 year old son and 15 year old daughter broke through the Governmental building and blew it up. More then 80 people died and 170 wounded. These shahids (martyrs) had been prepared by the commander of Special Battalion of Shahids Riyadus Salikhiin Shamil Basaev.

May 12, 2003. Znamenskoe (Chechnya). A car bomb exploded near the area of the headquarters of FSB: 37 people died, and 197 wounded.

2003. A car bomb exploded near Mozdok military hospital (North Ossetia) killing and wounding many patients.

2003. Bombings of electric trains in the area of Mineral Waters (Stavropol) claimed lives of over 100 civilians.

September 1-3, 2004. Beslan (North Ossetia). Of the 1,254 hostages whom the terrorists of Shamil Basaev tormented for days on end, 339 lost their lives, according to figures released thus far by the investigating commission, including 179 children, first-graders, and infants. Another 600 people, again including many children, were injured. Beslan and entire Ossetia became a place of misery, condemned to live with a profound psycho-historical trauma from now on (compare, Murphy, 2005).

These facts show that the tragedy is a logical outcome of regressive discourse in ethnic interactions in the Caucasus.

In the Georgian – South Ossetian conflict of 1989 and 1992, 1,000 people were killed; more that 1,800 wounded and 120 disappeared. The industrial infrastructure of the South Ossetian Autonomous Region was completely destroyed. In Tskhinvali, the South Ossetian capital, more then 80 percent of the dwellings and all –important installations were laid to waste. One hundred fifteen Ossetian villages were destroyed and more then 100,000 Ossetians became refugees (Arbatov, 1997, p.342). They came to North Ossetia with many to settle in the villages of Prigorodnii district – on the disputed territories with Ingushians. It increased Ossetian – Ingushian mutual mistrust and hatred. During “hot stage” of Ossetian – Ingushian conflict (10/31/89 – 11/06/89) from the entire Ingush population of the district around 30,000 became refugees. Result: the dominating self – perception of Ossetians, living in both Ossetias, has become an idea of existence in the “besieged fortress” surrounded by enemies who “are about to attack us”. Georgians, and in greater extent Ingushians, are percepted as “plotting traitors”. A suitable container, a “safe keeper” i.e. greater, united Ossetia – “a magic kingdom”—Alania is found onto which to project the split off (“good” part) of the self. Ingushians are looked upon as “suitable targets of externalization” (Volkan, 1988). The Ingushians in their turn have developed a highly egocentric victim position linked to ideas about entitlement – an effective platform to legitimate excesses against those whom one believes have wronged one’s own group in the past (Weston, 1997, p.26). The Chechens also blamed Ossetians, because their Chechnya was supposedly invaded from Ossetia, where Russian military bases are located, but Ossetians have not prevented it. Thus the dominating self – perception of Chechens and Ingushians is primitive revenge building on the fantasy that it
is possible to regain what was lost through the destruction of the perpetrator or representatives of the ethnic group of perpetrator. All these ethnocentric phobias reflected on the composition of the attackers, on the actions and outcomes of the tragedy, and on the stunning revelations of the author of the raid.

On September 17, 2004, Chechen terrorist Shamil Basaev issued a statement claiming responsibility for Beslan school siege. (http://www.afpc.org/rmm/rmm1192.shtml) (http://edition.cnn.com/2004/WORLD/europe/09/17/russia.beslan/) Newspaper reports have also linked his Ingush deputy, Magomet Yevloyev, to the school attack. This crisis was strikingly similar to the 1995 Budyonnovsk hospital hostage crisis and the 2002 Moscow theater hostage crisis in which hundreds were held hostage by Chechen fighters, also led by or answering to Shamil Basaev. Amidst of developing crisis some of the 32 hostage-takers, which included 5 women, were tentatively named: among them 12 Chechens and 9 Ingushians. This reinforced the worst Ossetian fears with regard to the intentions of attackers. Family names pointed that the latter belonged to the clans whose members died in mass of the hands of Russians in Chechnya, or to the Ingushian clans, whose relatives attacked Ossetia in 1992 and after their defeat were either murdered or became refugees (http://en.wikipedia.org/wiki/Beslan_school_hostage_crisis). In his interview to “Kavkaz Center” – an internet resource of Chechen separatists, Shamil Basaev admitted: “Our enemy establishes the limits to our actions. We are free to use the same methods as our enemy uses against us… So, we are free to use such actions against the people who support Russian occupants against us by their property, bodies, words, advices, etc… 100 kilometers away from Beslan with the help of Ossetia Russians continue to genocide Chechens, and we have more then 40,000 dead children… So, let Ossetian mothers feel what Chechen mothers have been feeling for years.” (Kavkazcenter.com, November, 22, 2004).

Revealed ethnic composition of attackers triggered spontaneous avalanche-like rally of self-armed Ossetian relatives of hostages and flood-like coming to their rescue of the paramilitary groups from South Ossetia.

The hostage-takers in Beslan were reported to have made the following demands:

- Withdrawal of Russian troops from Chechnya.
- Presence of the following people in the school:
  - Aleksandr Dzasokhov, president of North Ossetia-Alania,
  - Alu Alkhanov, president of Chechnya (other reports name presidential advisor Aslambek Aslakhanov, or Mukharbek Aushev, Duma member representing Ingushetia),
  - Vladimir Rushailo, Executive Secretary for the Commonwealth of Independent States.

In the camp of Federals this revoked memory of Budyonnovsk and subsequent humiliating Russian retreat. When Aslan Maskhadov – president of warring Chechens agreed to enter the scene and negotiate peace, the fate of hostages was sealed. Kremlin’s paranoia and fear of defeat prevailed. Apparently, it was at this point that Russian Special Forces activated their action plan to storm the school to rescue any possible survivors. The blood-freezing result of this dreadful decision is well-known.
From now on this trauma will be encapsulating in ethnic memory of Ossetians, more and more affecting their attitude and treatment of their ethnic neighbors. Immediate reactions have already followed. According to the census of 2002, 20,700 Ingushians out of those who had been forced out of Prigorodnii district of North Ossetia in 1992 have been allowed to return. After Beslan this positive process of reconciliation has been abducted and many Ingushians have left the area again fearing for their safety. Currently the local media is reporting about increasing number of incidents between Ossetians and Ingushs in the bordering settlements of this troubled territory. Concerning the Ossetians’ attitude towards Moscow we may refer to the opinion of a popular Ossetian historian Ruslan Bzarov. “After Beslan we have understood, - speaks Bzarov, - that we are with Russia, but it does not mean that Russia in all situations would be with us – Ossetians. We were betrayed by Russia for the first time in 1918, when they in Moscow decided to divide Ossetia between Georgia and Russia. And such an attitude to use Ossetia as a change coin in the relations between Moscow and our neighbors has continued throughout the entire century. And we know about that. But we also know that this is an inevitable price that our people should pay for the opportunity to survive in the hostile environment. This opportunity can be given to us only by Russia.” (Ossetia.ru, September, 25, 2006, p.5). I know that the majority of Ossetians share this opinion. This is a stunning example of regression to the phase of deep depression. I tend to define it as the post – Beslan masochistic syndrome. If to use Kleinian terminology, it may come out as a result of a profound shock when persecutory anxiety in childish behavior gives way to the fear of losing the mother’s love. Then a child is better able to handle frustration and displays a more caring pattern with feeling of guilt and wishes for reparation. This is exactly how many Ossetians reacted to the Beslan tragedy.
